By 1566 Ingegneri had moved to Cremona, and was in receipt of a small stipend from the monastery of S Abbondio. The dedication of his *Primo libro de madrigali a quattro voci*, which survives only in a 1578 reprint, states that the book was his first publication and refers to his having already spent some years in the service of the dedicatee, Giovanni Gadio, the prevost of S Abbondio. Gadio died in 1569, providing a latest possible date for the dedication, which may in any case not have appeared in the first edition. There is substantial evidence that the book was altered in reprinting, and it may even have been first published before Ingegneri moved to Cremona.

On the title-page of his five-voice motets of 1576 he styled himself prefect of music at Cremona Cathedral (see [illustration](#)), though the cathedral account books provide clear evidence of this appointment only from 1578. Ingegneri is first referred to as *maestro di cappella* in an entry dated 14 January 1580, which recorded that he was to receive a special bonus payment in recognition of his hard work in preparing the music for the preceding Christmas season. Even before that date, although Ingegneri was only called 'cantor' and the choir his 'fellow singers', the wording of entries clearly indicates that he was already in charge. He seems to have been on the best of terms with the cathedral authorities, since he received special bonuses on more than one occasion over the years. In 1581 he married Margherita Soresina, a singer; they appear to have had no children. He bequeathed his entire estate, including the house in S Vitale, to his sister Prudentia. The house passed from family hands in 1622. Although he had settled in Cremona, throughout the last two decades of his life, Ingegneri maintained ongoing contact with benefactors and patrons elsewhere. This is shown particularly through the commissioning and dedications of his secular works; complete volumes of madrigals were dedicated to patrons in Vienna, Milan, Parma and Verona, and isolated works appeared in anthologies compiled in Verona, Venice, Milan, Brescia, Ferrara and Rome. As the most distinguished musician in Cremona, Ingegneri was in the position to foster the city's most talented musicians; it is known that he tutored Claudio Monteverdi, but it is also likely that he taught Benedetto Pallavicino, Monteverdi's eventual colleague and rival at Mantua. For nearly a decade, between 1576 and 1586, Ingegneri published only madrigals; but after the dissolution of the Cremonese Accademia degli Animosi in 1586, he appears to have lost interest in

secular composition. He resumed the publication of sacred music, producing six more volumes before his death in 1592. He was a close friend of the reformist bishop Nicolò Sfondrato, later Pope Gregory XIV, to whom he dedicated no fewer than four books of sacred music over a period of 15 years.

2. Works.

Ingegneri's music reveals that he was a highly competent polyphonist; his contemporary, Pietro Cerone, hailed him as a master of counterpoint, and attributed to him the invention of a number of devices including 'double and inverted counterpoint at the 10th and 12th'. His sacred music catered admirably to the musical demands of the post-Tridentine church. Many of his motets, for example, are based on plainchant melodies which are occasionally used as strict cantus firmi, and his choice of texts shows a gradual inclination towards liturgical verse. Yet he seems not to have been greatly concerned with the intelligibility of the text, an issue that was prominent among reformers; this is by no means unusual, and may even reflect the prevailing attitude in Cremona. During Sfondrato's bishopric no specific mention of music, or the principles by which it should be governed, appear in the otherwise exacting and detailed synodal decrees. Ingegneri favoured polyphonic textures in his motets, the most extreme example of which is the four-voice *Noe noe*, a double canon by inversion with two different resolutions of the canonic voices. The masses also show evidence of the increasing influence of Tridentine reform. The first book, published in 1573, contains four parody masses. The works are freely contrapuntal in the *oltremontano* style, perhaps revealing the influence of his teachers, Berchem and Rore. By contrast, the masses in the second book, published in 1587, are based entirely on liturgical or freely invented material, and make much fuller use of syllabic text-setting and homophonic textures. But this development in his musical treatment of text may not have been due solely to current religious thinking. Ingegneri's later sacred works demonstrate the growing popular concern that musical settings should reflect the sense of the text. His responsories for Holy Week and their companion Lamentations correspond to Pietro Pontio's advice to use slow-moving homophony, with occasional dissonance 'to make the composition more lachrymose'. On the other hand, the celebratory book of polychoral motets, dedicated to Sfondrato upon his elevation to cardinal, was published for 7–12 or 16 voices, 'together and separately adaptable for various concerted musical instruments'.

A full assessment of Ingegneri's development as a madrigalist is hindered by the loss of his first book of five-voice madrigals and of the cantus part of the second. His later books, four from the 1580s and one posthumously published, all survive complete. The corpus spans over 20 years and reflects various influences that besieged secular composition during that period: the rise of the professional female performer, the development of instrumental playing, the humanist experiments of both French and Italian academies and the emergence of musical theatre. His madrigals show him to be a natural successor to Rore, and reveal an enduring fascination with the integration of coherent musical form with an intelligent and intelligible representation of the text. His means of expression make use of techniques which affect whole blocks of text and which may be juxtaposed

in contrasting sections: chromaticism, metre, relative note values, texture and tessitura. The emphasis is always on illumination, rather than illustration, of the textual conceit: although he frequently uses madrigalisms, they always appear as part of the wider affective context. The musical structure is governed by the syntactical, not the formal, structure of the text and is generally articulated through cadential relationships, with both the pitch and the arrangement of the cadence determining its structural importance. However, the reiteration, development and transformation of thematic material as both a unifying technique and an expressive device is also a prominent feature of his style. And like Rore, Ingegneri explored the possibilities of representing the text through harmonic organization; in many of his works mode, deviation from the mode, and cadential relationships are used as text-expressive tools.

His textual choices are varied, including verse by Petrarch, Bembo, Ariosto, Parabosco, Casone, Tasso and Guarini. His settings of Tasso's *D'aria un tempo nodrimmi* (1580) and Etienne de la Boetie's *Jay senty les deux maux* (1580) were composed before the poems themselves were published, suggesting that he had access to manuscript copies of the texts. A significant number of madrigals using a female narrative voice, or eulogizing identifiable female singers, may indicate contact with performers such as Tarquinia Molza and Laura Peverara in the years before they were employed at Ferrara. Some of the madrigals either dedicated to or associated with the Farnese court at Parma and the Accademia Filarmonica of Verona are clearly intended to be part of theatrical displays, commenting on dance formations, narrating the descent of a *deus ex machina* or describing the distribution of performing forces of both voices and instruments.

Documentary evidence shows that by the 1580s Ingegneri had organized a mixed instrumental ensemble of strings and wind at the cathedral in Cremona. His only exclusively instrumental compositions are two 'arie di canzon francese per sonare' which appear at the end of his second four-voice book of madrigals; some of his madrigals may have been performed by mixed forces.

3. Influence.

Ingegneri's success both during and after his lifetime is difficult to quantify. On one hand, both his books of four-voice madrigals were reprinted at least once, and his contributions to prestigious collective editions, such as Morsolino's *L'amorosa Ero* (RISM 1588⁵), and two of the collections for Laura Peverara, the Ferrarese *Il lauro secco* (1582¹⁷) and the Veronese manuscript tribute (*I-VEaf* Ms.220), indicate that he was well regarded by the cultural élite. However, his five-voice madrigals were never reprinted, and only a few of his compositions appear in contemporary anthologies. Indeed, his most popular works owe their transmission throughout Europe at least partially to misattributions to Rore and Palestrina.

Ingegneri's primary importance is as the teacher of Monteverdi, who acknowledged his debt on the title-pages of his first five publications. Many of the most striking and conspicuous devices in Monteverdi's early books are also features of Ingegneri's mature style, and in a number of instances

Monteverdi either parodied his teacher's work or borrowed thematic material for the setting of an unrelated text.

STEVEN LEDBETTER/LAURIE STRAS

Ingelius, Axel Gabriel

(*b* Säskylä, 26 Oct 1822; *d* nr Uusikaupunki, 3 March 1868). Finnish composer, writer and critic. He studied classical philology and literature at the University of Helsinki, worked as a teacher in Turku from 1847, lectured on music history and wrote novels, short stories and plays as well as reviews on music for several newspapers in Turku and Helsinki. As a composer he was self-taught, but nevertheless wrote the first symphony ever composed in Finland (1847). Its third movement ('Scherzo finnico') is in 5/4 metre, characteristic of Finnish rune singing, although it otherwise lacks the distinctive features of rune melodies. His opera *Junkerns förmyndare* (N.H. Pinello, 1853) was based on a subject from 16th-century Finnish history, and he also wrote about 100 choruses and songs to Finnish poetry (J.L. Runeberg, Z. Topelius and others) as well as some German songs (Schiller, Heine). As one of the first representatives of Finnish national Romanticism in music and as a pioneer of music criticism he has a place in Finnish music history in spite of his inadequate compositional skills.

ILKKA ORAMO

Ingenhoven, Jan

(*b* Breda, 29 May 1876; *d* Hoenderloo, 20 May 1951). Dutch composer and conductor. He studied with Brandts Buys in Rotterdam and later with Mottl in Munich, where he conducted the Munich Madrigal Society from 1909 to 1912. This was a famous ensemble of soloists which made many concert tours under his direction. By conducting the Munich Orchestra Association and organizing music festivals he introduced a great deal of contemporary Dutch and French music into Germany. In 1913 Ingenhoven retired as a performing artist to devote himself primarily to composition. During World War I he resided in Switzerland and Paris. After 1930 he retired as a composer and returned to the Netherlands.

Ingenhoven's preferred genres changed over time. During his first period in Munich he wrote orchestral works alongside pieces for chorus, vocal quartet and solo voice; before World War I he devoted himself to string quartets and from then until 1918 he composed chamber music for various trio combinations. In the years around 1920 he wrote the sonatas for violin and for cello and the final period was taken up with works for solo instruments within small ensembles.

Ingenhoven inherited certain stylistic elements from 16th-century music. His early works were always conceived polyphonically. Paired duets, imitation and polyrhythm are outstanding characteristics, especially in the vocal works from the Munich period. His song 'Nous n'irons plus au bois' (1909) from the *4 quatuors à voix mixtes*, which Ingenhoven claimed to be the first atonal vocal work by a Dutch composer, is a brilliant example of this style.

In the chamber works Ingenhoven's style became even more exclusive through a combination of the polyphonic elements and a new homophonic approach, with tonally indefinite chords, subtle dynamics and delicate timbre. He devised cantilena-like melodies, quasi-improvised as if he wanted to create *Jugendstil* in music. Although he used cellular motivic technique, the structure of his works always tends towards symmetry.

ANTHONY ZIELHORST

Inghelbrecht, D(ésiré)-E(mile)

(*b* Paris, 17 Sept 1880; *d* Paris, 14 Feb 1965). French conductor and composer. The son of a viola player at the Opéra, he played the violin from an early age. He enrolled at the Conservatoire, studying solfège in Ambroise Thomas' class and harmony with Taudou, but was later expelled, whereupon he joined an orchestra. His conducting début was at the Théâtre des Arts in 1908, where he directed 50 performances of Schmitt's *La tragédie de Salomé*. He mixed with artists and writers at Madeleine Lemaire's salon, and counted Reynaldo Hahn among his close friends. His most important musical friendship, however, was with Debussy: he directed the chorus for the première of *Le martyre de St Sébastien* in 1911, and continued to champion Debussy's music, *Pelléas et Mélisande* especially, throughout his life.

As director of music at the Théâtre des Champs Elysées (1913), he conducted the first production in French of Musorgsky's *Boris Godunov*. He went on to conduct at the Ballets Suédois, the Opéra-Comique (1924–5 and 1932–3), the Concerts Padeloup (1928–32), the Algiers Opera (1929–30) and the Paris Opéra (1945–50). In 1934 he formed the Orchestre National de la Radiodiffusion Française, inspired by the success of the BBC SO. During the war, he was suspended from his post for refusing to conduct *La marseillaise* while France was under occupation; he did not conduct again until the war was over. Besides his Debussy, Inghelbrecht's performances of Ravel, Roussel and Schmidt were particularly outstanding.

Inghelbrecht gained early recognition as a composer with the five piano suites which make up *La nursery* (1905–11), a collection of childhood

scenes presented with charmingly contrived naivety, which he later orchestrated. Less well known are the other orchestral suites, the operas and ballets. In these, the orchestration is polished and masterly, and the style richly eclectic, often suggestive of Fauré or Debussy. A number of works, such as *Pour le jour de la première neige au vieux Japon* (1908), the *Six danses suédoises* (1929) and the *Ballade dans le goût irlandais* (1939), explore foreign or 'exotic' influences. His last orchestral work, the suite *Vézelay* (1954), takes its name from the ancient pilgrimage town in which Inghelbrecht spent much of his life, and is one of his most bizarre, haunting creations. The Requiem (1941), written during World War II, is his only liturgical sacred work: the setting is theatrical and emotional, with echoes of Verdi in the 'Dies Irae' and some lyrical Italianate solo writing. His last work, the opera-ballet *Le chêne et le tilleul* (1960) represents, after its two comic predecessors (*La nuit vénitienne*, 1908 and *Virage sur l'aile*, 1947), the culmination of his operatic writing. Set in ancient Greece, its charming and initially directionless harmonies, in the style of Debussy, give no hint of the impending Bacchic frenzy of a wild dance with pungent rhythmic accompaniment.

NICHOLAS KAYE

Inghilleri, Giovanni

(*b* Porto Empedocle, Sicily, 9 March 1894; *d* Milan, 10 Dec 1959). Italian baritone. He was trained first as a pianist and discovered his voice while working as a répétiteur. In 1919 he made his début as Valentin in *Faust* at the Carcano, Milan, and then went on to sing with considerable success throughout Italy, at the Costanzi in Rome, the S Carlo in Naples (the first of many seasons in 1922, the last being 1948) and La Scala. He was enthusiastically received at his début in *Pagliacci* at Covent Garden in 1928, and returned there for the next two seasons and again in 1935. A highlight of his career in London was the 1930 *Traviata* with Ponselle and Gigli where his 'steadiness of tone, flawless phrasing and ease of manner' were commended as a model. He sang at Chicago in 1929, and later in France and Spain. In 1936 he appeared in the première of Malipiero's *Giulio Cesare* in Genoa. He continued to prove his worth as a musicianly singer (he was also a composer of opera, ballet and songs) until his retirement in 1953, after which he taught singing in Milan. Recordings show the fine voice and authoritative style that distinguished him in the 1920s; when he returned to the studios after the war his style had deteriorated, though his tone remained impressive.

J.B. STEANE

Ingignieri [Ingignero], Marc'Antonio.

See [Ingegneri, Marc'Antonio](#).

Inglott, William [Englitt]

(*b* 1554; *d* Norwich, 1621). English organist and composer. A chorister at Norwich Cathedral under his father Edmund Inglott in 1567–8, he was organist there from 1587 to 1591 and again from 1611 or earlier to 1621. In the intervening period, from 1597 to 1609 or later, William Inglott – presumably the same man – was organist of Hereford Cathedral. Inglott's

Short Service for four voices (Ven, TeD, Bs, Ky, Cr, Mag, Nunc) has been reconstructed by M. Walsh and R. Turbet (Wyton, nr Huntingdon, 1989), but for each of three anthems only a single part survives. There are two compositions for keyboard in the Fitzwilliam Virginal Book, *GB-Cfm*; there is also an untitled piece (a pavan) by 'Englitt' in Will Forster's Virginal Book (*GB-Lbl*; ed. in MB, lv, 1989).

JOHN CALDWELL/ALAN BROWN

Ingólfsson, Atli

(b Keflavík, 21 Aug 1962). Icelandic composer. He studied guitar and composition at the Reykjavík College of Music, graduating as a soloist in 1983. He received his degree in theory and composition a year later, and in 1986 he received a BA in philosophy from the University of Iceland. He continued his studies at the Conservatorio G. Verdi, Milan (1985–8), with Davide Anzaghi and Paolo Castaldi. He also studied with Franco Donatoni at the Accademia Chigiana, and privately with Gérard Grisey in Paris, where he also attended courses at the Conservatoire (1988–90) and at IRCAM. His music has been widely performed at European festivals and concert seasons by groups such as the Ensemble InterContemporain, Avanti!, the Arditti Quartet and the Ensemble L'itinéraire. He has also published a book of poetry, and has written on the development of Icelandic prosody from a musical perspective. His output consists almost entirely of instrumental works, characterized by a brilliant, colourful musical sound. Several of his works reflect his interest in prosody, and rhythm and metrics may be said to occupy a central role in many of them (*A verso*, *Le pas les pentes*, *Envoi*, *La métrique du cri*). In his recent work he has increasingly explored the point of contact between timbre, harmony and rhythm, which in his String Quartet no.1 'HZH' leads to a constant dissolution between prevalently timbral, harmonic or rhythmic situations, all of them issued from the same structural matrix.

Inharmonicity.

The deviation of a set of frequencies from an exact harmonic series. The most common musical application of the term is in discussion of the natural mode frequencies (or partials) of a stretched string. For a uniform, completely flexible string, the mode frequencies (or resonance frequencies) are members of the harmonic series represented by the following formula, in which n is the harmonic number (counting the fundamental as the first harmonic) and F is the fundamental frequency:

frequency of n^{th} harmonic = nF

The stiffness always present in a real string increases the frequency of each mode by an amount which depends on the mode number. The resulting inharmonic series of mode frequencies is given, to a good approximation, by the following formula:

frequency of n^{th} mode = $nF(1 + bn^2)$

The inharmonicity coefficient b can be calculated if the properties of the string are known. For a string of fixed radius and sounding length, the inharmonicity diminishes as the tension is increased.

For the relatively supple strings normally used on bowed and plucked instruments, the inharmonicity coefficient is very small, and such strings can be treated for most musical purposes as having exactly harmonic natural mode frequencies. The inharmonicity of piano strings, on the other hand, is far from negligible. A typical bass string on an upright piano may have an inharmonicity coefficient b of 0.0002; in this case the stiffness will have an insignificant effect on the frequency of the first string mode, but will increase the frequency of the twentieth mode by nearly 8% (a sharpening of more than a semitone).

Since the frequency spectrum of the sound radiated by a plucked or hammered string consists of the inharmonic natural mode frequencies of the string, the degree of inharmonicity can have a significant effect on the perceived timbre of the sound. String inharmonicity is also generally considered to be one of the causes of the octave stretching found on well-tuned pianos.

MURRAY CAMPBELL

Inisisri

(b Semarang, Java, 1951). Indonesian composer. From a family of singers of *kroncong*, popular Indonesian music originating from Portuguese songs, he became musically active at an early age. A rock drummer with the group Spider in the 1970s, Inisisri joined the experimental music group Kelompok Kampungan in the 1980s. Formed in the 1970s in Yogyakarta by musical academics and actors, this group performed a fusion of classical, rock and gamelan music. After its break-up he joined experimental rock groups including Sirkus Barock, Swami and Kantata. In 1994 Inisisri set up the percussion ensemble Kahanan with players of Kuntulan music from the Banyuwangi region of East Java. Kuntalan is a fast, dynamic and often polyrhythmic form of traditional *rebana* (tambourine) music. Kahanan has appeared on TV and at festivals including the Indonesian International Drum Festival, Jakarta Percussion Festival and Jakarta International Jazz Festival. Inisisri works regularly with other Indonesian experimental musicians.

FRANKI RADEN

Initial ascent.

(Ger. *Anstieg*).

In Schenkerian analysis (see [Analysis](#), §II, 4), a method of [Prolongation](#) consisting of a preliminary conjunct ascent from a note in the tonic triad to the first note of the [Urlinie](#). [Ex.1](#), based on Schenker's *Der freie Satz* (1935), fig.5, shows an ascent from the 3rd to the 5th of the C major chord, the 5th being the start of the *Urlinie* descent (indicated by capped numerals and a square bracket above).

As the initial ascent is preparatory to the *Urlinie*, not part of it, it need not be diatonic (see *Der freie Satz*, fig.38a). It may include a raised 4th, and so give the effect of a [Tonicization](#) of the dominant, as illustrated by Haydn's 'Emperor Hymn' (see [Stufe](#), ex.2); this example is exceptional because it shows the initial ascent covering the first 12 bars, i.e. fully three-quarters of the total length of the piece.

WILLIAM DRABKIN

Ink Spots, the.

American popular vocal group. Its members included Bill Kenny (*b* 1915; *d* 25 March 1978), Orville 'Hoppy' Jones (*b* 17 Feb 1905; *d* 18 Oct 1944), Charlie Fuqua and Ivory 'Deek' Watson. Their delivery of sentimental ballads was extremely popular during the 1940s and their close-harmony style directly influenced many black American vocal groups in the following decade. The group's sound was built around Kenny's tenor and falsetto voice and the rich bass of Jones. Kenny's diction was precise and clear while Jones would talk the lyrics of a middle eight or verse section on such numbers as *Whispering Grass* or *That's When Your Heartaches Begin* and would also occasionally sing the lead part. The standard Ink Spots arrangement featured the baritone of Watson, Fuqua's second tenor and Jones's bass harmonizing an accompaniment to Kenny's ethereal lead voice. Watson also played guitar and Fuqua guitar and ukelele. After Jones's death in 1944 the bass part was taken by Kenny's brother Herb.

Among their many best-selling recordings were *The Gypsy*, *Don't get around much anymore*, *You're breaking my heart* and, with Ella Fitzgerald, *Into each life some rain must fall*. Although the Ink Spots provided the blueprint for the doo-wop groups of the 1950s, the original group split up in 1952 and for the next four decades at least two groups were touring America and Europe as the Ink Spots.

DAVE LAING

Inner Asia.

Region situated between the great sedentary populations of Eurasia and East Asia. The kernel of Inner Asia is historically the home of nomadic pastoralists. Crossing the borders of three contemporary states, it comprises Mongolia, the southern Siberian Russian Republics of Tuva (Tyva) and Buryatia, and the Chinese autonomous regions of Inner Mongolia and Xinjiang ([fig.1](#)). Contemporary geopolitical borders are comparatively recent and do not coincide with musical landscapes created in performance. Moreover, as with other cultural areas, the borders of Inner Asia are diffuse, and musical interactions with neighbouring areas common. Traditional musical genres and forms share some characteristics with [Tibetan music](#), with those of southern Siberian peoples such as the Yakuts, Khakassy and Gorny Altai, as well as with Central Asian nomads such as the Kazakhs and Kyrgyz, who also spill over into contemporary Inner Asia (see [Kazakhstan, §1–5](#), [Kyrgyzstan, §1–4](#), [Uzbekistan, §1](#), [Turkmenistan, Tajikistan, Central Asia, China, §IV, 5\(ii\)](#), [Mongol music](#)).

The musical practices of Inner Asian peoples are inextricably bound up with their ethnicities, histories, environments and religions. As a region it presents a complex ethnic and linguistic picture, but its indigenous population is basically Mongol, with languages that belong to the Altaic family. There are two main divisions of Mongols; since the 13th century the Western Mongols and Eastern Mongols have periodically been at war. It was the Eastern Mongols who first succumbed to the Chinese Qing dynasty during the 17th century, and this remains a contentious issue.

For most of their histories, Mongols have hunted and lived off the products of their domesticated animals (horses, cattle, sheep, goats, camels). The

majority still live in easily transportable round felt tents in environments that are inhospitable and often dangerous. It is perhaps not surprising that their folk-religious, shamanic and Buddhist beliefs include spirits that both comprise and inhabit nature. They communicate with and seek to influence these spirits through a range of musical practices. Each region has had to endure the cultural onslaught of communism and has coped with it in different ways.

1. Historical connections.
2. Secular contexts.
3. Religious contexts.

CAROLE PEGG

Inner Asia

1. Historical connections.

In contemporary performances of song, music and dance, the peoples of Inner Asia create connections across contemporary geopolitical borders with peoples who once belonged to the same historical states and confederations. Khalkha Mongols and several other groups in Mongolia (e.g. Mongol Urianghais), as well as some groups in Inner Mongolia (e.g. Ordos Mongols), are connecting to the period of Chinggis Khan and the Mongolian Empire (1206–1368); others are creating associations with the Jungar State (*Züün Gar Uls*) (1630 to late 1750s), which encompassed most of west Mongolia, part of Tuva, Jungaria (south-west of the Altai mountains), eastern Turkestan (present-day Xinjiang) and Buryat territories around Lake Baikal (present-day Buryatia). Such affiliations broadly relate to the division between Western and Eastern Mongols. Vocal and instrumental genres of Western Mongol or Oirat groups share characteristics with groups north, south and west of current Mongolian borders, looking westwards to Central Asia rather than eastwards to the Eastern Mongols, who include the Khalkhas of central Mongolia. **Overtone-singing** (*höömii*), the extraordinary vocal technique in which a single performer simultaneously produces two or three separate vocal lines, is traditionally performed only by Western Mongol groups (but including those Khalkhas who live in west Mongolia and are referred to by Mongols as 'Western Khalkhas') and in Tuva, as well as among neighbouring peoples such as the Khakassians and Gorny or Mountain Altai. Similarly, use of the deep guttural voice (*häälah*) in Western Mongol epic performance connects with singers in Tuva and looks westwards to the Central Asian areas of southern Uzbekistan and southern Turkmenistan; in the latter the process is called *hümlmek* (cf Mongol *höömilöh*). The three-holed end-blown pipe, on which a performer plays a melody from harmonics while producing a vocal drone, is played by Altai Urianghais (see **Tsuur**), Tuvans (*shöör*) and Kazakhs of west Mongolia (*sybyzgy*); in the Altai mountain region of Xinjiang province, China; and among Kazakhs and Kyrgyz (*chöör*) in Russia. It is similar to the pipes, such as the Turkish *kaval*, of other pastoral peoples in Central Asia. The two-string fiddle, called **Ikil** by Western Mongols, *igil* by Tuva Urianghais and *ikili* by people of the Gorny Altai, is tuned and used differently from the horse-head fiddle (*morin huur*; see **Huur**, §1) played by Khalkhas, Buryats and Inner Mongolian groups. The *biy*-dance is performed by Western but not Eastern Mongols, and the

two-string lute is played by west Mongolian Altai Urianghais ([Topshuur](#)), Altais (*topshúr*) and Tuvans (*toshpulúr*).

Eastern Mongols who live in northern, central and eastern Mongolia share musical genres and instruments with Buryat Mongols and groups in southern Siberia, as well as with Mongols in Inner Mongolia, rather than with the Western Mongols. The two- and four-string tube spike fiddle of Buryat Mongols, *huchir*, is related to the southern Siberian *ducheke* of the Nanai and *tigrík* of the Nivkhi, as well as to the two-string [Huuchir](#) and four-string *dörvön chihteí huur*. These are used to accompany 'connected verse' (*holboo*, *qolbuga*) in musical narratives (*bengsen-ü üliger*) and tales of literary origin (*bengsen-üliger*) by Jaruud, Üzemchin and Ar Horchin Mongols in south-east Mongolia and by Jaruud, Üzemchin and Ordos Mongols in Inner Mongolia.

There are many close religious, political and cultural links with Tibet, which ruled over most of this area from the 7th century to the 10th. Oral and manuscript versions of the Gesar epic, which centres on a Tibetan hero of that period, have been found across the ethnic Tibetan culture area (see [Tibetan music](#)), as well as among Tuvans, Khalkha Mongols, Oirats, Buryats, Inner Mongols and Monguors. Affiliations between Eastern Mongols and Tibetans are displayed in their traditional wedding processes (see §2 below) and use of the horse-head fiddle (Mongol *huur*) and side-blown bamboo flute [Limbe](#) (Tibetan *gling-bu*). The latter is also played in China (*ti-zu*).

In the 20th century Mongolia, Tuva and Buryatia were subjected to Soviet communism, Inner Mongolia, Xinjiang and Tibet to Chinese communism. Under Soviet communism, the formula 'national in form, socialist in content' involved the elimination of diversity and the neutralization of musical traditions. Musical traditions of different ethnic groups were amalgamated, subordinated to the style of the majority group in each country or region and then fused with European art forms and put into theatres. Instruments were adapted to enable production of sounds that fitted the European tempered scale and harmonic system. Traditional musics and dances were 'folklorized'. Folk ensemble orchestras were created in which 'national' instruments played together with European art instruments. Dances such as the *biy*-dance and the religious dance-drama *tsam* were cross-fertilized with ballet steps (Pegg, 2001). Similarly, in Inner Mongolia, designated an autonomous region of the People's Republic of China since its foundation in 1949, Mongol music came under the influence of the Party's programme of the Cultural Revolution (1966–76), when artist organizations took the message of 'New China' to the whole country, and local musicians were incorporated into a state union (Pegg, 1992).

[Inner Asia](#)

2. Secular contexts.

Musical activities take place in herding and hunting contexts as well as during domestic and public celebrations. Inner Asian nomads are herders of domestic animals (sheep, cows, horses, goats and camels or yaks) and hunters of wild animals. A variety of vocal sounds, including whistling, calls, melodious short-songs (*magtaar*) and overtone-singing (*höömii*), are used to call and control animals and birds. Mongols use musical remedies for

domesticated animals that reject their young. For a ewe, the song includes the sounds 'toig, toig, toig'; for goats, 'chüü, chüü, chüü'; for cows, 'hoov, hoov, hoov'; and for camels they play the *huur* and sing. (Mares never reject foals.) The *morin huur* or *ikil* is often used to soothe restless horses and camels, sometimes hung from a camel's hump so that the wind continually sounds the strings. The fiddle is used when animals are giving birth and thus came to symbolize prosperity. Among Kazakhs, the end-blown pipe *sybyzgy* is played for the same purpose.

Herders spend many lonely hours in the steppes and mountains and use music and song for entertainment. Mongols say that long-songs (see [Mongol music, §II, 1\(i\)](#)) developed because of the need to fill their vast territory with sounds. The side-blown flute *limbe* and end-blown pipe *tsuur* are favoured by men because they are light and easily tucked into the belt. The jew's harp (*aman huur*) is played by both men and women.

Hunters, always male, use ritual musics before, during and after the hunt. Prior to the hunt, epics (*tuul'*) or praise-songs (*magtaal*) are performed in order to charm the spirits into giving game (see [Mongol music, §II, 1\(iii\)](#) and [\(iv\)](#)). Hunters also offer *tsatsal* ('milk-aspersions') and purify their saddle thongs with juniper while emitting rhythmical verses to the spirits. Altai Urianghais perform a special long-song, *Alag Altain Shild*, to instigate the hunter's departure. Hunters use a variety of vocal and instrumental sounds to lure animals, including imitating animals, whistling, singing and *höömii*. The marmot-hunting masked dance (see [Mongol music, §II, 3](#)) is performed by Mongols and Tuvans. After the kill, verses are intoned over the dead animal and long-songs performed on the journey home.

Official celebrations occur in both private and public space. Common to many Inner Asian peoples is the family celebration, a major occasion for music-making within the round felt tent as part of rites of passage. Traditionally, annual time is reckoned according to the lunar calendar. Ritual celebrations are held to bring in the New Year in the first month (February); to celebrate the arrival of summer when taking first milk from mares in the fifth month (June); to signal the close of autumn when marking foals with the brand of clan or tribe before releasing them and the mares into the wild; to inaugurate winter when settling into an appropriate new encampment; and to continue the revolution of the seasons by 'beckoning good fortune'. Life-cycle celebrations include a child's first hair-cutting; the wedding process (including felt-making and setting up a new tent); departure for travel, and funerals. Traditional wedding processes among Tibetan and Mongol groups are highly theatrical, including arrow rituals, wish-prayers for the couple's new dwelling, and competitions; they involve masters of ceremonies who use oratorical skills to orchestrate the unfolding dramas of both sides. Among Mongols, official festivals in public spaces include the 'Festival of Three Manly Sports' (*Eriin Gurvan Naadam*), with its competitions in horse-racing, wrestling and archery; these also involve performances of songs and praise-recitations (*tsol*) (see [Mongol music, §II, 1\(vi\)](#); see also Pegg, 2001). Traditionally linked to folk-religious rites and Buddhist beliefs and practices, the timing of the games was crucial, since they were believed to influence analogous events in the world. They were often combined with rituals performed at cairns or *oboo*.

[Inner Asia](#)

3. Religious contexts.

Three predominant religious complexes intermingle in Inner Asia: folk religion, Shamanism and Buddhism. Islam, practised by Kazakhs and Kyrgyz in west Mongolia and in Xinjiang, looks to the religious and musical traditions of Central rather than Inner Asia. The three Inner Asian religious complexes include mosaics of performing practices and discourses rather than discrete or fixed sets of practices or beliefs. They are syncretic and overlapping. The power of sound to communicate with spirits is recognized by all three systems, and circular movements in the 'path of the sun' are used by all in a range of performing practices. For instance, in folk-religious rituals the Mongolian masked dancer twirls a yak's tail during marmot hunting, the Buryat Mongol performs the *yoohor* dance in a circle, Mongolian child riders encircle a tethering line while performing the ritual song *giingoo*, champion Mongolian and Tuvan wrestlers encircle a standard as they perform the Khan Guruda dance, and umpires in archery competitions accompany their song with circular gestures as they invite the arrows to meet their mark. The circular gesture occurs in shamanic seances when spirits are called, and the shaman or shamaness spins while beating the drum. In Buddhist rituals, such as the masked dance-drama *'cham*, dancer-lamas move clockwise along a path marked by two concentric circles.

(i) Folk-religious practices.

Musical performances arising from folk-religious beliefs are essential to individual, family and clan life. These are performed by laypeople or by male ritual specialists, such as the Mongolian *bagshi*, who makes sacrifices and offerings, consecrates horses to spirits, pronounces banishing spells and makes divinations, and *tuul'ch* (epic bards), who use their performances to accomplish exorcism and weather-magic and to invite prosperity, fertility and health.

Vocal repertoires of folk-religious practitioners include praise-songs and epics as well as a range of rhythmical utterances such as wish-prayers, well-wishing words and anointments, invocations and curses. The continuum of sounds used in imitation of natural phenomena and animate beings in order to negotiate with spirits ranges from snorting and blowing to chanting and singing (see [also Tuvan music](#), [Overtone-singing](#)). Performance occurs within soundscapes in which the noises of nature – made by wind, water, animals and birds – have the power to communicate with, and effect, the lives and bodies of humans, and in which humans, by imitating those sounds, can in turn influence and affect all aspects of nature, including the spirits.

As among those of Central Asian countries, such as the *baxshi* or *zhirau* of Uzbekistan, the bards of Inner Asia use a deep, guttural vocal tone during epic performance to contact the spirit world and to heal or to control nature. Inner Asian bards create a ritual space, an imagined world linked to the real world by a system of 13s but apart from it, in which the epic drama may unfold and the power of performance be activated (see [Mongol music](#), [§III, 1](#)). Epic heroes, like other armed heroes on horseback, are the focus of religious cults. Star-gods are contacted by performances of incantations,

wish-prayers, long-songs and epics, and dances are performed to the goddess of fire.

(ii) Shamanism.

Shamanisms include a range of ritual specialists, whose discourses and practices vary according to historical, regional and political contexts. In ancient times, the male shaman helped men in hunting and war, while the female shaman made sacrifices to the fire of her clan. Prior to the 13th century, male and female shamans were believed to have equal powers as Protector and Guardian Spirits. During the period of the Mongol Empire (1206–1368), shamans were powerful political as well as spiritual advisors. Books, manuals and manuscripts on rites, ancestor worship, temple ceremonies, chiromancy, scapulimancy, dreams, prayers, hymns and the hagiography of 'Great Shamans and Shamanesses' were destroyed by Buddhists from the 16th century to the 19th and many of their practices and beliefs assimilated. In Mongolia, 'white' shamans accepting the new 'yellow' religion of Buddhism were transformed into 'yellow' shamans who were able to practice in monasteries, for instance in Dayan Derhe Sharavliin Hüree, situated on the border of Mongolia and Buryatia. Despite continued attempts to eradicate or assimilate Shamanism during the dissemination of both Buddhism and communism, shamanizing secretly continued and is once again flourishing. In contemporary practice, female shamans continue to be viewed as powerful. The practitioner's performance is oral and is dramatized and improvised according to whether the ceremony is for healing, advice on hunting or divination. In contrast to Eliade's archetypal male shaman who engaged in 'magical flight', male or female practitioners may choose to enter dissociated or semi-dissociated states. They employ a range of vocal and instrumental sounds while shamanizing and use their own distinctive melodies for invoking spirits and for rendering the spirit's advice. Percussive non-vocal and non-instrumental sounds are produced by small bells and miniature metal weapons or pins attached to the shaman's drum, staff, switch, rattle, drumstick and costume (see fig.2). The shaman may leap, spin, imitate riding and walking, or appear to dance or embody particular birds or animals.

The single-headed frame drum is the most frequently used shaman instrument among Inner Asian and Siberian peoples, symbolizing the saddle animal on which the shaman travels to the upper or lower worlds to negotiate with spirits or the mount that carries the invoked spirit to the shaman. The animal is identified with that of the skin from which the drumhead is made. Iron pins are attached to the back of the drum by means of a cross stick or wire (see [Hets](#)). Tuvans, Buryats and Darhats use a horse-headed staff or a staff with two or three fork-like branches, thought to fulfil the same function. This is beaten by a hide drumstick or thrust back and forth during invocations. For Tuvans, the staff is the first requisite of shamanism. As the practitioner's powers increase, an *orba* (drumstick) and *düngür* (frame drum) is requested during 'trance'. Senior Darhat shamans beat a drum. Buryats use the staff or drum to call 'black' spirits (*haryn duudlaga*).

Similarly, the jew's harp is used at different stages of the shaman's career or in different contexts according to ethnicity (Pegg, 2001).

(iii) Tantric Buddhist practices.

Mahayana or 'Great Vehicle' Buddhism, which included Tantrism (Vajrayana), travelled from India to Tibet and was later disseminated throughout Inner Asia. In Tibet four great religious traditions emerged: first Nyingmapa (Tibetan *rnying-ma-pa*), then Kargyudpa (Tibetan *bka'-brgyud-pa*) and Sakyapa (Tibetan *sa-skya-pa*) and finally, the reformist Gelugpa (Tibetan *dge-lugs-pa*). During the 13th century, powerful Tibetan monasteries competed for the favours of Mongol leaders. The Sakyapa school emerged as successful when 'Phags pa initiated Khubilai Khan in the practices of Hevajra (Tibetan *kye rdo-rje*) Tantra in exchange for sovereignty over Tibet. During the 16th century, the Gelugpa order gained predominance in the area, but the struggle between this (colloquially termed 'Yellow Hat') and the others (collectively termed 'Red Hats') continued to relate to the broader political situation. In contemporary Mongolia, the 'Red Hats' are viewed as being less formal and closer to the people.

Performance styles and repertoires vary between the four religious traditions. For instance, with reference to the melodies played on shawms (Tibetan *rgya-gling*, Mongol *bishgüür*), the Sakyapa tradition is known for its majestic style; Gelugpa for its sparse use of melodies; Kargyudpa for melodies with an extremely slow ascent to the highest pitch; and Nyingmapa for 'folksong-like' tunes. Similarly, there are clear differences in dance movements: Nyingmapa music and dance are very elaborate, with much movement; Gelugpa are 'classical', with minimal movements in line with their ideal 'not to make a show'. There were also variations within these performance traditions, between subdivisions of these religious schools as well as between monasteries within the same tradition. In addition, performance traditions and repertoires of monasteries in different states drew on Tibetan traditions but adapted them to local needs.

Scriptural recitation, together with liturgical performance, constitutes the cyclical basis of monastic life. Traditionally, each monastery had its own manuscripts containing song texts for chants and songs, and notations (Tibetan *dbangs-yig*, Mongol *yan-yig*) (see [Mongol music](#), §III, 3(i)). Chants performed by lamas during religious rituals were in Tibetan (with a small element of Sanskrit) and were interspersed with sounds of gongs, cymbals or wind instruments. In recent decades, ethnomusicologists and organologists have worked increasingly on the performance of Tibetan ritual (see [Tibetan music](#)), though there are few sources in European languages on the forms that notation took in Mongolia or on any Mongolian Buddhist performance traditions. H. Haslund-Christensen's recordings made in 1936–7 at Wang-Yin monastery in Inner Mongolia have not been published. P.J. van Oost produced a short article, and C.A. Pegg has published a précis of ongoing contemporary research.

The basic instrumentaria in Buddhist monasteries across Inner Asia is the same: a small hand-bell (Tibetan *dril-bu*, Mongol *honh*) held in the left hand together with the ritual sceptre (Mongol *dorje*) in the right; thigh-bone trumpets, usually played in pairs for invocation of fierce deities and to signal entry of masked dancers in the '*chams*'; long, metal bass trumpets and white, end-blown conch-shell trumpets; wooden shawms; and a range

of cymbals and double- and single-headed frame drums. In monasteries in Mongolia and Inner Mongolia, additional instruments were traditionally to be found: the half-tube zither [Yatga](#) in Mongolian areas, the gong-chime (Chin. *yün-lo*, Mongol *duuduram*) and free-reed mouth organ (Chin. *sheng*) in Chinese areas.

The Buddhist '*chams* (Mongol *tsam*) is a masked Tantric dance-drama performed on public occasions. In Tibet, '*chams* is thought to have developed out of a fusion of Indian Buddhist ritual dance (Tibetan *gar*), Indian Buddhist theatre and pre-Buddhist Tibetan masked ceremonial dances performed by Bonpo monks and lay men and women (see [Tibetan music](#), §II, 2(ii)). A dance book (*'chams-yig*) of iconographical, choreographical, musical and ritual information, written mostly by the fifth Dalai Lama, Ngag Dbang Blo Bzang Rgya Mtsho, when he ruled Tibet (1617–82) but completed by later spiritual heads of Gelugpa, is based primarily on Nyingmapa and Sakyapa traditions. As Buddhism spread, the structure of the dance-drama remained, though characters were given local interpretations and new ones added. In all '*chams*, movements of dancer-lamas metaphysically create the spheres of heaven, wind, water and fire: the iconographic details of the Mandala. Dancer-lamas invoke and embody Tantric deities for those spheres together with their retinues; malevolent spirits, also created and invited, are forced to enter a human effigy (Tibetan *linga*) previously made of dough, wax or paper and then magically destroyed; and parts of the 'corpse', i.e. the dead bodies of the spirits, are offered to the deities of the Mandala.

In areas where the Gelugpa order predominated, non-Buddhist forms such as epics were considered as ideological weapons of rival religious complexes. In areas where 'Red Hat' orders prevailed, lamas protected and patronized epics by inviting bards to the monasteries to perform; indeed, sometimes lamas themselves performed. In west Mongolia this gave rise to legends that some lamas were reincarnations of epic heroes. Dani-Hürel, hero of a lengthy Bait and Dörvet epic cycle, was said to have been reborn in the Bait Dejeelin monastery, where he held the grade of *bagsh-gegeen*. Similarly, epic heroes became identified as Buddhist gods. Other non-Buddhist musical genres, such as long-songs and full-scale musical dramas, were performed in the monasteries of 'Red Hat' orders (see [Mongol music](#), §III, 3(iv)).

Innes, Frederick Neil

(*b* London, 29 Oct 1854; *d* Chicago, 31 Dec 1926). American trombonist and bandmaster of English birth. At 13 he joined the band of the First Life Guards, of which his father was a member, while studying the violin, piano, trombone and harmony. In 1874 he went to Boston, where he played at the Howard Street Theater and in the Boston Cadet Band. In 1876 he performed with Patrick Gilmore at the Philadelphia Centennial Exposition, then moved to New York. By the end of 1879 he was a soloist with the Gilmore Band. In 1880 Innes began playing difficult cornet solos on his trombone, and a 'War of Blasters' ensued between Innes and the infuriated Jules Levy, 'The Cornet King', much to the delight of Gilmore's audiences at Manhattan Beach. Except for a brief trip to Europe, where he acquired a reputation as a soloist in Hamburg, St Petersburg, Berlin and Paris, Innes remained with the Gilmore Band until 1883. A Paris newspaper called him the 'Paganini of the trombone'. He formed his first band in 1887; from 1888 to 1896 he directed the 13th Regiment Band of Brooklyn, New York, and then Innes' Orchestral Band. With these bands he toured the USA and Canada, performing in various cities, at industrial fairs and at expositions in Chicago (1893), Buffalo (1901), St Louis (1904), Seattle (1909) and San Francisco (1915). In 1914 he moved to Denver, where he formed a municipal band. In 1916 he founded the Innes School of Music, which offered home-study courses for bandmasters, orchestra directors and instrumentalists. After his wife's death he moved to Chicago in 1923 to become president of the Conn National School of Music.

Sousa and Clarke considered Innes the greatest trombone player of his time. As a band director, he is recognized as the first to have included the string bass, harp and chimes as band instruments, to have devoted entire programmes to the compositions of Wagner and Beethoven, and to have played complete symphonies. He conducted from memory, even when performing two different programmes daily for several weeks. The Innes School had a great impact on the development of instrumental music education in America. Innes's compositions include two comic operas, cornet and trombone solos (including *Sea Shells Waltz* and *Phenomenal Polka*), orchestral suites (including *A Trip to the World's Fair*, *Pictures of the Rockies* and *Out in the West*), marches (including *The Chronicle Telegraph*, *The Atlanta Constitution*, *Gloria Washington*, *Love is King* and *The Washington Times*), waltzes, overtures, humoresques and cantatas.

RAOUL F. CAMUS

Innocentio del Cornetto.

See [Alberti, Innocentio](#).

In Nomine

(Lat.).

Title given to a number of exclusively English instrumental compositions of the 16th and 17th centuries that use the Sarum antiphon *Gloria tibi Trinitas* as their cantus firmus. The In Nomine was the most conspicuous single form in the early development of English consort music, over 150 examples surviving by some 58 composers from Taverner to Purcell.

WARWICK EDWARDS

[In Nomine](#)

1. [Origin](#).

The origin of the term In Nomine may be traced to a single work, John Taverner's six-part Mass *Gloria tibi Trinitas*. The cantus firmus on which this work is built was an antiphon sung at first Vespers on Trinity Sunday in the Sarum rite ([ex.1](#)). The Benedictus section of Taverner's mass falls into two unequal parts, the second setting the words 'In nomine Domini' for four of the six voices. This extract seems to have become detached from the main work and circulated as a separate movement. Some idea of its popularity over the 100 or so years following may be gathered from the

number of surviving arrangements. With the original Latin text it is found in *GB-Lbl* Add.4900, f.61v, as a piece for voice and lute (but with the latter part torn out). The words became 'In trouble and adversity' in Day's *Certain Notes* (1565) and *Lbl* Add.15166, f.88v, and 'O give thanks' in *Lbl* Add.30480–84, f.53r etc. The movement was also arranged for keyboard and for lute, but most sources present it in four textless parts. Naturally the title attached to these is not that of the cantus firmus in the second lowest part but the incipit of the original words, 'In nomine'.

In Nomine

2. The 16th-century consort In Nomine.

It is not difficult to appreciate the reasons for the acceptability of the In Nomine section of Taverner's mass as instrumental part music in the second half of the 16th century. The normal complexities of early Tudor church music are absent, for it is the only section of the mass in which the whole of the plainchant melody appears in notes of equal length (breves), in duple time and with only three accompanying parts. Of no less importance, it is a fine piece in its own right and not surprisingly attracted imitations using the same cantus firmus, the same title and also in many cases similar melodic material. Taverner's opening phrase, derived from the plainchant ([ex.2a](#)), was taken up by over a score of composers, and a later phrase ([ex.2b](#)) was used as an opening by Thorne, Stogers, Bevin, Parsons and Byrd. But stylistically Taverner's In Nomine stands apart from the main repertory, which in the 16th century is more strictly imitative in the manner of chansons by Flemish composers. A gap of some 20 years may separate Taverner's composition (?before 1530) from that of its successors, though the tradition must have been established by the end of the 1550s. In Nomines exist by Thomas Preston and Robert Golder who died in the mid-1560s, and the earliest extant source of In Nomines, the Mulliner Book (*Lbl* Add.30513: Taverner, Johnson, White), has been dated about this time. One of the major sources (*Lbl* Add.31390) bears the date 1578, by which time the form had undergone considerable development which was not to be taken substantially further until the beginning of the next century.

The favoured number of parts seems to have risen during this early phase from four to five: *Lbl* Add.31390 contains a number of four-part In Nomines 'brought up to date' with an added part of inferior quality. The plainchant is still most commonly found in the second part down with its final on D, but it may occur in any part (less commonly the lower two) and transposed to G or A. A close relationship may be seen between many of the settings; the opening of Parsons's popular five-part In Nomine ([ex.3](#)), for example, was

copied by Alcock and Woodcock, and Byrd was clearly influenced by the whole piece in his fifth In Nomine (numbering in *Collected Works*, xvii). This 'friendly emulation', as Peacham put it, inevitably led to the production of 'clever' pieces. The plainchant appears in notes of five-minim value in settings by Parsley, Stogers and Tye, while Picforth contrived an In Nomine in which each part has a different note value maintained throughout. No less contrived but with a more musical result are In Nomines that use only one point (Tye, Parsons, White).

The most prolific writer of In Nomines was Christopher Tye, many of whose pieces bear nicknames. His work is often referred to in connection with the growth of an instrumental style in English consort music. The In Nomine 'Rounde', for instance, has an exceptionally wide overall range of parts (*D* to *c*"), and the In Nomine 'Saye so' has many wide leaps and awkward melodic lines ([ex.4a](#)). Particularly striking is the opening to the In Nomine 'Crye' ([ex.4b](#)). (For an illustration of Tye's In Nomine 'Blamles', see [Sources of instrumental ensemble music to 1630](#), fig.4.) Tye's In Nomines, especially the more original ones, do not appear to have been widely circulated and few composers seem to have been influenced by them. More interesting from the point of view of the development of a style distinct from vocal forms are the In Nomines by Tallis, Robert Parsons (i), Robert White, Nicholas Stogers, Alfonso Ferrabosco (i) and a number of lesser figures. They used certain distinctive features in a desire to heighten tension towards the end, including the use of short imitative phrases broken up by rests (Tallis, Parsons, Stogers), scale passages in quavers (Ferrabosco) and change of time from duple to triple (Tye, Stogers). Against this background may be seen Byrd's In Nomines which stand out not only for their technical mastery, but also for their well-handled structure, their expressiveness and their rhythmic vitality.

[In Nomine](#)

3. The 17th-century consort In Nomine.

Composition of In Nomines seems to have fallen off in the later part of the 16th century, though some composers such as Bull left examples which must be early works, perhaps exercises in composition. However, the upsurge of interest in consort playing at the turn of the century sparked off

a vast new range of instrumental music. In Nomines featured alongside fantasias and shared their style with its intricate rhythmic patterns and proliferation of small note values. Among the best are the five-part settings by Orlando Gibbons. A further search for originality is reflected in the In Nomine Fantasia of Alfonso Ferrabosco (ii), in which each part in turn has a variation on the plainchant. Tomkins's two In Nomines are unique in employing only three parts. John Milton is rumoured to have outdone all predecessors by composing an In Nomine in 40 parts, but if it was ever written it is not now extant. Some years later William Lawes and John Browne gave a new aspect to the cantus firmus by transposing it from minor to major. Browne's composition is also notable for the instructions it contains about speeds, 'come of' (fast) and 'drag' (slow). Another In Nomine by William Lawes in six parts allows the plainchant to wander between the two treble and two bass viols. The last of the In Nomines, by Purcell, are among the greatest in their austerity and dignity. Particularly telling is Purcell's exploitation of seven viols together using a formula of repeated minims (ex.5) that goes back to Parsons and beyond, thus emphasizing the continuity of a 150-year tradition.

In Nomine

4. In Nomines for keyboard and other media.

A number of consort In Nomines were transcribed for the keyboard and other media, while others were subjected to reworkings, for example Byrd's keyboard version of Parsons's five-part In Nomine. A cittern part (*GB-Cu* Dd.4.23, f.24v) survives from another consort arrangement of the same piece. One of Dowland's *Farewell* fantasias seems to be a unique example of an In Nomine written specifically for lute. In Nomines composed originally for keyboard belong to an entirely different tradition which is closer to earlier liturgical plainchant settings for keyboard. The writing may be either in a keyboard idiom, often of some rhythmic complexity, or in a vocal manner similar to consort settings of other cantus firmi such as the Sarum hymn *Christe qui lux es*. The cantus firmus unit is usually based on the semibreve, not the breve, and significantly many settings bear the title of the plainchant *Gloria tibi Trinitas* (no consort In Nomines do). Early examples are six by Blitheman, three anonymous ones in *Och* 1142A, two (or possibly three) by Nicholas Stogers, two by Alwood and one each by Byrd, Nicholas Carleton and Tallis. Bull's 12 settings (one with the cantus firmus laid out in groups of 'five minims and a crotchet' as described by Morley) and a keyboard duet by Nicholas Carleton are slightly later examples. Finally there are seven settings by John Lugg and six (dated 1647–52) by Thomas Tomkins. The influence of Taverner's In Nomine and its successors on these pieces is not a strong one, the main connection

being that they happen to use the same plainchant, and in some cases the same title as a result of a confusion of traditions.

[In Nomine](#)

5. Other In Nomines.

A few pieces called 'In Nomine' are not based on the plainchant *Gloria tibi Trinitas*. The title is clearly an error in the case of one of Byrd's *Clarifica me, Pater* settings in *GB-Lbl* Add.30485 (the plainchants have similar openings) and William Lawes's *On the plainsong* in *Lbl* Add.29410–44. An error is again possible in a plainchant fantasia for keyboard attributed to Gibbons, but perhaps by Bull, which is described as 'In Nomine' in only one of its six sources. The case of Alwood's In Nomine in the Mulliner Book is different. It is built on a five-note treble ostinato which also served as the basis for his Mass *Praise him praiseworthy*. The title of the keyboard piece may reflect a loose melodic connection with the 'In nomine Domini' of the mass. The bass part of a short anonymous 'In Nomine' in the Scottish manuscript *Lbl* Add.36484 is probably part of a mass setting. No satisfactory explanation has yet been given for the title *In nomine pavin* which appears in Morley's *Consort Lessons* (1599) and, together with a galliard, in versions for solo lute attributed to Nicholas Stogers. A consort piece by William Cobbold called *Anome* has no demonstrable connection with the present subject.

[In Nomine](#)

6. Contemporary comment.

There is a remarkable absence of contemporary comment on the In Nomine, and it is particularly surprising that there is no mention of the form in Morley's *Plaine and Easie Introduction to Practicall Musicke* (no In Nomines by Morley survive). We have to wait until the end of the 17th century for significant information. Living in an age temperamentally unsuited to 'grave music' in which phrases and cadences were not clearcut, Roger North did not have a high opinion of most In Nomines:

It is a sort of harmonious murmur, rather than musick; and in a time when people lived in tranquillity and at ease, the entertainment of it was agreeable, not unlike a confused singing of birds in a grove. It was adapted to the use of private familys and societys; and for that purpose chests of violls, consisting of 2 trebles, 2 means, and 2 bases were contrived to fullfill 6 parts, and no thro-base (as it is called) was then thought of, that was reserved to other kinds of musick.

North's account of the early background of the In Nomine may not be far from the truth (though his account of its origin is wide of the mark):

But it is sure enough that the early discipline of musick in England was with help of the Gamut to sing plainsong at sight, and moreover to descant, or sing a consort part at sight also, with such breakings, bindings and cadences as were harmonious and according to art; and this not of one part onely, but the art was so farr advanced that divers would

descant upon plaine-song extempore together, as Mr Morley shews. And this exercise was performed not onely by voices and extempore, but whole consorts for instruments of 4, 5 and six parts were solemnly composed, and with wonderfull Art and Invention, whilst one of the parts (comonly in the middle) bore onely the plain-song thro'out. And I guess that in some times, little of other consort musick was coveted or in use. But that which was styled *In nomine* was yet more remarkable, for it was onely descanting upon the 8 notes with which the sillables (*In nomine domini*) agreed. And of this kind I have seen whole volumes, of many parts, with the severall authors names (for honour) inscribed.

Though the music itself suggests that 16th-century In Nomines were composed for instruments, there are indications that they were often sung. The title-page of *Lbl Add.31390* reads *A booke of In nomines & other solfainge songes of v: vj: vij: & viij: parts for voyces or Instrumentes*, and the cantus firmus part of one of the In Nomines is accompanied by the instruction 'this must be songe 4 notes lower'. A fragment of a six-part In Nomine by Blancks exists to the words 'With waylinge voice from out the depth of sinne', and Gibbons's *Cryes of London* might be described as a pair of In Nomines, each section having the plainchant in the second voice. Three anonymous consort songs employ the *Gloria tibi Trinitas* plainchant, as does Milton's song *If that a sinner's sighs*. The 'whole volumes' of In Nomines that North saw may have been the earlier layer of *Ob Mus.Sch.D.212-16*, the only extant set of partbooks devoted exclusively to this type of composition.

[In Nomine](#)

7. Later use of the In Nomine.

In Nomines have attracted the attention of some 20th-century composers. In *Die schweigsame Frau* Richard Strauss, requiring some characteristic early 17th-century English music, quoted from one of Bull's keyboard In Nomines. On a more serious level the *Gloria tibi Trinitas* plainchant and In Nomines by Taverner, Blitheman and Bull permeate many of the works of Peter Maxwell Davies, notably the two Taverner Fantasias, *Seven In Nomine* and the opera *Taverner*. The Blitheman In Nomines form the basis for Roger Smalley's *Gloria tibi Trinitas I* and *Missa brevis*.

TABLE OF CONSORT IN NOMINES

The following summary of consort in Nomines in approximately chronological order includes those for voices. Alfonso Ferrabosco (ii)'s In Nomine Fantasia, and fragments. Pieces with conflicting attributions are included under the most unlikely composer. For further information see articles on individual composers. Thmatic catalogues are in Meyer (1934) and, for 16th-century In Nomines,

in Edwards. All known keyboard In Nomines are mentioned in the main text. For details of sources and modern editions see Caldwell (1965).

Innsbruck.

City in Austria, capital of the Tyrol province. The reigning princes at first resided in their ancestral castle, Schloss Tirol (now Castel Tirolo, Italy); Meran (now Merano) was the first capital of the province, which was allied to Austria from 1363. Duke Friedrich transferred his residence to Innsbruck, which had become a township in 1239, and from 1420 built a palace, the Neuer Hof, to which Emperor Maximilian added a splendid oriel, the Goldenes Dachl. Between 1766 and 1770 a new palace was built, which has survived. On the extinction of the Tyrolean royal house (1665) the province passed to the Austrian emperor. In 1918 the Tyrol became a federal state of Austria.

Innsbruck

1. Church music.

The main church, St Jakob (a cathedral since 1964), is first mentioned in 1180. The Gothic building erected subsequently was demolished in 1717 and replaced by a Baroque church, consecrated in 1724. Church music in the Middle Ages was the responsibility of a Kantorei consisting of teachers and pupils at the church school (the parish school, later the Lateinschule). In addition to music the boys were instructed in Latin and other subjects. The earliest record of a schoolmaster dates from 1204, and an organ is known to have been in use by the 14th century. The Lateinschule master conducted the music in church and taught the boys singing. The Kantor

gave general instruction in music and also 'in figurativis' (polyphony), and rehearsed the music for services.

The Gymnasium founded by the Jesuits in 1562 offered a considerably higher level of education, and replaced the Lateinschule, which continued to be used as a hostel for choirboys and as a music school. Under the last Lateinschule master Georg Angermann (1594–1634) the Kantorei became a parish choir, the pupils giving way to officially appointed singers and instrumentalists. His successors called themselves choirmasters, and later 'Chorregenten', and were also prebendaries. Originally the choir sang in the presbytery, in front of the high altar, and the main organ stood in the nave near the chancel; from 1645 the choir and organ were both in a gallery on the west wall. After the rebuilding of St Jakob an organ was built (1724–6) by Kaspar Humpel, who lived for a time in Wilten (now a suburb of the city); it was altered in the 19th century and was transferred to the church at Hötting in 1932. The original organ case was used for a new organ, built by Rieger of Jägerndorf.

Emperor Joseph II's ecclesiastical reforms (1765–90) included the dismissal of members of the choir, who were replaced by amateurs, adversely affecting the standard of church music. After the mid-19th century the choir improved once more, reaching a peak under the directors Lambert Streiter (1903–24) and Karl Koch (1924–71, also a prominent composer). In the 1990s the choir was still the most important church choir in the city.

The court's services were held in St Jakob until the building of the Hofkirche (1555–63), the earliest example of Renaissance church architecture in the north Tyrol, which contains the cenotaph of the Emperor Maximilian I. The original organ was built by Jörg Ebert of Ravensburg (1555–61), enlarged in the 17th and 18th centuries and restored from 1972 to 1976. The Hofkirche also served as a church for the Franciscan monastery from 1564. Built onto it is the Silberne Kapelle, where Archduke Ferdinand II of the Tyrol is buried; it has a positive organ in a case dated 1614 with eight stops and mostly wooden pipes, possibly of Italian origin (fig.1). Other churches that have cultivated choral music at some time are the collegiate church at Wilten, the Servite church, and the parish churches of Wilten and Pradl (another suburb of the city).

[Innsbruck](#)

2. The Hofkapelle; secular music to 1750.

The Tyrolean sovereigns already had trumpeters and pipers in their service when they resided at Schloss Tirol. In Innsbruck these instrumentalists were augmented by trombonists, timpanists, harpists and lutenists. There is evidence that after 1463 there was a Kantorei under the direction of Niklas Krombsdorfer; Hofhaimer was appointed organist in 1478. Although it appears that under the Emperor Maximilian I there was only a small resident Kantorei in Innsbruck, he visited the city with the Reichskapelle, under the direction of Georg Slatkonja. At that time the parish church was also the court church, and the emperor had organs installed there; the most important was built by Jhan Behaim from Dubrau (1512–15).

Under Maximilian's successor, Archduke Ferdinand, there was no Hofkapelle, and the organists at St Jakob also worked at the court as music teachers; however, the reign of Archduke Ferdinand II (1567–95) was a period of musical splendour. The musicians were divided into two groups of between 33 and 47 members: the Vokalkapelle, with singers, organists and lutenists; and the Hofmusik, to which the instrumentalists belonged. The singers were mainly from the Netherlands, whereas most of the instrumentalists were from Italy. Wilhelm Bruneau was Kapellmeister until 1584, and was succeeded by Regnart. The many members of the Kapelle who, like Regnart, were known as composers included Alexander Utendal, Christian Hollander, Giovanni, Giorgio and Jacobus Flori, Franz Sales and Tiburtio Massaino. The monarch collected valuable musical instruments for his gallery at Schloss Ambras: these included a cittern by Girolamo de Virchis (Brescia, 1574), an ivory lute by Georg Gerle of Innsbruck, violins by Gasparo da Salò and Dorigo Spilmann and chamber organs with intarsia embellishments. The Kapelle was dispersed in 1595.

The next ruler, Archduke Maximilian of Austria (1602–18), had had a Kapelle in Bad Mergentheim since 1586, from which 16 performers accompanied him to Innsbruck. From 1607 to 1648 Johann Stadlmayr was his Kapellmeister. The next ruling prince, Archduke Leopold V (*d* 1632), also arrived in Innsbruck with his own Kapelle, and his predecessor's musicians, with the exception of Stadlmayr, were dismissed. In 1632 the Kapelle had 45 singers, including four castratos, and instrumentalists. Between 1629 and 1631 the archduke had the Ballspielhaus to the north of the castle converted into a theatre.

Both music and the theatre flourished under Archduke Ferdinand Karl (1646–62). The Hofkapelle consisted of three groups: that for church music, under the direction of Ambrosius Reiner (1648–72); the court trumpeters, mainly for open-air music; and the chamber musicians (virtuoso singers and instrumentalists), who were directed by Antonio Cesti (1652–8, 1661–5). Cesti also composed several operas for the prince, including *L'Argia*, which was performed in 1655 for the official conversion to Catholicism of Queen Christina of Sweden. The Kapelle's celebrated members included the bass viol player William Young (before 1652 until 1662). The prince had a Komödienhaus built in the Venetian style (1652–4); it was the first self-contained opera house in a German-speaking country and was the first German stage to have a permanent company for opera, drama and Singspiel (fig.2).

With the death of Archduke Siegmund Franz (1665) the Tyrolean line of the House of Habsburg came to an end. The province fell under Emperor Leopold I, who disbanded the court at Innsbruck, and with it the Hofkapelle, although in 1666 some of the musicians were reinstated to form the Kaiserliche Hofmusik, serving any royalty temporarily residing at Innsbruck. In addition, the governor Duke Karl Philipp of the Palatinate (1707–17) maintained a private orchestra under the Kapellmeister Jakob Greber; its Konzertmeister was Gottfried Finger, who, like Greber, had returned from London. When Karl Philipp left Innsbruck his musicians followed him to Neuburg, Heidelberg and Mannheim, where they formed the nucleus of the orchestra that was to achieve international fame under Stamitz and his successors. The Kaiserliche Hofmusik declined and was dissolved in 1748.

Innsbruck

3. Secular music from 1750.

The last of the court opera performances was the first performance of Hasse's *Romulo ed Ersilia*, on the occasion of the wedding of Archduke Leopold and the Infanta Maria Ludovica (1765). In subsequent years the theatre was leased to outside contractors, the first of which was known as the Kaiserliches und Königliches Hoftheater, and, after 1785, the Nationalhoftheater and Nationaltheater; its repertory consisted mainly of plays, but operas and Singspiele were also performed. From 1852 to 1918 the theatre's leaseholders were not obliged to perform operas; these became the domain of Italian and, after 1866, German companies. The old theatre was used until 1844, and a new classical-style building was opened in 1846 on the same site. In 1886 the theatre came under the control of the town, becoming the Stadttheater and in 1939 the Tiroler Landestheater. It had a permanent opera company from 1918. The rebuilt theatre (1961–7) seats 801, with 250 seats in the Kammerspiele, and its season runs from September to the beginning of July.

The first public concerts took place in the Redoutengebäude, built in 1772–3 at the request of the Empress Maria Theresa. The municipal halls were erected on the same site (1888–90); these were destroyed in 1944, but in 1955 they were restored on the original plan. Only the larger of the two halls (cap. 919) is used for concerts. A further concert hall (cap. 259) is in the Musikverein (now the conservatory), built in 1912. The castle theatre was also destroyed in 1944, but was restored as a congress building, completed in 1973; it has two halls (cap. 1479 and 223) which are also used for concerts.

In the theatre (from the 18th century) and at public concerts (19th century) an orchestra played, which included professional or amateur musicians according to circumstances. A permanent ensemble, the Städtische Musikkapelle, was founded in 1893; after 1900 it was known as the Städtisches Orchester and, later, the Innsbruck SO.

Innsbruck's choirs have included the male-voice Innsbrucker Liedertafel (1855), Deutscher Männergesangverein (1901) and Wolkensteiner (1911), and the internationally renowned mixed choirs 'Walther von der Vogelweide' and 'Mentlberg' (both 1947).

The first public concerts were organized by the Kasinoverein (1787–c1840). From the early 19th century music was cultivated more thoroughly by the Musikverein, whose orchestral, choral and solo concerts continued to 1939 and under the title Konzerte der Stadt Innsbruck from 1947. Since 1979 they have been held in the Kongresshaus (containing three halls, the Dogana, cap. 1200; the Saal Tirol, cap. 1500; and the Saal Innsbruck, cap. 256). The Ambraser Schlosskonzerte, founded in 1963 to mark the 600th anniversary of the unification of the Tyrol and Austria, are held in July and August in the Renaissance Schloss Ambras near Innsbruck, with music of the 13th to the 18th centuries played on period instruments. As an educational pendant to these concerts, the Internationale Sommerakademie für Alte Musik was founded in 1972; from 1977 a concert series, the Festwochen der Alten Musik, complemented the

lectures. Productions of Baroque oratorio and opera began at the same time, notable for the revival of the operas of Cesti. Since 1958 the Innsbrucker Orgelwochen have taken place at Whitsun (annually since 1965). The triennial Paul Hofhaimer organ competition (from 1972) uses historic organs. A triennial Radiopreis für Alte Musik was established in 1996 by the Tyrolean studio of Österreichischer Rundfunk (ÖRF) and the city of Innsbruck.

The Musikverein also founded a music school, whose directors were conductors. After the dissolution of the society in 1939 the school continued as the Städtische Musikschule, becoming the conservatory in 1957 and the Tiroler Landeskonservatorium in 1990. At the university (established 1669) a musicological institute was opened in 1920 whose foundation may be attributed to Rudolf von Ficker; from 1994 it was directed by Tilman Seebass. The library of the Tiroler Landesmuseum Ferdinandeum contains historic manuscripts and printed works as well as many sound recordings. There are valuable musical instruments of the 16th to 18th centuries in the collection of the Kunsthistorisches Museum in Schloss Ambras. The Tyrolean studio of ÖRF, which devotes many concerts and talks to contemporary music, played a leading part from 1950 in the Österreichische Jugendkulturwochen, which in 1969 became the Musikprotokoll of the Steierische Herbstfestival.

Music printers were active in Innsbruck from the mid-16th century, when hymnals were printed, including the *Innsbrucker Gesangbuch* (1586), printed by the court printer Johann Baur. In the 19th century the firm of Johann Gross printed the first editions of several of Bruckner's choral works. The Edition Helbling firm publishes early music and facsimiles as well as works on musicology and music teaching. A Tyrolean cultural journal, *Das Fenster*, is published several times a year in Innsbruck, and also covers subjects from the South Tyrol. Builders of organs and makers of violins and wind instruments have been active in the city since the 16th, 17th and 19th centuries respectively.

Inoue, Michiyoshi

(b Tokyo, 23 Dec 1946). Japanese conductor. After studying with Hideo Saito at the Tōhō Gakuen College of Music he became an associate conductor of the Tokyo Metropolitan SO in 1970. The following year he won the first prize at the Guido Cantelli Competition in Milan and conducted at La Scala. Between 1977 and 1981 he was chief guest conductor of the New Zealand SO. Returning to Japan, he was music director of the New Japan PO from 1983 to 1988, and was appointed principal conductor of the Kyoto Municipal SO in 1990. He also serves as president of the Japan Shostakovich Society. Inoue's conducting is notable for its rhythmic vitality

and emotional intensity; he has a broad repertory, and has shown an impressive command of difficult contemporary scores.

MASAKATA KANAZAWA

Insanguine [Monopoli], Giacomo (Antonio Francesco Paolo Michele)

(*b* Monopoli, nr Bari, 22 March 1728; *d* Naples, 1 Feb 1795). Italian composer and teacher. He was admitted to the Poveri di Gesù conservatory, Naples, on 19 January 1743, studying there with Abos and Feo until November 1743, when the conservatory was closed and he went to the S Onofrio. He studied there with Abos and Durante, becoming a *mastricello* until Durante's death in 1755. In 1756 he had his first opera, *Lo funnaco revotato*, performed at the Teatro dei Fiorentini; it is said to have been highly successful and was revived there in 1760. Insanguine's production of operas thereafter was somewhat intermittent, but he was also involved in the patching up of operas by other composers. According to remarks supposed to have been made much later by Paisiello, 'Monopoli was the *maestro delle pezze*, that is, [he wrote] those numbers that were added in revising other composers' scores at the impresario's expense, as a result of which he lost standing among professional musicians'. The full extent of his work of this sort is not known. Most of his own operas written before 1770 were comic ones performed at Neapolitan theatres, and of these only *Lo funnaco revotato* is known to be extant. *L'osteria di Marechiaro* (1768) was particularly successful. In 1770 he had a work performed at the S Carlo for the first time, a setting of *La Didone abbandonata*. According to Prota-Giurleo, this commission began as an assignment to revise and direct Galuppi's setting, and only when Galuppi's work proved impossible of adaptation to the needs of the S Carlo was Insanguine asked to set the text anew. Perhaps because of the success of this work he thereafter composed mostly *opere serie*, including four for the S Carlo (as well as his completion with Errichelli of Gian Francesco de Majo's last opera, *Eumene*, which was performed there in 1771). His last two operas for the S Carlo, *Medonte* (1779) and *Calipso* (1782), were not successful. Something of his standing at this time may perhaps be seen in the fact that he was paid only 230 ducats for *Calipso*, while among the composers of the other three operas performed that season, the popular Cimarosa, making his S Carlo debut, received 340, the young Francesco Bianchi 250 and only the little-known Curci less (the minimum fee of 200 ducats).

Insanguine was made a teacher at the S Onofrio conservatory on 23 August 1767. In 1774 he succeeded Dol as *secondo maestro* there and as organist of the second choir at the Cappella del Tesoro in S Gennaro. In 1776 he became organist of the first choir and in 1781 *maestro di cappella*. In 1785 he succeeded Cotumacci as *primo maestro* at the conservatory, a post he held until his death. In 1793 the students complained that his age made him incapable of carrying out his duties and Salvatore Rispoli was appointed special *secondo maestro*.

The scanty references to Insanguine in contemporary lexicons suggest that he was little known outside Naples except as the composer of a few popular arias. The disrespect for him in Naples reflected in Paisiello's remark above (although Paisiello is known to have been particularly lacking in charity towards most of his fellow composers) perhaps also appears in Villarosa's judgment, repeated by Florimo and later writers, that he had 'a style lacking in inspiration [estro] and taste'. Insanguine was an expert craftsman and always up to date (an aria in the library of the Royal College of Music, London, sung by Aprile in an unidentified *opera seria* at Palermo in 1766, is in a modern style more common in the 1770s and has no trace of *galant* intricacies); however, his music usually has a slightly perfunctory quality, reflected in the excessively regular working out of his aria forms.

DENNIS LIBBY (text), JAMES L. JACKMAN/MARITA P. McCLYMONDS
(work-list)

In seculum.

The most-used tenor melisma (cantus firmus) of the late 12th century and the 13th. It is drawn from the verse of the Easter Gradual *Haec dies* (*LU*, 778; *ex.1*). It first appeared as an integral part of two early organa, and there are 15 clausulas on this segment, three of which serve as motet sources. 46 separate motet complexes using this tenor survive from the latter part of the period. Particularly interesting are an early Spanish hoquet (later made into a motet) and five other instrumental settings, two based on the hoquet and one marked 'In seculum viellatoris', presumably because it was written by or for a vielle player. Use of the *In seculum* tenor appears to have been confined mostly to France, and only one of the works based upon it (a motet) is known to be English.

GORDON A. ANDERSON

Institut de Recherche et Coordination Acoustique/Musique [IRCAM].

Music research institute in Paris. In 1970 President Georges Pompidou of France invited the composer and conductor Pierre Boulez to establish a centre for research into new music and associated technologies, to be situated in Paris adjacent to the Centre Pompidou. Seven years later IRCAM became fully operational with Boulez as director, a post he held until 1992 when it passed to Laurent Bayle. Boulez conceived IRCAM as a multi-disciplinary centre, and it was initially organized into five distinct areas – electro-acoustics, computer, pedagogy, instruments and voice – each headed by a specialist. This devolved arrangement proved problematic; a reorganization in 1980 and another in 1984 resulted in a more streamlined structure which, while preserving most of the original objectives, has focussed primarily on two areas, computer music production and computer music research.

Because its management has been able to make policies with few external constraints, IRCAM has fostered a strikingly broad range of musical activities. Artistic aims and objectives have predominated in determining the course of technical research. This climate has brought significant dividends in the form of new tools for computer music composition and new works for the genre. Over the years the development of technical resources has progressed from highly specialized hardware tools such as the 4X digital audio processor, built in the first instance to meet the musical requirements of Boulez for his major work *Répons* (1984), to more generic systems such as the IRCAM Musical Workstation or, more recently, a range of software tools designed for the modern generation of general-purpose personal computers.

PETER MANNING

Institute for Studies in American Music [ISAM].

Research and information centre at Brooklyn College, City University of New York, founded in 1971 with H. Wiley Hitchcock as director. Its basic function is 'to provide a suitable academic framework in which to encourage, support, propagate and evaluate research in music' of the USA, and to this end it publishes monographs, bibliographies, discographies and the lectures of scholars in American music to whom it has granted fellowships. It also presents concerts and colloquia; in 1974, with the Yale School of Music, it held the first international conference on an American composer, the Charles Ives Centennial Festival-Conference. The institute is a principal repository of scores and tapes of music by Cowell. It publishes the biannual *I.S.A.M. Newsletter* (1971–).

Institute of Jazz Studies.

An archival collection and research centre at Rutgers, the State University of New Jersey, Newark. It was founded in 1952 by the jazz historian Marshall Stearns, and was transferred to the Newark campus in 1967. The collection has greatly expanded through donations and acquisitions and now constitutes the foremost archive of jazz and jazz-related materials under university auspices, with more than 100,000 phonograph records and 3000 books, and extensive holdings of periodicals, record catalogues, research files, photographs, films and jazz memorabilia. The institute also conducts a major programme in jazz oral history. From 1973 to 1980 it published the biannual *Journal of Jazz Studies*, which was superseded in 1982 by the *Annual Review of Jazz Studies*.

EDWARD BERGER/R

Institute of Musical Art.

New York conservatory founded in 1905 and renamed Juilliard School of Music in 1924. See New York, §12.

Institute of Renaissance and Baroque Music.

American organization founded in 1944 and in 1946 renamed [American Institute of Musicology](#).

Institut für Neue Musik und Musikerziehung.

German organization founded in 1948. See *under* [Darmstadt](#).

Instrument

(Ger.).

Although it now has only the general meaning of 'musical instrument', the word 'Instrument' in German used to have the more specific meaning of 'keyboard instrument'. To judge from the title-pages of late 16th-century German keyboard anthologies by Elias Nikolaus Ammerbach (1571, 1575 and 1583), Bernhard Schmid (1577) and others, 'Instrument' then meant 'string keyboard instrument' in opposition to organ; the volumes are said to be written in a tablature for 'Orgel und Instrument'. This interpretation was confirmed by Praetorius, who wrote in *Syntagma musicum*, ii (2/1619), chap.37, that the *Symphony* – his collective name for harpsichord or clavicymbalum, virginal, spinet and the like – was generally called 'Instrument', a usage he criticized for its ambiguity. Like many other musical terms, however, the word meant various things at various times, and it was not always used consistently. In the 17th and 18th centuries, for example, 'Instrument' sometimes referred specifically to the clavichord. At least that conclusion seems warranted from the reference to 'Instrument, Spinet oder Clavicymbel' on the title-page of Benedict Schultheiss's *Clavier-Lust* (Nuremberg, 1679) and other similar examples. Jakob Adlung, in *Anleitung zu der musikalischen Gelahrtheit* (Erfurt, 1758), p.558, wrote that a large spinet was called 'Instrument im engern Verstande', or even 'Virginal'. And in the early 19th century the word 'Instrument' was occasionally used to refer to the piano.

HOWARD MAYER BROWN

Instrumental modifications and extended performance techniques.

The instrumentarium of Western music throughout its history has been in a state of continuous change, and every type and period of music has given rise to its own modifications of existing instruments and playing techniques. The desire for instruments capable of greater range, volume and dynamic control has led not only to the use of new materials and improvements in design but also to the invention of new instruments, many of which have achieved small success and are now regarded as little more than curiosities. These developments, naturally, form the matter of other articles in this dictionary, in which the evolution of individual instruments to their

present state is fully described. The 20th century saw an unprecedented expansion in the instrumentarium and a host of new approaches by composers and performers to the use of existing instruments; because these experiments often took place outside the mainstream of musical life it seems appropriate to discuss them as a group.

HUGH DAVIES

Instrument modifications & extended performing techniques

1. Introduction.

In the second half of the 20th century the problem of creating a repertory for a new or modified instrument became less significant than in the past, when even instruments for which major composers wrote important works (such as Schubert's Sonata for arpeggione and piano, d821) were not thereby guaranteed survival; indeterminate and graphic scores and compositions with unspecified instrumentation, together with various areas of free improvisation, have supplemented the compositions of those who often combine the three distinct functions of instrument inventor and/or builder, performer and composer in a single person. Some of these have come from different artistic disciplines, although often with a musical grounding, finding their way into the new field of invented instruments for a variety of creative reasons.

Since 1950 only a small proportion of Western music for ensembles in any style or area, including symphony orchestra, jazz and dance band, rock and folk group, has been played entirely on instruments that existed in, for example, 1900. At least half of the total output of three of the leading avant-garde composers who first came to prominence in the 1950s, John Cage, Mauricio Kagel and Karlheinz Stockhausen, includes new resources; they include unusual percussion, Renaissance, folk and non-Western instruments to newly invented acoustic, electro-acoustic and electronic instruments, as well as [Toy instruments](#), musical costumes, [Sound effects](#), environmental sounds, live electronics and electronic music on tape. Contemporary rock music relies heavily on instruments that were unknown before the 1930s, such as the electric guitar, electronic organ, electric piano and synthesizer. This flood of new instruments has been supplemented by many modifications, both temporary and permanent, of standard instruments in ways that go far beyond the intentions of the manufacturer or original designer; a number of composers have also called for extended performance techniques on traditional instruments.

Instrument modifications & extended performing techniques

2. Keyboard instruments.

(i) The piano.

The instrument that has been modified in the greatest variety of ways is the piano. A comparative newcomer, it was still in the early stages of its evolution in the 19th century, and many versions of both upright and grand forms were constructed. An early modification, which survives today in pianos manufactured by Steinway and many American companies, is the third or 'sostenuto' pedal, first introduced in 1844 by Boisselot in Marseilles, but not established until the American branch of Steinway adopted it in 1874. Some Bösendorfer grand pianos have an extension of a minor 6th to the normal range in the bass for reinforcing the left hand with octaves; a hinged flap covers these keys when they are not required, to prevent confusion in the player's visual orientation. Since the 1840s several modifications to the shape and lay-out of the keyboard, intended to simplify fingering, have been tried out (for example, the two manuals of the [Emanuel Moór pianoforte](#), c1920, are tuned one octave apart – with provision for coupling them together – to simplify the execution of octaves and other large intervals; see also [Janko, Paul von](#); [Keyboard, §3](#)), and many inventors have built microtonal pianos (see [Microtonal instruments, §2](#)). Even mirror-image left-handed pianos have been constructed; in 1876 Mangeot in Paris built several grands and uprights that combined a left-handed and a right-handed keyboard (as proposed by the pianist Józef Wieniawski), and a reversed copy of a Graf piano from 1826 was built for the left-handed pianist Christopher Seed by Poletti & Tuinman in the Netherlands in 1998. The largest piano ever built is probably the vertically strung Klavins piano in Bonn, in which the keyboard is some 4 metres above floor level on a special balcony for the performer.

In the 20th century many temporary modifications were made to the piano and new playing techniques applied to it. Isolated effects were required by Schoenberg in *Drei Klavierstücke* op.11 (1909), in which certain keys are silently depressed to raise the dampers and allow the strings to vibrate sympathetically, and Charles Ives, who in the 'Hawthorne' movement (1911) of his *Concord Sonata* called for the use of a piece of wood $14\frac{3}{4}$ " (37.47 cm) long for the playing of diatonic clusters, while an 88-note 'plank' plays repeated clusters in the section 'Fabrika' of Aleksey Semyonovich Zhivotov and Mikhail Yudin's oratorio *Lenin* (c1930), and an 'octave bar' for clusters (eight white and six black keys) is specified in Lou Harrison's *Piano Concerto with Selected Orchestra* (1985). String glissandos, played by the fingers, are specified in Rued Langgaard's *Sfaerernes Musik* (1916–18).

The first composer systematically to explore unusual piano sounds and techniques was Henry Cowell. His innovations included the playing of chromatic and diatonic clusters (in *Adventures in Harmony*, 1913, and *The Tides of Manaunaun*, ?1917) and glissandos across several strings or along single strings, executed with the fingers while the dampers are raised (*The Banshee*, 1925), plucking the strings (*Aeolian Harp*, c1923, and *Piece for piano with strings*, 1924), damping the strings with the fingers and small mutes, and playing them with hammers and plectra, to create what he termed the 'percussion piano' (*The Leprechaun*, 1928–9) and stopping the strings to alter the pitch or produce harmonics (*Sinister Resonance*, 1930). Sheets of paper are threaded between the strings in Satie's *Le piège de Méduse* (1913) and an upright piano modified in the same way is proposed as an alternative to Georges Cloetens's [Luthéal](#) specified by Ravel in his

Tzigane (1924) and *L'enfant et les sortilèges* (1920–25), which adds two treble and two bass stops to a normal grand piano; these provide, separately and in combination, additional timbres resembling cimbalom, harpsichord and lute or harp, created by placing suspended metal bolts and additional felt dampers in contact with the strings. A similar system, in which thin brass tongues folded round strips of felt are placed between the hammers and the strings, was devised by Pleyel to make the sound of the piano resemble that of a harpsichord; it was used in Reynaldo Hahn's opera *Mozart* (1925) and by Gabriel Pierné in 1926. In the early 1930s in works for percussion ensemble William Russell specified simple preparations such as a cluster board, string glissandos, and strings plucked and struck by beaters.

Unusual effects can also be obtained by playing the keyboard. Gordon Monahan's *Piano Mechanics* (1981–6) is 'a catalogue of actions and activities which approach the production of isolated acoustical resonances at the piano', including hand-swept strings, rapidly repeated single notes and clusters, trills and tremolos, partial damping with pedal and hand on strings; as with the repetitive 'strumming' technique adopted from the late 1960s by Charlemagne Palestine in performances of his own solo piano compositions, these techniques are intended to build up and vary substantial resonances and overtone structures in the instrument.

The best-known of all piano modifications is John Cage's [Prepared piano](#), devised in 1940 (not, as generally stated, 1938), in which a variety of objects are inserted between the strings, changing both timbre and pitch, to create a one-man percussion ensemble; a range of different, more muted sounds is heard when the soft pedal is depressed (fig. 1). The prepared piano was the culmination of Cage's explorations of some of Cowell's ideas – the muting of strings both manually (*Imaginary Landscape no. 1*, 1939) and by sliding a metal cylinder along them (*Second Construction*, 1940), and sweeping them with a stick (*First Construction (in Metal)*, 1939). Up to 1954 he wrote nearly 30, mostly solo works for the prepared piano, some of them for dance performances. Over 120 composers have composed at least one work featuring the prepared piano. Closely associated with Cage around 1940 was Lou Harrison, who devised the 'tack piano', in which thumb tacks or drawing pins are inserted into the hammers to create a metallic sound quality. This idea (known in German as the 'Reissnagelklavier' or the 'Reisszweckenklavier') was arrived at independently and applied mainly to upright pianos by other musicians, including the composers Henry Brant, Paul Dessau, Kagel, Wilhelm Killmayer and György Ránki, as well as the honky-tonk pianist Winifred Atwell, and was used for producing louder piano sounds in early film music recordings; old and out-of-tune pianos, which produce a similar effect, have been called for (usually in theatrical contexts in connection with 1920s jazz or other popular musics), notably by Alban Berg, Max Brand, Peter Maxwell Davies (several works), Karl Aage Rasmussen, Zygmunt Krauze and Irwin Bazelon. The 'percussion piano' of Cowell was further developed by Lucia Dlugoszewski as the 'timbre piano' (1951), in which the strings are bowed with small 'bows' to produce sustained sounds; a similar approach has been adopted in several compositions since 1972 by Curtis Curtis-Smith, while since 1977 Stephen Scott has created a series of works in which the strings of a single instrument are bowed by an ensemble of about ten

players with various flexible and rigid 'bows', as well as solo pieces in which silently depressed keys raise the dampers from the electromagnetically excited strings. Annea Lockwood and Hans-Karsten Raecke have developed their own, somewhat different approaches to preparing pianos. The piano strings are plucked in Tan Dun's *Concerto for Pizzicato Piano* (1995) and, as the 'Saitenklavier', in Stockhausen's *Klavierstück XVI* (1999). The piano has been the subject of many modifications besides that of preparation, and considerable use has been made of different methods of playing the strings, frame and case, both with fingers and various implements, in works by Kagel, Cage, Orff, Lukas Foss, Ben Johnston and others. Pianos with the action removed so that they must be played like a cimbalom have been specified by Peter Maxwell Davies and Denis Aplvor, and the strings are struck with T-shaped 'cluster-sticks' in works by David Bedford and Davide Mosconi. Foss, Bedford, George Crumb, Xenakis and others have called for undamped piano strings which vibrate sympathetically when other instruments are played nearby.

The most radical of all the modifications applied to the piano – electrification – was introduced in the 1920s and 1930s. Instruments such as the Elektrochord and the Neo-Bechstein-Flügel were adapted versions of the normal piano, electrically amplified to give variations in timbre and volume and a far longer sustain time than normal because they had no soundboards. Since the 1930s the sound-generating systems of electric pianos increasingly used reeds, rods or electronic oscillators instead of strings, while at the same time the outward appearance of the instruments has come to bear less and less resemblance to the acoustic original. The [Player piano](#) has provided a further means of surpassing the capabilities of the standard piano, and many composers, including Stravinsky, Hindemith, Grainger, Casella, Malipiero, Milhaud, Antheil and Toch wrote works for it, culminating in the series of astonishing virtuoso compositions by Conlon Nancarrow, which far exceed in speed and rhythmic complexity anything that a human pianist could play. Interest in the player piano among composers increased substantially from the 1980s.

(ii) Others.

A limited amount of modification has been carried out on other keyboard instruments. Clusters and plucking or striking the strings of the harpsichord (already explored by Friedrich Wilhelm Rust in the late 18th century for lute-like sounds) have been incorporated into some new repertory for the instrument, in particular works written for Elisabeth Chojnacka. The harpsichord has also been amplified, as in the Thienhaus-Cembalo and the electric harpsichords manufactured by Baldwin. As with the piano, a large number of experimental microtonal reed organs and pipe organs were built, chiefly between the mid-19th century and the 1930s, though a few, notably the 31-note organ of Adriaan Fokker and several electronic instruments, were devised later. The pipe organ has been modified for works commissioned by the organists Karl-Erik Welin and Gerd Zacher, who had built to his own specifications an organ with a touch-sensitive Great manual. Glissandos and timbre changes, produced by altering the wind pressure, have been obtained by switching an organ off during a sustained sound, and Zsigmond Szathmáry has removed individual pipes for

controlled reduction in wind pressure. An unusual bamboo pipe organ was built in the Philippines by Diego Cera around 1816–24. The electronic organ is not (with very rare exceptions) an electronically amplified pipe organ (see [Electric organ](#)), though a number of hybrid pipe and electronic instruments, which may be regarded as modified pipe organs, have been built.

Instrument modifications & extended performing techniques

3. Strings.

(i) The guitar.

After the piano the instrument that has probably undergone most modification is the guitar, especially in the form of its 20th-century offshoot, the [Electric guitar](#). Other long-established commercially manufactured versions of the guitar include the dobro, or [Resonator guitar](#), which has a metal disc mounted under the bridge to give increased volume, and the Hawaiian guitar, which evolved from the technique of laying a guitar across the lap and playing it with a slide. Since the 1960s, when the electric guitar first enjoyed great popularity, a number of new electro-acoustic and electronic variants have been devised. The Stick, developed by Emmett Chapman and marketed by Stick Enterprises in Los Angeles since 1973, consists of a long, wide, fretted neck with two sets of five strings; the left hand plays the treble ones (tuned in 4ths) and the right the bass ones (in 5ths), hammering them against the frets to set them vibrating. A guitar-like synthesizer controller, David Vorhaus's Kaleidophon, which also frees the right hand from its normal function, is only one of a number of such instruments developed since the late 1970s. Two devices intended to sustain the notes of the acoustic guitar are the Gizmotron and the Bass Gizmotron, devised by the rock musicians Kevin Godley and Lol Creme and improved by John McConnell around 1971; they each consist of a set of small revolving wheels that activate the strings. The E-bow ('energy bow'), which has a similar purpose, electromagnetically activates only one string at a time. A considerable range of electronic modification devices that process the signal produced by an electric guitar have been manufactured and have become part of the standard equipment used by pop and rock musicians.

Instrument inventors have made further and more unusual experiments with the guitar. Harry Partch refretted guitars in 1934 and 1945 to adapt them for the playing of music in his 43-note system, and many others have made similar adaptations to facilitate playing in various microtonal tunings. Hans Reichel has extended the frets on an acoustic guitar right up to the bridge, and has constructed a bodyless electric guitar which consists of two necks joined together at their lower ends to form a single straight length with pickups attached. Instruments based on the electric guitar have been made by Fred Frith, including an eight-string fretless version with a pickup at each end of the strings; Glenn Branca has done similar work. Strings about six metres long connect a string on each of two acoustic guitars to a low piano string for added resonance in Kagel's *Tactil* (1970).

Particularly in popular music, where the electric guitar has been most extensively adopted, new and often extravagant performing techniques have been evolved. Some country music performers on the electric

Hawaiian guitar use models with four necks, one of which is prepared and reserved for sound effects such as train noises, much as guitarists in Hawaii previously specialized in producing animal and bird sounds. Jimi Hendrix's performances included passages in which he played the instrument with his teeth, without interrupting the flow of the music. Temporary adaptations of the guitar, similar to those found in the prepared piano, have been devised, notably the attachment to the strings of small 'crocodile' clips and the insertion between them of threads of cotton or thin lamellae, and the use of bows and electric motors with the guitar laid on its back; among the exponents of electric and acoustic guitars prepared in such ways are the composer and guitarist William Hellermann, and the improvisers Keith Rowe, David Toop, Frith, Peter Cusack, Gerry Fitzgerald, Mike Cooper, Eugene Chadbourne (who also plays a modified dobro), Henry Kaiser and Kevin Drumm. Other new playing techniques involve additional microphones, movable bridges and hand-held slides (including the country music 'bottleneck'), scordatura of one or more strings, percussive playing on the body (as in flamenco), and acoustic feedback (pioneered by Hendrix and the improviser Derek Bailey in the late 1960s).

(ii) Others.

Bowed strings are probably the group of instruments to which modifications were applied earliest, but paradoxically they received less attention in the 20th century. Adaptations to the instruments themselves, such as scordatura tunings and the use of the mute, and non-standard performance techniques – for example, playing *col legno*, making percussive effects on the body and producing harmonics – have long since been accepted. Luigi Russolo's *arco enarmonico* was a new form of bow designed to eliminate the need for fingering. Electrical amplification of bowed strings was introduced and quite extensively explored in the 1920s and 1930s and, especially since efficient contact pickups became available (including some that are built into special bridges), has become widespread in most types of music. A number of electric bowed string instruments have been devised with soundboards (bodies) of reduced size, or no soundboards at all (see [also Electronic instruments, §I, 2\(i\)\(c\)](#)); the similar [Stroh violin](#), though itself not electrified, was designed for use in the recording studio.

Other experiments in the adaptation of instruments of the violin family have included the mechanically operated modified string instruments (including two six-string violins with flat bridges for ease of executing three-note chords) constructed by Erich Doerlmann for Herbert Eimert's ballet score *Der weisse Schwan* (1926), and Harry Partch's 'adapted viola' (1928–30) with a cello fingerboard, designed for playing microtonal music. New instruments have been constructed with different compasses and size–compass relationships: shortly before 1920 Léo Sir built six such instruments to complement the standard four (they were used in Honegger's *Hymne pour dixtuor à cordes*, 1920); and Carleen Maley Hutchins and Frederick A. Saunders of the Catgut Acoustical Society of America have devised a set of eight instruments (see [New Violin Family](#)) which have had some success (Henry Brant featured them in *Concert for True Violins*, 1966); single instruments designed to extend the compass of the normal violin are the Violino grande and Gunnar Schonbeck's treble violin (tuned a 4th higher). Ken Parker has constructed a ten-string double

electric violin for the Indian violinist Lakshminarayana Shankar, in which two separate bodies with five strings each are mounted on a convex support; the strings can be tuned to cover a range from that of the double bass up to the violin. Jon Rose has modified a number of bowed strings: his instruments, which have additional strings (including sympathetic strings), bridges and fingerboards, include a ten-string 'double violin' whose two bodies are placed end to end on an extended neck, and a violin and cello with 19 strings. Violins have been made from metal, transparent or coloured perspex (for rock musicians); experimental lopsided instruments have been built, and violins, mandolins and guitars have been constructed from two-ply sheets of wood that are assembled from used matchsticks (some 10,000–12,000 per instrument) with the burnt heads retained for decoration.

Around 1920 Carlos Salzedo devised many new techniques for the harp, including glissandos and the use of various kinds of plectra; Anne LeBaron has prepared her harp with sheets of paper and crocodile clips. Electric harps and specially-designed pickups are manufactured; Zeena Parkins has played an electric harp of her own design.

Instrument modifications & extended performing techniques

4. Wind.

(i) Brass.

Modifications to brass instruments in the 20th century largely fell into three categories: the use of newly invented mutes; the use of 'wrong' mouthpieces; and alterations to the structure of an instrument. A number of new types of mute were introduced in jazz and dance bands in the early years of the 20th century, including a tin-can mute for a cornet (1917), various home-made mutes (used, notably, by the Original Dixieland Jazz Band), the 'wa-wa', aluminium 'hat' (modelled on the Derby bowler hat worn by musicians) and the 'plunger' (which in its original form was a rubber sink plunger without the handle); the last gives a very vocal quality to the sound and was pioneered in the 1920s by, among others, the trumpeter Bubber Miley. John Silber has explored a variety of new mutes for the trombone, including flat discs, found objects and several that incorporate tuned organ reeds. Reeds have also been added to mouthpieces: Silber has used many types of single-reed mouthpiece and another trombonist, Vinko Globokar, has played on different reeds and other mouthpieces; a bassoon reed has been fitted to the French horn by Gordon Mumma and in the Tromboon devised for 'P.D.Q. Bach' by Peter Schickele.

Modification of an instrument by rearranging the tubing or removing or adding sections has been explored by several virtuoso brass players. In *Tubassoon* (1979) Melvyn Poore features quadrophonic amplification of four open sections of the tuba, controlled by the valves and played with a bassoon reed; he has also played the tuba with a clarinet mouthpiece and an oboe reed. The tuba player Zdzisław Piernik has created an instrument with multiple bells, which somewhat resembles an experimental trombone invented by Adolphe Sax in the mid-19th century, having seven tubes with individual bells, and six valves. The improviser George Lewis has treated his trombone by removing sections while playing. In *Bolos* (1962) by Jan

Bark and Folke Rabe special effects are produced by hitting the mouthpiece of a trombone with the palm of one hand, blowing through a separate mouthpiece and removing the slide so as to produce a 'vacuum smack'. The distinctive uptilted bell of Dizzy Gillespie's trumpet (originally the result of an accident) was adopted by the trumpet section of his orchestra to compensate for the downwards angle of the instrument when the players were reading from a score.

(ii) Woodwind.

Woodwind instruments have been less often subjected to dismantling and rearrangement than brass, though Globokar's *Discours IV* (1974) calls for three performers playing a single clarinet body with three mouthpieces, and Evan Parker devised a similar Communal Blown Instrument in which a selection of wind mouthpieces are fitted to a single large tube with a horn. Special effects are obtained by using mouthpieces separated from their instruments, such as a double reed or the top joint of a single-reed instrument, and wind instruments with the mouthpiece, reed or top joint removed have been played somewhat in the manner of brass instruments (the first occurrence of the latter technique is probably in the part for sarrusophone in the opening of Ravel's opera *L'heure espagnole*, 1907–9).

The saxophone was the basis of several new instruments of an experimental nature: the jazz saxophonist Roland Kirk specialized in playing two unusual variants – the Manzello (a curved soprano, similar to the Saxello) and a modified Stritch (a straight alto) – simultaneously with a normal instrument; slide saxophones were briefly popular in the 1920s and 1930s and several modern versions have been made, including Paul Lytton's Lyttonophone; and Jim Sauter and Don Dietrich have created a composite saxophone by playing on two instruments with the rims of the bells touching. New designs for woodwind instruments, intended to simplify or extend their playing techniques, include the 'logical bassoon' with electric action, the slide Vermeulen flute, several new systems of keywork devised by Robert Dick, wind instruments that control small synthesizers, such as the Lyricon, Electronic Valve Instrument (later marketed by Akai, together with the saxophone-like EWI) and Yamaha's WX series, and the fanciful variants, one of which (fig.2) can be assembled in different ways, invented by Hans-Karsten Raecke. Flutes and pipes have been made of materials such as plastic and (increasingly) bamboo, and David Toop devised a combination of the Mirliton and a duct flute, in which a live wasp, imprisoned in an enclosed compartment, provides a drone. Devices added to woodwind instruments to modify their sound include the occasional improvised mute, and electronic devices which process the signal the instrument produces (such devices are widely used with other instruments, particularly the electric guitar, but octave multiplier and divider circuits are primarily intended for use with wind instruments).

Extended performance techniques have been thoroughly explored by woodwind players. Flutter-tonguing has become common, and other techniques, such as unorthodox cross-fingerings, multiphonics, split notes, circular breathing, and humming, singing or growling while playing, are becoming increasingly so. Key noise is specified in a number of works, the earliest of which was probably Varèse's *Density 21·5* (1936).

Instrument modifications & extended performing techniques

5. Percussion.

A percussionist typically does not specialize in a single instrument, but learns more neutral finger and stick techniques that can be applied to any resonant object, which can just as easily be a found object or a newly invented instrument. During the 20th century the greatest expansion of resources was in the area of percussion; many of the instruments and performance techniques that are now standard in the symphony orchestra were first introduced up to the 1930s in jazz, variety performances, the music hall, accompaniments to 'silent' films and so on. This expansion can be divided into several areas: in addition to the modifications to be considered here, there are the enormous range of noise-makers and 'found' instruments required in some experimental works (for examples of which see [Sound effects](#)), the adoption and integration into the orchestra of many non-Western instruments (a process that has gone on for several centuries), the development of new instruments such as the flexatone, musical saw and vibraphone, and the recent evolution of [Electronic percussion](#) used primarily in rock music.

Familiar instruments have been used in many contexts as the source of new sounds, ranging from the 'rimshot' on drums, which first became popular in the 1920s, and the 'water gong' devised in 1937 by John Cage, to bowed cymbals and vibraphone keys, cymbals inverted on drum skins and the great variety of sounds obtained from a large Paiste tam-tam (160 cm diameter) activated by a battery of different objects in Stockhausen's *Mikrofonie I* (1964) (the sounds are also modified and amplified electronically). Substantial amplification of smaller percussion was employed in several works performed by the solo percussionist Max Neuhaus in the mid-1960s.

New variants of existing percussion instruments may be considered in corresponding groups. Several new drums have been devised, such as the Geophone, a rotating drum containing sand, used by Messiaen and others; the Boobams developed by William Loughborough which Henze has featured; and the Rototoms invented by Michael Colgrass in the 1960s, which offer the resources of a set of tuned drums that have been employed by Peter Maxwell Davies and other composers, as well as rock musicians. The sizzle cymbal and hi-hat, found chiefly in popular music and jazz, have been supplemented in improvisational contexts by cymbals made of scrap and found materials; Paul Burwell has cut small cymbals to square, elliptical and flower-like shapes, altering the ratio between the circumference and the size and therefore modifying the overtones they produce. Chimes and gongs have been made of unusual materials such as marble (Robert Erickson and Gunnar Schonbeck), stone (Carl Orff), glass (Anne Lockwood and the members of the Glass Orchestra), and bamboo, aluminium and steel (David Sawyer's Handchime). Modern versions of the musical glasses, as well as the struck Bouteillophone, are required in a number of 20th-century scores. Early in the century John Taylor & Co. of Loughborough constructed a set of cup bells (two and a half octaves) for the Dutch composer Daniel Ruyneman: Ruyneman's own Electrophone electric bells date from around the mid-1930s. Keyed percussion instruments are well-represented in the work of Harry Partch and other

makers of microtonal instruments; in addition Ron George has built extended vibraphones, Schonbeck has made marimbas out of marble, and Christopher Charles Banta has specialized in building bass and contrabass marimbas with individual resonators. Various types of Lamellophone have been adopted or constructed, including the Marimbula specified by Cage in *Imaginary Landscape no.3* (1942) and more recently in works by Henze.

Whole families of percussion instruments have been devised and used by Lucia Dlugoszewski (fig.3) and large numbers individually by Mauricio Kagel for his theatrical works. Several new ergonomically efficient systems for mounting percussion kits have been constructed, including the Loops console of Ron George.

The enormously expanded battery of instruments with which contemporary percussionists are often surrounded is accompanied by an equally large selection of beaters and sticks, and this has often led to the 'wrong' sticks being used, either from choice or because there is no time for the player to change to the appropriate ones. Two types of stick devised in the 20th century are the jazz 'wire brush' of the 1920s (adapted from an outdoor fly swatter) and the 'superball mallet' (based on the eponymous ultra-resilient rubber toy ball) originally constructed in the early 1970s, which is ideal for unusual friction effects. Multi-stick techniques, the player using two or more sticks in each hand, have become quite common; a similar approach is adopted in the part for the tapered kidney-shaped Deri drum in Stockhausen's *Momente*, where a fast tremolo is executed by two sticks (held in one hand) pivoting round a third stick that is drawn across the skin of the drum to create a glissando.

Instrumentation and orchestration.

The art of combining the sounds of a complex of instruments (an orchestra or other ensemble) to form a satisfactory blend and balance. The term 'orchestration' is often used to denote the craft of writing idiomatically for these instruments. 'To orchestrate' has also come to mean to score for orchestra a work written for a solo instrument or small ensemble. There have been many attempts to differentiate the terms 'orchestration' and 'instrumentation' since Berlioz juxtaposed the two in the title of his *Grand traité d'instrumentation et d'orchestration modernes* (Paris, 1843); in this context the two terms should be considered as inseparable aspects of a single musical concept. Instrumentation by itself is a more general term, denoting the selection of instruments for a musical composition, either as part of the composer's art or by the performers for a particular performance.

Instrumentation and orchestration

1. Middle Ages and Renaissance.

Orchestration is a difficult concept to apply to medieval and Renaissance music, if only because there was no ensemble that corresponded to the modern orchestra, and because composers almost never (except in the case of specialized notations such as lute tablatures) specified their intended instrumentations. The usual modern sense of the term, to mean the exploitation of different instrumental colours for their symbolic meanings and aesthetic effects, seems to have been foreign to most of the period. Yet even in the Middle Ages there were stereotyped instrumentations – each with its own developing, diverging practical tradition and symbolical associations – in which can be seen the basis of many of the later principles of orchestration.

From the Middle Ages through the 15th century, three types of instrumental ensemble predominated in Europe. The trumpet band (trumpets and kettledrums) was used for signalling (see [Signal \(i\)](#)) and ceremonies (see [Festival, §2](#)): it had a high prestige but, because of the limitations of the natural trumpet, a restricted musical usefulness. Soft or *bas* ensembles, consisting of a variety of bowed and plucked strings, woodwinds, portative organs, and so on, were used for indoor dancing and background music; such was the association of these instruments with secular activities that they were often prohibited in church (although, paradoxically, it is soft instruments that are most often depicted in angel-concert paintings). The loud band (*haut musique* or *alta*; see [Alta \(i\)](#)) of shawms, later with slide trumpets or trombones, was used for dancing, processions and other outdoor music, and its symbolic associations were somewhere between the other two: loud bands seldom appear in angel-concert paintings, but because of their ceremonial history, they were the first type of ensemble allowed in church. There is relatively little evidence before 1500 for voices and instruments regularly performing together on composed polyphony; when it happened, the instruments were usually

those of the loud band for church music, and the lute and/or harp for secular songs.

In the 16th century these categories persisted, but they became increasingly blurred as instrumental music developed as an amateur pursuit, and as instruments that were equally at home in loud and soft music, such as the cornett and the dulcian, became more widely used. The 16th century also saw the rise of families of instruments, identical except for size and therefore pitch (e.g. viols or recorders) that could be played together as a homogeneous consort. In some cases where the highest or lowest members of the family were impractical, the standard consort used a substitution (the trombone family, for example, was completed by cornetts in the treble). The *a cappella* choir, which dominated both church polyphony and secular song for the entire Renaissance, probably should be considered the archetype for all instrumental consorts. The consort ideal governed or influenced most of the known instrumentations of the 16th century, including the largest ensembles, such as the famous band of S Marco, Venice, under the Gabriellis (essentially a redoubling and expansion of the standard cornett-and-trombone ensemble), and those accompanying the Florentine *intermedii* (which consisted of combinations of various instrumental family groups). Recorded instrumentations that combine instruments promiscuously are rare (but see [Consort](#) for a discussion of the English mixed consort of the late 16th century and the 17th).

Professional instrumentalists of the Middle Ages and Renaissance were trained to play many instruments, and they were routinely called upon to switch several times over the course of a performance. The best ensembles and their directors thus had considerable flexibility of instrumentation, and in some cases, notably the *intermedii* orchestras, they worked this flexibility to magnificent effect. However, their criteria for choosing one instrumentation over another remain largely unclear. The richest testimony to the late-Renaissance director's thought processes is probably the third volume (1618) of Praetorius's *Syntagma musicum*, with its long and detailed instructions on how to combine the different families of instruments with voices in concerted sacred music; yet the advice always centres on practical concerns (range, loudness, comfortable keys, the ability to play more than one note at a time) and never on the aesthetic motives behind any choice of instrumentation.

Throughout the 16th century there are at least hints that certain instrumental colours were being used for symbolic effect: *intermedii* orchestras, for example, often used trombones to accompany Olympian and infernal scenes, reeds for shepherd scenes, trumpets for battle scenes, etc. But the influence of this kind of thinking outside theatrical music should probably not be overestimated; for most working ensembles, matters of tradition and practicality were paramount. The old distinction of *haut* and *bas*, the ideal of the matched consort, the grandeur to be achieved by multiplying and combining families and adding chordal instruments such as organs and lutes, and the strengths and weaknesses of the individual instruments: some combination of these factors is sufficient to explain most of the normal instrumentations of the late Renaissance. And even to the end of the period and in the most distinguished ensembles, the desire for simple variety should not be

discounted as a motivation: in 1586, for instance, Francisco Guerrero ordered the cathedral band of Seville to play their three verses of the *Salve regina* with shawms, cornetts and recorders, 'for having them always on the same instrument is annoying'.

Instrumentation and orchestration

2. Baroque orchestration.

The evolution of orchestration in the Baroque era was closely related to four musical developments: the establishment of new, large-scale forms in which instrumental groups functioned as the accompaniment for vocalists (opera, oratorio, etc.); the adaptation of the concertato principle for ensembles including soloists (concerto types, suites, etc.); the unprecedented improvement and growth in instrument making during the 17th century (strings in Italy, woodwinds in France); and the acceptance of keyboard instruments as regular members of orchestras where they were entrusted with the harmonic support of the repertory.

Opera became the leading stimulus in the transformation of the earlier consort-based instrumentation into a gradually standardized mixed ensemble of strings, woodwinds, brass (with percussion) and continuo. In 17th-century Italy lavishly orchestrated court presentations and public opera houses with modest accompanying ensembles flourished side by side. Instrumental settings of court operas were governed by a number of factors: the type of occasion (indoor or outdoor), the size of the hall, the availability of players, and the content of the libretto. The latter had considerable influence on developing stereotypes in orchestration.

The symbolic usages of the *intermedii* ensembles discussed in §1, above, continued to be employed. For *L'Orfeo* (1607), Monteverdi specified 42 individual instruments grouped in three categories: strings (10 *viole da braccio*, 2 *violini piccoli alla Francese*, 2 *contra bassi da viole*); the *fundamenti* (continuo section: 2 harpsichords, 1 double harp, 3 *chitarroni*, 2 *ceteroni*, 2 *organi di legno*, 2 regals, 1 *basso de viola da braccio*); and winds (1 *flautino all vigesima secondo*; 2 flautini, 2 cornetti, 1 *clarino con quatro trombe sordine*, 5 trombones. The presence of the *trombe sordini* (muted trumpets) suggests that timpani would also have been used (as constituents of the contemporary trumpet band). His fascinating orchestration fused the late Renaissance tradition used in *intermedii* and *pastorales* and the new concertato style (e.g. 'Possente spirito') with the Venetian *cori spezzati* principle, creating a uniquely colourful style of instrumentation for the ritornellos and sinfonias. Among the great variety of court operas produced before 1670, it seems that Roman and Florentine composers such as Filippo Vitali, Stefano Landi, Caccini, and Antonio Cesti – whose *Il pomo d'oro* (Vienna, 1668) utilized the largest recorded court orchestra – were the most inspired by Monteverdi's orchestral innovations. By way of contrast, Venetian public opera houses (where interest was focussed on the virtuosity of the singers and the ingenuity of the machines) tended to employ much smaller ensembles, typically comprising a small string orchestra with a continuo of two or three plucked string instruments and keyboards, with the occasional addition of recorders and other wind instruments. Contemporary printed librettos indicate the use of individual instruments for special effects both on and off the stage.

As the century progressed there was a general change in scoring. The distinction between the use of continuo accompaniment for the voice and of orchestral ritornellos to fill in the interludes between stanzas gradually disappeared after 1650. The orchestra began to participate in the arias, adding imitative exchange, echoes or embellished melodic lines. An ensemble of three (2 violins and continuo) or five parts (2 violins, 2 violas and continuo) became standard. During the last three decades of the century, composers introduced solo wind parts in arias, as well as the concerto style with various obbligato instruments. The trumpet became increasingly popular, and began to appear regularly as a member of the orchestra, in addition to its customary use for special effects on and off the stage. Trumpets were used either in opening sinfonias set usually for two trumpets and five-part strings, or in arias written for solo voice and trumpet(s) with continuo accompaniment. In the sinfonias the winds alternate with the strings in concertato manner, except in the opening and closing bars where they all play together. The arias mostly use solo voice, solo trumpet and continuo for the A section of the Da Capo form, contrasted often with a string accompaniment for the middle section.

The orchestration of oratorios and cantatas was less uniform. During the first half of the 17th century instrumental scoring for sacred and secular vocal music tended to be based on the availability of players. Monteverdi's late madrigals sometimes require two to four string parts with basso continuo; in *Il combattimento di Tancredi e Clorinda* (1624) he uses pizzicato and measured tremolo to express the dramatic nature of the text. In the mid-17th century, a three-part setting (two upper parts and basso continuo) became the standard formula for accompanying larger vocal works. For short cantatas and other brief vocal pieces composers selected freely from the instruments available. All types of orchestration were affected by the gradual transformation of the older polychoral setting of church music into the concerto style, in which a small solo group (concertino) competed with the larger tutti (ripieno) ensemble.

A remarkable exploration of methods of orchestration took place in Rome at the turn of the century. A small chamber band comprising four violins, two violas, cello, double bass and keyboard, was regularly employed by Cardinal Ottoboni to perform concertos for entertainment, and also to accompany opera, oratorios and cantatas, all under the direction of Corelli. For special occasions they became part of a greatly extended 'festival' ensemble comprising 33 strings with harpsichord, and occasionally a few winds (trumpets, oboes and bassoons). An example of this flexibility in scoring is Lanciani's *Amore e Gratitudine* (1690–91) which was given ten times at the palace; of these, eight performances used the regular chamber orchestra, but the remaining two were supported by the 40-member 'festival' band without basic alterations in the music. Nevertheless, the 'tutti' and 'soli' indications for accompanied arias in the manuscript score suggest an orchestral division into concertino and concerto grosso groups. It seems that the practice of orchestral subdivision was customary in Corelli's orchestra beyond purely instrumental works. In the manuscript of G.L. Lulier's serenata *Gloria, Roma, Valor* (1700), also prepared for Ottoboni's musical establishment, the score indicates the individual concertino lines above the ripieno parts.

Rome was also the venue of Alessandro Scarlatti's mature musical output. Oboes, bassoons, trumpets and a four-part string group constitute the instrumental basis for his orchestration. In his orchestras after 1710 a standard string ensemble provides the accompaniment for the vocal solos; winds – in varied combinations – either take obbligato parts in arias or double the string parts in tutti writing. There are numerous special orchestral effects; e.g. a march in *Tigrane* where 'the oboes and bassoons play on stage, the violins in the pit in unison'; Policar's aria (with string support) in the same opera features an obbligato viola d'amore part; 'violoncello e leuto' make up the concertino with unison violins and continuo as the ripieno in an aria for Tigrane. As continuo arias gradually disappeared from Scarlatti's stage works, accompanied recitatives took over the dramatically charged scenes. The exchange between the vocalists and the chordal-melodic punctuation in the strings provided the model for *accompagnato* settings throughout the 18th century. Concerted accompaniments were also frequent in his oratorios, where the composer often employed string ensemble with a concertino of one or two solo violins against a *concerto grosso* or ripieno set for two violins, two violas and basso continuo.

The principle of contrast regulated the orchestration in Baroque concerto forms. Such contrast could be limited to placing the four-part string tutti against concertino of violins – a method preferred by Corelli in his multi-movement structures – or extended to various configurations of solo strings and winds, an approach perfected and brought to virtuose heights by Vivaldi. The emphasis on contrast spread to most instrumental forms; dance suites and overtures in particular display great diversity in orchestration, ranging from solo woodwind phrases echoing tutti passages, to entire middle sections in *da capo* dance movements given to a trio of two oboes and bassoon.

The last three decades of the 17th century saw the rapid spread of the new Italian vocal and instrumental forms to all the major European musical centres. An increasing number of Italian composers were offered positions in foreign courts; there they either rearranged earlier works or composed new pieces to suit the local conditions. Inevitably, the need for diversity created a much broader spectrum in orchestration than the one they had left behind in Italy. Court opera developed in two major new locations, Vienna and Paris, both with considerable instrumental resources. Under Emperor Leopold I, the Habsburg court developed a permanent musical establishment for opera and oratorio (the latter given during Lent) which was noted for spectacular productions throughout the Baroque era. Italian domination manifested itself in all aspects of the Kapelle: composers, singers, librettists and several instrumentalists were imports. What the musical content lacked in originality, was made up for in resources; in 1705 the Hofkapelle numbered 102 members (including the vocalists). All contemporary Italian devices in orchestration were put to use: tutti strings enlarged with oboes and bassoons, concerted arias and duets with a variety of instruments, woodwind trios in dances and other instrumental pieces, brass ensembles in large choral scenes, and echo effects. Among the more unusual settings is the final scene of Antonio Draghi's *Il riposo nelli disturbi* (1689): composed for double choir, the first choir is accompanied by three 'clarini' and two trumpets, while the second group

uses three sections of violins, two cornetts, three trumpets and basso continuo. Draghi also showed a preference for brass instruments in his oratorios. Other unorthodox combinations include the use of the chalumeau in works by Ziani and Giovanni Bononcini. However, in Vienna, as in Rome, the strongly individualistic approach to orchestration declined dramatically after 1720 in favour of more uniform string-dominated groupings (with a few winds).

In contrast to the Italian dominance of the Viennese musical scene, the evolution of orchestration in France followed an independent path. Although the Parisian court had at its disposal considerable instrumental resources from the beginning of the 17th century onwards (the Grande Ecurie, the Chapelle, the Chambre and the 24 Violons du Roi), a recognizable 'French timbre' started to emerge only after the ascension to the throne of Louis XIV, and the appointment of Lully as *compositeur de la musique instrumentale* in 1653. French Baroque orchestration owes its individuality to the ballet, which remained the favourite theatrical genre throughout this period. In place of the Italian vocal and instrumental bel canto idiom and the emphasis on virtuosity in instrumental music, Lully underlined the contrast of timbres among the woodwinds, strings, the extended continuo group and the occasional brass instruments. When in 1672 he assumed the direction of the Académie Royale de Musique, Lully had fused the 24 Violons du Roi and the 'petits violons' into a full orchestra of over 40 members. To this he added woodwind and brass players from the Ecurie and several 'part-time' players of unusual (non-orchestral) instruments. The regular orchestra consisted of a five-part string group of instruments of the violin family; bass viol, theorbo and harpsichord; transverse flute, recorders in five sizes, oboes and *taille de hautbois*, and bassoons; and trumpets with timpani. In the string group, the violins took the highest part (*dessus de violon*), 3 viola parts filled out the middle, and the *basse de violon* (tuned a whole tone lower than the cello) performed the bass part. Woodwinds were given prominent parts, sometimes without the strings. Furthermore, Lully established an elite chamber ensemble, the *petit chœur*, the members of which were charged with the 'singing and accompanying of recitatives and ritournelles' and, in general, with the performance of the most demanding pieces. Having created this distinctive subdivision within the orchestra, Lully extended the principle of contrast into a permanent system of performing practice in the Académie which was taken up by Rameau and remained a constant feature to the end of the Baroque era. As well as in his ingenious application of the subdivisions of the orchestra, Rameau's importance as an innovative orchestrator lies chiefly in the well-drawn indications for individual instrumental use in his colourful scores and in his nature-related music, which ranges from solemn 'sun festivals', to bird songs, tempests and earthquakes.

17th-century England was slow to adopt continental musical customs. This reluctance was due partly to the political upheaval caused by the Civil War, partly to the abolition of the King's Musick during the Commonwealth, and partly to the preference of the music-loving public for the contrapuntal idiom of late Renaissance vocal and instrumental works. Outside the court, very few of the aristocracy maintained a musical group large enough to include an orchestra. In addition, the new Italian violins, the essential component of the Baroque orchestra, became available in larger numbers in England

relatively late, after 1660. Hence, regardless of the fact that about 100 musicians were engaged at court until 1642, a systematic orchestral practice did not evolve until the last decade of the century. In general, English composers dealt with orchestration in a more individualistic way than their Italian and French counterparts. On the one hand, court music – prompted by Charles II's preference for the French orchestral style – embraced the newly-organized band of the 24 violins (with a few additional winds), using it for entertainment, birthday odes, masques and other fashionable pieces, all played in the Lullian manner. On the other hand, the theatre provided English composers with an opportunity to exploit more unusual instrumentations. Though the infiltration of Italian concerted music increased from 1670 onwards, the English theatre orchestras, unlike those of the Venetian opera houses, were not dominated by the string group. Oboes, bassoons, recorders, transverse flutes, trumpets and timpani were the preferred instruments in larger productions together with a four-part string ensemble and harpsichord. For occasional music, a three-part setting was the standard arrangement in vocal pieces and instrumental interludes alike, while choral scenes used the tutti strings with trumpets or oboes. Certain characteristic patterns can be observed in the music of Purcell: vocal solos were often accompanied by two recorders or flutes and basso continuo; the trumpet appears as a favoured timbre, with a solo voice and continuo, or as a pair in conjunction with four-part strings and continuo for symphonies (sometimes two oboes, tenor oboe, bassoon and timpani were added to this grouping). A curious 'special effect' marked 'tremulo' occurs in the 'Prelude while the Cold Genius rises' in *King Arthur*.

In reference to foreign influences, one finds connections to the French style of orchestral subdivision in a number of scores written during the last decade of the 17th century: 'Grand Chorus' or 'play all' is contrasted with the term 'vers' for solo voice with small ensemble accompaniment in works by Eccles, Jeremiah Clarke, Daniel Purcell and Finger; and trio sections are scored for two oboes and bassoon, in the French style. Native experimentation with instrumentation for stage music and orchestral works was cut short by the successful introduction of Italian opera to English audiences (Giovanni Bononcini: *Camilla*, London première, 1706). The sensation caused by Handel's *Rinaldo* (1711) illustrates the shift in public taste towards the Italian style. Handel's orchestration, however, is not purely Italian: elements from the French tradition (extensive use of woodwind instruments) are mixed with the German interest in brass sound and spiced with 'special effects', all fused into a wide palette of timbres. In Handel's orchestral music the size and combination of instruments seem determined by the form and occasion. The concerti grossi were set for the Corelli-type string chamber group enlarged at times with solo woodwinds but a wind band of over 100 players performed the Music for the Royal Fireworks during a public dress rehearsal at Vauxhall Gardens. Handel's imagination for instrumental hues came to the fore in his operas and oratorios. There his basic orchestra of strings, woodwinds, a select brass group and continuo adhered to the Italian concerto subdivision: the ripieno section played the introductions and ritornellos in arias and duets, whereas the vocal accompaniment was assigned to the smaller (concertino) group, comprising mostly strings. Recorders and flutes continued their traditional role in pastoral scenes; exceptional virtuosity appears in the transverse flute writing of *L'Allegro, il Penseroso ed il Moderato*, where the soprano

and the solo flute imitate bird calls over a light continuo accompaniment. As in Italy, brass instruments are usually added to the choir in dramatic scenes and there are numerous instances where brass sounds are used to signify danger, death or conspiracy. Two examples of 'special effects' used by Handel are the carillon (a keyboard instrument on which hammers strike bells or metal plates) in *L'Allegro* and the harp mixed with the mandolin in *Alexander Balus* to suggest an exotic oriental sound.

New Italian forms were introduced in Germany by Schütz following his two visits to Venice during the early part of the 17th century, but his attempts to create a broader base for a truly German Baroque instrumental sound were all but eradicated by the ravages of the Thirty Years War. Germany's artistic recovery (after 1670) coincided with the gradual spread of Italian and French styles in orchestration. Orchestras were traditionally employed at courts, in wealthy independent cities and by the larger congregations of the Lutheran churches. The activities of the *Collegium musicum* societies of German universities increased the public's awareness of contemporary music and helped to create a demand for permanent instrumental groups in smaller centres by the end of the Baroque period. While Munich, Dresden, Berlin and the courts in the far eastern provinces demonstrated a strong dependence on Italian customs, the western and northern regions showed a varying level of interest in the musical style of France: young composers such as Georg Muffat, Johann Fischer, J.C.F. Fischer and J.S. Kusser were sent to Paris to learn the 'new' violin technique and subsequently composed in the latest fashionable contemporary forms.

Major court orchestras averaged between 14 and 20 players in size, though this number was sometimes increased for festive occasions. The orchestra of the publicly supported Hamburg opera was the only ensemble in the independent cities comparable in size to that of the Académie Royale de Musique. The larger court bands of Brunswick, Hannover and Stuttgart had enough flexibility to perform orchestral works and concertos, accompany operas and other vocal pieces, and play dance music for the ballet. The standard German Baroque orchestra contained all the wind and string instruments (with some percussion) regularly used in Italian and French orchestras, and the resulting mixed style of orchestration is characteristic of late Baroque instrumental practice in Germany. The Italian virtuoso concertino-ripieno orchestration functioned alongside the French multi-level *petit choeur-grand choeur* division, often employed alternately for consecutive movements or arias in the same piece. Recurring ideas include a solo violin with solo voice over a basso continuo accompaniment, with or without strings; flutes used as a contrast against the tutti orchestra or as unaccompanied instrumental colour in arias; and muted double-reed and brass instruments. After 1700 pizzicato became a widely used device, sometimes involving the complete string section, at other points the cello section or the double basses alone.

Bach's experimentation with unusual timbres and newly designed instruments resulted in seemingly endless combinations. In his orchestral works he increased the number of concertino players and scored for a greater diversity of solo instruments (e.g. Brandenburg Concertos nos. 1 and 2). In scoring for the 'quiet' instruments (transverse flute, bass viol, etc.) the entire ensemble was considered as a concertino with additional

continuo accompaniment (Brandenburg Concertos nos.3 and 6); hence there was no need for doubling. Furthermore, he transferred the violin-dominated solo concerto idiom to the harpsichord, thereby elevating that continuo instrument to solo status in the orchestra and establishing the keyboard concerto as an independent form. Bach's most ingenious scoring can be found in his large-scale vocal works, written mainly for the Lutheran church service. He maintained variety, often in accordance with the dictates of the text, by mixing contemporary (French, Italian) performing customs with the earlier polychoral technique, thus creating a rich source of vocal and instrumental colours to be played by solo and tutti ensembles within the available subdivisions. His diverse instrumentation included, in the woodwinds: the transverse flute, recorder, *flauto piccolo*, four types of oboe (including da caccia, taille, and d'amore) and bassoon; in the brass: horns, trumpets and timpani, and trombones, to which the *corno da tirarsi*, *tromba da tirarsi* and *cornetto* are added; and the strings were extended to include the violino piccolo, viola d'amore, *violetta*, bass viol, violoncello piccolo and viola pomposa. For a more detailed discussion of his use of continuo instruments, see Dreyfus (1987).

An examination of Baroque orchestration would be incomplete without a brief mention of Telemann's contribution to the subject. In his preface to *Der Harmonischer Gottes-Dienst* (1725–6) he reiterated most of the above described principles of instrumental usage relative to vocal accompaniment: when and how to combine the solo obbligato part with the ripieno and, as a reference to performance practice, the double meaning of dynamic signs, i.e. *f* = loud/tutti, *p* = soft/solo. Furthermore, it is generally accepted that the orchestration of his later works serves as a transition towards the galant style through colourful timbre combinations within a lighter texture that placed the emphasis on the melodic line.

Instrumentation and orchestration

3. 1750 to 1800.

The change of style in instrumental music which occurred towards the middle of the 18th century naturally affected methods of orchestration. Under the influence of the Italian opera overture and the prevailing aristocratic taste, composers came to adopt a style of writing that emphasized a single melodic line, often based initially on the major or minor triad, and relied on crisp rhythms in *allegro* movements. There was not, however, a complete break with the past. Fugal movements or movements containing extensive fugato writing, occur, often as finales, in the works of Richter, Monn, Wagenseil, the two Haydns and Dittersdorf, and may be said to reach their climax in the finale of Mozart's 'Jupiter' Symphony (no.41). The clarity of Baroque orchestration was maintained, so much so that often the strings are in two-part harmony, with first and second violins in unison and violas an octave above the cellos. The reason for treating the violas in this way can hardly be the alleged incapacity of viola players, since they were expected to be as nimble as the other strings. The purpose is obviously to add a greater clarity to the bass line, as an organist might by adding a 4' stop on the pedals. The practice of writing figured basses gradually disappeared during the second half of the 18th century, though it is still to be found in C.P.E. Bach's symphonies and continued in London for some time (e.g. in symphonies by J.C. Bach and

Boyce). A keyboard instrument, however, remained an essential part of the orchestra and presumably supplied the missing harmonies when the texture was in two parts.

Many of the earlier symphonies are written for an orchestra of two oboes, two horns, bassoons and strings, sometimes with the addition of a single flute and sometimes with two flutes replacing the oboes. As late as 1788 Mozart, in the first version of his G minor Symphony (no.40, K550), was writing for an orchestra of this size. These limited resources provided fewer opportunities for contrast than the larger Baroque ensembles, but the principle of contrast was still observed, though it operated in a rather different way. Oboes doubled the violins in a tutti and intervened from time to time as soloists. Doubling, however, was not consistent, and a further use for oboes and horns was found in the provision of a harmonic background, either sustained or emphasizing the beats in a tutti. When four horns were used, for example in occasional symphonies by Vanhal, Haydn (nos.13, 31, 39 and 72) and Mozart (nos.18, 19, 25 and 32), an even richer background was possible, particularly if the two pairs of horns were crooked in different keys. Bassoons, at first used merely to double the bass, became more and more independent: like the oboes and horns they could contribute to the harmonic background, and a single bassoon could share solo passages with the other woodwind. Mozart in particular delighted in writing for flute and bassoon two octaves apart. Passages for wind alone, in contrast to the strings, for example in Haydn's 'Military' Symphony (no.100), are common, as they had been in the early part of the century, but more characteristic is the occasional appearance of one or more wind instruments from the ensemble.

The introduction of the clarinet, in an improved form, added to the resources of the woodwind family, but it was not until the later years of the century that it became generally available. Apart from concertos (e.g. those by Carl Stamitz) the earlier composers showed little understanding of the instrument's capabilities and tended to treat it like a variety of oboe, to which indeed it was often an alternative. The writing for clarinets in Mozart's 'Paris' Symphony (K297/300a, 1778) shows no evidence of the sensitive approach to be found in his works a few years later. In the five symphonies from Haydn's Second London Set which include clarinets there are isolated solo passages (notably in nos.99 and 103) but relatively little idiomatic writing, though shortly afterwards he wrote effectively for the instrument in *The Creation* (1798).

An early example of arpeggios in the lower register of the clarinet occurs in the Andante of the overture to J.C. Bach's *Temistocle* (1772), written for Mannheim. There are three clarinets here, described as 'clarinetti d'amore'. The notation is for instruments in D, with the third instrument written in the bass clef and transposing up a 9th in accordance with a convention of the time. Since, however, the arpeggios for the third instrument go down to written C (sounding *d*) it seems probable that the parts, in spite of the notation, are actually for clarinetti d'amore in G, the key of the movement. Later effective examples of arpeggios in the lower register occur in the introduction to Haydn's *The Creation* and the Trio of the Minuet in Mozart's Symphony in E \flat (no.39, K543). Arpeggios covering a wider range are common in concertos and in pieces like the aria 'Parto, parto' in Mozart's

La clemenza di Tito (1791), where the clarinet obbligato is played by an instrument with an extension of a major 3rd to the bottom of its compass. It may have been a growing appreciation of the tone-colour of the lower register of the clarinet that induced composers to replace it on occasion by the basset-horn.

In an ensemble consisting of woodwind, horns and strings there were no serious problems of balance; it was obviously felt, however, that the high trumpet parts written by earlier composers would disturb this balance. Such parts were still being written in England by Boyce as late as the 1770s, but continental composers preferred to avoid the higher register and to use trumpets mainly to reinforce a tutti, though the limited number of notes available imposed some uncomfortable restrictions when the music modulated away from the tonic key. When Mozart provided additional accompaniments for *Messiah* in 1789 he suppressed or rewrote all Handel's trumpet parts, though he originally thought of retaining the obbligato in 'The trumpet shall sound'. A natural consequence of the change of style was that trumpeters lost the art of playing florid parts in the high register. Horn players did not suffer the same fate. Passages of extreme difficulty, both at the top and at the bottom of the compass, occur in a number of late 18th-century works, for example in Haydn's Symphony no.51 (c1772), where in the Adagio the first horn (in E \flat) rises by step to the 22nd harmonic (sounding a \flat) and the second horn descends to the note sounding B \flat . Mozart made less extravagant demands but did not exclude virtuosity, for example in Fiordiligi's aria 'Per pietà' in *Così fan tutte* (1789). Timpani, as in the past, were normally, but not invariably, associated with trumpets. Composers discovered that both trumpets and timpani could be used quietly, as well as to reinforce a sonorous tutti. In the Adagio of Haydn's Symphony no.102 both the trumpets and the timpani are muted, though they are required to play *forte* as well as *piano*. An effective use of *piano* timpani, without trumpets, is at the end of 'Et incarnatus' in Haydn's *Theresienmesse* (1799).

Until the invention of the valve trumpet in the 19th century a flexible and homogenous brass ensemble was hardly possible. Gluck, in *Orfeo ed Euridice* (1762), followed the old tradition of associating cornetts with trombones; but by that time the cornett was virtually obsolete, and Gluck had to replace the instruments with clarinets when he revised the work for Paris in 1774. The reintroduction of trombones into opera was natural at a time when composers sought to intensify the impact of drama. Hence Gluck used them in *Orfeo* to give extra emphasis to the Furies' cries of 'No' and to create a striking contrast with the harp and pizzicato strings which accompany Orpheus. Trombones are also associated with the Furies in *Iphigénie en Tauride* (1779) and similarly with the statue and the powers of Hell in the final scene of Mozart's *Don Giovanni* (1787). As instruments which had long been used in the church, they were equally suitable for scenes of a solemn or ritual character, such as the march that opens the second act of Mozart's *Die Zauberflöte* (1791) and the aria 'O Isis und Osiris' which follows. In church music and oratorio their main function was to support the altos, tenors and basses of the chorus.

By the end of the 18th century the treatment of the woodwind, whether it included clarinets or not, had acquired a subtlety unknown to the earlier

symphonists. The master of this art was Mozart, not least in his piano concertos. The instruments engage in dialogue with each other or with the solo pianist. Phrases are nonchalantly passed from one to the other, so that the instrumental colour is constantly shifting and changing. The horns, though less prominent as soloists, participate in this activity. This subtlety extended to opera; the entry of the horns in the aria 'Dove sono' in Mozart's *Le nozze di Figaro* (1786) has an emotional force far exceeding the simple means employed. Gluck had already shown how instruments could interpret what the characters in a drama were feeling or even what was in their subconscious minds. In *Orfeo* a wind instrument echoes the singer's cry 'Euridice' – a clarinet (chalumeau) in the original version, an oboe in the revised version for Paris. The plaintive appoggiaturas for oboe in Agamemnon's air 'Peuvent-ils ordonner' in *Iphigénie en Aulide* (1774) show Gluck's instinct for choosing the right instrument, as does the flute solo in the D minor Ballet of the Blessed Spirits in the Paris *Orphée* which drew from Berlioz the exclamation 'Quel poète!'. Haydn's approach was on the whole more direct; but the oboe solo at the end of the introduction to his Symphony no.104 is very much in Gluck's vein, and the influence of opera is apparent also in the recitative for solo violin in Symphony no.7 ('Le midi'), to which C.P.E. Bach's Symphony in F (1776) supplies a parallel. Haydn had a gift for vivid illustration, for example 'La tempesta' (beginning quietly) at the end of his Symphony no.8 ('Le soir') or the lion's roar – on trombones, bassoon and double bassoon, with trills for the strings – in *The Creation*. Equally vivid are the loud whoops for trombones in the hunting chorus in *The Seasons* (1801) – a type of writing that one associates more with Verdi; and in the finale of the Symphony no.68 the bassoons, generally regarded in the 18th century as serious instruments, are treated as clowns.

The emphasis on dramatic expression in operas of the second half of the 18th century led to a more extensive and detailed indication than formerly of dynamics, notably in the operas of Jommelli and Traetta. Abrupt alternations of *piano* and *forte*, sharp accentuation (*sforzando*) and the use of crescendo and diminuendo were characteristic of a new style of orchestral writing. The style immediately affected the composition of symphonies, and the crescendo, frequently used at the beginning of a movement, became a feature of performances at Mannheim, as well as being used by composers elsewhere, for example by Haydn in his Symphony no.1 and by Gossec in his op.3 no.6. It is unusual, however, to find distinctions of dynamics between one part of the orchestra and another; if a solo is marked *piano*, for example, the accompaniment is not normally marked *pianissimo*. Brass instruments usually have the same dynamics as woodwind and strings, and a good balance must have depended on verbal direction at rehearsal.

Instrumentation and orchestration

4. 19th century.

The 18th-century legacy to nascent Romanticism was significant. With Haydn and Mozart an increasingly standard orchestral force based on pleasing symmetries of voice, colour and number had taken shape, most progressively with the addition of the clarinet to the woodwind section. There arose a repertory of primarily orchestral devices – the so-called

'Mannheim' effects, drone figures to signify rusticity, the pairing of horns in 5ths to suggest pastorality, the use of fugue as a proffer of academic credentials, the association of brass and janissary percussion with military and by extension political activity, the monologues and conversations of the Mozart concertos – which began to be known and used well beyond their initial spheres of influence. Composers for the Italian lyric stage recognized the connection between character and instrumental timbre, as well as the possibilities of applying the vocal bel canto style to orchestral parts; the French had seen and heard remarkable exercises in the deployment of large instrumental and vocal forces by considerations of space, speed and volume. The new intersections of artistic enterprise fostered the notion of an essentially poetic use of the orchestra, one that emphasized the obvious correlations between visual and audible colour.

Both economic prosperity and the need to address sweeping demands for increased capacity on every musical front stimulated a new burst of activity in instrument manufacture that included both the perfection of rudimentary mechanics and the invention of whole new families of instruments. Innovation in instrument manufacture kept pace with composers' demands and in turn stimulated compositional advances. Chromatic mechanisms for the woodwind instruments (most notably the Boehm system, as perfected by the Triébert family for oboe, by H.E. Klosé and L.-A. Buffet for the clarinet, and by Almenraeder and Heckel for the bassoon) emerged in the 1830s and 40s. Piston- and rotary-valved brass instruments were introduced to the orchestra in the late 1820s and commonly adopted within a decade. A chromatic harp was made possible by Erard's double-action pedal mechanism of 1810. Instruments of the violin family were built with longer necks and fingerboards, a higher bridge, and increased tension of the strings to obtain a more powerful sound; use of the Tourte bow eventually became universal. The Romantics' fascination with classical antiquity resulted in antique cymbals and Middle-Eastern percussion being brought into the orchestra (and not a few suggestions of what was understood as the Greek and Roman heritage); military bandmen, often simultaneously engaged as orchestral wind players, made use of a bewildering variety of old and new families of instruments.

Beethoven's many advances in orchestration were studied and absorbed by subsequent composers. Some notable effects are his melodic use of timpani in the Violin Concerto and scherzo of the Ninth Symphony, the separating of the double bass and cello lines in the 'Eroica' and the scherzo of the Fifth, and the birdcalls and other descriptive elements in the 'Pastoral'. Heroic ideals necessitated the enlargement of the orchestral force, which soon routinely included piccolo, double bassoon and three trombones. In the funeral march of the 'Eroica' Symphony Beethoven fashioned a noteworthy internal cross-reference with the use of percussive rhythmic figures in the accompanying strings to suggest a drum tattoo; in the Fourth Piano Concerto he engaged the performing force in an overt conversation, harnessing orchestration to evoke voice, gender and the suggestion of some unknown narrative. (This kind of thinking resonates strongly in Robert Schumann's Piano Concerto in A minor, 1841–5, where the piano takes a primarily 'feminine' role and the orchestra a 'masculine' one: almost certainly intended to suggest the voices of Clara and Robert themselves.) The addition of vocal soloists and a choir for the finale of the

Ninth Symphony (1822–4) marked a turning point in orchestral sound, purpose and possibility.

Schubert's last two symphonies, the 'Unfinished' (1822) and the 'Great' C major (1825–8), could not have greatly influenced the earliest Romantic efforts owing to their temporary disappearance; yet they came to be known to both Schumann and Mendelssohn by the late 1830s and may well have had an impact on those composers' subsequent works. Schubert's orchestral technique evolved from a simplistic, almost naive approach in his scoring of the Fifth Symphony (1816; no clarinets, trumpets or timpani) to the sophisticated orchestrational details (string tremolo, haunting interjections of the trombones and so on) that serve as agents of a prevalingly psychological argument in the 'Unfinished'. In the 'Great' Symphony he again redefined orchestral possibility, with unprecedented washes of bold, homogeneous tutti sonority, the full integration of the trombones, and the refined delicacies of the slow movement, epitomized by the duo of cellos and oboe, and the gentle horn motif. The immediate repercussions of Weber's *Der Freischütz* (1821) were substantial, notably by virtue of the opera's success in defining intersections of dramatic, scenic and orchestral effect: e.g. the Samiel motif played by the timpani and by pizzicato double bass beneath tremolo strings, the use of horns to depict hunting, and the pair of piccolos used to evoke the supernatural.

Given its often prosaic strategies of accompaniment, Italian opera was a surprisingly fertile proving ground for imaginative deployment and combinations of instrumental voices. In the orchestral introduction to a singer's *Scena*, an extended instrumental solo with cadenzas might accompany the vocalist's entrance and continue into the recitative, e.g. the music for horn and harp which precedes Giulietta's 'Oh! quante volte' from Bellini's *I Capuleti e i Montecchi* (1830). The familiar 'Rossini crescendo' is primarily a matter of orchestration; the cello episode from the overture to Rossini's *Guillaume Tell* (1829), another milepost in the association of orchestral and human voice, was reflected in such passages from Verdi's work as the opening of *La Traviata* and the love scene in Act 1 of *Otello*. The economics of grand opera required, above all, ongoing novelty, as much from the orchestra as from stage machinery and scenic tableaux. In *Les Huguenots* (1836) Meyerbeer called for a viola d'amore (played in the first performance by Chrétien Urhan, who was also the viola soloist for Berlioz's *Harold en Italie*) and bass clarinet; he used saxhorns in *Le prophète* (1849). The increasing degree of violin virtuosity also had its effect on writing for strings, as instructions such as pizzicato, *con sordino*, *sul ponticello* and *col legno* became common in orchestral parts.

Berlioz, Mendelssohn and, to a lesser extent, Schumann profited as much from each other in defining the Romantic orchestra as they did from their predecessors. Berlioz, with his rare blend of curiosity, observation and passionate commitment to innovation, was the most progressive of the three. His approach to orchestral deployment grew naturally from his interest in expanding the ideals of the symphonic genre, typically for narrative or dramatic effect. Already in the *Messe solennelle* of 1824 the trumpets of the Day of Judgement are unleashed; by the *Grande messe des morts* (1837) the same material is presented by four brass choirs, one placed at each corner of the performance space, thus articulating what he

later called his 'architectural' approach. The list of progressive details in the *Symphonie fantastique*, Berlioz's first symphony (1830), is formidable: the troubled cello and double bass heartbeats at the start of the *idée fixe*; the two harps in the waltz movement; the echo dialogue between the english horn and an offstage oboe, and the 'distant thunder' of timpani in the pastoral scene; the clarinet evocations of the Beloved in both the fourth and fifth movements; and the bone-rattling *col legno* in the witches' dance. The finale's splendid opening with eerie and grotesque effects of muted *divisi* tremolo strings, wind glissandos and wolfish brass with stopped-horn echoes confirms the arrival of a persuasive new approach to orchestral sonority. Of these originalities, perhaps the most quickly absorbed were the multiple *divisi* writing for strings (also essayed by Mendelssohn) and the expansion of the woodwind from pairs to triples and quadruples with the addition of the piccolo, the english horn and the E \flat clarinet. The extent of the influence of Berlioz and French grand opera on Wagner is most audible in the opening gesture of the Prelude and the english horn solo in Act 3 of *Tristan und Isolde*. More subtle features of Berlioz's style are the increasing association of timbre with gender (e.g. the voices of Harold, Romeo and Juliet) and the quintessentially French decoration of the night musics in *Roméo et Juliette*, *Les Troyens* and *Béatrice et Bénédicte*. Equally original and provocative is the 'once upon a time' opening of Mendelssohn's *Midsummer Night's Dream* overture (1826), whose four chords for high woodwind seem to define how the combination of harmony, contour and registration can instantly evoke a narrative context; his elfin, lunar brush stroke carries through the overture and much of the later incidental music. Similarly evocative approaches are to be found in the descriptive overtures, most notably *Die Hebriden* (first performed 1832) and the spectacular scenic world of *Elijah* (1846). In the symphonies Mendelssohn adopted a somewhat more conservative stance, but all three major works (the Reformation Symphony, 1830, rev.1832; the Italian Symphony, 1833, rev.1834; and the Scottish Symphony, 1842) embrace the idea of orchestration to emphasize programmatic context. Tradition has it that Schumann's understanding of orchestral possibility was rudimentary or flawed – and Chopin's non-existent – but at the very least both composers demonstrated the particular poetry to be found in the interaction of a solo pianist and orchestra.

By the time Romanticism was in full flower, in the 1830s, it was necessary to take stock of the modern orchestra and to theorize its very concept. The first treatises on the new crafts of 'instrumentation' and 'orchestration' were by the French bandmaster Jean-Georges Kastner (1837, 1839) and by Berlioz (1843). Both men described the ambitus and acoustic properties of the available instruments and presented cases of their effective use by way of published musical examples in score. Berlioz emphasized the work of the composers he most revered – Gluck, Spontini and Beethoven – along with a few passages of his own; Kastner, meanwhile, described how the celebrated *Tuba mirum* from Berlioz's *Grande messe des morts* had been constructed. Richard Strauss translated Berlioz's work into German, appending new examples from later composers (1904–5), and Widor described his own treatise (1904) as an updated supplement. Other important texts (notably Gevaert, 1863; Ebenezer Prout, 1876; Rimsky-Korsakov's *Principles of Orchestration*, 1913) followed the same general

strategy. As the 19th century progressed, orchestration came to be understood as it is today: on the one hand, the disciplined knowledge of the construction and technical character of the individual instruments, readily learnt from manuals and directly from orchestral musicians; on the other, the body of thought concerning orchestral purpose, effect and philosophy, best learnt from the detailed study of published scores by innovatory composers. As textbooks the treatises served their purpose well (as in the case of Bruckner, who learnt his trade from books); as essays in aesthetics they were conspicuously less coherent. This latter might be said, too, of Wagner's florid but uninformative musings on the orchestra's role in music drama.

What is important about the treatises is how they tend to assume an entirely new, major step in the compositional enterprise, one that takes place after completion of a bar-for-bar draft playable at the keyboard. Operas, for instance, usually existed in vocal score long before the final full score and parts were ready; composers talked of having nearly finished a work, with only the orchestration left to do. So conceived, 19th-century orchestration amounts to a dialectic between the initial composition of passages with a particular scoring in mind, and the craft of subsequently distributing the rest among the available force. It could scarcely have been otherwise, given the multitude of different instruments (and transposition schemes) available to the symphonist, who now needed a fundamentally different compositional process than that which was required to compose a work for keyboard, chamber ensemble or strings alone. The second edition of Berlioz's orchestration treatise (1855) included a new essay on 'The Conductor's Art', recognizing another basic change: the transfer of authority for the transmission of orchestral works to another party. The daily interaction between chapelmaster and musicians was lost, and the conductor now shaped and in some respects finished the work according to his own sense of its sound and structure and the performance traditions of his orchestra. The notation of full scores became correspondingly more detailed, with instructions directed as much to the conductor as to the individual players.

Liszt, who came to symphonic composition in the late 1840s, was initially constrained by the modest size of the Weimar court orchestra (fewer than 40 players) and by his own inexperience; for a time August Conradi and later Joachim Raff assisted him in expanding short scores for full orchestra. But by the time of his orchestral masterpiece, *Eine Faust-Symphonie* (1854), he was able to muster a full force to excellent and decidedly personal effect, notably in the delicate and much admired chamber textures of the 'Gretchen' movement. Likewise in the 1850s Verdi developed a recognizably personal orchestral idiom, characterized largely by multi-octave doublings and great fertility in rhythmic distribution of the standard, repeated-note accompaniments of Italian tradition. The density of the notation tends to mask the subtlety of the result, a delicacy of nuance accomplished through staccatos, rests, and a prevailing soft dynamic: Verdi frequently admonished his conductors to do nothing with the orchestra that would impede expression onstage. Even the most explosive segments of the Requiem (1874) embrace a clarity of orchestral gesture seldom achieved in contemporaneous works of corresponding size.

Wagner's revolutionary redistribution of the orchestral force proceeded along two distinct avenues: the weaving of intricate orchestral counterpoint into a foundation of string sonority on the one hand, and the block opposition of large homogenous choirs, or bands, on the other. The brass were especially appropriate to the subject matter of the *Ring* (first performed 1876), with its dominant themes of heroism and strife and its frequent allusions to the nether regions; the result was a prevailing sonority of ponderous low-register brass, including not only bass trumpet, bass trombone and contrabass tuba, but also the specially designed choir of Wagner tubas. By contrast the unfulfilled longing of *Tristan und Isolde* is established largely by way of the melancholy double-reed sonorities; its ecstasy and night-time passion, by the strings. In sheer numbers the Wagnerian orchestra constitutes a quantum leap from a few dozen to nearly a hundred players, the size assumed by many later composers to be the orchestral norm. The post-Wagnerian composers Bruckner, Saint-Saëns and Franck, all of whom were organists, sensed and carried forward a correlation between Wagner's manipulation of the orchestral choirs and the registration of the pipe organ. Bruckner retained a strong reliance on the horns and low brass, notably in the Adagio of his Seventh Symphony (1881–3), the lament on Wagner's death with its celebrated climax for four Wagner tubas and conventional bass tuba. Brucknerian textures are often defined by string tremolo and pizzicato, the latter frequently outlining bass ostinato patterns over which various contrapuntal strategies are played out, but there is a concomitant effort to escape Wagnerian density in a search for clarity and sobriety of expression.

Brahms's practice combines an essentially Beethovenian approach to orchestral size and purpose with a pianist's understanding of multi-octave ambitus (e.g. Third Symphony, first movement) and bimanual juxtaposition (Second Symphony, second movement). The unmistakable, characteristic Brahms sound is achieved through a sensuous blend of interlocking melodic solos and duos supported by richly figured accompaniments rooted primarily in the strings. His considerable store of orchestral originality, e.g. the horn solo with violin obbligato at the close of the Andante of the First Symphony (1862–76), the triangle in the scherzo of the Fourth (1884–5) and the unprecedented sonorities of the solo work in the Double Concerto for violin and cello (1887), is put more to the service of structural rigour than glamorous display. But his copiously decorated final cadences achieve as climactic an effect as any in the century.

Late Romantic composers committed to nationalist ideals or the programmatic genres tended to proffer orchestral analogues of popular practice in which castanets, tambourines and guitar effects flavoured the ubiquitous Spanish rhapsody, and all manner of village band imitations – notably woodwinds in parallel 3rds – were intended to suggest the presumed simple pleasures of rustic life. Orchestration device joined dance patterns, modal inflection and native language in the coding of nationalism. Late Romantic programme music relied heavily on orchestration for its effect, as in the willowy solo violin figure used to evoke the narrator in Rimsky-Korsakov's *Sheherazade* (1888), the clash of arms in Tchaikovsky's fantasy overture *Romeo and Juliet* (1869, rev. 3/1880), countless manifestations of bad weather and surges of a river or the sea.

Mahler and Richard Strauss shared an affinity for minutely detailed, copiously inked scores of broadly Wagnerian approach. Mahler's work is particularly compelling in its extremes, as in the shrieking cries of the Fifth Symphony (first performed 1904) or, at the other end of the spectrum, the childlike naiveties, such as the use of jingles and the absence of trombones and tuba in the Fourth (first performed 1901). He left a particularly personal stamp in the use of the then dangerously emblematic birdcalls, distant military trumpets and village bands; most memorably, perhaps, with the *Frère Jacques/Bruder Martin* round begun by double bass and solo bassoon in the darkly comic 'Hunter's Funeral Procession' movement of the First Symphony (first performed 1889). Strauss's orientation in the tone poems and symphonies is mostly programmatic (e.g. the tittering of *Till Eulenspiegel* and the majestic pipe-organ climax of Zarathustra's ascent) and, in the case of the symphonic cowbells and alphorns, occasionally excessive. But whatever their artistic merit, these kinds of passages made possible his orchestral triumph: the unmistakable silver of *Der Rosenkavalier* (1911), cast by the glockenspiel, high woodwinds and strings, and the three soprano roles, is in many ways an apt summary of the 19th century's aspirations. By the turn of the century, Debussy had begun the wholesale rethinking of compositional materials that resulted in yet another orchestral identity, one that is profitably compared with the work of the impressionist painters (see §5 below). His techniques constituted the aural equivalent of the fast-changing spectrum of 20th-century thought, and opened up new possibilities for composers just as some had begun to suspect, wrongly, that the riches of the hundred-piece orchestra had been thoroughly mined.

Matters of 19th-century orchestration and its history continue to provide fuel for debate in contemporary performance of that era's repertory. One question is the degree to which performers should feel welcome to adjust orchestration to account for later mechanical improvements and the changing taste that favoured the 'big orchestra' sound. The precedent was set early on, notably with Wagner's inclination to rescore passages in Beethoven's Ninth Symphony to achieve better balance. Recordings of the great orchestras and conductors of the latter half of the 20th century suggest that the custom of 'completing' natural horn and trumpet parts in the Beethoven symphonies with pitches available on the valved successors continues to be widespread. Where local or inherited performance custom begins to diverge from the best interests of the composition remains a matter for scholarly study and deliberation among historians, players and conductors. These issues were particularly engaged in the recordings of the 1980s and 90s by Roger Norrington, John Eliot Gardiner and other avatars of the performing practice movement. They revealed to many listeners how attention to a composition's original conditions of orchestral size, layout, mechanics and techniques (along with attention accorded to the composer's metronome markings) might result in fresh understandings of its context and meaning. At the very least they demonstrate the remarkable evolution of the relationship between the composer and the orchestra that the terms 'instrumentation' and 'orchestration' attempt to define.

[Instrumentation and orchestration](#)

5. Impressionism and later developments.

Perhaps the most original orchestration of the later 19th century is that which can be related to the movement in the visual arts known as Impressionism. Here the colours of the orchestra complement the other aspects of composition on more or less equal terms. Fragments of the sound spectrum are juxtaposed, rather than merely blended, and this may happen even within the compass of a single melody or motif. Without entering into semantics, it is fair to say that this type of scoring gives an impression of its musical object at least as much as Manet's famous *Impression* does of a sunrise. It is entirely appropriate that many paintings by the Impressionist school were listed in the private collection of Chabrier, who in his kaleidoscopic orchestral pieces, such as *España* (1883) and *Marche joyeuse* (1888), provided some of the earliest examples in this manner. Mahler, though generally applying his colours in broader strokes, well knew how to exploit the occasional dab of unexpected timbre, and his scherzos (as in the Fourth Symphony of 1900) often contain sudden and brilliant shifts of colour and texture.

The evolution of tonal harmony at about this time, with its expansion of resources and its loosening of the structural and semantic ties of diatonicism, allowed other aspects of sound, including instrumental colour, a far greater prominence. Composers began to recognize that it was not only the melodic, harmonic and rhythmic features of a musical form that could legitimately claim the listener's prime attention; agogics, dynamics and timbre began to be manipulated more consciously and more prominently. Again the obvious instances provide an apt correlation, for the most strikingly virtuoso handling of these formerly neglected 'parameters' is found precisely in the work of those composers most intimately concerned in the dissolution of diatonic harmony, Debussy, Schoenberg, Webern and, in his highly individual way, Busoni.

In the *Prélude à l'après-midi d'un faune* (1894) Debussy showed himself acutely responsive to the sensual properties of instrumental sound; it is hard to study the work's opening bars without seeing in them a refined development of Weber's orchestral thinking. The fine textural distinctions in the string writing achieved by using solos and subdivisions of the groups owe something to Berlioz and Wagner (see the string distributions in *Lohengrin*, for example), and the application of colour is often frankly impressionistic, but the evocative blends themselves are entirely within the Romantic tradition. Debussy's *Nocturnes* (1899) were in this respect an important step forward. A sense of melodic, harmonic or rhythmic purpose is entirely absent from the steadily moving chords and wispy arabesques of *Nuages*; texture and timbre are heavily relied on to convey not merely the required atmosphere but the whole of the composer's intentions. The fading percussion at the close of *Fêtes* foreshadows many a 20th-century composer's emancipation of 'noise' (Milhaud, Stravinsky, Bartók, Varèse, and eventually electronic music). In *Sirènes* Debussy used the additional colour of a wordless women's chorus, though here it is clearly programmatic – an uncharacteristic 'literalism' which obscures appreciation of the voices' timbral qualities. This idea, too, was taken up by later composers, for example by Ravel in *Daphnis et Chloé* (1912) and by Milhaud in *Les choéphores* (1915–16) and *L'homme et son désir* (1918). Debussy's later orchestral works are notable less for their colouristic innovations than for their elaboration of the figurational role of each

instrument – an interest which may have come to him from the Russians in general and from Rimsky-Korsakov in particular.

Wagner, Debussy and Mahler seem to have been the predominant influences on the orchestral technique of Schoenberg. In *Pelleas und Melisande* (1903) and *Gurrelieder* (1911) the orchestration is both adventurous and ambitious, the latter work bringing into play a multitude of performers. More significantly, it is primarily with Schoenberg's name that the concept of the *Klangfarbenmelodie* (melody of sound-colours) is associated; in 'Farben' (no.3 of Five Orchestral Pieces, 1909) there is a minimum of melodic, harmonic and rhythmic activity, and the interest centres on the alternations and manipulations of blended instrumental colour. The piece is, in other words, a logical successor to Debussy's *Nuages*. If 'melody' is defined as 'that continuous aspect of music claiming the listener's chief attention', one can understand both the special application of the term to tone-colour and the peculiar conditions that must be accepted by a composer wishing to replace 'pitch melody' by 'timbre melody'. As was to happen later with dodecaphonic music's avoidance of all diatonic suggestions, in 'Farben' Schoenberg could impose his new concept only through a ruthless negation – the withdrawal of anything likely to be construed as a melody of pitches. Webern's view of the matter was more positive; he wanted to integrate the rapid play of colours with existing compositional techniques, whether his own (Five Pieces, 1913; Symphony op.21, 1928) or Bach's (arrangement of *Ricercar a 6 voci*, 1935).

Although it is sometimes claimed that the 20th century has its own characteristic orchestral constitution – *The Rite of Spring* has often been cited as paradigmatic – the actual practice of composers has not supported this view, which arises rather from the relative stability of the orchestra's structure as an institution. It owes this stability more to its role in the furtherance of 19th-century music and traditions than to developments in 20th-century orchestral thinking. Composers of conservative inclinations, and especially those working within the symphonic tradition, have hesitated to question conventional norms of orchestral format and balance, their innovations being restricted to the gradual judicious addition of new timbres (further pitched and unpitched percussion instruments, the piano, previously neglected members of woodwind families, and to some extent instruments borrowed from alien cultural forms, such as the military band).

The reversion to Classical and pre-Classical models in 20th-century music led some composers to reduce the scale of their orchestral forces; other factors contributing to this tendency were considerations of economy (notably in the works composed by Stravinsky after 1913) and the exploration of new varieties of orchestral balance. It was the latter that caused Stravinsky to dispense with violins and violas in his *Symphony of Psalms* (1930), though it is possible to find precedents for this in 19th-century music: violins are not used in Méhul's *Uthal* (1806) or in Brahms's A major Serenade op.16 (1859), and Fauré's exclusive reliance on lower strings in the first two sections of his Requiem (1887) anticipates Stravinsky's work still more closely.

For many composers the abandonment of Wagnerian orchestral forces was followed by a fundamental redistribution of timbral balance on a far

greater scale than the minor adjustments of the *Symphony of Psalms*. For Stravinsky himself *The Rite of Spring* (1913) gave way to the wind-dominated *Renard* (1915) and the pitched percussion sonorities of *The Wedding* (1923); Webern followed the vast forces of his *Six Pieces* (1910) with the attenuated solo textures of the *Five Pieces* (1913), although even in the earlier pieces his instrumentation had already become characteristically rarefied; and Varèse retained little more than the luxuriant percussion department of the immense *Amériques* (1921) orchestra for his subsequent *Hyperprism* (1923), paving the way for the exclusively percussive *Ionisation* of 1931. Arguably Schoenberg had led the way with his scaling-down of the orchestra to a mere 15 solo instruments in the *First Chamber Symphony* op.9 (1906), where the instrumental writing suggests a debt to Wagner's *Siegfried Idyll* (1870).

Chamber orchestras became increasingly common in music written during the first decades of the 20th century. Sometimes, as with Schoenberg's work, the smaller ensemble proved a more flexible medium for the articulation of a richer than normal polyphony. Sometimes allusions were intended to the 'classical' sonorities of the 18th century. That trend was far from unknown in the 19th century, which had its divertimentos and serenades for wind or strings (Dvořák, Grieg, Gounod), but in the 1920s and thereafter the classicizing tradition became central to the music of Stravinsky, Hindemith, Bartók and many others. Sometimes there might be reference to typical forms of early jazz ensemble (Stravinsky, Copland and Hindemith again provide examples, along with Milhaud and Weill), though more often the instruments were freely selected to make up unprecedented combinations (Varèse, and many works by Ives and Milhaud). In the extreme case of heterodoxy, composers would build their own instruments, as Russolo did, and later Partch. From the 1930s onwards new electronic instruments began occasionally to enter the orchestra, especially the ondes martenot (Honegger, Varèse, Messiaen) and the theremin (often in film music).

The further anti-conventional impetus of the years immediately after 1945 was reflected in a widespread rejection of the symphony orchestra in favour of mixed groups of soloists. This reaction was perhaps fuelled by the evidence of recent history, which indicated a regression by most leading composers – Schoenberg, Stravinsky, Hindemith, Bartók – towards more conservative, even 19th-century, ways of writing for orchestra. For a challenge to that tradition, composers looked back to such works as Schoenberg's *Pierrot lunaire* (1912), which in some cases offered a direct model in using an ensemble as an effective foil to the voice (Boulez's *Le marteau sans maître*, 1953–5; Barraqué's *Séquence*, 1955). Since timbre was now to be treated as a primary musical variable, the instrumentation of a piece began to be seen as essential and unique: that tenet underlay Stockhausen's and Feldman's works of the 1950s and 60s. Paradoxically, however, the foundation of performing groups to play the new repertory resulted in a new kind of conformity, centred on a core of 14 or so soloists representing all the usual orchestral instruments. Ligeti's works show elegant solutions to the severe problems of balancing such a formation.

However, the rejection of larger resources was not complete. Indeed, some orchestras, particularly those affiliated to European broadcasting

organizations, positively encouraged experiment in the 1950s, 60s and early 70s. Instrumental groupings might be separated to produce spatial effects, as in Stockhausen's *Gruppen* (1955–7); earlier works using similar techniques had to wait until this period to be performed complete, for Ives's Fourth Symphony (1910–16) was not heard until 1965, nor Schoenberg's *Die Jakobsleiter* (1917–22) until 1961. Other possibilities included electronic transformation of instrumental sound (Stockhausen's *Mixtur*, 1964), alteration to the norms of orchestral placement (Boulez, Berio, Barraqué, Brant, Nono), movement of soloists on stage (Boulez, Musgrave), presentation of the orchestra as theatrical spectacle (Birtwistle, Stockhausen, Kagel), introduction of ancient, exotic or fringe instruments (Kagel, or, in a spirit more of local colour, Henze and Takemitsu), addition of electronic music on tape (Nono, Boulez, Babbitt), use of quarter-tones (Nono), addition of voices (Stockhausen, Berio) and re-centring the orchestra on wind and percussion (Messiaen, Birtwistle, Reich). Even in works for relatively conventional forces, these last three composers tended to conceive of the orchestra as a group of distinct choirs, rather as Stravinsky had done in works from *The Rite of Spring* to *Agon*, and so to maintain a tradition of block-style orchestration quite contrary to 19th-century practice.

No less powerful a condition of late 20th-century orchestration was, however, continued adherence to 19th-century models as exemplified in the works of latter-day symphonists (Henze, Davies, Schnittke), and from the 1970s onwards, in the music of less conventional composers (Berio, Feldman). Meanwhile those composers such as Stockhausen, who had little concern to integrate themselves within normal concert life, moved right away from the orchestra. This change, which made the orchestra again an essentially traditional institution, was precipitated in part by an increasing need for economy, since unconventional orchestration normally requires extra players and extra rehearsal time. Radical innovation in the 1980s and 90s was maintained mainly by smaller ensembles, and only where funding was still generous (as at Boulez's research institution, IRCAM, which fostered a large repertory of works with computer-controlled electronic transformation) or else when a prominent composer could command the resources of several ensembles (e.g. Reich's *City Life*, with urban sounds reproduced on samplers). Against the tide, Lachenmann, Holliger and some other composers have continued to expand orchestral resources by exploiting unconventional instrumental techniques. Composers such as Berio, Boulez, Knussen and Benjamin have also found the standard orchestra to be a continuing source of new sonorities and an abiding vehicle for creative virtuosity.

Instrumentation and orchestration

6. Popular musical theatre.

Orchestration for American musical theatre in the 20th century grew, like the form itself, from both European-style operetta and popular theatre such as vaudeville. The former derivation used a reduced version of a 'legitimate' orchestra; the latter, a flexible scoring capable of rendering the new vernacular rhythms. Early masters of the two styles were respectively Victor Herbert (*Babes in Toyland*, 1903; *Naughty Marietta*, 1910) and Frank Sandler (*Very Good Eddie*, 1915; *Oh, Boy!*, 1917).

The 1920s and 30s saw the consolidation of the rhythm section – piano, drums, bass, occasionally guitar (as in jazz bands, which in fact were sometimes hired by name for theatre pits: e.g. the Red Nichols band for Gershwin's *Girl Crazy*, orch. Bennett, 1930) – as a foundation for the orchestra for jazz or dance shows. Such shows also employed saxophones (usually doubled by the clarinetists), unlike the operetta-style musicals. The two formats were of course often mixed and modified. In the course of maintaining a busy schedule, the best orchestrators (Saddler, Robert Russell Bennett, Hans Spialek) learned to utilize their players' special abilities. Woodwind players eventually had to double on more instruments, and not just those of like family: there was for a time a vogue for bass oboe, even oboe d'amore (both used in *Oklahoma!*, orch. Bennett, 1943), as well as alto flute and basset-horn. Two-piano teams, a popular attraction of the time, participated in the theatre as well; Kern's *The Cat and the Fiddle* (orch. Bennett, 1931) had three. Violas, their stereotypical 'oompahs' absorbed by the rhythm section, were (and are) sometimes omitted altogether; at other times, particularly in the absence of a piano, a second desk of violas was added to provide a more audible beat and a solid middle range.

With orchestrators' credits featuring more prominently in the playbills of the 1940s, each production began to seek more of an individual sound. This was the era when Bennett created a consistent sound for the big Rodgers and Hammerstein shows using non-doubling 'operetta' woodwind, harp and no piano, which he (with Philip J. Lang) continued to exploit into the 1950s for Lerner and Loewe as well. Ted Royal (*Brigadoon*, 1947) and Hershy Kay were important new names during this period, while Spialek (*Babes in Arms*, 1937; *The Boys From Syracuse*, 1938) withdrew from Broadway, to return for the revival of Rodgers and Hart's *On Your Toes* in 1983. The late 1950s marked the end to this approach as the doubling reed section became universal and newer voices in orchestration brought new sounds into the pit: notably Sid Ramin, Irwin Kostal (both of whom orchestrated *West Side Story*, 1957, to Bernstein's specifications), Ralph Burns, Eddie Sauter and Robert Ginzler. Ginzler, in particular, had his trademark sounds, such as high-pitched close harmony in the woodwind (*Bye Bye Birdie*, 1960; *How to Succeed in Business without Really Trying*, 1961). More and more, unique orchestral complements were tried: no string section (*No Strings*, R. Rodgers, orch. Burns, 1962); no upper strings (*110 in the Shade*, H. Schmidt, orch. Kay, 1963; *Anyone can Whistle*, S. Sondheim, orch. Walker, 1964); and special timbres such as the lute, cimbalom, accordion, double bassoon or harmonica.

As amplification gradually became universal it affected the sound of theatre orchestration, despite orchestrators' general determination to maintain an acoustically valid balance: vocal projection became less crucial, and the newer popular sounds affected scoring. A pioneer in this respect was the orchestration for *Promises, Promises* (B. Bacharach, 1968), with its studio-style use of microphones and rebalancing of the pit. This was the work of Jonathan Tunick, who came to be particularly associated with Stephen Sondheim, having orchestrated most of his works since 1970. From the 70s onwards, theatre orchestration has been characterized by the trend towards smaller and smaller orchestras, and the increased use of electronic instruments (including synthesizers, not only for distinctive colour

but to replace absent instruments). Other orchestrators who have come to prominence during this period include William David Brohn (*The Secret Garden*, 1991; *Ragtime*, 1996), Billy Byers (*City of Angels*, 1989), Michael Gibson (*My One and Only*, 1983; *Kiss of the Spider Woman*, 1990) and Michael Starobin (*Sunday in the Park with George*, 1984). Outside the opera house the full orchestrations of earlier times are now heard mostly in special circumstances, such as concerts devoted to restoration and preservation.

BIBLIOGRAPHY

APPENDIX

introduction to the hornbostel-sachs classification system

Treatises on systems of classification are by and large of uncertain value. The material to be classified, whatever it may be, came into existence without any such system, and grows and changes without reference to any conceptual scheme. The objects to be classified are alive and dynamic, indifferent to sharp demarcation and set form, while systems are static and depend upon sharply drawn demarcations and categories.

These considerations bring special difficulties to the classifier, though also an attractive challenge: his aim must be to develop and refine his concepts so that they better and better fit the reality of his material, sharpen his perception, and enable him to place a specific case in the scheme quickly and securely.

A systematic arrangement for musical instruments concerns first of all musicologists, ethnologists, and curators of ethnological collections and those of cultural history. Systematic arrangement and terminology are urgently needed, however, not only for collections of material, but also for their study and in its interpretation. He who refers to a musical instrument by any name or description he pleases, being unaware of the points which matter, will cause more confusion than if he had left it altogether unnoticed. In common speech technical terms are greatly muddled, as when the same instrument may be indiscriminately called a lute, guitar, mandoline or banjo. Nicknames and popular etymology also mislead the uninitiated: the German *Maultrommel* is not a drum, nor the English jew's (properly 'jaw's') harp a harp, nor the Swedish *munngiga* a geige ('fiddle'), nor the Flemish *tromp* a trumpet; only the Russians are correct when they call this same instrument, a plucked lamella, by the uncommitted term *vargan* (from Greek *organon*, 'instrument'). Homonyms are no less dangerous than synonyms: the word 'marimba', for instance, denotes in the Congo the set of lamellae usually called 'sanza', but elsewhere it denotes a xylophone. Ethnological literature teems with ambiguous or misleading terms for instruments, and in museums, where the field-collector's report has the last say, the most senseless terms may be perpetuated on the labels. Correct description and nomenclature depend upon knowledge of the most essential criteria for the various types – a condition which, as a visit to a museum will show, is hardly ever met. One will find, for instance, that oboes, even when still in the possession of the double reed which unmistakably proclaims them for what they are, are noted as flutes, or at best as clarinets; and should the oboe have a brass bell one may be certain of the label 'trumpet'.

A system of classification has theoretical advantages as well as practical uses. Objects which otherwise appear to be quite unrelated to each other may now become associated, revealing new genetic and cultural links.

Herein will always be found the leading test of the validity of the criteria upon which the system is based.

The difficulties which an acceptable system of classification must surmount are very great, since that which suits one era or nation may be unsuitable as a foundation for the instrumental armoury of all nations and all times. Thus the ancient Chinese based their classification on material, distinguishing between instruments made of stone, metal, wood, gourd, bamboo, hide and silk; consequently, to them, trumpets and gongs, stone harmonicas and marble flutes, shawms and clappers, each belonged together.

Our own present-day practice does not amount to much more. Sound-instruments are divided into three major categories: string instruments, wind instruments and percussion instruments. This cannot be defended even on the grounds that it satisfies day-to-day requirements. A large number of instruments cannot be fitted into any of the three groups without placing them in an unnatural position, like the celesta, which, as a percussion instrument, is brought into close proximity to drums and so on. As a remedy one introduces a fourth group under the disconcerting heading 'miscellaneous' – in any systematic grouping an admission of defeat. Moreover, the current classification is not only inadequate, but also illogical. The first requirement of a classificatory system is surely that the principle of demarcation remains the same throughout for the main categories. Our customary divisions, however, follow two different principles, string instruments being distinguished by the nature of the vibrating substance but wind and percussion by the mode of sound-excitation – ignoring the fact that there are string instruments which are blown, like the Aeolian harp, or struck, like the pianoforte. The customary subdivisions are no better. Wind instruments are divided into woodwind and brass, thus giving a subordinate criterion of differentiation, namely, material, an unjustifiable predominance and flagrantly disregarding the fact that many 'brass' instruments are or were once made of wood, like cornetts, serpents and bass horns, and that in any case many 'woodwind instruments' are optionally or invariably made of metal, as flutes, clarinets, saxophones, sarrusophones, tritonicons etc.

The objections which can be raised against the crudity of the customary divisions are now familiar to organology (*Instrumentenkunde*), and in recent decades scholars have made more than one attempt to attain something more satisfactory. Leaving aside classifications which have owed their structure to the peculiarities of this or that collection, catalogues have latterly in general adopted a system which Victor Mahillon has used since 1888 for his comprehensive catalogue of the Museum of the Brussels Conservatory.

Mahillon takes the nature of the vibrating body as his first principle of division, and thus distinguishes between instruments (1) whose material is sufficiently rigid and at the same time sufficiently elastic to undergo periodic vibration, and named by him 'self-sounding instruments' (*instruments autophones*; for reasons which Sachs has explained in his *Realexikon der Musikinstrumente*, Berlin, 1913, p.195a, we prefer the term idiophones); (2) in which sound waves are excited through the agency of tightly stretched

membranes; (3) in which strings vibrate; and lastly (4) in which a column of air vibrates. Thus he distinguishes four categories: self-sounders, membrane instruments, string and wind instruments. Besides the uniformity of its principle of division, the system has the great advantage in that it is capable of absorbing almost the whole range of ancient and modern, European and extra-European instruments.

Mahillon's system of four classes deserves the highest praise; not only does it meet the demands of logic, but also it provides those who use it with a tool which is simple and proof against subjective preferences. Moreover, it is not so far removed from previously used divisions as to offend well-established custom.

It has seemed to us, however, that the four-class system stands in pressing need of development in fresh directions. Mahillon started on the basis of the instruments of the modern orchestra, with which, as an instrument manufacturer and musician, he was in closest contact, and it was these which gave him the initial challenge to work out his system. Then, as the collections of the Brussels museum grew under his direction, he explored over years of relentless effort the limitless field of European and exotic organology. Inevitably a newly acquired specimen would now and then fail to fit into the system, while certain subdivisions which figure importantly among European instruments – e.g. those of keyboard and mechanical instruments – assumed an unwarrantably prominent place. Mahillon had indeed been led, for the sake of the European instruments, to juxtapose categories which did not logically build a uniform concept. Thus he divided the wind instruments into four branches, (1) reed instruments (*instruments à anche*), (2) mouth-hole instruments (*instruments à bouche*), (3) polyphone instruments with air reservoir and (4) cup-mouthpiece instruments (*instruments à embouchure*). Consider too the drums, which he grouped as frame drums, vessel drums and double-skin drums; he consequently divided the skin drums corresponding to our side- and kettledrums – and likewise the *autophones* – into instruments of untuned pitch (*instruments bruyants*) and those of tuned pitch (*à intonation déterminée*). This is an awkward distinction, since a wide range of transitional sounds occurs between pure noises and noise-free tones; indeed, save for a few laboratory instruments, there are no sound-producers that can truly be said to yield either pure noise or pure tones, the sounds of all the usual musical instruments being more or less wrapped in noise. Mahillon later seems to have sensed this when he contrasted noise-instruments with those *à intonation nettement or intentionnellement déterminée*; but the criterion is subjective and as a rule incapable of proof.

In general, Mahillon was right to subdivide the four main classes into 'branches' differentiated by playing action. Yet for string instruments it was a dubious procedure; a violin remains a violin whether one bows it with a bow, plays it pizzicato with the fingers, or strikes it *col legno*. Perhaps this seems a lopsided argument, since the violin is, after all, designed to be bowed. But there are other instances. One could cite instruments whose playing action has changed in the course of time but whose form has remained unaltered. This was the case, for example, with the ancient Celtic *crowd* [crwth], which can be proved to have been plucked in the earliest times, but which came to be bowed in the High Middle Ages: should the

history of instruments therefore deal with it half in a chapter on plucked string instruments and half in one on bowed, although the instrument itself remains just the same? Then there is the psaltery, which is turned into a dulcimer (*Hackbrett*) when the player uses beaters; should one, in a collection, separate the psalteries, otherwise indistinguishable from each other, into two groups on the grounds that in one country of origin it was customary to pluck it but in another to beat it? Should I place the clavichord and the pianoforte side by side but house the harpsichord with the guitars because its strings are plucked?

All these considerations have persuaded us to undertake afresh the attempt to classify musical instruments. We were fortunate in having at our disposal as a ready-made base the large and extensively described collections of the Brussels museum out of which Mahillon's system had grown. At the same time we are aware that with increasing knowledge, especially of extra-European forms, new difficulties in the way of a consistent classification will constantly arise. It would thus seem impossible to plan a system today which would not require future development and amendment.

Like Mahillon, we accept the physical characteristics of sound-production as the most important principle of division; but even at this point considerable difficulties are met since acoustic physics has so far covered but the smallest fraction of the preliminary investigations. Thus inadequate research has yet been undertaken on the sound-production of the bullroarer, the vibratory manner in north-west American 'ribbon-reeds', the vibration events in bells, gongs, kettledrums, plucked drums, and wind instruments with free reeds and finger-holes. To such difficulties must be added others arising from the morphology of instruments. The problem of defining the term 'frame drum' (*tamburin*) for example, is scarcely capable of satisfactory solution; undoubtedly the typical frame drum represents a concise concept not to be disregarded in any classificatory system, but the transition between this and the pronouncedly tubular drum occurs without a break, often making it impossible to decide on the basis of shape whether a specimen belongs to the one kind or to the other.

Other obstacles in the path of the classifier are instruments showing adulterations between types (*Kontaminationen*). The fact of adulteration should be accounted for by placing such instruments in two (or more) groups. In museums and catalogues these cases will be arranged according to the dominant characteristic, but cross-references to other characteristics should not be omitted. Thus, among instruments of every class one may find rattling devices which belong to the inventory of idiophones – a feature which cannot be taken into account when placing the instrument in the classification. But where the adulteration has led to an enduring morphological entity – as when kettledrum and musical bow combine in a spike lute – it must have a place of its own within the system.

We must refrain from arguing our subdivisions in detail. Whosoever will check these critically, or test them in practice, will doubtless repeat the lines of thought which are not set out here, with minor variations of his own.

In classifications it is often customary to indicate the ranking of divisions within the system by means of specific headings, as especially in zoology

and botany with expressions like class, order, family, genus, species, variant. In the study of instruments, Mahillon himself felt this need and met it by introducing the terms *classe*, *branche*, *section*, *sous-section*; on Gevaert's advice he refrained from using the term 'family' on account of its widely known use for instruments of like design but of different sizes and pitches.

We consider it inadvisable to maintain consistent headings throughout all rubrics for the following reasons. The number of subdivisions is too big to manage without bringing in a petty superfluity of headings. Moreover, in any system one must leave room for further division to meet special cases, with the result that the number of subdivisions could for ever increase. We have purposely not divided the different main groups according to one uniform principle, but have let the principle of division be dictated by the nature of the group concerned, so that ranks of a given position within a group may not always correspond between one group and another. Thus terms like 'species' may refer in one case to a very general concept but in another to a highly specialized one. We therefore propose that the general typological headings be restricted to the topmost main groups, though one could, like Mahillon, speak of the four main groups as classes, of the next divisions (with a two-unit symbol [*zweiziffrig*]) as sub-classes, the next (three-unit) as orders, and the next (four-unit) as sub-orders.

We have refrained from providing a subdivision containing no known existing representative, save in cases where a composite type may be assumed to have had a precursor in a simpler type now extinct. Thus it can be assumed from analogy with numerous types that Man rubbed a solid, smooth block of wood with the moist hand before he ever carved a series of differently pitched tongues by cutting notches into the block, as in the friction block of New Ireland. Again, where the wealth of forms is exceptionally vast, as with rattles, only the more general aspects of their classification can be outlined in the scheme, and these will certainly require further elaboration.

In general we have tried to base our subdivisions only on those features which can be identified from the visible form of the instrument, avoiding subjective preferences and leaving the instrument itself unmeddled with. Here one has had to consider the needs not only of museum curators but also of field workers and ethnologists. We have carried the subdivisions as far as seemed important for the observation of cultural history and detail, though the plan of the whole classification makes possible its application to the material either summarily or in great detail as desired; general treatises and smaller collections may not require to follow our classification to its last terms, while specialist monographs and catalogues of large museums may well wish to extend it in further detail.

The application of our findings in describing and cataloguing is substantially facilitated by use of the Dewey numerical system (since the numerical arrangement for the *Bibliographie Internationale* of musical instruments applies only to European instruments, and is anyhow as inadequate as can be, we have planned our own numerical order independently). If those in charge of large collections who issue catalogues in the future decide to accept our numerical arrangement, it will become possible to find out at

first glance whether a given type of instrument is represented in the collection.

The ingenuity of Dewey's idea lies in the exclusive use of figures, replacing the more usual conglomeration of numbers, letters and double letters by decimal fractions. These are so used that every further subdivision is indicated by adding a new figure to the right-hand end of the row; the zero before the decimal point being always omitted. Thus it becomes possible not only to pursue specification to whatever limits one desires and with never any trouble in the manipulation of the numbers, but also directly to recognize from the position of its last figure the ranking of a given term with the system.

It is also feasible in a row of numbers to divide off any set of figures by points. Say, for example, that it is a bell chime (*Glockenspiel*) which is to be coded and placed in the system. In the context of the system we are dealing with an idiophone, the class to which the initial code-figure 1 is allotted. Since the instrument is struck it belongs to the first sub-class, and so another 1 is added (struck idiophones = 11). Further addition of relevant code-figures produces the ranking 111 since it is struck directly; and then, as a struck-upon (i.e. percussion) idiophone, it earns a fourth figure, in this case 2 (1112 = percussion idiophones). Further specification leads to 11124 (percussion vessels), 111242 (bells), 1112422 (sets of bells), 11124222 (sets of hanging bells) and 111242222 (ditto with internal strikers) – obviously, everyone must decide for himself how far to go in a given case. Instead of the unmanageable number now arrived at, we write 111.242.222. The first cluster shows that we are dealing with an idiophone that is struck directly, while the second and third together imply that we are dealing with bells.

Common considerations among all instruments of a class – e.g. with membranophones the method of fixing the skin, and with chordophones the playing method – may be noted with the aid of figures appended to the essential code-number by a dash: the pianoforte would be entered as 314.122–4–8 and the harpsichord 314.122–6–8, because 8 represents the keyboard, 4 the hammer playing-action and 6 the plectrum playing-action, both instruments having the same main number indicating board zithers with resonator box.

Any of the subordinate criteria of division may, if desired, easily be elevated and treated as a higher rank in the classification, by switching the positions of figures. Thus, for a bagpipe in which chanter and drone are both of the clarinet type, the code-number would read 422.22–62, i.e. a set of clarinets with flexible air reservoir. But if, for instance in a monograph on bagpipes, one wished to especially distinguish these (i.e. chanter and drone) features, one could write 422–62:22, i.e. reed instrument with flexible air reservoir whose pipes are exclusively clarinets.

Conversely, in order to bring closer together groups which are separated in the system, it is possible to turn a main criterion of division into a subordinate one without destroying the system: one simply replaces the first relevant figure by a point (.) and then adds it after a square bracket (]) at the end of the number. Thus in the example of bagpipes, it might be important to specify these instruments as always polyorganic (i.e.

composed of several single instrumental units) but with components which are sometimes clarinets and sometimes oboes; instead of 422–62:22 = reed instrument (*Schalmeieninstrument*), with flexible air reservoir, polyorganic, composed of clarinets, it might be preferable to write 422–62: . 2 = set of reedpipes (*Schalmeienspiel*) with flexible air reservoir = bagpipe, and then to differentiate further by writing 422–62: . 2]1 = bagpipe of oboes, or 422–62: . 2]2 = bagpipe of clarinets. (This use of the symbols – :] is slightly different from that of the Classification Bibliographique Décimale, but is nevertheless within its spirit. The rules are: the dash is employed only in connection with the appended figures listed in the tables at the end of each of the four main sections; subdivisions beyond these are preceded by a colon [thus 422–62 = reed instrument with flexible air reservoir, but 422–6: 2 = 422.2–6 = oboe with air reservoir]; subdivision answering to the omission of a figure is preceded by a square bracket.)

Other specifications applying to a subordinate group are suffixed to the code-figures of the latter, e.g. 422–62: . 2]212 = a bagpipe of clarinets with cylindrical bore and finger-holes.

These innumerable cases in which an instrument is composed of parts which in themselves belong to different groups of the system could be indicated by linking appropriate figures by a plus sign. One then avoids repetition of a number common to both such parts, writing this number once and following it with a point: a modern trombone with slide and valve would then appear not as 423.22 + 423.23, but as 4232.2 + 3, and similarly bagpipes composed partly of clarinets and partly of oboes, as cited above, would become 422.62: . 2]1 + 2.

In certain circumstances it may be necessary not only to rearrange the rankings of the concepts and create new subdivisions, but also to incorporate into the higher ranks of the classification some criterion which has purposely not so far been used. There is nothing to prevent this being done, and we should like to illustrate it by a final example, at the same time showing how we envisage the development of our system for special purposes. Let us imagine the case of a monograph on the xylophone. The system divides struck idiophones (111.2) by the shape of the struck bodies, thus: struck sticks (111.21), struck plaques (111.22), struck tubes (111.23) and struck vessels (111.24). Xylophones could fall into any of the first three, but the shape of the sounding bodies is here of little relevance – the transition from sticks to plaques being quite fluid – and so the fifth figure may be removed, and, if desired, added as]2 at the end. For the sixth figure we insert 2, if the description is to concern only multi-tone instruments, giving 1112. . 2 = sets of struck idiophones (*Aufschlagspiele*). We must, however, exclude sounding bodies of metal, stone, glass etc., and must therefore create a subdivision according to material which the system does not already provide, thus: [\Frames/F922842.html](#) Further stages in this classification of the xylophone would make use of morphological criteria significant from an ethnological point of view:

Classification

1112. .21.1 *Bedded xylophone*: the sounding bodies rest on an elastic foundation

1112. .21.11 *Log xylophone*: the foundation consists of separate logs; there is generally a shallow pit in the ground beneath the sounding bodies (found in Oceania, Indonesia, East and West Africa)

1112. .21.12 *Frame xylophone*: the bearers are joined by cross rods or bars

1112. .21.121 *Rail xylophone*: the frame hangs from the player's neck on a sling and is kept clear of his body by a curved rail (South-east, East and West Africa)

1112. .21.122 *Table xylophone*: the frame is borne on a trestle (Senegal and the Gambia)

1112. .21.13 *Sledge xylophone*: the sounding bodies lie across the edges of two boards (Central Africa)

1112. .21.14 (*Bedded*) *trough xylophone*: the sounding bodies lie across the edges of a trough- or box-shaped vessel (Japan)

1112. .21.2 *Suspension xylophone*: the sounding bodies lie on two cords without any other foundation

1112. .21.21 (*Free*) *suspension xylophone*: without case (southern Vietnam)

1112. .21.22 (*Suspension*) *trough xylophone*: with trough-shaped box (Myanmar, Java)

Rail xylophones and table xylophones are to be further subdivided thus: 1 without resonators; 2 with resonators; 21 with resonators suspended singly; 22 with resonators struck into a common platform. The resonators, in most cases gourds, often have holes sealed by a membrane, showing adulteration with 242 (vessel kazoos). Possibly the method of mounting the membranes (directly, or over a cone-shaped frame) will demand another subdivision. One can, however, dispense with adding another number since frame xylophones without resonators are unknown.

Appendix reprinted from Hornbostel and Sachs, 1914 (by permission of Limbach Verlag, Berlin), Eng. trans., 1961/R

Instruments, classification of

1. Introduction: the classification system of Hornbostel and Sachs.

'Musical instrument' is a self-explanatory term for an observer in his own society; it is less easy to apply on a worldwide scale because the notion of music itself in such a wide context escapes definition. Hornbostel (1933, p.129) advised that 'for purposes of research everything must count as a musical instrument with which sound can be produced intentionally', and wrote of sound-producing instruments, or, for short, sound instruments. The German word 'Instrumentenkunde' and its English equivalent 'organology' avoid the issue by taking the reference to sound or music for

granted. Hood (1971, p.124) distinguished between organology and organography, intending the distinction to separate description plain and simple from the body of knowledge that bears on problems of taxonomy and on the principles that at one time or another have served as bases for systems of classification. Both have in common a concern for structural detail.

The flow chart (fig.1), mapping currents of ideas about musical instruments, places construction (material, design) at the centre, as the common ground and link between organography and organology. The three rectangles to the right refer to intrinsically musical aspects, those to the left to contextual ones. Lateral arrows lead to the centre of the diagram, while curved lines bypassing the centre indicate that a classification might treat details of construction as secondary in importance. For the collector of musical instruments concerned primarily with the objects themselves, or for the performer in his own native music, some of the headings in the diagram must seem far-fetched, yet any one of them could serve as a major criterion for classification in any of the 5000 languages of the world. Some classifications may be narrowly local, utilitarian or ethnic. Others are speculative in that they are derived from a cosmology and meet the challenge of universal applicability because the cosmology is itself implicitly universal.

The first classification of musical instruments suitable for worldwide use was devised by Victor-Charles Mahillon, curator of the instrument museum of the Brussels Conservatory, for his catalogue of the collection. Mahillon's catalogue, which began to appear in 1880, became the basis of several later systems, the most notable of which was that of E.M. von Hornbostel and Curt Sachs in their *Systematik der Musikinstrumente: ein Versuch*, published in 1914. This system eclipsed its predecessor and achieved a pre-eminence which it never lost, despite subsequent challenges, adaptations and developments. Hornbostel and Sachs were as concerned to establish an open-ended discussion ('ein Versuch') of the problems inherent in classifying musical instruments as they were to show how their own ideas could best be translated into practice. Their use of the Dewey decimal system heralded the important role of non-verbal symbols in years to come. The introduction to the classification, in which they discussed general principles and anticipated the criticisms that their practical system might invite, is printed in its English translation as an appendix to this article.

The classification proper, which follows on the introduction, includes definitions where terms are not self-explanatory (for full lists, see [Aerophone](#), [Chordophone](#), [Idiophone](#), [Membranophone](#)). The main headings up to the third digit of the numerical code give a comprehensive view of the classification, as follows:

- 1 Idiophones (80 entries)
 - 11 struck idiophones
 - 111 idiophones struck directly
 - 112 idiophones struck indirectly

- 12 plucked idiophones
 - 121 in form of a frame
 - 122 in comb-form
- 13 friction idiophones
 - 131 friction sticks
 - 132 friction plaques
 - 133 friction vessels
- 14 blown idiophones
 - 141 blown sticks
 - 142 blown plaques
- 2 Membranophones (43 entries plus 20 suffix entries)
 - 21 struck drums
 - 211 drums struck directly
 - 212 rattle drums
 - 22 plucked drums
 - 23 friction drums
 - 231 friction drums with stick
 - 232 friction drums with cord
 - 233 hand friction drums
 - 24 singing membranes (kazoos)
 - 241 free kazoos
 - 242 tube- or vessel-kazoos
- 3 Chordophones (79 entries)
 - 31 simple chordophones or zithers
 - 311 bar zithers
 - 312 tube zithers
 - 313 raft zithers
 - 314 board zithers
 - 315 trough zithers
 - 316 frame zithers
 - 32 composite chordophones

- 321 lutes
- 322 harps
- 323 harp lutes
- 4 Aerophones (122 entries)
 - 41 free aerophones
 - 411 displacement free aerophones
 - 412 interruptive free aerophones
 - 413 plosive aerophones
 - 42 wind instruments proper
 - 421 edge instruments or flutes
 - 422 reed pipes
 - 423 trumpets

What must have seemed most curious to contemporaries of Hornbostel and Sachs in the Europe of 1914 was the size and scope of the class of idiophones. Although some of them were familiar from traditional music, other music hardly made use of them. Yet they were about to invade and conquer a large section of Western instrumentation, and by the 1970s the Hornbostel and Sachs classification appeared well balanced with respect to Western music of all kinds. The traditional threefold division into string, wind and percussion had found a rival.

[Instruments, classification of](#)

2. Precursors.

Recent research has drawn attention to the need to view the Hornbostel and Sachs system, and others, in a historical perspective, including schemes in the ancient or classical societies of Greece, the Arab world, China, South Asia and elsewhere. For example, the traditional European threefold division into string, wind and percussion instruments derived from and was also at times an alternative to the twofold classification evident in ancient Greek and early Christian thought. In Hellenic Greece, instruments were classified in two groups, the animate ('the human vocal') and the inanimate, with a further classification of inanimate instruments into string and wind, ignoring percussion. In later Hellenistic Greece the rhetorician Pollux (late 2nd century ce) distinguished a category of percussion instruments, which included plucked or beaten strings, and one of wind instruments, while the first three-category classification of wind, string and percussion was presented by Porphyry (242/3–c305 ce). The predominant structure of classification schemes from late Roman through the medieval and Renaissance periods into the 20th century was the three-category model presented by Boethius in the order of string, wind and percussion, though the two-category model of Pollux also showed some persistence. The vocal instrument continued to reign supreme until modern times, but

the reputation of inanimate instruments, especially strings and winds, grew steadily.

In the Arab world, orally transmitted taxonomy has survived which distinguished instruments according to myths of their origin and included wind, string and percussion instruments, but the theorist Al-Fārābī excluded percussion from his broad-ranging but basically twofold classification of string and wind instruments. Twofold and threefold Greek and Roman schemes persisted in European classifications for at least 1200 years though based on a different rationale. The fourfold Hornbostel and Sachs scheme somewhat resembles an ancient Indian scheme developed in the *Nāṭyaśāstra* treatise (2nd century bce–6th century ce) which includes stretched strings, ‘covered’ drums, ‘hollow’ winds and ‘solid’ idiophones.

[Instruments, classification of](#)

3. Extensions.

The Hornbostel and Sachs scheme has been extended to encompass new types of instrument and changing views of the term ‘instrument’. Galpin took note of the latest developments, adding a fifth ‘genus’ called ‘electro-phonetic instruments’ (1937, pp.29–30). Sachs, who called this group ‘electrophones’ (*SachsH*, pp.447–9, 467), divided it into three subcategories: (1) instruments with electronic action; (2) ‘electro-mechanical’ instruments (in which sounds produced in the usual way are transformed into electric vibrations by amplification through an electronic device); and (3) ‘radioelectric’, based on oscillating electric circuits (see Kartomi, 172–3). Hood (1971, p.144) named this category ‘electronophones’ whereas Sakurai (p.40) argued that ‘electrophones’ should not be regarded as one single group because they have heterogeneous primary resonators. The category became accepted in its broad outlines though it, and its terminology, have been loosely used. Logically it should include only instruments that actually produce sounds by electrical means (e.g. organs with electric action) as well as radioelectric instruments (such as synthesizers) that are characterized by their electric source of sound. Articles by Moorer (1977) and Risset and Wessel (1982) clarified the distinction between instruments that produce sounds electronically and those that simply process natural sounds. Bakan, Bryant and Li (1990) called their fifth category electronophones and divided it into synthesizers and samplers; instruments with electronic action were placed elsewhere. (See [Electrophone](#).)

In the late 20th century the human voice was often considered to be a musical instrument and was used as such in some new compositions. The idea is very old (see §2 above); the Indian writer Nārada (between the 10th and 12th centuries) also included the singing voice, along with handclapping, among his five categories of instrument (*Sangīta-makarānda*). In 1980 Dale Olsen introduced the term ‘corpophones’ for instruments that are part of the human body.

[Instruments, classification of](#)

4. Other 20th-century approaches.

Critics of the Hornbostel and Sachs system point to the calculated lack of a uniform principle for determining the hierarchies within the different groups.

Schaeffner's classification is invulnerable in this respect; indeed, he presented a system that was logically perfect and coherent. Schaeffner distinguished two main classes: vibrating solid substances and vibrating air. The class of solid substances is divided into three groups: non-tensile, flexible and tensile. At first glance it must seem odd that strings and membranes should be lumped together in the same group because of the susceptibility to tension that they have in common, but it will seem convincing to anyone who has seen the fingers of the left hand of an Iranian *tombak* player 'fingering' the drumhead: the juxtaposition of string and drum reflects not simply the cold logic of the system, but musical sense as well. There is indeed a significant link between classification and music. However, Schaeffner's system is rarely used.

Dräger matched the scope envisaged in the flow chart above (fig.1). He argued that he could not identify an instrument satisfactorily unless he took into account the musical and also physiological functions that it was to serve. This led him to consider not only aspects of the object as they present themselves to the eye but also the many linkages that tie a musical instrument to the player's person. In addition, the description of the musical instrument was to include its acoustic potential. Dräger's ideas were logical extensions of the Hornbostel and Sachs system (Dräger was a pupil of Sachs). His *Prinzip* sketches the outlines of an ideal organology that would require for its application a wealth of data – a thorough understanding of musical practice, collectively, and the person of the player, individually – that are not available on a worldwide scale.

Hood, too, sought to go beyond organography and establish a genuine organology that would attend to 'particular techniques of performance, musical function, decoration (as distinct from construction) and a variety of socio-cultural considerations' (p.124). Towards this end he designed a 'symbolic taxonomy, inspired by the symbolic language of Labanotation [a method of dance and movement notation]'. His 'organograms', have occasionally been severely criticized (for a complex example, with Hood's reading of it, see [fig.2](#)); however, they do seem to appeal to a generation of scholars familiar with symbolic languages and diagrams and less committed than their elders to verbalization.

A significant trend in organology since the 1960s has been towards emancipation from the musical instrument as an object, for the sake of a deeper understanding of the musical instrument as aspect (see Reinecke, p.177). Reinecke gave an example of what such a change of approach might mean, and the kind of classification that might emerge from it, by showing how four classes of instruments – trumpet instruments, flute instruments, bells and gongs ('ringing metal'), and string instruments – could correlate with the following set of four emotional stereotypes: first, the aspect of awe, of catastrophe, that describes awareness (conscious or otherwise) of the limited power of humankind, of one's being subjected to destiny, in short, the opposite to the possession of 'superior force'; second, the aspect of the category 'life', of fertility and resurrection, in short, the opposite of death; third, the aspect of authority, as (acknowledged) power to which one must bow; and fourth, the aspect of one's realization of the existence of order as a force, of harmony that corresponds to the emotional aspect of wisdom, insight and foresight. Such correlations were

foreshadowed in the work of Sachs (1929) and Schaeffner (1936). Reinecke's approach is in line with the tendency in the social sciences to formulate questions and seek explanations in the function of a phenomenon rather than in its structure. The mechanical and acoustic structure of the musical instrument thus becomes part of a parcel of information embracing a whole cluster of relationships. In fig.1 this requirement is reflected in the fact that the lateral arrows converge on the object instead of emanating from it.

The practical completion of Dräger's multi-faceted classification scheme awaited the development of the computer, which made possible the extension of the boundaries to encompass any criteria that a researcher might find useful. By the 1970s the day-to-day collection and storage of data about musical instruments had begun to benefit from the new technologies of the computer and the hologram. Malm (1974, pp.119ff) developed a project 'Musinst' that called for the collaboration of musical instrument collectors in a commonly agreed programming of their material in the computer language of the IBM 360 Assembly System. He considered the hologram to be an important tool. Instead of the static view of a two-dimensional photograph that presents the same image from whatever angle it is viewed, a hologram reveals different elevations of the holographed object when the viewer changes position in relation to the viewing screen, as if he or she were actually moving around the real object. The close integration between hologram and computer banks of data envisaged by Malm came to fruition in the work of Ramey (1974), who developed a computer-dependent multivariate information storage and retrieval system based on the schemes of Hornbostel-Sachs and Dräger, and identifying 'morphological', 'acoustic' and 'anthropological' data.

Like many of his contemporaries, Herbert Heyde contributed to a shift away from limited-character classification, adopting a historical approach based on the structural, functional and mensural aspects of instruments and including factors related to the player's body as well as mechanical and electronic ones. Likewise, Tetsuo Sakurai modified the Hornbostel and Sachs scheme to include primary resonators and secondary vibrators. René Lysloff and Jim Matson developed a 'multidimensional scalogram analysis' graphic method based on 37 variables grouped according to characteristics of the sounding body, the substance (supports, attachments), the resonator, sympathetic vibration, the sound instigator, the player-instrument relationship, the performance context, and the sound context and tuning.

Scientific ideas and methods influenced the study of musical instruments in other ways. Stockmann (1971; see also Elschek and Stockmann, 1967 and Becker, 1969) used the language of information theory and introduced cybernetic models. Although he acknowledged the value and usefulness of systematics in organology, he found that it prevented or at least made more difficult the development of a typology proper (1967). Systems are static; they proceed from sharp divisions and categories that must provide for any contingency and be valid for all instruments – even imaginary ones. Stockmann also questioned the excessive concern with structural criteria that has prevailed in classification systems for musical instruments, because those criteria neglect functional relations that may render

meaningless a system that limits itself to merely physical characteristics. He said of the new typological method that 'typological differentiation, that is, the isolation of variants, groups of variants and types, centres on a very simple, selective principle, namely the presence or absence of certain characteristic criteria' (1967, p.21). Typologists, in fact, 'proceed like the computer and scan the totality of the data they want to compare as to whether certain criteria do or do not occur'. Inevitably typologists require special graphic symbols to cope adequately with a multitude of phenomena. Elschek's elaborate tables of symbols (1967) account in minute detail for morphological and ergonomic features. A high proportion of Elschek's signs are iconic – tending, that is, to portray the phenomenon represented.

Heyde distinguished between 'natural' and 'artificial' systems of classification. The former take into account the historical genesis and development of the instruments; the latter are based on any arbitrary viewpoint that disregards 'genetic' factors. He included the Hornbostel-Sachs and Dräger systems in this second category. Heyde believed that modern systems generally identify the chain of elements by which a musical instrument translates into acoustic energy (i.e. sound) the nervous (or mechanical or electronic) energy that the musician (or machine or electric current) applies to the instrument. But the source of energy was itself occasionally used as a principle of classification.

Heyde's system allows for as many as 11 elements in the analytical diagram of an instrument; one relatively simple instrument, the bullroarer, belongs to Heyde's quarternary order, i.e. has four elements (see [fig. 3](#)). Heyde's terminology and flow charts appeal to the expert in cybernetics. Nevertheless they deserve to be studied by the layman: they are extreme examples of the replacement of ordinary language by new scientific symbols arranged in diagrams. Heyde claimed that his own system was 'natural', i.e. genetic, in that he could correlate the number of elements in an instrument with its place in a cultural-historical sequence.

The desire, evident in Heyde's book, to place musical instruments in some kind of evolutionary sequence had already found strong expression in Sachs's *Geist und Werden der Musikinstrumente* (1929). Sachs derived his conclusions from a study of the worldwide distribution of musical instruments, reinforced where possible by archaeological and prehistoric evidence, ethnological theories and, for the more recent strata, historical facts. On the basis of these data he distinguished 23 strata. The earliest included instruments of universal distribution, such as corporeal percussion and rattling devices suspended from the body. The most recent, comprising the 2nd millennium ce, included instruments like the kettledrum, the *sanza* and certain lutes. Strata 1 to 12 represented the Stone Ages, 13 to 19 Antiquity, and 20 to 23 the Middle Ages. Hornbostel, in his study of the musical instruments of Africa (1933), reduced the original number of strata to seven, and Sachs himself (*SachsH*, pp.63–4) stated that 'for the purposes of this book, three will suffice: early, middle, and late'. Distribution studies and surveys rarely include information on the density of occurrence, either in relation to a limited area and society, or in worldwide terms.

[Instruments, classification of](#)

5. The study of classification systems.

The first cross-cultural, historical and cognitive-structural study of classifications of instruments and the concepts of instruments which govern them was presented by Kartomi (1990) who argued that to classify objects such as musical instruments is a fundamental principle of human thinking and that society's or individual's classifications of instruments tend to express that society's or individual's cultural assumptions. Kartomi distinguished between societies whose beliefs, practices, histories and classificatory schemes have been perpetuated largely by oral transmission (many South-east Asian, Pacific and West African societies) and societies marked mainly by literary transmission (many societies in Europe, the Middle East, China and South Asia). Naturally much more historical source data is available for the latter. Some schemes are in a state of flux while others have persisted for centuries or even millennia. The data suggests that a culture or subculture normally has several co-existing ways of organizing information about musical instruments, ensembles or both, some of which may be based on a number of intersecting facets and others on single- or multiple-character steps of division. Some embody a culture's profoundest ideas or belief systems. In both kinds of societies classifications range from broad schemes (with few steps or categories) to close groupings (having a substantial number of steps). Late 19th- and early 20th-century comparative musicologists wrote for Western readership and therefore classified a society's instruments in a Western scholarly fashion rather than in native categories. Until recently, 20th-century classifications tended to be scholar-imposed, as in the case of Mahillon in Europe.

Scholar-imposed, or artificial, schemes normally take the form either of 'keys' (tree diagrams; see [figs.4](#) and [5](#)), with one 'character' (distinguishing feature) of division per step, or of 'typologies', applying more than one character or 'facet' (sharply defined aspect) for each step. 'Culture-emerging', or natural, schemes take the form of 'taxonomies' ([fig.6](#)), which apply one character of division at each step, or of 'paradigms', which apply more than one principle of division at each step. Both taxonomies and keys are based on downward classificatory thinking (logical division), starting from the general or abstract and moving to the specific, while paradigms are based on the horizontal and vertical intersection of facets. Typologies involve upward thinking, starting with the detail and moving to the more general or abstract. In the process of understanding a taxonomical problem, human beings continually alternate between upward, downward and lateral thinking, for example when trying to avoid inaccuracies, especially at the lower levels in downward schemes. Keys and typologies are schemes constructed for a particular semantic purpose, while taxonomies and paradigms grow from the individual cultural context and musical practice.

Oskár Elschek developed a method based on upward thinking, beginning by inspecting in detail the attributes of a group of objects (e.g. flutes) and classifying them according to increasingly higher levels of generality in order to isolate variants, groups of variants and types. He dubbed this method 'typological' and devised a set of special graphic symbols for it. Typologies, unlike keys, are based on a multi-character or multidimensional

method of arranging objects according to the simultaneous intersection of categories, as exemplified in [fig.7](#).

Taxonomies of instruments apply one character of division per step ([fig.8](#)), while paradigms are groupings based on the simultaneous application of more than one dimension of an object. Among the Tiboli in the southern Philippines, for example, it is necessary to include both solo instruments and ensembles in the one scheme because some instruments are played only solo and others only in ensembles ([fig.9](#)). Since the Tiboli apply three main dimensions in simultaneous intersection in their classifications, their mode of classificatory thought is paradigmatic. The empty cells in the paradigm indicate that the Tiboli never use their lute and bowed string ensemble in the 'strong' musical style, nor their gong, drum and stick ensemble in the 'gentle' musical style, and that instruments played 'with the breath' are always played singly, never in ensemble.

Native classification schemes became important sources only in the post-colonial era (after c1970), beginning with scholars such as Hugo Zemp (1971, 1978). In view of the preoccupation of organologists with the method of classification by logical division, it can initially be surprising to learn that taxonomies and keys are not universally accepted as being the 'natural' way of classifying and that some societies have traditionally thought in terms of paradigms. There is no evidence that members of orally transmitting cultures such as the 'Are'are (Solomon Islands) or the Tiboli prefer to group instruments in rigidly ordered taxonomies by single-character division, though this mode of thinking is not foreign to them. We know that in many societies several parameters are taken singly or simultaneously into account when constructing taxonomies of instruments, which suggests that multifaceted division may be widespread.

The form of a scheme is related to a culture's hierarchial preferences for certain instruments. Thus, instruments that are highly valued in a culture are normally more intensively classified than the less-important instruments; for example, in some Javanese schemes, gongs and drums, which are at the top of the hierarchy, are more closely subdivided than other instruments.

In a scheme based on the mode of sound excitation, the classifier's or culture's attitude to the way in which sounds are excited on an instrument partly or largely determines the number and content of categories. For example, if members of a culture regard beaten and plucked instruments as having different modes of excitation, they will classify them into those two separate categories, while members of a culture that regards beating and plucking as similar performing actions will subsume them into one category. The classification by the Roman writer Boethius is an example of the former while the scheme of the Hellenistic author Pollux and the dominant Dan (Côte d'Ivoire, Liberia) and Kpelle (Liberia) schemes of West Africa are examples of the latter.

Though many schemes throughout the world take the form of logical division, in some cultures instruments are classified primarily on morphological and acoustic grounds, and in others they are divided mainly according to functional symbols of cosmic or spiritual ideas, sexuality, royal character and aplomb, or as vessels housing various spirits of nature or the

ancestors. Classifications of instruments resemble each other across the cultures most closely when based on mode of sound excitation or the single, purely musical factors, and they differ most strongly from each other when based on broader social, religious, or other belief structures. When strict logic comes into conflict with the functionality or simple systematic convenience of a scheme – that is, when ambiguous categories cannot easily be avoided – logic usually falls by the wayside. If logic is used as the evaluative standard, the observer is put in the position of dismissing most inferences as deviant, faulty, or not up to standard. Sometimes, indeed, loose ends are useful in that they can be interpreted as evidence of diachronic processes, as unwitting preservers of elements of change in terminologies or structures.

Schemes that fulfil the requirements of strict paradigmatic form or logical division and schematic symmetry are rare in any culture, whether or not it has a literary or an oral orientation. Sometimes a scheme has developed spontaneously to illustrate a particular idea and therefore had no need to incorporate all the diversity of detail into a watertight symmetry, nor to account for possible loose ends. Sometimes it has expanded, contracted, or changed in some other way at some point, and maintained some old components alongside the new, giving it a somewhat illogical or inconsistent appearance. Nomenclatures and terminologies may have changed in meaning or have been attached to different instruments in the course of time. Ambiguous or contradictory titles of categories or other lexemes are sometimes comprehensible only when regarded as reflecting historical change.

Inconsistencies in a scheme, whether apparent or real, and even if unaccountable, are partly attributable to the fact that the very imposition of boundaries creates problems: borderline cases always arise when boundaries are imposed. By its very nature a given instrumentarium used in practice cannot be fitted into a perfectly logical classification scheme. The reason for this is the very expansiveness and the creativity of the human beings who conceive of, fashion, and continually change the form and meaning of instruments. Our human minds may need such schemes to assist us to comprehend a diverse body of objects or ideas and to aid memory. However, we must reconcile ourselves to the fact that perfectly logical schemes that deal adequately with all aspects of a body of data simply do not evolve in living cultures, since the primary aim is virtually never to comply with the requirements of strict logical division.

Instruments, collections of.

Musical instruments are collected for many reasons – for use in performance, as objects of veneration or visual art, to furnish ethnological and historical evidence, to illustrate technological developments and serve as models for new construction, for financial investment and sale, and merely to satisfy curiosity. Amateur and professional musicians, wealthy aristocrats, religious and municipal bodies, schools and museums are among those who amass instruments for one reason or another. Criteria distinguishing successful modern collections include not merely size, but also quality and accessibility of holdings, condition and documentation of individual objects, and integrity or coherence of the whole. This article outlines the history of instrument collecting with attention to the motives and conditions that influence collectors, and deals with assemblages of musical instruments gathered intentionally and more or less permanently. Instruments awaiting dispersal (e.g. in a dealer's or maker's shop) or accumulated apparently by chance are considered only in passing.

[Instruments, collections of](#)

1. [The earliest collections.](#)

Assemblage and deliberate preservation of groups of instruments is an ancient but not a universal practice. Little evidence exists of large-scale collecting outside urban centres; nomads, subsistence-level tribes and

those occupying hostile environments may not save instruments at all. Though Amerindians seldom preserved collections of instruments, descendants of the Aztecs still occasionally hoarded specimens of the *teponaztli* and *huéhuetle* in the 1950s. Elsewhere, particularly in settled societies where ensemble performance predominates, collections associated with worship or venerated in their own right are not uncommon; notable examples include New Guinean slit-drums, East African royal drums, and ceremonial instruments in Himalayan monasteries. Such groups may be of substantial size: the Tibetan monastery at Tin-ge owned at least 12 bone trumpets, four long trumpets, and hundreds of cymbals, drums, small bells, and other ritual noisemakers. Special ceremonies, taboos and skills connected with their manufacture and use reinforce the instruments' extra-musical connotations among non-literate societies; revered collections may thus be said to express a people's history and beliefs. But largely because of political factors and the greed of Western collectors many native assemblages have been dispersed, injuring continuity of traditional practices in affected areas such as central Java, where late 18th- and early 19th-century rulers of some principalities maintained three complete gamelans. Although national pride and affluence have led to re-establishment of collections in some former colonies, the most extensive repositories occur today in urbanized, literate societies with long histories of instrumental art music.

The oldest extant groups of instruments, dating back some 6000 years, do not represent consciously preserved collections. Late Roman and early medieval instrument groups, usually fragmentary and found in northern European mounds, may similarly be coincidental. Since relatively few ancient instruments survive, however, such small archaeological assemblages demand attention. Archaeological departments of art and history museums often include instruments that are not catalogued with the institutions' main instrument collections, but are accompanied by excavation data without which the objects might be valueless to scholars. A major responsibility of modern collectors is to obtain accurate documentation of their instruments and to transmit this information with the instruments should they change ownership; in this respect archaeological and ethnographic collectors generally have been conscientious.

Quite apart from accidental accumulation, the thoughtful collection of instruments is an ancient practice. History records the jealous guarding of many individual instruments, including even a fake 'lyre of Paris' that Plutarch mentioned as being kept in Troy in 334 bce; references to collections are less common, but although well-known passages in 2 *Chronicles* and *Daniel* may be late and unreliable there is no reason to doubt that collections of instruments formed part of the sacred property both of Solomon's temple and of Nebuchadnezzar's band. The Second Temple seems to have owned a small orchestra of lyres, harps, horns, trumpets, oboes and cymbals, and there is much evidence of earlier collections used in ritual and entertainment.

Besides collecting instruments for ensemble performance, many ancient peoples hoarded apotropaic (evil-averting) and votive instruments for inclusion at burials. Cult instruments brought together to be entombed constitute the oldest extant true collections. Tutankhamun's tomb (c1352

bce) yielded pairs of trumpets and sistra, but most Egyptian burial collections consist only of jingles or votive clappers. Of greater interest to musicians is an assemblage excavated in 1972 from the 2100-year-old tomb of a Chinese noblewoman near Changsha, Hunan province. This includes models of performers playing miniature instruments, as well as real instruments in a state of fine preservation. The Elgin auloi and fragmentary lyre now in the British Museum, from a 5th-century bce Athenian tomb, were likewise once playable. Despite topical inscriptions such as occur on bronze ceremonial instruments excavated in 1955 from the 5th-century bce tomb of the Marquis of Cai, Shouxian county, Anhui province, such interred collections were probably never intended to be seen again in this world.

After the destruction of instruments ordered by Emperor Qin Shihuang (221–210 bce) China again became the home of remarkable collections intended for use in performance. Unlike Indian courts, where small ensembles predominated despite the wealth of instruments available, Tang court ministries and conservatories of music involved hundreds of musicians playing about 50 kinds of instruments, often in large orchestras. The cosmopolitan Tang court conservatory (established 714 ce) collected not only the finest Chinese instruments but also foreign ones brought from trade centres as far west as Bukhara, gifts to the music-loving Emperor Xuan Zong (712–56). In quality and quantity, as well as in geographical scope, his repositories dwarfed any known in Europe for nearly the next 1000 years. Some idea of those holdings may be gained from the dozens of superbly decorated instruments still preserved at the Japanese Imperial Treasury of Shōsōin at Nara; many of these were played by foreign musicians at the unveiling of a Buddha at Tōdaiji temple in 752.

Under the Song dynasty (960–1280) some Chinese shrines employed as many as 120 *qin*, 120 *se*, 200 *sheng*, 20 oboes and percussion. In 1114 the emperor continued the practice of instrument exchange on a grand scale by sending to Korea a collection that included ten sets each of stone chimes and bells.

[Instruments, collections of](#)

2. Medieval.

Despite ample iconographic evidence of the many types of instruments assembled at medieval European music centres and despite extant descriptions of occasional large ensembles, we know of no permanent instrument collections of the Middle Ages that approached in size those of contemporary east Asia. Those European instruments that were held in highest regard were complex, rare and probably outside the mainstream of musical activity. There seem to have been no significant collections as such during the earlier Middle Ages. Instrumental music had been discouraged for religious reasons, but even in Islamic Spain, where by 755 Córdoba under the caliphate had become an important music centre, instruments appeared only in small groups except on extraordinary occasions. Since solo and small ensemble music predominated there was no reason to assemble large numbers of instruments for use in performance as in China, and few medieval nobles could afford to employ more than a handful of musicians. While the Church Fathers' censure of

secular musical pleasures might not have been taken too seriously, little energy was spent in preserving what could be considered mere tools. Apart from such things as church bells, only those few instruments that found their way to treasuries among other objects valued for appearance, precious materials, or historical associations were saved intentionally. It is likely that the musicians' plain, perishable tools, of which itinerant players seldom owned more than they could carry, simply wore out.

Gradually the rise of polyphony created a demand for more and better-blending instruments. Ceremonial performance called for loud wind instruments like those owned by London's Goldsmiths' Company band, enriched in 1391 by purchase of new trumpets, clarions, shawms, a bombard and a bagpipe – perhaps, with some drums, a guild's typical collection. Domestic music required softer instruments; in 1425 the Parisian Jacques Duchié owned 'harps, organs, vielles, gitterns, psalteries and others, all of which he knew how to play'. Contemporary writers frequently mentioned amateur virtuosos; Sollazzo in Simone Prodenzani's *// Saporetto* (c1400), who could play any instrument, may have had authentic counterparts who owned a variety of instruments. The court musician's status had much to do with the formation of collections, for example at the Burgundian court where noble children took lessons on richly decorated instruments from Philip the Bold's 28 musicians (1367). Yet there is no evidence that groups of the loveliest instruments were set apart from ordinary use to be appreciated as art objects.

[Instruments, collections of](#)

3. Renaissance to 1800.

The flourishing of instrument collections during the Renaissance, especially in Italy, is best understood in the context of collecting in general. With increasing wealth and ease of travel, collectors gathered great numbers of exotic objects both for amusement and instruction. Competition led to ostentation, since according to Matarazzo 'it belongs to the position of the great to keep horses, dogs, ... court jesters, singers and foreign animals', and the largest number of different specimens was most impressive. The contemporaneous development of idiomatic instrumental music elevated the status of instrument makers, who in some towns were protected by professional guilds. Growth of instrument families in all pitch ranges made it desirable to obtain complete consorts, adding new varieties as they became fashionable. Fulfilling aristocratic demands for instruments of utmost magnificence, makers produced art objects worthy of display in private *musei* and *Wunderkammern*; an impression of these studios survives in the intarsias that lined Federigo da Montefeltro's studios at Urbino and Gubbio. By commissioning elegant instruments towns and churches joined the nobility and rich merchants in demonstrating prosperity and good taste. All these factors encouraged instrument collecting.

With important exceptions noted below, most of the Renaissance and Baroque collections have become dispersed. Some idea of their contents can be gained from various published inventories and descriptions. A 1503 inventory of Isabella of Castile's royal alcázar reveals about 20 instruments, some old and broken, a modest assemblage used mainly in performance. A century later Philip II's royal palace in Madrid boasted not

only 136 wind, 44 string and 11 keyboard instruments, but also ten Chinese instruments (1602 inventory; the collection, part of which Philip inherited from his aunt, Queen Mary of Hungary, was dispersed through sale a few years later). Wind instruments likewise far outnumbered strings at Henry VIII's Westminster (1547 inventory), where Philip van Wilder had in his charge about 320 instruments (not counting gilt horns, drums and the like), including 40 keyboards. Raymond Fugger's music chamber in Augsburg held (in 1566) nearly 400 instruments, including over 100 flutes and recorders, about 140 lutes and many violins and harpsichords by famous makers, gathered from all over Europe. The Berlin court orchestra owned (in 1582) 72 instruments, 60 of them wind, while Archduke Ferdinand II of the Tyrol's collections (1596) comprised over 230 costly instruments, nearly 80% wind. Ferdinand's personal collection, now at the Vienna Kunsthistorisches Museum, was kept at his Ambras residence near Innsbruck. French 16th-century collections were far less impressive, but Jean de Badonvilliers, councillor to François I, left a number of string and keyboard instruments at his death in 1544. A 1603 inventory of the Hengrave Hall collection survives; in that year the royal collection provided violins for Queen Elizabeth's funeral.

Woodwind instruments usually outnumbered strings in Renaissance repositories, but have not survived in such profusion. Wooden flutes and reed instruments, being cheaper and offering less opportunity for decoration than strings, were considered less worth preserving when they became obsolete; they were also harder to modernize (ivory ones were more precious and often elaborately carved, but less useful in performance; hence they survive in relatively high numbers). Wind instruments in sets often belonged to repositories heavily drawn on by professional performers. The Kassel Hofkapelle inventories of 1573, 1613 and 1638 record loans to the count's musicians; there and elsewhere it appears that valuable, decorated keyboard instruments seldom left their usual chambers (hence more harpsichords and organs occur in inventories than one might expect since one or more might have had to be kept wherever music was often performed). These stationary, seldom loaned instruments are more likely than most to have become 'collectors' items'.

Only gradually did connoisseurs evolve the concept of a collection as a work of art, capable of displaying internal harmony and of expressing its owner's taste. Private collectors rather than institutional buyers were mainly responsible for developing this attitude, and Italy in particular was full of collectors. Venice boasted Agostino Amadi, Luigi Balbi, Marco Contarini (whose collection passed to the Correr family and parts of which came to the Paris and Brussels conservatory collections), Leonardo Sanudo and Catarino Zeno; in Bologna lived Ferdinando Cospi; in Ferrara, Antonio Goretti; in Florence, Ridolfo Sirigatti; in Padua, Enea degli Obizzi (whose collection is now in the Vienna Kunsthistorisches Museum); in Rome, Michele Todini and Athanasius Kircher; and in Milan, Manfredo Settala. Finally, there were the more renowned d'Este, Sforza and Medici families. According to Bottrigari, Isabella d'Este's nephew Alfonso II kept his collection in two great chambers where his musicians played; the instruments were arranged by category, and separated according to whether they were played or 'different from those ... usually made today',

and included Vicentino's *arcicembalo* and a set of crumhorns (possibly those now in the Musée des instruments de musique, Brussels).

In Spain and Portugal, noteworthy collections belonged to the Duke of Calabria at Valencia and to Queen Mary of Hungary. Northwards were the private holdings of Jean Baptiste Dandeleu, Caspar Duitz, Hendrick van Brederode, and Constantijn Huygens. Hans Burgkmair's *Triumphzug* illustrates instruments from Maximilian I's Hofkapelle. A certain Felix Platter owned instruments in Basle.

In 1659 Elias Ashmole received a Guinea Coast drum from Johan Tradescant the younger, whose 1656 *Musaeum Tradescantianum* catalogue records several African and Indian drums under the heading 'Warlike Instruments' (a Guinea drum and a fragment of a side-blown horn remain in the Ashmolean collection, Oxford); similar instruments had been illustrated by Praetorius (*Theatrum instrumentorum*, 1620). Athanasius Kircher's museum at Rome contained instruments discussed in his *Musurgia universalis* (1650); and Filippo Bonanni, curator of Kircher's collection from 1698, drew on Kircher's text as well as Marin Mersenne's *Harmonie universelle* (1636–7) for his own *Gabinetto armonico* (1722). Michele Todini's *Dichiaratione della galleria armonica* (1676) describes his own idiosyncratic collection, which included curious instruments of his own design; his extraordinary harpsichord flanked by figures of Polyphemus and Galatea survives in the Metropolitan Museum of Art, New York. Todini exhibited his collection publicly, and Winternitz believed that it might have constituted 'the first museum exclusively devoted to musical instruments'.

Of particular interest later in the Baroque era were the keyboard instruments in collections of Cosimo III and Ferdinando de' Medici (supervised by Bartolomeo Cristofori after 1716), Cardinal Ottoboni and Queen Maria Barbara de Braganza. In England Sir Samuel Hellier assembled a distinguished collection in the mid-18th century including the Stradivari violin now known by his name; the greater part, however, he sent to his country house so that his estate workers could enjoy orchestral music-making – an early example of the provision of sets of instruments for workers' recreation which became common with 19th-century industrialists. By that time it was common for collectors to obtain antique instruments at public sales.

Some outstanding 18th-century musicians were collectors. The celebrated castrato Farinelli owned several precious keyboard instruments (nicknamed 'Coreggio', 'Rafael', 'Titian' and so on), some inherited from Queen Maria Barbara; his testament (1782) specifies that his collection, formed for playing domestic music, should be perpetually preserved in good order along with his music library for the exclusive enjoyment of devoted musicians. Bach at his death owned 19 instruments estimated at nearly a third of the entire value of his estate. Curatorial responsibilities may have stimulated other notable composers of instrumental music. In 1673 Henry Purcell was apprenticed to John Hingeston, Charles II's instrument keeper, as an unpaid 'keeper, maker, mender, repayer and tuner of the regalls, organs, virginalls, flutes and recorders and all other kind of wind instruments whatsoever'; ten years later Purcell succeeded Hingeston. One of Haydn's contractual responsibilities as Vice-

Kapellmeister to the Esterházy was to look after the instruments and order new ones for the prince's orchestra. Vivaldi's duties at the Pio Ospedale della Pietà included the purchase of instruments.

Instruments, collections of

4. Since 1800.

The French Revolution sounded the death-knell of aristocratic hoarding. From then on middle-class utilitarian ideals underlay the evolution of public collections, first shown by the ambitious 'collection of antique or foreign instruments and also for those in present use which by virtue of their perfection may serve as models' proposed for the new Paris Conservatoire by the 1795 National Convention. Regrettably, most of the treasures inventoried for the *Commission temporaire des arts* perished as firewood during the winter of 1816, and it was not until 1864 that the Conservatoire's museum began with the acquisition of 230 instruments from Louis Clapisson. In Edinburgh John Donaldson, holder of the University Chair of Music, assembled a collection of old and unusual instruments and acoustical apparatus (perhaps the first to be brought together for scholarly study and academic teaching) and built a museum (1859) still in use for this purpose. This was followed in the 1870s by the creation of the Brussels Conservatory's museum from the private collections of F.-J. Fétis, Victor-Charles Mahillon and others; then in 1888 came the acquisition of Paul de Wit's first collection by the Berlin Königliche Hochschule für Musik. Perhaps the oldest institutional collection still thriving is that of the Gesellschaft der Musikfreunde in Vienna, begun in 1824 with the acquisition of F.X. Glögg's instruments and administered in trust since 1938 by the Kunsthistorisches Museum; this repository holds both the Ambras and Obizzi collections, combined by Julius Schlosser in 1916 to form the Sammlung alter Musikinstrumente.

By the 18th century the notion of musical progress had become tied to technical improvement in instrumental manufacture. Growing concern with design standards for mass-produced goods led in the 19th century to the founding of museums of decorative arts in which old instruments occupied an honoured place; London's Victoria and Albert Museum is an example. Loan exhibitions encouraged competition among makers and confirmed the importance of exposing foreign models; one instance is the gamelan that so impressed Debussy at the 1889 Paris Exhibition. Temporary loan exhibitions enjoyed much popularity in England, where an important pioneering display took place in 1872 at the South Kensington (now the Victoria and Albert) Museum. Others followed, some producing useful catalogues: Milan (1881), London (Royal Albert Hall, 1885), Bologna and Brussels (1888), Vienna (1892), Chicago (1893), London (Crystal Palace, 1900), Boston (Horticultural Hall, 1902), and again London (Fishmongers' Hall, 1904). The Fishmongers' Hall catalogue explained the motive for such exhibitions: 'to enable all interested in music under its various aspects to contrast, as a fruitful means of instruction, its past with its present condition – to estimate its growth and development, and to observe what progress has been made in the work of the instrument maker'.

Darwinian theories of evolution, scientific interest in acoustics, easy contact with colonial areas and abundant funds encouraged 19th-century collectors

whose holdings became the nuclei of many museum collections. Some museums emphasized educational objectives while catering for middle-class tourists with a taste for the exotic; others became archival, veritable Noah's arks of primary source material for research. Many institutions inherited problems as well as benefits from the acquisition of instrument hoards offered by amateurs whose wealth and enthusiasm usually offset their understandable lack of discernment. Most private collectors were rich dilettantes with little musical knowledge; others were professional performers or instrument manufacturers; only a few were music scholars of the first rank. Yet so readily available were fine antiques during the 'golden age' of collecting (up to World War I) that, whether through careful search or mere luck, collectors of every level of sophistication accumulated and eventually gave to museums many significant instruments (as well as many fakes).

By the early 20th century the pace of acquisition had slowed, and museums did not always have clear objectives. Some important public collections were established, for instance in Leipzig, when thanks to the magnificence of with Henri Hinrichsen the state of Saxony was able to purchase the collection of Wilhelm Heyer of Cologne to create the Leipzig University Musikinstrumenten-Museum in 1926. In Berlin Curt Sachs (Director of the Collection at the Hochschule für Musik from 1920 to 1933) exploited the collection in his pioneering organological work. On the other hand, the cleric, collector and scholar Francis Galpin could find no museum in Britain that would accept his collection of 560 instruments – one of the first truly systematic organological collections – and it was acquired in 1917 by the Museum of Fine Arts, Boston, USA. Some museum collections stagnated, or in some cases added haphazardly to their holdings.

After World War II collections public and private found a new sense of direction, fostered by the early music movement hand-in-hand with flourishing research and publication in organology. The discovery of the novel sounds of period instruments in early music gave collections a new and vital purpose, either by directly providing instruments for performance, or indirectly by supplying the information needed by players and instrument makers to reconstruct new instruments giving the sounds it was believed the old would have produced. Measurements, drawings and organological publications now found a growing market.

The Galpin Society was formed in 1946, followed by the Gesellschaft der Freunde alter Musikinstrumente, the American Musical Instrument Society, the Association des Collectionneurs d'Instruments de Musique à Vent, and other societies. The impetus for these was provided by collectors; the main activity of the largest of these has been the production of scholarly journals.

In the second half of the 20th century private collections sprang up and flourished, held in check only by increased prices for historic instruments. As time passed, instruments of later periods were considered to be collectable, reflecting the fact that instrument designs have continued to evolve. Some private collections have since been dispersed at auction, some taken over by institutions. The better managed private collections have standards of care and documentation quite up to professional

museum standards, and some private collections have been of outstanding importance, assembled with well-informed connoisseurship.

Public collections of instruments (as with other museum sectors post-World War II) placed a new importance on communication with wider audiences using improved display techniques and, latterly, the Internet. The emphasis on interpretation led to thematic rather than taxonomic displays. Towards the end of the 20th century, museums installed sound or multimedia systems, and exploited computer interactive techniques.

At the same time, there was more thorough documentation, with catalogues becoming more analytical, seeking to distinguish between original material and design and later repairs and adaptations, and considering the cultural and social contexts of the original production of instruments, rather than just the technical means. Museum documentation increasingly recorded knowledge about provenance, former use, and the circumstances surrounding the making of instruments. Recognizing the importance of research and of reliable provenance data, some museum staff undertook field trips, acquiring sound recordings and information of kinds often lost when instruments are purchased through dealers or at auction.

Collectors, especially museums with a mission to preserve artefacts for posterity, became increasingly aware that the actual use of historic instruments in performance is not sustainable. In many cases playing and restoration resulted in damage or other loss of integrity. It was also realized that historic instruments as they have come down to us are not in the condition their makers left them, wood having shrunk and warped and metal having corroded and undergone changes in structure, and that the best contribution of early instruments is to serve as models for copying or to contribute data for new instruments based on the study of many originals. Specialist museums and some private collectors made instruments available for study by makers or published technical drawings.

The establishment of the formal teaching of organology and academic research at university collections in Edinburgh, Yale, Leipzig, South Dakota (Shrine to Music Museum, Vermillion) and Oxford (Ashmolean Museum, Bate Collection, Pitt Rivers Collection) took place in the second half of the 20th century. Some of the more important collections which were originally attached to conservatories have become state museums. In these cases new buildings were often provided, including the impressive new museums in Berlin (1984), Paris (1997) and Brussels (2000).

The second half of the 20th century also saw a significant increase in co-operation, not only in exhibitions but also in professional activities. The Comité international des musées et collections d'instruments de musique (CIMCIM) was formed with members from 14 countries in 1960, becoming part of the International Council of Museums. In 1971 CIMCIM gave birth to the International Association of Instrument Collections, reabsorbed in an enlarged CIMCIM in 1975. The organization provides a forum for the exchange of professional experience and has produced publications of value to public and private collectors of instruments alike.

5. List of collections.

This list includes collections containing 30 or more musical instruments, and occasionally those with smaller numbers of particularly significant instruments or with a specific theme. More archaeology and ethnography museums and mechanical instrument collections are cited than in previous *Grove* publications. Collections, whether institutional or private, are always in a state of flux: they grow and shrink, are bought and sold or absorbed wholesale into other collections, and they are sometimes dispersed. Information for this article was gathered between 1990 and 2000, and comes from several sources: from questionnaires answered between 1990 and 1995 for the *International Directory of Musical Instrument Collections* (IDMIC), sponsored by the Comité international des musées et collections d'instruments de musique (CIMCIM), and from a variety of published sources (see bibliography, below). In those instances where collections still known to exist did not respond to the IDMIC survey, the entry has been repeated from *Grove*⁶.

Detailed information about collections is also available from organizations such as the Galpin Society (Britain), the Gellschaft der Freunde alter Musikinstrumente (Switzerland), the Kommission für Instrumentenkunde der Gesellschaft für Musikforschung and the American Musical Instrument Society. The IDMIC is published and maintained on the worldwide web.

Instruments, conservation, restoration, copying of.

A complex set of issues surrounds the competing demands of the preservation and use of cultural objects. Conservation and restoration are the two regimens followed in the care of such objects: conservation seeks the preservation of the status quo, and restoration seeks a return to working condition. The physical operation of any historic resource incurs maintenance, wear of moving parts, and the eventual replacement of components. Bringing a historic musical instrument into playing condition, and continuing its use, therefore becomes a source of contention when the processes and materials employed might mask or obliterate information on the original state of the instrument or its subsequent use. It is a tenet of museum practice that objects be preserved in the state in which they were acquired, and that intervention changing their condition be kept to a minimum. However, as musical instruments are among the most highly dynamic, interactive and evocative of artefacts, conserving them in a non-playing condition excludes the possibility of exploring their original intended function as producers of sound. Although the philosophies of conservation and restoration appear, therefore, to be polarized, it is nevertheless a mistake to assume that they share no common values. The ultimate intention of both is to ensure the continued existence of cultural resources; it is only in the methods adopted that differences of approach arise.

Conservation of musical instruments encompasses all attempts to arrest decay, stabilize structures, surfaces and components, and maintain intact

as much of the original material of the instrument as possible. Its objective is to preserve instruments unaltered for both present and future generations. Conservation practices employ as little intervention as possible, requiring that, wherever feasible, materials applied to an instrument can be removed later without harm. Damaged parts are removed and replaced only where sufficient structural justification exists, or where the parts are clearly spurious and detract from or confuse the instrument's information yield. All removed parts are accurately and completely labelled and kept either with the instrument or with its accompanying documentation. Much attention is paid to the condition of surfaces since they may elucidate previous phases of use: marks of wear are evocative of playing styles; indentations around hitchpins provide clues on earlier stringing; tool marks allow interpretation of manufacturing techniques; previous repairs and alterations give insight into weaknesses and design changes.

A large part of the conservation effort is focussed on the object's surroundings because the stability and longevity of materials is related directly to the natural forces that impinge upon them. Environmental conditions conducive to the preservation of musical instruments include stable levels of relative humidity and temperature, low light levels, absence of pollutants and biological agents, and control of the many causes of physical change. Understanding the impact of the environment, and its monitoring and control, are key functions in conservation.

The practice of conservation is highly documentary. The condition of instruments, ongoing changes to them and features of their construction and past use are all recorded. Any proposal for treatment must be set out systematically in writing, with accompanying photographs or drawings, and approved by a second party to provide a system of checks and balances. Wide consultation during the formulation of treatment proposals is advocated. Treatment is recorded in such a way that both present and future scholars will have a clear understanding of what was done, how and why. Complete documentation minimizes repeated examination, which might cause damage; thus many museums have commissioned technical drawings of their more popular holdings. Advances in technology have provided a variety of new techniques. Photography and radiography are well established. The newer resources of electronic documentation allow precise measurement of such features as the width of bores and the thickness of components, the recording of acoustic spectra, and the analysis of materials and their condition. Advances in database management allow swift access to records and the compilation of comparative data.

Like the museum profession from which it emerged, conservation is supported by codes of ethics. However, the comparatively small number of practitioners worldwide precludes the systems of peer review and accountability encountered in the larger and more organized professions. The codes of ethics for conservation therefore provide guidance for practice, rather than enforceable rules of conduct. There is no code of ethics specific to the conservation treatment of musical instruments because the conservation profession regards them as no different in

essence from the many other functional objects encountered in museums, and for which similar strictures concerning intervention apply.

The chief criticism of the conservation regimen, when applied throughout a collection, is that it silences instruments whose chief function is the production of musical sounds. This is offset by the emphasis on documentation, examination, analysis and preservation, which ensures that information embodied within the instruments remains intact and is accessible to scholars.

The aim of restoration is the return of instruments to playable condition so that their music-making function can be fully expressed and exploited. Restoration demands research into historical workshop techniques, an understanding of the materials of construction, and a knowledge of contemporary musical practices. It is essential that the restorer be trained in a variety of manual and mechanical production techniques, experienced in dealing with a wide range of raw materials, and fully conversant with the manufacture of the instruments under treatment. The documentation of treatment has become an important part of restoration, not necessarily as an emulation of museum practice, but rather with the more direct aim of recording and disseminating the increasingly intricate and sophisticated information derived from it.

It has been argued that much of what has been learnt about the historical techniques of musical instrument making has been derived from examinations conducted during the processes of restoration. This is especially true of keyboard instruments, which are very complex. Through disassembling an instrument, repairing and refurbishing it, and then bringing it back into peak working condition, insights and technical information are gained. But restoration practices are necessarily invasive, original joints are taken apart, weakened parts are strengthened, missing parts are reconstructed, and parts that no longer function are replaced. Thus, the yield of information derived from a restoration treatment must always be balanced by the net loss of integrity to the object itself.

Restorative treatment should be carried out only if its goals are very clearly established, and if a complete understanding of the original state of the instrument exists. An argument against restoration is that, as the acquisition of information is a cumulative process, a definitive understanding of any previous historical state can never be achieved. Thus, a treatment will always be based upon the best information available at the time, and as treatment is without exception irreversible, a permanent change of state will be imposed on the instrument. It is, indeed, possible to discern stages of fashion in the restoration of musical instruments, and a practitioner well versed in workshop techniques and practices can identify easily the period in which a particular piece of restoration work was done. A second argument against restoration lies in the lack of reliability of the results. As artefacts age their materials change inexorably by the processes of natural decay, while over time they are also transformed by human use. Because it is impossible to quantify these factors, the difference in performance between the instrument in its newly made state, and in the state following its deterioration and subsequent restoration, must remain obscure. And the more mechanically complex the instrument, the

less reliable will be the information gained after its restoration. Thus the chief argument in favour of restoration, that of returning the instrument's original voice and action, loses much of its persuasiveness.

The restoration of unique and previously unrestored early instruments was, at the end of the 20th century, becoming a thing of the past. Scholars had recognized the extent and value of information contained in unrestored instruments, and the news that a well-known early example was to be worked upon was greeted with consternation and alarm, in contrast to the anticipation and excitement of a few decades earlier. This change of attitude was occasioned by the realization that the majority of accessible early instruments had been subjected to much more manipulation in the previous few decades than at any time in their previous history, and that they were, indeed, a diminishing and non-renewable resource. Also, it was then agreed that enough was known of early instrument-making techniques that little of sufficient value could be added during a restoration.

In some collections a compromise position was often achieved whereby previously restored instruments, whose fund of technical information could already be said to be devalued, continued to be played under strictly controlled conditions. In this way musicians and scholars unfamiliar with the sound and feel of early instruments could have the experience of playing them, although it is impossible to state categorically that any information on a particular instrument's original sound and dynamics could be gained in this way. The impact of playing such an instrument is purely aesthetic and very personal.

It is generally recognized that the aim of attempting to capture elements of particular musical instrument's original disposition is better served by making an accurate copy. There has been much discussion over what constitutes an 'accurate' copy of an early instrument, and it is now generally agreed that an 'accurate' copy is an aspiration, not a goal. Organic substances in particular behave in unpredictable ways and some materials available to makers of earlier periods are unobtainable today. Also, standards of measurement and limitations of accuracy ensure that the original and the copy will differ. But beyond these physical limitations is a conceptual problem: the modern maker is not striving to emulate what exists now, but what existed at the time of manufacture. Thus, there is inevitably a degree of theorization, experimentation and trial and error in the process. Making a good working copy is as much a developmental process as the restoration of an original, with the obvious advantages that the original retains its documentary value and the cost of failure is more supportable.

ROBERT BARCLAY

Instruments and technology.

The transfer of technology from disparate branches of knowledge has had a far-reaching impact on the design and construction of musical instruments. In some cases instrument makers have merely borrowed and adapted an existing technology developed for other purposes; in others they have conceived musical applications for a seemingly unrelated but nevertheless analogous device or technology. This article examines the interaction of instrument making and technology in the context of the Western world.

During the Middle Ages various technological innovations – including the development of mining and the vertical trip hammer-operated mill, copper smelting and the more efficient production of calamine, a zinc sulphate used in alloying brass – made it possible to produce stronger and smoother sheet metal of consistent quality and thickness. Thus, skilled instrument makers were able to form thin tubes for trumpets and organ pipes; to fashion folded trumpets as well as slides for what later became trombones; and to flare bells out at the end with more reliability and uniformity. All these factors contributed to the acoustical properties of the instruments: not only could the players produce far more ‘musical’ notes, but slides extended by transposition the instruments’ natural harmonic series.

Commencing in the late 14th century a number of keyboard instruments incorporated radically new actions employing pivoting keys which returned to their original positions after striking or plucking a string. The mechanical principles were derived in part from the descriptions of moving simulacra by Hero of Alexandria (1st century ce). Part of Greco-Roman and Alexandrian science preserved for many centuries in Byzantium, this knowledge had been acquired by the Arabs, who developed their own extraordinary art of astronomical instrument building (such as mechanical armillary spheres and geared astrolabes, as well as astronomical clocks including dials for planetary movements, moon phases, calendars and time of day), incorporating sophisticated linkages and gearing. A second major influence on the keyboard mechanism was the principles of the escapement and so-called jackwork found in a series of Chinese texts on automata and astronomical clocks such as the description of his water-driven clock-tower by Su Sung (1090). This oriental/Islamic heritage was transmitted to western Europe in the 13th century, and is seen for example in the astronomical codices at the Court of Alfonso el Sabio (c1272) and the planetarium clock of Giovanni de’ Dondi (1364). From about 1350 the flourishing craft guilds and court scientists in Europe produced a profusion of mechanical hardware, including extremely complex time-keeping devices. Many of these individuals, notably the astronomer Henri Arnaut de Zwolle, also invented prototypes of both the clavichord and harpsichord. The organ keyboard benefited from this technology as well; a possible further influence was the application of loom construction, with its foot-operated treadles, to the instrument’s pedalboard.

The lathe, refined for greater precision in the construction of scientific instruments, particularly the cutting of screw threads, became important in the manufacture of woodwind instruments. The earliest lathes, powered by a hand-crank or a spring pole and treadle device, were developed into an extremely versatile tool during the late 16th and early 17th centuries, when the technology was exported from Flanders and southern Germany to other

European countries. Further improvements included a tool holder, a weight-driven spindle which rotated continuously while holding the wood in place, and, later, water-powered drive mechanisms. The so-called ornamental turning lathe included cams and templates that permitted more intricate motions and increased accuracy. It was soon applied to musical instrument building, resulting in a more uniform and reliable manufacture; bores, for example, could be machined with far greater precision. Advances in the making and working of iron (mining, smelting, alloying and casting) between about 1600 and 1750 were soon reflected in specific aspects of musical instrument construction such as more uniform materials, precise shaping and the fabrication of keys.

During the 19th century mechanical technology improved greatly, due in part to the spread of education and industry, and the availability of strong, ferrous metals. Cast iron was extensively used for buildings, their façades and architectural ornaments, as well as for railroad bridges. The development of modern machine-shop manufacturing and the machine tool industry gave rise to musical instrument firms such as Distin in England, Brod and Sax in France, and Conn in the USA. Cheap high-tensile steel became available, thanks in part to technologies invented in the late 1850s by Henry Bessemer (blowing air through molten cast iron) and William Siemens (the open-hearth furnace process). Such knowledge was disseminated through books, journals, newspapers, mechanics institutes and night schools. By 1800 the Ecole Polytechnique in Paris had published charts and plates illustrating a wide variety of machine elements including gears, rods, screws, nuts, cranks and levers. In 1816 C.J.B. Karsten brought out the first edition of his *Handbuch der Eisenhüttenkunde*, which contained detailed drawings of all kinds of blower systems as well as the various types of valves used in both furnaces and ironworks. The quality and variety of available raw materials increased substantially, as did the reliability of mass production, especially following the advent of steam power. The direct alloying of copper and zinc (as opposed to cementation with copper and calamine), the production of tough, durable spring steel, the use of nickel for sliding components, electroplating and the development of gas flame-controlled soldering techniques are but a few examples of improvements in manufacture.

The period from about 1810 to 1880 was characterized by vitality and innovation in the development and manufacture of musical instruments. As the art of moulding and casting iron improved, this material was appropriated by piano builders to produce instruments with greater volume of sound, which necessitated heavier stringing and much higher string tensions. Traditional wooden frames, even when reinforced with metal braces, proved inadequate and by 1843 the Boston firm of Chickering began producing grand pianos with one-piece iron frames. Later refinements in both the chemical composition of steel and its casting led to more durable frames which were less likely to crack under pressure. High-tensile steel wire was used not only in suspension bridges but for piano strings as well. Theobald Boehm, who worked out the proportions and devised the basic mechanism of the modern flute, was a practising musician, a goldsmith and for 12 years superintendent of the Bavarian steel industry. Well grounded in acoustics and skilled in delicate metalwork, he set about determining by trial and error the ideal dimensions and

uniform placement of tone holes according to rational criteria. In 1828 he established a successful manufactory in Munich, where about 1847 he produced an all-metal flute with elaborate keywork, improved acoustics, uniform tone production and greater volume of sound.

The most important industrial tool in the late 18th and early 19th centuries was the steam engine, which required a system of control valves for the passage of steam, water or air. Karsten's *Handbuch* helped transfer this technology to the fabrication of valve brass instruments, obviating the need for either hand-stopping to correct 'non-musical' harmonic notes or a full set of crooks for all keys. This was accomplished by two Germans, Friedrich Blühmel and H.D. Stölzel. Blühmel, a miner who played waldhorn and trumpet in a company band, had observed the techniques for distributing and regulating the supply of air to blast furnaces and the venting of air in ironwork forges. The sliding valves which turned the air to furnaces on and off led Blühmel to conceive of using a piston valve to divert the flow of air in the trumpet's tube to a set of longer or shorter loops, thus shifting the harmonic series from the instrument's natural key to another and producing an entire scale. After much experimentation he demonstrated his valve trumpet in 1816. Two years later he began his association with Stölzel, a Berlin horn player, instrument maker and repairer who by 1815 had crafted a trumpet equipped with two valves for lowering its basic pitch by either a semi- or a whole tone, producing all the notes of the chromatic scale with even tone-colour. Together Blühmel and Stölzel applied for a patent on a spring-controlled slide-valve mechanism for both trumpets and horns. By 1828 Blühmel, working independently, designed and produced a cylindrical rotary valve inspired by the spring-driven rotary valves used to channel air to forges.

Similarly radical alterations were made in the use and construction of the timpani in the early 19th century. A growing number of composers found the tradition of tuning the drums in unaltered perfect 4ths or 5ths unduly restrictive. Timpani parts in the newer orchestral repertory often demanded rapid retunings both during and between movements. Such quick changes of pitch were impossible on instruments equipped only with threaded tuning bolts around the rim. This problem was easily solved by locksmiths and metalworkers applying the mechanical technology brought about by the Industrial Revolution: the tension of the skin head could rapidly be adjusted by turning a single master screw, by rotating the kettle itself or by manipulating a series of gear wheels with the foot. In 1812 Gerhard Cramer, court timpanist in Munich, working with the royal armourer and locksmith, built the first cast iron lever- and gear-operated 'machine' drum. The musician-inventor Johann Stumpff (c1815) in Amsterdam based his timpani on the concept of an armature and central screw found in the swivel desk chair. Johann Einbigler of Frankfurt (1836) employed a threaded vertical tuning crank pressing against a pivoted rocker-arm. Both August Knocke, a manufacturer of firearms in Munich (c1840), and Max Puschmann in Chemnitz (1880) used elaborate systems of rods, gears and cog-wheels found in contemporary industrial machinery. However, the sheer brute force required by Knocke's drum, and the metal strain from the torque caused by rotation in Puschmann's model, made their mechanisms impractical. The most successful, and now ubiquitous, timpani was the 'Dresden' model invented by Carl Pittrich in 1881. It used steel rather than

iron and employed a foot pedal, ratchet and mechanical couplings which converted the semicircular motion of the pedal into a vertical reciprocating motion acting on the head by means of the tension mechanism. This concept had been widely used in steam engines and punch presses, as well as in machines controlled by foot-treadle linkages, such as the common mangle found in commercial laundries.

The harnessing of electricity stimulated interest in its application to music. Examples of simple technological transfer range from motor-operated organ bellows and key actions to the amplifiers used in the vibraphone and electric guitar. The invention of the three-element amplifying valve or vacuum tube by Lee DeForest in 1912 prompted a large-scale research effort at the Bell Telephone Company (later Bell Telephone Laboratories) focussing initially on the characteristics of speech and hearing, and later on music and sound in general. The need for more precise instruments led to the construction of devices to convert sound waves into electricity and reconstitute them into sound with minimal distortion. The most noteworthy of these early efforts from the musical point of view was the introduction of electrical recording and reproducing in 1925.

A series of electronic musical instruments, such as the theremin and ondes martenot, both developed in the 1920s, employed oscillators controlled by the performer combined with amplification and loudspeaker output. In some of these instruments tones were produced by electrical frequency generators, in others by rotary or vibrating mechanical generators. The electronic organ of Laurens Hammond had 91 rotary electromagnetic generators driven by a motor with associated gears and tone-wheels. The wave forms thus produced could be synthesized by permutations and combinations into complex musical tones. In 1955 Harry Olson of RCA invented an electronic music synthesizer. The instructions were stored by means of a typewriter-like keyboard which punched the commands into a 40-channel, binary-coded paper tape describing the desired musical sounds. The roll of tape in turn activated a series of tone generators which produced the actual synthesized output.

The application of computer technology to music was anticipated in the 1840s when the mathematician Ada Lovelace speculated on the possibilities of using punched cards to input music and the rules of composition into a mechanical calculator, enabling it to compose 'elaborate and scientific pieces of music'. This technological 'transmission belt' ultimately led to modern commercial scientific laboratories and university-based electronic music studios. In one type of pioneering experiment the computer selected the notes according to either mathematical rule or numerical sequence (probability). These in turn were converted, measure by measure and part by part, into a musical score and performed by 'live' musicians. In a second variety the basic rules of composition were stored in the computer's memory. Following or imitating these steps, the computer selected or rejected each successive note and then stored the sequence of numbers representing each wave-form in terms of pitch on thousands of punched cards. Converted electronically into oscillations, these 'notes' drove a loudspeaker. Computer music was never widely accepted by the listening public, and is now little more than a historical relic. On the other hand, many composers use digital computer technology to produce an

almost infinite variety of synthesized sounds, especially for films and television.

Intabulation

(Ger. *Intabulierung*; It. *intavolatura*, *intabolatura*).

An arrangement for keyboard, lute or other plucked string instrument of a vocal composition; the term is especially applied to those prepared in the 14th, 15th and 16th centuries, and written in [Tablature](#), the system of notation using letters, figures or other symbols instead of notes on a staff. The 16th- and 17th-century keyboard pieces published in Italy and designated 'd'intavolatura' (as in 'Canzone d'intavolatura') are exceptions to the general practice, since that repertory includes abstract instrumental canzonas, toccatas, variation sets etc., as well as arrangements of vocal compositions; thus 'intavolatura' seems in this case to refer not to the genre of the composition but to the fact that the music was printed in staff notation on two staves, as opposed to 'partiture' (the plural of 'partitura'), in which each part is given a separate staff. In general, intabulations from the 14th century to the 16th incorporate all or almost all the voices of the vocal composition into the arrangement, although on occasion less important voices are omitted, several voices are combined into one, or chords and even whole passages are redistributed to make them fit better under the hands of a single player. Almost invariably, the arrangements are enriched by more or less extensive embellishment.

The practice of making intabulations arose in the late Middle Ages, doubtless as a result of the fact that keyboard players had to prepare special scores for themselves when they wished to take part in performances of vocal music, which was normally written into manuscripts not in score but as a series of separate parts ('choirbook format'). The earliest intabulations appear in the Robertsbridge Codex (*GB-Lbl* Add.28850), dated about 1360 and written in a combination of staff notation and letters. The manuscript includes two intabulations of motets from the *Roman de Fauvel*, taken over fairly literally from the vocal parts but adapted to fit within the player's hands and with ornamentation added to the upper voices. The Reina Manuscript (*F-Pn* n.a.fr.6771), one of the most important sources of 14th-century polyphonic secular music, contains a single keyboard piece, an arrangement in score of *Questa fanciulla*, a ballata by Francesco Landini, in which the upper part is highly decorated. But the largest repertory of 14th-century intabulations – and the largest

repertory of keyboard music in general – is the Faenza Codex, possibly written as late as the early 15th century, but containing an exclusively Trecento repertory, including extravagantly embellished intabulations of French music by Machaut, Pierre des Molins and various anonymous composers, as well as arrangements of secular Italian music by Jacopo da Bologna, Bartolino da Padova, Landini, Antonio Zaccar da Teramo and others, all notated in score.

From the 15th century an extensive repertory of intabulations for keyboard instruments survives in German sources, all written in a keyboard tablature that combines letters with staff notation. The largest manuscript by far, the Buxheimer Orgelbuch, prepared probably in the third quarter of the 15th century, contains some 256 compositions, many of them intabulations, and it includes one composition marked 'in cytaris vel etiam in organis' ('either for harp or for organ'). But there are also almost a dozen smaller German sources of 15th-century keyboard music (ed. W. Apel, CEKM, i), and they all furnish additional examples of intabulating technique. Like the other compositions in the Buxheimer Orgelbuch, the intabulations of motets, lieder and, above all, French chansons (the leading secular genre in the 15th century) follow the precedents established in the previous century. For the most part, all voices of the vocal model are taken over into the solo arrangements and a more or less elaborate process of ornamentation is applied to the upper voices, often turning it from a lyrical melody into a *perpetuum mobile* in keyboard style. The lower voices are left much as they were in the vocal model, or varied or ornamented slightly, or reduced to a single part by omitting the contratenor altogether or combining it with the tenor. In some compositions the intabulators have recomposed relatively brief sections.

With the change in playing technique from plectrum to fingers in the late 15th century, lutenists and other players of plucked string instruments began to perform polyphonic music, including arrangements of masses, motets and secular music. The invention of music printing enabled publishers to issue great quantities of music for keyboard instruments, as well as for lutes, vihuelas, guitars, citterns and other plucked strings (see *Brownl*). Thus in the 16th century the number of intabulations increased sharply.

The technique of intabulation, as explained, for example, by Adrian Le Roy and Vincenzo Galilei, remained essentially the same throughout the century. Musicians were taught to take over into their arrangements as much of the vocal model as the techniques of their instruments would allow. Lutenists and keyboard players were expected to play most four-part music literally (not all of them did so), although they might need to omit some voices, or to thin the texture slightly in places, when they intabulated compositions with five, six or more voices. Guitarists and cittern players, on the other hand, could not be so literal; at times they give the merest impression of the original part-writing.

Virtually all 16th-century intabulators added ornamentation to the vocal models they arranged, partly out of necessity, since fast passage-work helped to sustain the fragile sounds of lute, vihuela and harpsichord. Even so, many virtuosos added more ornaments than modern musicians think

tasteful, although some, such as the vihuelist Miguel de Fuenllana, scarcely ornamented their models at all. Many instrumentalists of the 16th century relied mostly on pre-formed stereotyped figuration patterns, runs, turns and trills. Sometimes Francesco Spinacino and Joan Ambrosio Dalza, who published anthologies of lute music in the first decade of the century, maintained quaver or semiquaver motion almost constantly from beginning to end of a piece, obscuring the contours of their models beneath an avalanche of endless and directionless scale fragments. Similarly, the German keyboard composers of the last 30 years of the 16th century, including Ammerbach, Schmid, Paix and Nörmiger – the so-called ‘colourists’ – overwhelmed their models with mechanical decoration. Hans Gerle, a German lutenist of the mid-16th century, on the other hand, sometimes left out one inner voice or more to make his showy diminutions easier to play, and he sprinkled diverse ornamental clichés throughout a piece apparently at random. Heavily ornamented intabulations from the mid-century often restrict the number of stereotyped figuration patterns applied to any one section of a composition. Repeated wherever possible, these ornamental clichés form a superstructure, so to speak, over the given vocal piece, a network of motifs independent of the original conception. Diego Ortiz used this technique in his arrangements printed in his treatise on the viol, and some lutenists, like Sebastian Ochsenkun, seem to have adopted the same procedure. Some of the greatest virtuosos of the century, like Valentin Bakfark and Francesco da Milano, went further than lesser musicians in ornamenting their models, sometimes transforming the originals into idiomatic and virtuoso instrumental pieces by means of a profusion of ever-varying runs, turns and trills. They seem to have used the original music as a vehicle for comment and elaboration, for a virtuoso display of variation technique.

Intabulations of 16th-century vocal music provide instruction, then, in the techniques of embellishment used by a variety of musicians in performance, and are helpful in indicating the difference between the way music looks on the page and how it must have sounded in the Renaissance. Tablatures, especially those for plucked string instruments, are also useful in elucidating how 16th-century musicians added accidentals to music, according to the rules of *musica ficta*, since tablature indicates precisely where performers were to put their fingers on the strings, and hence is more apt to include the particular chromatic inflections heard in performance than music written in staff notation.

HOWARD MAYER BROWN

Intavolatura

(It.).

Any collection of solo instrumental music, usually for lute or keyboard and printed during the 16th or 17th century, which is 'in tablature'. The term was often used in its literal sense, as in Francesco Spinacino's *Intabulatura de lauto: libro primo* (Venice, 1507) and Antonio Valente's *Intavolatura de cimbalo* (Naples, 1576), which are in Italian lute tablature and Spanish–Italian keyboard tablature respectively. However, the word 'intavolatura' and its most common derivatives (*tabulatura*, *intavolate*, *tabulati*, *intabulatura*, *intabolatura*, *intavolature*, etc.) were frequently used on the title-pages of 16th- and 17th-century Italian and German sources to describe music printed not in one of the conventional tablatures but in keyboard score (on two staves) or, at a slightly later date, in keyboard *partitura*. This use of the term derives from the fact that the earliest of such sources often contained compositions that had originally been written for voices but which had been 'intabulated' (i.e. put into notation for solo instrumental performance); it was thus intended to indicate that the music had been adapted to keyboard notation rather than to convey the precise nature of the new notation. Invariably these intabulations involved a degree of elaboration of the original material. The use of the term 'intavolatura' was later extended to include collections of works conceived originally for keyboard instruments. The earliest surviving *intavolatura* for keyboard is the *Frottole intabulate da sonare organi: libro primo*, issued in 1517 by the Rome printer Andrea Antico. The use of the term 'tabulatura' to describe the keyboard *partitura* is first seen in German publications of the 1620s, notably in Samuel Scheidt's *Tabulatura nova* (Hamburg, 1624).

Interlude

(Fr. *intermède*; Ger. *Zwischenspiel*; It. *intermedio*, *intermezzo*; Lat. *interludium*).

A general term for music played or sung between the main parts of either a musical work or, occasionally, a non-musical event.

(1) In church services organ interludes have at various times been customarily inserted – often improvised – between the verses of psalms and hymns (see [Psalm interlude](#)).

(2) In a theatrical performance an interlude consists of an instrumental item between acts (see [Act music \(i\)](#), [Entr'acte](#), [Zwischenspiel](#)) or, on a more elaborate scale, an entertainment such as an [Intermedio](#) or [intermezzo](#) (see [Intermezzo \(ii\)](#)). Debussy's *Pelléas et Mélisande* and Berg's *Wozzeck*, for example, include important interludes that are dramatically related, indeed essential, to the whole design. Although interludes are not necessarily always so called, Stravinsky and Britten adopted the term for such episodes. The two interludes of Britten's *The Rape of Lucretia* respectively tell of Tarquinius's ride to Rome and comment on the rape itself (i.e. those episodes that cannot easily be represented on the stage). The six purely orchestral interludes (one a *passacaglia*) that punctuate the action of *Peter Grimes* either prepare for the music of the next scene or continue the development of material from the previous one. Interludes may enjoy an independent existence in the concert hall, as do five of those in *Peter Grimes*.

(3) In instrumental music an interlude is usually a short connecting episode between movements rather than a movement in itself; there are examples in Stravinsky's *Symphony in Three Movements* and *Movements for Piano and Orchestra*, though when the latter was published Stravinsky discarded the term 'interlude'. Thomas Mace (*Musick's Monument*, 1676) provides examples of modulating interludes for lute, observing that a skilful performer playing two successive suites in different keys should not 'Abruptly, and Suddenly Begin, such New Lessons, without some Neat, and Handsom Interluding Voluntary-like-Playing; which may, by Degrees, (as it were) Steal into That New and Intended Key'. Roger North later advocated the same practice. It was revived by Hindemith in *Ludus tonalis* (1942), where each Interludium provides a smooth transition between the tonal centres of successive fugues. Elgar used the term 'interlude' of the two episodes for reduced orchestra in *Falstaff* in which Falstaff's mind turns back to the days of his youth.

MICHAEL TILMOUTH/R

Intermède [intermédie, intramède, entremets]

(Fr.).

Like the Italian *Intermedio*, a spectacle given between the acts of a stage work. It entertained the audience, allowing the actors to 'catch their breath, or change their costumes, or to allow time for changing the stage sets' (*Dictionnaire de Trévoux*, iii, 1743, p.1718).

The history of the *intermède* in France is complex, and the degree of latitude in what constituted an *intermède* was indeed wide. The earliest examples date from the 16th century; they used Italian comedians and stagecraft and were built on the tradition of Italian mascheratas and French *entremets* (elaborate choreographic and musical spectacles given at court banquets). Cardinal Bibbiena's comedy *La calandria* (1513) was performed for Henri II at Lyons (27 September 1548) with four *intermèdes* representing the four ages of mankind (iron, bronze, silver and gold). At Blois in February and April 1556 four *intermèdes* were inserted between the acts of G.G. Trissino's *Sofonisba* in a French translation by Mellin de Saint-Gelais. The 'entremets' of the 1559 edition include choruses and a monologue, *La furie mégère*, by J.-A. de Baïf, who also contributed five 'Chants recitez entre les actes de la Comédie' for his own comedy *Le brave, ou Le taillebras*, performed at the Hôtel de Guise (28 January 1567).

The *intermèdes* of the *Balet comique de la Royne* (performed at the Petit Bourbon, Paris, 15 October 1581) turned the tradition of the *masquerade* towards a more dramatic type of *intermède*. The mythological subjects and sumptuous staging of those for *L'Arimène, ou Le berger désespéré*, a pastorale by Ollenix de Mont-Sacré (given at the château of Nantes, 25 February 1596) are also more dramatically conceived.

In the 17th century the Jesuits were among the first to use ballets as *intermèdes* in their theatre productions. As early as 1614 a French ballet,

Ballet des onze anges, was inserted at the end of the second act of *Le jeu de la conversion de St Guillaume d'Aquitaine* in a performance in Brussels (9 February). From 1623 to 1631 five Latin tragedies by the Englishman Joseph Simons were performed with danced *intermèdes* at the Jesuit college of Saint-Omer.

In the latter part of the century, notably at the Collège Louis-le-Grand, Paris, more elaborate *intermèdes* were placed between the five acts of Latin tragedies. Some of these were closely aligned with the action of the tragedies that they supplemented; some were extended compositions in their own right (e.g. *Sylvandre*, a 'pastorale en musique ... pour servir d'intermèdes' for the tragedy *Coriolanus*, March 1683). From 1684 the concept of the *intermède* could embrace an entire opera, comparable in every way to those of Lully and Quinault which were then drawing crowds to the Académie Royale de Musique. *Démétrius* by Claude Oudot (performed 5 March 1685, music lost), *Celse martyr* by M.-A. Charpentier (performed 10 February 1687, music lost) and *David et Jonathas* by Charpentier (performed 28 February 1688) are examples of 'tragédies en musique pour servir d'intermèdes à la pièce latine'. Among other composers who wrote *intermèdes* for Latin tragedies were Beauchamps, Lalande, Pascal Collasse, Campra, J.F. Lallouette, Clérambault, Henry Desmarests and J.N.P. Royer.

In Paris, French *intermèdes* performed between the acts of Mazarin's ill-fated Italian opera importations proved more popular than the operas themselves. The title-page of Carlo Caproli's *Le nozze di Peleo e di Theti* (14 April 1654) states that the opera was 'intermingled with a Ballet on the same subject'. In Cavalli's *Xerse*, however, the six entrées of ballet composed by Lully for the 1660 performances in Paris, which 'serve as intermèdes to the Comedy', have nothing whatsoever to do with the subject of the opera.

For his tragedies *Esther* (1689) and *Athalie* (1691), which were written for the young ladies of the Maison Royale St-Louis de Saint-Cyr, Racine tailored all the *intermèdes* (music by J.-B. Moreau) to the specific goal explained in his preface to *Athalie*: 'In imitating the Ancients, I aimed for continuity of action that never permitted an empty stage; the *intermèdes* ("intervalles") between the acts being marked only by the hymns and moral lessons of the chorus that comments on the action just past.' The original versions of Racine's masterpieces could not be staged publicly until 1791 when the law on 'freedom of the theatres' abolished the Académie Royale de Musique's monopoly on works with choruses.

The full range of possibilities inherent in French *intermèdes* may be observed in those by Lully (and later by Charpentier) for 14 of Molière's comedies, where they may precede or follow the comedy as well as separate its acts. The *intermèdes* of *George Dandin* (1668) have no bearing on the comedy; nor do those of *Les amants magnifiques* (1670), which include a sung prologue (first *intermède*) before the comedy, a self-contained pastorale (third *intermède*, between Acts 2 and 3) and a brilliant operatic celebration of the Pythian games following the comedy (sixth *intermède*). On the other hand, *La princesse d'Elide* (1664) begins with an *intermède*, a sung prologue preparing the action of the comedy, and minor

characters from the comedy take part in its other *intermèdes*. *Le bourgeois gentilhomme* (1670) also contains *intermèdes* closely related to the plot, yet concludes with the *Ballet des nations*, an *intermède* totally independent of the comedy.

In mid-18th-century French opera, 'intermède' had two meanings. It was the translation of the Italian 'intermezzo' to refer to the Italian *opere buffe* that were performed in Paris in French. Thus Pergolesi's *La serva padrona*, when performed in Paris in French translation as *La servante maîtresse* (1754), was termed a 'comédie mêlée d'ariettes, intermède italien'. When Rousseau defined 'intermède' as 'a work of music and dance inserted between the acts of an opera, or sometimes a comedy', he was describing the French practice for the latter but only the original Italian one for the former. In France these translations were always given as independent works – one of two or three on an evening's programme. By extension, 'intermède' was also applied to works in a similar lighthearted spirit and generally in one or two acts, originally written in French. These were performed at either the Académie Royale de Musique, where they were sung throughout (e.g. Rousseau's *Le devin du village*, 1752), or the Opéra-Comique or other theatres, where they had spoken dialogue (e.g. Duni's *Nina et Lindor*, 1758). By the late 18th century the term 'intermède' had virtually disappeared.

Intermedio [intromessa, introdotto, tramessa, tramezzo, intermezzo]

(It.; Fr. *intermède*).

A form of musico-dramatic entertainment inserted between the acts of plays in the Renaissance and Baroque periods.

1. Introduction.
2. Early types.
3. Intermedi and Renaissance dramatic theory.
4. Intermedi and the chorus in tragedy.
5. Intermedi in Florence: 1518–89.
6. Intermedi and opera in the 17th century.

DAVID NUTTER

Intermedio

1. Introduction.

Intermedi were first performed at the court in Ferrara in the late 15th century between the acts of the ancient comedies of [Plautus](#) and [Terence](#) and those of their humanist successors. Because these plays were divided into five acts four *intermedi* were required; later *intermedi* were added before and after the play to increase the number to six, but that was by no means the rule. Since the stage remained open for the entirety of the play once the curtain had been drawn, the insertion of *intermedi* was a means of clarifying the division of the play into acts. In some instances only instrumental music was used, played out of sight of the audience (*intermedio non apparente* or 'invisible'). Far more popular, however, was the staged or 'visible' type (*intermedio apparente*), performed by costumed singers, actors and dancers who enacted a pastoral or mythological story through pantomime and rhythmic movement. During the 16th century attempts were made to unify in theme the *intermedi* for one performance, or to connect them with the play in some way. Learned and complex literary themes notwithstanding, the attraction of *intermedi* remained that of entertaining the spectators. Court *intermedi*, those produced for a specific occasion such as a wedding, were the most lavish and costly of all, and combined the 'marvels' of stage effects with mythological allegories designed to flatter the patrons in the audience. Regrettably, little of the music composed for *intermedi* survives. Only two complete sets of *intermedio* music are extant, those performed in Florence in 1539 and 1589, issued in special commemorative editions. But many accounts of performances survive in letters and diaries, and in the specially printed

description booklets of contemporary writers; these often give detailed information about costuming, scenery, music, instruments and other particulars. In addition, drawings and engravings of costumes, stage perspectives, machinery and sets for *intermedi* are important supplementary material. The *intermedio* proved popular in France (under the name [Intermède](#)) and provided a certain impetus to early opera; *intermedi* were also precursors of the 18th-century Neapolitan intermezzo (see [Intermezzo \(ii\)](#)). (See also [Masque](#).)

[Intermedio](#)

2. Early types.

Music played from behind the scenes was often used to fill gaps between the acts of plays, as once the curtain that covered the stage set was removed it could not be replaced. This type of *intermedio*, where the stage remained empty and the performers were hidden, served to mark off the acts without unduly diverting attention from the play itself. An early example of this *intermedio non apparente* is mentioned in the Ferrarese court diarist Bernardino Zambotti's account of the performance in Ferrara in 1487 of Niccolò da Correggio's *Fabula di Caephalo*, which is described as having 'the sounds of diverse instruments between the acts' ('intermedii a li acti'), the first known use of the term. In 1496 Baldassare Taccone's *Danae* was performed in Milan (with stage machinery designed by Leonardo da Vinci); Taccone's stage directions at the end of the acts indicate that 'the large instruments were hidden behind the stage machines', whereas the 'pifferi, cornamuse, timpani e altri instramenti occulti' were probably distributed behind the two-level stage. Ariosto's *I suppositi*, given before Pope Leo X in Rome in 1519, had *intermedi* performed by shawms, *cornamuse*, cornetts, viols, lutes, a small organ with different registers, a flute and a voice, as well as a vocal consort. The last *intermedio* was staged: 'a *moresca* that portrayed the tale of Gorgon'. The device of hidden music played from behind the scenes continued throughout the 16th century. Originally an extra-dramatic interpolation, it was soon adapted to more expressive ends, such as setting the mood of the play as the curtain rose, or accompanying onstage singers alone, or in conjunction with onstage instruments and singers in order to amplify the sound.

Among the ancestors of the staged *intermedio apparente* may be counted the mimed, sung and danced court entertainments inserted between the courses of banquets (*introuesse*, *entremets*), interpolations between the acts in medieval drama and the hymns sung between one 'day' and the next in mystery plays. Staged *intermedi* first occur between the acts of Latin comedies by Plautus and Terence performed in translation at Ferrara in the late 15th century. These court entertainments had no bearing on the play nor any continuity of theme among them, but rather served to amaze and amuse the spectators, providing relief from the play. They were sometimes staged on a lavish scale: during Carnival in 1499 four plays were produced at Ferrara (*Eunuco*, *Trinummo*, *Penulo* and a repeat of the first with different *intermedi*) requiring altogether 16 different *intermedi*. The chronicler Giano Pencharo recorded that there were 133 actors and 144 *intermedio* performers, the latter dressed as 'peasants, youths, nymphs, buffoons and parasites'. The subject matter of these *intermedi* was varied: pastoral and hunting scenes, tales from classical mythology and stories

recounting the foibles of love. Each *intermedio* took the form of a *moresca* – a mimed and choreographed dance executed by an exotic, bizarre or comic group costumed as nymphs, shepherds, hunters, rustics and so on. The action was highly stylized and subordinated to the rhythmic regularity of the music provided by onstage tambourines, drums and bells and probably also offstage instruments. The pace could be accelerated by changing to a quicker dance and those mentioned besides the *moresca* proper include the *brando* (branle), *chiaranzana* (chiarentana) and *dordoglione* (tourdion). Occasionally the action was broken by the recitation of verses explaining the pantomimed action or by the singing of stanzas with improvised accompaniment played by the performer on the *lira da braccio* or lute. In addition, vocal music was sometimes performed on stage by costumed musicians who enacted a story with music and gestures. The third *intermedio* of the 1499 performance of *Eunuco* at Ferrara had a scene in which ‘six happy and gay nymphs led by a musician appeared; they were followed by some youths in chains singing with sweet harmony songs of lamenting, complaining of their misfortune at being the slaves of women’. In 1502 four plays by Plautus were staged with *intermedi* at Ferrara during the wedding celebrations of Alfonso d’Este and Lucrezia Borgia. Isabella Gonzaga, who had come from Mantua for the wedding, described the *intermedi* in a letter; after the third act of *Asinaria* music was performed by her own court musicians ‘Tromboncino, Paula and companions’. Another observer stated that the music was performed by eight singers, including a woman from Mantua, and was accompanied by three lutes. The wedding celebrations were concluded by a performance of *Casaria* which included a *barzilletta*, sung by Tromboncino in praise of the newly married couple, and six-part viol music.

In Venice societies of young gentlemen formed fancifully named acting companies for the performance of plays (Compagnie della Calza). They were led by well-known actors such as Zuan Polo, Domenico Tajacalze and later [Angelo Beolco](#) (‘Ruzante’). Their performances of Latin comedies given in the homes of Venetian patricians and recorded in the diaries of Marin Sanudo were sometimes furnished with *intermedi*. For a performance of *Miles gloriosus* given on 19 February 1515 in Ca’ Pesaro by the company of the ‘Immortali’, Zuan Polo devised ‘a new comedy’ consisting of two *intermedi*: the first was an infernal scene which ended with music sung by nymphs on a triumphal float (‘carro triunfal’), and the second portrayed the judgment of Paris. Apart from staging a series of partly sung, partly spoken encomiastic *rappresentazioni* on mythological or religious themes performed before the doge between 1571 and 1605, Venice contributed little to the growth of the *intermedio* tradition because its wealth was not concentrated in the hands of one reigning family and its political organization was different; indeed comedies were banned on several occasions by the Council of Ten because they attracted the city’s courtesans.

Dramatic performances were cultivated at Urbino from the 15th century, but by far the most important historically was the première of Cardinal Bibbiena’s *La calandria* on 6 February 1513. Baldassare Castiglione witnessed the events and described them in a letter; there were four *intermedi* and an attempt had been made to unite them in theme. The first *intermedio* portrayed an episode from the quest of the Golden Fleece: from

the ground where Jason had sown the teeth of a dragon, armed men sprang up and danced a 'fiery *moresca*' before killing themselves. The remaining three *intermedi* showed Venus on a float drawn by two doves, Neptune on a float drawn by seahorses, and Juno on a float in the shape of a cloud drawn by two peacocks; each tableau was accompanied by an appropriate retinue of dancers costumed as cupids, sea monsters or exotic birds. After the comedy, Cupid ('Amorino') appeared and recited some verses explaining the significance of the *intermedi*: the triumph of love over discord and war. This was followed by the 'hidden music of four viols and then by four voices and viols who sang a stanza with a beautiful melody; almost a prayer to love'.

During the early 16th century *intermedi* of the *moresca* type were gradually supplanted by those with humanistic literary themes embodied in mythological allegory. The conceptual framework became imbued with the humanist awareness of Man as the centre of the universe, and this was represented on stage by the glorification, emblematic as well as material, of the ruling house and, by implication, the absolutist regime. As the *intermedio* developed in both form and significance into an ideal vehicle for courtly extravagance, music played an increasingly important role in the production, furnishing effects in sound no less ingeniously contrived and executed than the visual wonders of stage machinery.

Intermedio

3. Intermedi and Renaissance dramatic theory.

According to humanist dramatic theory derived from Aristotle, a coherently constructed dramatic work covered between the prologue and epilogue the space of one day or one night. Each of the five acts represented a self-contained segment of time within which the dramatic action took place; the intervals between the acts, and therefore the *intermedi*, suspended but did not break the action, while allowing an artificial compression of time necessary to indicate the passage of hours between one act and the next. Where there was a particularly important interval of time to be shown, one *intermedio* of a set might draw attention to it; for example, the canzone *O dolce notte*, which appears between Acts 4 and 5 of Machiavelli's *Mandragola*, shows the passage of time between one day and the next (Machiavelli, aware of having broken the unity of time, emphasized it, and his characters explain and apologize for his lapse). With other plays the entire set of *intermedi* marked the passage of time. The six *intermedi* for *Il commodo* (Florence, 1539) progress through specific times of day: dawn, early morning, mid-morning, midday, evening and night, a progression enhanced by a stage setting incorporating an artificial sun which moved across the heavens through the appropriate positions. Similarly Bernardo de' Nerli's *intermedi* for Leonardo Salviati's *Il granchio* (Florence, 1566) representing the four ages of man (childhood, youth, maturity, old age) took place at the appropriate times of day (morning, noon, afternoon and night), thus reflecting the time span represented by the play. The Aristotelian unity of action was more rarely observed in any one set of *intermedi*, although exceptions include the *intermedi* celebrating the victory of love over discord and war performed with Cardinal Bibbiena's *La calandria* (Urbino, 1513) (see §2 above), the adaptation of the tale of Cupid and Psyche from Apuleius's *The Golden Ass* as *intermedi* for a performance of Francesco

d'Ambra's *La cofanaria* (Florence, 1565) and the four *intermedi* on the exploits of Apollo performed between the acts of the anonymous *Occulta fiamma amorosa* at Padua in 1566.

The success of *intermedi* was commented on by dramatists and critics who either attempted to rationalize their bearing on the play or refuted them outright, even attempting to regain control by devising and writing their own. One wag remarked that the play had come to serve as *intermedi* to the *intermedi* and A.F. Grazzini ('il Lasca') complained in the prologue to *La strega* (1556) that 'once *intermedi* were made to serve the comedy, but now comedies are made to serve the *intermedi*'. Theorists were often critical of the disruption caused by the introduction of *intermedi* into the play; G.G. Trissino, who advocated singing only for the choruses of tragedy and comedy, was forced to admit that 'instead of these choruses, music, dance and other things are introduced in the comedies played nowadays which are called *intermedi*; these are very different from the action of the comedy and sometimes so many buffoons and jugglers are introduced that another comedy is made, an inconvenience that does not allow one to enjoy the doctrine of the comedy' (*La 5a et la 6a divisione della poetica*, Venice, 1562, p.32). The role of the chorus, where it should be used, how it was to be performed and whether it could be replaced by the *intermedio*, was a much discussed topic; but opinions, terminology and definitions varied considerably among theorists. Bernardino Daniello stated that 'unlike in tragedies, choruses are no longer used in comedies; but in their place between one act and the next so that the stage will not be empty, music, songs, dances and jesters are customarily introduced and mingled' (*La poetica*, Venice, 1536, p.39). G.B. Giraldi Cinthio, having noted that the chorus in ancient dramas divided the parts or acts, went on to add that 'today we make this distinction with music at the ends of acts when the stage remains empty ... either making the musicians arise from the middle of the stage by means of machines ... or hearing them from behind the scenes so that no one is seen. This latter manner is easier and more in use, but the other is more pleasurable, not to say marvellous, especially if the musicians are in costume' (*Discorsi intorno al comporre de i romanzi, delle comedie, e delle tragedie*, 1554, p.250). Angelo Ingegneri thought that *intermedi* could be useful in comedy and the pastorale, but would prevent tragedy from achieving its end; 'for these reasons *intermedi* give wide berth to tragedies, whereas in pastorales and comedies they are not only acceptable, but are a most considerable adornment; and however similar or dissimilar that they may be to the play, they always enrich the spectacle and delight the spectators'. As for the chorus, Ingegneri thought it should be used in tragedy only in a verisimilar way, commenting on and rendering public the action of the protagonists and that this kind of chorus should not be used in comedy or the pastorale 'because these two kinds of poems imitate private actions ... without any other persons having knowledge or curiosity about them'. However, in circumstances 'where the chorus takes the place of an *intermedio*, or where no other music is used, it should be sung in a more elaborate manner; in this regard it is not a bad idea to give the chorus instrumental support played from behind the scenes, taking care however that together they make a unified sound and do not appear to be two choruses, or the one the echo of the other' (*Della poesia rappresentativa et del modo di rappresentare le favole sceniche*, Ferrara, 1598, pp.22, 25, 79).

The use of the term 'intermedio' for the entertainments before and after a play was occasionally considered an abuse. The Florentine academician Bernardo de' Nerli, who wrote the *intermedi* for Leonardo Salviati's *Il granchio* (Florence, 1566), commented that 'because *intermedi* correspond to the canzoni that were sung by the chorus [in classical dramas], and these were sung not before or after the play, but only in the middle, it seems reasonable that *intermedi* should take place only between one act and the next'. But public demand for spectacle was so strong that Nerli felt obliged to add two madrigals sung by the Muses before and after Salviati's comedy 'in order not to depart from usage and to please the audience accustomed to seeing something before and after the comedy' (*PirrottaDO*, 227). A change in a playwright's attitude towards the audience was expressed somewhat later by Nicolò Rossi, who justified the addition of comic *intermedi* on the grounds that, since audiences were more ignorant and less erudite than formerly, the action ought to be adapted to the character of the spectators (*Discorso intorno alla comedia*, Vicenza, 1589, p.34).

Intermedio

4. Intermedi and the chorus in tragedy.

A contemporary description of a performance of Seneca's *Hippolytus* given at Ferrara in 1509 states that the chorus consisted of ten people dressed in classical costumes and that each of the four choruses was sung: the first by a soloist accompanied by a *lira*, the second by all the chorus divided into three groups and the third and fourth by the chorus divided in two in which the music was composed in modes 'that tended more towards sadness than sweetness'. The description concludes 'no other *intermezi* were performed', suggesting that choruses at the end of acts were thought to function in a similar way to *intermedi* between the acts of comedies but distinguished from them in that the choruses form an integral part of the dramatic action. G.G. Trissino's *Sofonisba* (1515), based on Livy but with dramatic theory derived from the Greeks, is considered to be the earliest example of European tragedy, but imitation of the Greeks proved difficult and dramatists turned back to Latin examples. G.B. Giraldi Cinthio's *Orbecche*, performed at Ferrara in 1541 with music by Alfonso dalla Viola, took its form and division into five acts from Seneca. Giraldi Cinthio's treatise on dramatic forms, the *Discorsi intorno al comporre de i romanzi, delle comedie, e delle tragedie* (1554), sets out the fundamental elements of the horror tragedy: a heroic world in which 'great and terrible' actions can take place, the unities, moral aims, catharsis and an elevated style and language.

Trissino, Giraldi Cinthio and many others discussed the crucial role of the chorus in tragedy in their theoretical writings without reaching any conclusions. It was generally agreed, however, that choruses at the end of acts should be sung, although exactly how they were to be sung remained problematic because of the difficulty of adapting existing musical systems to those described by ancient Greek writers. If the problems were numerous, there were nearly as many practical solutions attempted. Of particular interest were the performances of Gabriele Bombasi's tragedy *Alidoro* at Reggio nell'Emilia in 1568 and Lodovico Dolce's *Le troiane* in Venice in 1566. Both these tragedies were performed with *intermedi*, a

procedure unusual enough to warrant apologies by the authors, pleading public demand for spectacle rather than lack of erudition. In Dolce's tragedy, based on the *Troades* of Seneca, the chorus of Trojan women has only a speaking part, whereas music was reserved for the *intermedi* which 'were made only to serve the music'. The *intermedi* are unusual in that they form an integral if perhaps not essential part of the action: in the first Trojan soldiers address the chorus; in the second there is a dialogue between Pluto and the shades of slain Trojans; in the third a dialogue between Neptune and sea gods celebrating the destruction of Troy; and in the fourth a gathering of the gods of Parnassus who plead with Juno for pity. The music for these *intermedi*, composed by Claudio Merulo, does not survive.

Bombasi's *Alidoro*, recited on the occasion of a visit to Reggio nell'Emilia by the Duchess of Ferrara, Barbara of Austria, was organized on different lines. Bombasi justified the introduction of *intermedi* on the grounds that, if unified in theme and easily understood by the spectators, they could provide a necessary point of repose from the complexities of the plot. In order not to distract from the action and so as not to confuse the audience, the performers of the *intermedi* were 'made to appear from places not used by the actors, rising from the ground, appearing in the sky and descending from the heavens'. The spoken prologue was preceded by vocal and instrumental music whose 'gravity, terribleness and misery showed that the tale about to be represented could not be anything but tragic'. The four *intermedi*, unified in theme, represented the four elements: earth, water, air and fire which, by means of elaborate allegory, paid tribute to the house of Austria. (Guarini, who was among the spectators, may have been influenced by these *intermedi*; the four he devised for the projected Mantuan performance of *Il pastor fido* in 1593 took as their theme the harmony of the four elements: the music of the earth, sea, air and heavens.) It is not known who composed the music of the *intermedi* for *Alidoro*, nor is it described in much detail. The third *intermedio*, however, included an early example of the echo device used on stage: a rainbow and clouds appeared with Juno, Jove and the four winds and 'while this machine was seen, the music always imitated the words and with the last accents reiterated the sound of Echo; this was a judicious invention as she is the daughter of air, and as the poets say, cannot be depicted nor simulated except with sound'. Set in England and Scotland, *Alidoro* had choruses made up of the 'women of London'. When the chorus entered into dialogue with one of the principal characters on stage its lines were spoken by the chorus leader. The choruses at the end of the acts were sung by the same woman, a soprano, who was accompanied behind the scenes by 'sweet and soft' instruments playing the 'bass and middle parts' of the composition. The music followed the meaning of the words, gave 'more the impression of discourse than song' and was delivered with appropriate mimed gestures at 'the pace of ordinary speech without repeating any of the words'.

The role of the chorus in tragedy is treated in Angelo Ingegneri's *Della poesia rappresentativa* (1598), a work founded on his own experience of staging *Edipo tiranno* (Orsatto Giustiniani's translation of Sophocles' *Oedipus Rex*) for the opening of the Teatro Olimpico at Vicenza in 1585. According to Ingegneri the chorus should always be present on stage and play the role of the interlocutor and passive observer. But 'when alone on

stage the chorus should always sing, becoming, as it were, a pure but serious, noble and well-ordered *intermedio* of the tragedy'; nor does the chorus require 'any other *intermedio* or even music than that provided by its own voices'. Andrea Gabrieli's choruses for the ends of acts of *Edipo tiranno* adhere closely to Ingegneri's ideal: 'the choruses of tragedies should consist only of rare and select human voices and one should see to it that the music is composed by an accomplished musician capable of writing serene, grave, plaintive and varied music. And by "varied" I mean that by its nature it induces sadness in accord with the greatness of the calamity. The words, above all, must be clearly enunciated so that they are understood by all the spectators in the theatre without losing the least syllable'. Gabrieli's choruses, published in Venice in 1588 (ed. in Schrade), show that his prime concern was that the words be understood. To this end he adopted a *falsobordone* style (one spectator commented unfavourably on their resemblance to priests chanting the Lamentations of Jeremiah), a free rhythmic declamation of the words based on natural stress (Giustiniani's lyrical choruses are in blank verse) and chromatic progressions to add harmonic colour and expression. Each of the four choruses is cast in sections for one to six voices, with some sections marked 'solo' or 'duo'. The chorus of 15, the number imitating ancient Greek tragedy, was made up of 12 singers and three speaking parts ('interlocutors'). Trumpet fanfares were heard before the play began (compare the opening toccata of Monteverdi's *Orfeo*); once the curtain had dropped four six-part pieces by Marc' Antonio da Pordenon for voices and instruments were heard from behind the scenes to show that hymns and prayers were being offered up to the gods by the inhabitants of Thebes.

Intermedio

5. Intermedi in Florence: 1518–89.

In Florence the most spectacular and lavish *intermedi* were reserved for state occasions, but a number of plays were performed with the addition of sung interludes between the acts. These *intermedi*, usually marked 'madrigale' or 'canzone' in the play text, appear to have been cultivated mainly in Florence, beginning with the canzoni written by Machiavelli for his *Mandragola* and *La Clizia*, four of which were set by Verdelot for performances in 1525 and 1526. In 1544 Francesco d'Ambra's comedy *Il furto* was performed for the Accademia Fiorentina with five madrigals between the acts composed by Francesco Corteccia. These were published in the second edition of Corteccia's *Libro primo de madrigali a quattro voci* (1547); they take their subject matter from an episode in the play and are written in a straightforward homophonic style. Another member of the academy, Leonardo Salviati, had his comedy *Il granchio* performed in 1566 with *intermedi* by Bernardo de' Nerli (see §3 above). Other plays performed on a small scale at Florence with madrigals used as *intermedi* include d'Ambra's *I Bernardi* (1547), A.F. Grazzini's *La gelosia* (1550), G.M. Cecchi's *Il servigale* (1555) and Luigi Alamanni's *La Flora* (1556), the last with added *intermedi* by Andrea Lori.

The first documented performance of a play for a Florentine state occasion took place in 1518 when Lorenzo de' Medici and Madeleine de la Tour d'Auvergne, recently married at Amboise, were fêted with Lorenzo Strozzi's *Commedia in versi*. According to Strozzi's contemporary biographer

Francesco Zeffi, the music was planned by Strozzi himself and was widely imitated afterwards. Before the comedy began, the loud sounds of trumpets, *cornamuse* and shawms 'aroused the emotions of the listeners'; during the second act three lutes were played by three richly dressed Moors; during the third 'sopranos, raising their voices according to the action on stage' sang to four viols; during the fourth 'the highest pitched quilled keyboard instruments' accompanied a 'noisy tumult' on stage, and music for the last act was played by four trombones, 'their voices modulating artfully and sweetly'. Strictly speaking these were not *intermedi*, but incidental music keyed to the stage action. Nonetheless they show several features developed later in Florentine *intermedi*: the use of a consort of instruments of one family and the singing of one voice-part of a piece accompanied by an instrumental consort.

The earliest Medici wedding for which the music is fully documented was that of Cosimo I de' Medici and Eleonora of Toledo at Florence in 1539. For the nuptial celebrations a comedy by Antonio Landi, *Il commodo*, was performed. The *intermedi* were written by G.B. Strozzi and the music was composed by Francesco Corteccia. The music for the *intermedi* and a number of other pieces written for the celebrations were published in the same year at Venice in a special commemorative edition (ed. in Minor and Mitchell). There were six *intermedi*, one before the prologue and one after each of the five acts of the play; the last *intermedio* consisted of two numbers.

Before the play began, the figure of Dawn appeared on stage and sang the top line of a five-part madrigal to the accompaniment of a 'claviorganum' (a harp stop on the harpsichord, and flute and nightingale stops on the organ) and a bass viol. The second and third *intermedi* were sung respectively by six shepherds accompanied by a cornett and five crumhorns, and three mermaids accompanied by an ensemble of three flutes and three lutes played by sea nymphs and sea monsters. In the fourth *intermedio* Silenus was discovered asleep in a cave by Mnasyllus, Chromis and Aegle at midday. Awakened, he sang alone a four-part madrigal 'playing all the parts' on a violone disguised as a tortoise shell, a lament for the lost Golden Age of the ancients that would return under Cosimo's rule. The fifth *intermedio* showed eight nymphs returning from a hunt in late afternoon who sang a four-part madrigal unaccompanied. The last act closed with the figure of Night 'dressed in a black silk veil with a blue starred headdress ... singing sweetly to the accompaniment of four trombones. The singing was so sweet that, in order not to leave the spectators asleep, there suddenly came onto the stage 20 bacchantes, of whom ten were ladies and the rest satyrs. Among all these, eight played, eight sang and danced in the middle of the stage and two on each side played drunk' (Minor and Mitchell, 342, 349). Their instruments, cornetts, crumhorns, violin, pipe and tabor, trombone, harp and tambourine, were disguised as a human shinbone, a stag's head, a goat's horn, a vine stalk and other objects. The rudimentary symbolism in the choice of instruments and voices and the variety in scoring show the careful planning of these *intermedi*. Apart from Silenus's song and the danced triple-time finale, Corteccia's madrigals for the other *intermedi* are strongly contrapuntal and make no concessions to the exigencies of the stage. A unity of theme connects the four central *intermedi* which all make veiled reference to Cosimo and Eleonora. Their

primary theatrical function, however, was to serve as a temporal backdrop to the comedy, marking off the time of day as the action progressed.

Similar in structure were the *intermedi* performed with Bibbiena's *La calandria* at Lyons in 1548 staged by the resident Florentine community for the visit of Henri II, King of France, and his wife, Catherine de' Medici. All the music (now lost) was by Piero Mannucci, an otherwise unknown composer described as 'organist to the Florentine church of Notre Dame' at Lyons. There were six *intermedi*. The first, performed before the play, and the last, performed after the play, consisted of two and three scenes respectively. As in 1539 the figures of Dawn and Night circumscribed the temporal action, but in addition Apollo sang stanzas in *ottava rima* (accompanied by a *lira da braccio*) that paid homage to the spectators and introduced the subject matter of the *intermedi*. These were unified in theme and consisted of four tableaux portraying the ages of iron, bronze, silver and gold. The last was accompanied by figures representing peace, justice and religion, qualities informing Henri's reign; the music was performed by five voices, two cornetts and three trombones. The number and variety of instruments exceeded that of the 1539 *intermedi*; in particular the addition of single or multiple foundation instruments to pure, mixed or double consorts of instruments represented a notable advance. Night, for example, was accompanied by four flutes, four trombones and two spinets, and the song of the Age of Silver was performed by a solo voice, five lutes, bass viol and spinet.

In 1565 Francesco d'Ambra's comedy *La cofanaria* was performed at Florence for the wedding of Francesco de' Medici and Johanna of Austria, with *intermedi* devised by G.B. Cini. These were unified in theme and loosely based on the story of Cupid and Psyche taken from *The Golden Ass* of Apuleius. The preparations were entrusted to a number of court artists including Giorgio Vasari and [Bernardo Buontalenti](#) and the music was by Alessandro Striggio (i) and Corteccia. A special set was built in the Salone dei Cinquecento in the Palazzo Vecchio (a huge room measuring 53 metres long, 22 wide and 18 high). According to Grazzini's published description 'it was necessary to make the sound of the music very full' because of the large size of the room. The *intermedi* and the play were intended to be mutually reflective, the one complementing the other: according to Grazzini, the story of Cupid and Psyche was fitted 'to the comedy with all the skill at our command, with the intention of making it appear as if that which is enacted by the gods in the fable of the *intermedi* is likewise enacted, as it were, under the constraint of a higher power, by the mortals of the comedy'. In the first *intermedio* the scene opened on a concave perspective of Olympus, from which appeared, growing ever larger, a cloud supporting Venus, the three Graces and the four Seasons. As her chariot descended it was accompanied by instrumental music played by four double harpsichords, four viols, two trombones, two recorders, transverse flute, straight cornett and two lutes. With the arrival of Venus at the front of the stage, Cupid appeared from one side attended by the four passions, Hope, Fear, Joy and Pain. Venus with her attendants then sang an eight-part madrigal, *A me, che fatta, son negletta e sola*, complaining of Psyche. This piece, one of only two to survive from these *intermedi* (RISM 1584⁴; ed. in Osthoff, ii, 122), was accompanied off stage by two harpsichords, four viols, lute, cornett, trombone and two recorders.

Cupid promised revenge on Psyche and shot arrows into the audience while singing with his attendants a five-part madrigal concerted with four flutes, trombone, bass lute and harpsichord. Added to this ensemble were a soprano viol, alto recorder and bass viol improvising their parts and playing *passaggi*. This stylized dialogue between Venus and Cupid, here a novelty, was increasingly used in later *intermedi* (see [Dialogue](#), §3). Moreover the new resources of scenography, enabling changes to be effected invisibly before the audience, provided a sequence of 'marvels' of a wide variety: in the third *intermedio* the floor grew into seven mounds out of which 14 Deceptions ('Inganni') slowly arose, some holding crumhorns disguised as snares and hooks; in the fourth the mounds were replaced by smoking craters out of which arose Discord, Ire, Cruelty, Rapine, Revenge, two Laestrygonians and the Furies. While singing and playing a madrigal, these characters performed 'in the manner of combatants a new and extravagant moresca'. In the fifth *intermedio* Psyche descended to Hades, hounded by Jealousy, Envy, Worry and Scorn; four viols disguised as serpents appeared in the smoke and were played by Psyche's companions as she sang a lament; Cerberus, belching flames, appeared from an opening in the floor after which Psyche crossed the Styx on Charon's boat. Psyche's lament, *Fuggi speme mia*, sung by Giulio Caccini, then aged 14, was accompanied off stage by four trombones and *lirone* and was reported to have moved the spectators to tears; it survives in an intabulation for lute by Vincenzo Galilei (RISM 1584¹⁵; ed. in Brown, 1972, pp.17ff). In the last scene Psyche and Cupid, reunited, sang and danced around Mount Helicon two canzonettas in praise of Hymen and his new devotees, Francesco and Johanna.

In 1568 Lotto del Mazza's comedy *I Fabii* was performed with six *intermedi* on the occasion of the baptism of Leonora de' Medici, the first child of Francesco de' Medici and Johanna of Austria. All the music was by Alessandro Striggio (i), the set by Baldassare Lanci and the costumes by Buontalenti. The most striking scenographic novelty of the evening came during the fifth *intermedio* when the front of the stage was covered by a cloud machine, permitting a change of the hitherto constant perspective backdrop view. The *intermedi* included the infernal, pastoral and celestial scenes that were by that time conventional, and ended with a banquet of the gods in the heavens above Florence celebrating the birth of Aphrodite, a clear reference to the young Medici princess. The only music to survive from these *intermedi*, Striggio's ten-part madrigal *O giovenil ardire* (RISM 1584⁴), was sung unaccompanied on stage during the second *intermedio* by ten of the 12 monsters of the labours of Hercules. It is noteworthy that this piece, and one from the 1539 *intermedi*, are the only *a cappella* performances recorded for the entire series of Florentine *intermedi*.

Archduke Karl of Austria visited Florence in 1569 and was entertained with a performance of C.B. Cini's comedy *La vedova*. The six *intermedi*, again all with music by Striggio, were intended to flatter and impress the visitor. Several had episodes derived from Aristophanes, Ovid and Dante, in which their creator, Cini, claimed to have 'outdone the ancients'. In one scene the guests saw peasants converted by a witch into frogs; and in another, where a magician had traced circles on the floor with his wand, the shades of poets, painters, sculptors, musicians and alchemists appeared in an instant on stage only to vanish again at a command. The description of these

intermedi contains no information about their instrumentation, but the soprano parts of several of Striggio's compositions survive in manuscript (B-Bc 27.731). There is more use of dialogue, and in more complex forms, to extend the episodes. No more plays with *intermedi* were performed in Florence until 1583, when Giovanni Fedini's *Le due Persiglie* was performed for the Medici princesses. Among the musicians who collaborated on writing music for the six *intermedi* were Striggio, Cristofano Malvezzi and Jacopo Peri.

For the wedding in 1586 of Cesare d'Este and Virginia de' Medici, Giovanni de' Bardi's comedy *L'amico fido* (now lost) was performed at the opening of the new theatre in the Uffizi. The *intermedi* devised by Bardi took as their theme the various tributes of the gods who, in honour of the newly married couple, restored to earth the Golden Age. Each *intermedio* represented the gift of one divinity: Jove sent the Virtues, Hell opened to swallow up the Evils, Zephyrus and Flora brought eternal spring, Neptune calmed the ocean's storms and Juno restrained the elements. The spectacle ended with a celebratory chorus of Tuscan shepherds and shepherdesses. The music, by Striggio, Malvezzi and Bardi, does not survive. The four central *intermedi*, representing the four elements of which the universe was thought to be constituted, allowed besides the usual infernal, pastoral and celestial scenes the addition of an aquatic scene. In this scene Thetis rose from the sea which became rough as she sang; she disappeared beneath the waves and Neptune appeared, shook his trident and calmed the sea; the rocky shore changed to green banks; two groups of nymphs arrived and, with a song, commanded the sea monsters to be still, and then the whole scene vanished.

In 1589 the most costly and spectacular *intermedi* ever devised were performed for the wedding of Ferdinando de' Medici and Christine of Lorraine. The complete subservience of the comedy to the *intermedi* is evident from the fact that they were performed twice with Girolamo Bargagli's comedy *La pellegrina* and twice more with two different comedies, performed by the acting troupe of the Comici Gelosi. The team of artists assembled for the occasion was large: Giovanni de' Bardi, [Ottavio Rinuccini](#) and [Laura Guidiccioni Lucchesini](#) wrote the texts; most of the music was composed by Malvezzi and Luca Marenzio, with individual contributions by Peri, Antonio Archilei, Bardi, Giulio Caccini and the recently appointed ducal superintendent of music, Emilio de' Cavalieri. Bardi was in charge of all the celebrations, including the ordering of their literary themes, Cavalieri supervised the music, and Buontalenti the costumes and staging (fig.2). Bardi chose as his theme the power of ancient music. The musical tales included the harmony of the spheres, the rivalry in song of the Muses and the Pierides (fig.3), Apollo victorious over the serpent Python (fig.4), the story of Arion and the descent of Rhythm and Harmony from heaven to earth. The unity of theme was broken only by the obligatory infernal scene in which the Age of Gold that was to follow the royal marriage was foretold to the spirits of Hell (fig.5).

The music, published by Malvezzi in Venice in 1591 (ed. in Walker, 1963), ranged in style from expressive and highly ornamented solo songs accompanied by the chitarrone to massive polychoral madrigals requiring 60 singers and at least 24 instruments. Instrumental sinfonias were used to

begin an *intermedio* or to cover a change of scenery, and 'novelty' instruments included the cittern, mandora, guitar and psaltery. According to Malvezzi three chamber organs played in all the 'concerti' (a harpsichord is mentioned only once) and the regal was used for one *intermedio*. The sixth *intermedio*, portraying the descent of Rhythm and Harmony, had appropriately varied and complex music by Malvezzi and Cavalieri, and contained five separate compositions. The opening one by Malvezzi, *Dal vago e bel sereno*, was performed from the heavens by the gods, first by instruments alone and then by voices and instruments. This was answered from the stage by 20 couples carrying rustic instruments who sang a six-part madrigal by Malvezzi. The third item, *Godi turba mortal*, was sung as a solo accompanied by chitarrone. Next followed the largest piece in the festivities, Malvezzi's 30-part *O fortunato giorno*, sung and played by all the company divided into seven choirs; according to Malvezzi, 'in order to avoid the difficulty of wide leaps, facilitate memorization and produce better harmony' the piece has only six real parts in the tutti sections in spite of its massive size. The 'ballo finale', combining dance (rhythm) and music (harmony), was choreographed and composed by Cavalieri; Laura Guidiccioni's words were added only after the music had been written. It was performed by two alternating ensembles of three and five parts, the three-part ensemble comprising [Vittoria Archilei](#) playing the Spanish guitar, Lucia Caccini playing the Neapolitan guitar and a performer named Margherita playing the tambourine, while the rest of the performers made up the five-part ensemble. The opening tutti chorus, known variously as the *Ballo del Gran Duca*, *Aria di Fiorenza* and *Ballo di Palazzo*, became famous throughout Europe and served as the basis for over 100 compositions by other composers (Kirkendale, 1972).

G.M. Cecchi's sacred drama *L'esaltazione della croce*, performed on the same occasion by the Florentine religious confraternity of S Giovanni Evangelista, had six *intermedi* on biblical stories set to music by Luca Bati (the music is lost). Unlike the earlier Florentine *sacre rappresentazioni*, this was not performed in a church but in a temporary theatre specially constructed for the purpose and large enough to accommodate stage machinery. The *intermedi* differed from their secular counterparts only in subject matter and included a sinfonia, instrumentally accompanied solo songs and concerted polychoral madrigals.

The difference between stage music and that not intended for a specific occasion was apparently more one of purpose than of kind; this is suggested by the appearance of isolated pieces from *intermedi* in individual prints and anthologies directed at general public consumption. Strophic dance choruses, polychoral dialogues and madrigals with the top line embellished by a soloist and the lower parts played on chordal or melody instruments are clearly adapted madrigalian forms pressed into service of the theatre rather than newly invented ones. However, in spite of similarities with other kinds, *intermedio* music, either composed or borrowed from the current repertory, appears to have been carefully selected to meet the requirements and conditions of theatrical performance. For example, the music written for the 1589 *intermedi* generally avoids textual and musical extremes of expressiveness that would have served little purpose on the stage, and much of it shows a strong rhythmic pulse coupled with clearly defined diatonic harmonies that

facilitated memorization and served to project the music and words into the audience. But the fact that more *intermedio* music is lost than survives should be sufficient to caution against any quick generalizations of style, particularly in view of the fact that by 1589 a new generation had supplanted older and more experienced composers such as Striggio.

To what extent the music was made to serve the stage action or the action made to conform to the music is difficult to determine precisely, since modifications to the original scheme might be introduced during rehearsals (Warburg, *Gesammelte Schriften*, appx). Considerations of the space to be occupied by the performers on stage appear to have been important to the choice of form: polychoral madrigals with interlocking phrases and harmonies, for example, allowed groups of performers to be separated vertically or horizontally on the stage without danger of losing cohesion; and a solo singer suspended on a cloud machine could spin out an elaborately embellished melody of cosmic eloquence seemingly without earthly hindrance. The number of singers rarely exceeded the number of voice parts of a composition, but no such restriction was applied to the instrumentalists who could, or in some cases had to be, placed off stage. The composer normally specified exactly the size and variety of the instrumental forces. The detailed descriptions of instrumentation for music within a given context and intended for a specific purpose is of the utmost importance to an understanding of contemporary ideas and standards of effective sonorities. A comparison of the extant descriptions (Brown, 1973) shows that the combination of characteristic tone-colours, of both individual instruments and families of instruments, was never haphazard and to some extent could symbolize the stage action (see *Performing practice*, §I, 4, 5).

Intermedio

6. Intermedi and opera in the 17th century.

Intermedi did not disappear after the birth of opera but became interwoven with it. *Intermedio* traditions furnished many of the themes and conventions of early opera. Rinuccini's libretto for *Dafne* is an expansion of the third *intermedio* for 1589, the battle of Apollo and Python; the same author's libretto for *Euridice*, set by both Peri and Caccini, had its antecedents in the ubiquitous infernal scenes, and in particular the episode of Psyche in the underworld in Cini's *intermedi* of 1565. Of all the early operas, Monteverdi's *Orfeo* (1607) draws most heavily on the *intermedio* tradition. The change in scene from pastoral to infernal, Apollo's rescue of Orpheus from the Bacchantes and their ascent to heaven on a cloud, the large and varied groups of instruments often used for atmospheric effects, the danced choruses and the final *moresca*, are features already familiar from 16th-century *intermedi*.

As well as absorbing much from the *intermedio* tradition, operas, like spoken plays, were felt to need their own *intermedi* for contrast. Both genres continued to have *intermedi* written for them occasionally in the 17th century. Caccini's opera *Il rapimento di Cefalo* (libretto by Chiabrera), performed in Florence in 1600 for the proxy wedding of Maria de' Medici to Henri IV of France, had *intermedi* devised by Giovanni de' Medici requiring 100 musicians and 1000 men to work the machines. In 1608, for the wedding of Cosimo II de' Medici and Maria Maddalena of Austria, M.A.

Buonarroti's play *Il giudizio di Paride* was performed at Florence with *intermedi* representing Astraea, the garden of Calypso, Amerigo Vespucci's ship (the first historical *intermedio*; fig.6), Vulcan and the temple of peace. Alfonso Fontanelli, who was among the spectators, wrote that the play was hardly noticed, either because the story was too well known or because the attraction lay in the *intermedi*. Another entertainment for this occasion, Francesco Cini's *La veglia dei sogni*, was performed between court dances in the manner of an *intermedio*; dances by courtiers could also serve as *intermedi*, as they did for Marco da Gagliano's opera *La Flora* (1628).

The *intermedio apparente* continued in Italy throughout the first half of the 17th century, and was probably a more common form of association of music and spectacle than opera was during that period. Several were given with the sponsorship of the Florentine court, such as *Olimpia et Bireno* (music by Andrea Salvadori), used between the acts of Antonio Folchi's comedy *La pertica* in 1622, or the *intermedi* of Jacopo Cicognini's *Il martirio di S Agata* (music by G.B. da Gagliano) of the same year. Even away from Florence the *intermedi* of *L'Ilarocosmo* of Ignazio Bracci were used for a Medici wedding (1621; music by Pietro Pace). Guarini's *L'Idropica*, performed for the wedding of Francesco Gonzaga and Marguerite of Savoy at Mantua in 1608, had *intermedi* specially written for the occasion by Chiabrera (music by Monteverdi, Salamone Rossi, Marco da Gagliano and others) and followed the courtly tradition of *intermedi* established earlier at Florence.

The principal environment of the *intermedio* was in the literary academies, which in small and large towns produced a constant stream of spoken comedies and other plays with *intermedi*. The Accademia dei Ravvivati of Bologna performed a series of *intermedi* with music by Ottavio Vernizzi for Silvestro Branchi's plays including *Stratira* (1617), the *intermedi* *Ulisse e Circe* for the opera *L'Alteo* (1619) and *L'amorosa innocenza* (1632). The Accademici Inviati of Vicenza maintained a similar tradition. Most of these *intermedi* are known only by their texts, printed with the plays for which they were devised. Those for which music survives include G.B. Boschetti's *Strali d'amore* (1618), composed for an unidentified comedy at Viterbo in 1616, Girolamo Giacobbi's *L'Aurora ingannata* (1608), given between the acts of Ridolfo Campeggi's *Filarmindo* at Bologna in 1608 and Domenico Belli's *Orfeo dolente* (1616), performed with a Florentine revival of Tasso's *Aminta* in 1616. *Intermedi* of this kind probably diminished in frequency with the spread of opera to the provincial centres about mid-century.

Stefano Landi's *Il Sant'Alessio*, first performed at Rome in 1631 or 1632 (1634), is one of the few printed scores that contains an *intermedio*, the scene added after the first act, that introduces dancing for the sake of diversity. Another Roman opera, *Chi soffre speri* (1639) by Virgilio Mazzocchi and Marco Marazzoli, has an *intermedio* after the second act using chorus and ballet, entitled 'Alla fiera' ('At the fair') for which Marazzoli wrote the music. Among the courts that imported Italian musicians for the purpose of performing operas was the Polish court at Warsaw, where the opera *La Santa Cecilia*, believed to be by Marco Scacchi, was staged in 1637. This work (an opera, not an oratorio, in spite of its sacred action) had six mythological *intermedi*, which differ in subject matter from the libretto proper.

In the second half of the century, most Italian *intermedi* were composed for the public theatres which dominated the operatic scene. A good example is furnished by the revivals of Venetian operas in Rome at the Teatro Tordinona in the 1670s where Stradella composed *intermedi* for operas by Cavalli, Cesti, Sartorio and others. Stradella's insertions show the persistence of the mythological divertissement in the *intermedio* tradition, and perhaps also a greater fondness for pomp and splendour on the part of Roman as compared with Venetian audiences. Venetian plays continued to use *intermedi* in the 1650s, however, when Giacomo Castoreo, who acted as librettist for Cavalli and P.A. Ziani, produced several stage works with 'intermedi fatti per la musica'.

Typical of the Italian genre in France were the *intermèdes* for Molière's *Le malade imaginaire*, first performed at Paris in 1673, and in a second version in 1674. On both occasions music was provided by Charpentier, who had studied with Carissimi at Rome. The Italian background of these French *intermèdes* is apparent, but the influence of French taste appears in the considerable use made of the ballet; the *intermedio* after the first act is opened by a character called 'Polichinelle', and the words are in Italian, not French. Although the circumstances that had made the *intermedio* a splendid and extravagant court entertainment had changed during the 17th century, the tradition of offering variety and diversity by way of interludes in both spoken plays and operas had by no means died out; it provided stage music with an important point of departure for future developments.

Intermezzi.

A rare term for a piece inserted between the saraband and the gigue in a suite, as, for example, in Gottlieb Muffat's *Componimenti musicali* (see Guido Adler's introduction to DTÖ, vii, Jg.iii/3, 1896/R).

Intermezzo (i).

A term sometimes used for light theatrical works inserted between the acts of Renaissance comedies (see [Intermedio](#)).

Intermezzo (ii) (It).

Literally, an entr'acte. The term was applied during the 18th century, in place of the earlier [Intermedio](#), to a miniature comic opera in Italian (the French counterpart is the [Intermède](#)) involving two characters (rarely three or more), performed in segments between the acts of a larger work, usually an *opera seria*. The genre flourished during the first half of the 18th century, then gradually disappeared, giving way to the fully fledged comic opera (see [Opera buffa](#)). Often, especially in earlier years, its name appeared in the plural as 'intermezzi', sometimes also 'intermedii', 'scherzi musicali' etc. This referred to its performance during the entr'actes (hence the plural) of the larger work; but from the very beginning the intermezzo was unified by a single plot and cast of characters. The segments (in effect, the 'acts' of the intermezzo) were known as 'parti', as in 'intermezzo di due (tre) parti'. Two such 'parts' (performed between Acts 1 and 2 and Acts 2 and 3) were commoner than three; a third 'part', if present, was performed before the final change of scene in the main presentation.

The intermezzo traces its ancestry to the comic scenes of Seicento opera which, towards the end of the century, were beginning to fade away. Venice took the lead in 'expurgating' the librettos of the *dramma per musica* of its 'improprieties' in an attempt to lend it some of the dignity of classical tragedy. Comic scenes were glaring instances of such breaches of taste; hence their gradual removal. By the first years of the 18th century comic scenes had become rare in Venice, though not entirely absent. One important consequence of their reduction was to deprive the specialized *buffo* singers of their niche.

It is therefore not surprising that the earliest intermezzos known to us today were performed in Venice. And though the term may crop up earlier, in connection with the comic scenes of 17th-century opera (as in Domenico Gabrielli's *Flavio Cuniberto*, 1688), Venetian intermezzos differed from

traditional comic scenes in that they introduced entirely new plots and characters, and very soon developed their own, independent dramatic procedures. The very first one appears to have been *Frappolone e Florinetta*, performed at the S Cassiano theatre in February 1706 between the acts of the opera *Statira* by Francesco Gasparini. The libretto was not printed; it survives as an anonymous manuscript (*I-Vnm*) but may be ascribed with certainty to Pariati (the music, now lost, was most probably by the composer of the main opera, Gasparini). There may well have been other intermezzos performed, but not published, at about that time: only in October 1707 did the Venetian censorship require publication of intermezzo librettos, thus placing them under its supervision.

The S Angelo theatre briefly entered the field, but during the next few years it was the S Cassiano, with Pariati as poet and Gasparini and (later) Albinoni as composers, that presented the most successful intermezzos. At least three of these were to gain widespread fame as their interpreters, the Mantuan *basso buffo* G.B. Cavana and the Bolognese contralto Santa Marchesini, set out on their travels: Gasparini's *Erighetta e Don Chilone* (1707) and *Parpagnacco* (1708), and Albinoni's *Pimpinone* (1708), the score of which is the earliest specimen of its kind to survive. *Erighetta* is loosely modelled on *Le malade imaginaire* by Molière, who was to become a favourite source of subjects for intermezzos.

In contrast to the Venetian practice of only sporadically performing such independent intermezzos with *opere serie*, the Neapolitan custom during the first two decades of the 18th century was to incorporate comic scenes into nearly every new opera; local composers, including Giuseppe Vignola, Francesco Mancini, Francesco Feo and Leonardo Leo, added the traditional *scene buffe* to works first produced elsewhere without them. After 1720, when the comic elements finally gained complete independence from the *opera seria* libretto, the Neapolitan intermezzo entered a golden age, exemplified in the works of such composers as Domenico Sarro (intermezzos of *Brunetta e Burlotto* frequently revived under the title *La capricciosa e il credulo*, 1720), Hasse (*La contadina*, 1728), Pergolesi (*La serva padrona*, 1733) and Giuseppe Sellitto (*La vedova ingegnosa*, 1735). Neapolitan librettists of that time include Bernardo Saddumene, G.A. Federico and Tommaso Mariani, all of whom were at the same time providing texts for the new, full-length *opere buffe* playing in that city's smaller theatres.

Substantial contributions to the intermezzo repertory were made by the Bolognese composer G.M. Orlandini, whose works, including the enormously successful *Il marito giocatore* (1719), had their first performances in different Italian cities and seem to belong to no particular local tradition. Important figures active outside Italy include Francesco Conti (Vienna) and Telemann (Hamburg).

Apart from Molière's comedies, at least six of which were adapted as librettos for intermezzos (e.g. Antonio Salvi's version of *Le bourgeois gentilhomme*, published at Florence in 1722 as *L'artigiano gentiluomo*), librettists made use of a variety of other sources. Situations from the *commedia dell'arte* were ready to hand, and there is no doubt that intermezzo singers learnt much from their confrères in the matter of acting;

unwritten *lazzi* (sight gags) were part of their stock-in-trade, as several contemporary writers testify. 'These buffoons cry, roar with laughter, throw themselves about, indulge in all manner of pantomime, and never deviate from the beat by so much as an eighth of a second', wrote Président de Brosses from Rome in 1740. The English traveller Edward Wright, in an account of intermezzo singers he heard at Venice about 1720, wrote: 'They laugh, scold, imitate other Sounds, as the cracking of a Whip, the rumbling of Chariot Wheels, and all to Music'. Although some of these effects were doubtless improvised by the performers, musical scores furnish abundant examples of written-out portrayals of laughter, sneezing, weeping, the palpitations of a love sick heart and the like. Other important characteristics of the *buffo* style exemplified in the intermezzo include a lively, frequently disjunct vocal line; constant repetition of short, balanced phrases; parody effects directed mainly at the musical conventions of *opera seria*; and – above all – absolute fidelity of music to text, frequently manifested by extreme changes of tempo and style within a single aria or duet. As a contrast to the prevailing *buffo* style, composers sometimes introduced mock-pathetic numbers and arias modelled on dance rhythms. From their texts and occasional stage directions, it appears that the latter were sometimes actually danced by the *parti buffe*, whose favourite step seems to have been the minuet.

Stock comedy figures, such as the old man and the braggart captain, people the world of the intermezzo. By far the most common of the stock types is the cunning servant girl, widow or shepherdess who, despite her humble station, through feminine wiles plays a *burla* (trick) on her male partner or ensnares him in matrimony. Often the soubrette's name indicates her sharp cunning, as, for example, Serpina ('little snake') in Federico's *La serva padrona* (1733) or Vespetta ('little wasp') in Pariati's *Pimpinone* (1708). Other common dramatic themes include the supernatural, probably deriving from the close connection between the comic characters and transformations of the *intermedi* in 17th-century opera, and satire directed at the *opera seria* (e.g. Sarro's *L'impresario delle isole Canarie*, 1724, attributed to Metastasio).

The intermezzo exhibits nearly as rigid a standard musical format as contemporary *opera seria*. Each 'part' customarily contains one or two arias for each of the two singing roles (one or more mute roles frequently appear) and a final duet, all in da capo form and separated by secco recitatives. Accompanied recitative appears infrequently and usually in a parody context, while overtures and other types of independent instrumental music are lacking altogether or confined to short, concluding dance pieces. But stylistically it is more progressive; its simple harmonies, homophonic accompaniments, general melodiousness and symmetrical phrase structure are clear harbingers of later 18th-century Classical style.

The vogue of intermezzos spread quickly to the playhouse, where *commedia dell'arte* companies were fighting a losing battle to retain some of the audience they had lost to opera. As early as 1711, comedians inserted musical intermezzos between the acts of their plays at the S Samuele theatre, Venice; in the 1730s Carlo Goldoni served his theatrical apprenticeship as purveyor of intermezzo librettos to another company acting at that theatre.

During the first half of the 18th century travelling singers, among them the celebrated team of Antonio Ristorini and Rosa Ungarelli, carried the intermezzo repertory throughout Italy and to nearly every European city that supported Italian opera; intermezzos performed between the acts of *commedia dell'arte* plays at Moscow in 1731 preceded by five years the earliest *opere serie* heard in Russia. Intermezzo performances by itinerant troupes are recorded as early as 1716 in Wolfenbüttel, 1717 in Brunswick and Dresden, 1724 in Prague, 1726 in Mannheim, 1727 in Breslau and 1737 in London. The process of diffusion continued with the tours of Angelo and Pietro Mingotti's opera companies in Austria, Germany and Denmark between 1737 and 1760 and in conjunction with the pantomimes presented by the impresario Nicolini's troupe of Piccoli Olandesi (Dutch children) in central Europe between about 1745 and 1750. Perhaps the most significant of the intermezzo's extra-territorial conquests was Paris. Performances of *opere buffe* and intermezzos there during the seasons of 1752–4 by a troupe of singers brought from Strasbourg by Eustachio Bambini precipitated the [Querelle des Bouffons](#), a literary polemic which inspired many musical parodies and imitations that opened a new chapter in the history of French opera.

By 1750 ballets had almost completely supplanted intermezzos as the principal entr'acte diversions in performances of *opere serie*, although works to music by such composers as Rinaldo da Capua, Gioacchino Cocchi, Niccolò Piccinni and Baldassare Galuppi continued to figure occasionally between the acts of Italian spoken plays throughout the remainder of the 18th century. Because of the size of their casts (up to seven), which permitted large-scale ensembles and concerted finales, these intermezzos, or 'farsette' as they were often called, differ little from contemporary *opere buffe* except in length and function (see [Farsa](#)). Many, in fact, were simply versions of full-length comic operas shortened to fit between the acts of a play and reduced to fit the number of available singers (e.g. *Il filosofo di campagna*, an *opera buffa* by Goldoni and Galuppi, Venice, 1754, and *La serva astuta*, a condensed version performed as an intermezzo at Venice in 1761).

CHARLES E. TROY, PIERO WEISS

Intermezzo (iii).

A term used since the early 19th century for movements or sections, generally within larger works; also for independent pieces, often for piano solo and predominantly lyrical in character. Burney was among the first to use the term to describe instrumental music. In a brief summary of Haydn's style he wrote: 'He has likewise movements which are sportive, *folatres*, and even grotesque, for the sake of variety; but they are only the *entremets*, or rather *intermezzi*, between the serious business of his other movements' (*BurneyH*, ii, 959–60). Mendelssohn gave the title 'Intermezzo' to the third movement of his Second Piano Quartet (1823), where it replaces the usual scherzo, and Brahms followed this precedent in his G minor Piano Quartet (op.25) of 1863. Schumann used the term frequently in his early piano music. The middle section of the scherzo in the Sonata op.11 is so called: its burlesque character ('alla burla ma pomposo') with the exaggerated rhetoric of its recitative passage perhaps suggests that Schumann, his mind at that time never far from the world of Harlequin and Columbine, may have conceived it in terms of the earlier tradition of the comic intermezzo. In the second number of *Kreisleriana* op.16, intermezzos form two sections comparable to the two trios which Schumann, like Beethoven and others, sometimes provided in his scherzos; a similar structure is found in the third of the *Romanzen* op.28. Here Schumann seems to have thought of the term as almost synonymous with 'trio', but the intermezzos of op.4, which he described to his friend Töphen as 'larger Papillons', are independent pieces which themselves have middle sections marked 'alternativo'. The intermezzo of Brahms's Piano Sonata op.5 forms an integral part of the work, leading into the finale, as does that in Balakirev's Piano Sonata. Brahms also composed numerous independent intermezzos (e.g. as in op.76), and his last works include 14 pieces so called (in opp.116–19).

In the 20th century the term was used a good deal in light music, but less in symphonic works. The 'Intermezzo interrotto' of Bartók's Concerto for Orchestra provides, apart from its satirical reference to Shostakovich in the 'interruption', a point of lyrical repose in the score. In Elgar's 'Enigma' Variations, the tenth ('Dorabella') is an intermezzo whose feathery delicacy is calculated to give precisely the right contrast between 'Nimrod' and 'GRS'.

The intermezzo as an instrumental interlude between acts was often used in operatic scores and theatre music of the 19th and 20th centuries. Mascagni's *Cavalleria rusticana*, Puccini's *Manon Lescaut*, Delius's *Fennimore and Gerda* and Wolf-Ferrari's *I gioielli della Madonna* contain familiar examples that are virtually equivalent to entr'actes. They may function simply as points of relaxation in a score with which they have no musical or dramatic connection. The intermezzo in Mendelssohn's music for *A Midsummer Night's Dream*, on the other hand, is carefully related to dramatic events at the close of the second act and the beginning of the third.

MAURICE J.E. BROWN

International Alliance for Women in Music [IAWM].

International organization created in 1995 through the merging of the International Congress on Women in Music (ICWM), American Women Composers (AWC) and the International League of Women Composers (ILWC). The International Alliance for Women in Music aims to build on the work of the three original organizations in celebrating and encouraging the activities of women in music.

The League of Women Composers was founded by composer Nancy Van de Vate in 1975 and renamed the International League of Women Composers in 1979. In the words of its founder, the ILWC aimed 'to create change and to provide a larger number of women musicians their first real opportunity to enter the professional mainstream'. At the time of the merger it was a networking organization operating in over 36 countries, with a well-established journal. The ILWC supervised various projects, including the publication of a directory of music by women, several radio series, an association with Arsis Press (which specializes in the publication of music by women) and a competition for student composers.

American Women Composers was founded by composer Tommie E. Carl in 1976. The organization aimed to promote the work of American women composers by establishing a library of scores (housed at George Washington University), publishing the biannual *AWC NewsForum*, mounting concerts and producing recordings of music by American women.

The International Congress on Women in Music, initially organized by Jeannie Pool, held its first event in 1980, and thereafter held regular congresses in the United States and Europe consisting of concerts, workshops and academic papers all aimed at an international exchange of

information about music by women. In 1990 the organization merged with the ILWC.

The IAWM publishes the *IAWM Journal* three times a year and, since 1997, a scholarly journal *Women and Music: a Journal of Gender and Culture*. It also holds regular IAWM congresses (in the tradition of the ICWM) and maintains an extensive website which includes links to bibliographies, discographies and course syllabuses on women, gender and music; women in music organizations worldwide; music publishers, archives and libraries, and many other resources.

SOPHIE FULLER

International Association of Music Information Centres (IAMIC).

A worldwide network of national organizations promoting new music. It was established in 1958, originally as a meeting of 'National Music Centre Representatives'; IAMIC was then formed in 1962 as a constituent branch of the [International association of music libraries](#) (IAML). This affiliation continued until 1991 when IAMIC became a fully independent association under the aegis of the International Music Council. In 1999 it had 40 members, most of which are autonomous organizations with national status, giving them access to funds from a range of sources including national, regional and local government, arts councils, major foundations and copyright organizations. Music information centres have as their chief purpose the documentation and promotion at home and abroad of their national music (with emphasis generally on contemporary art music), and collect scores, parts, recordings, books, articles, analyses of compositions, interviews and press cuttings; many also issue publications and recordings. The following is a list of such centres.

Australia: Australian Music Centre, PO Box N 690, Grosvenor Place, NSW 1200

Austria: Music Informations Zentrum Österreich (MICA), Stiftgasse 29, 1070 Wien

Belgium: Centre Belge de Documentation Musicale/Belgisch Centrum voor Muziekdocumentatie (CeBeDeM), rue d'Arlon 75–77, 1040 Bruxelles

Brazil: UNICAMP, CEP 6136, 13083–970 Campinas, São-Paulo

Canada: Canadian Music Centre, Chalmers House, 20 St Joseph Street, Toronto, Ontario M4Y 1J9

Colombia: Centro de Documentación Musical, C/24, No.5–60, 4 Piso, Santafé de Bogotá 1

Croatia: Music Information Centre, Zagreb Concert Management, Kneza Mislava 18, 10 000 Zagreb

Czech Republic: Hudební Informační Středisko, Besední 3, 118 00 Praha 1

International Association of Music Libraries, Archives and Documentation Centres

(IAML; Fr. Association Internationale des Bibliothèques, Archives et Centres de Documentation Musicaux, AIBM; Ger. Internationale Vereinigung der Musikbibliotheken, Musikarchive und Musikdokumentationszentren, IVMB).

An organization formed after World War II to promote international cooperation and standardization in such matters as cataloguing, standards of service, personnel training and the exchange of materials between libraries. The body was founded in Paris in 1951, after preparatory meetings in Florence (1949) and Lüneburg (1950), as the Association Internationale des Bibliothèques Musicales. In 1980 its name was changed to embrace the broader interests of music archives and documentation centres, though the acronyms have remained the same. By 1998 IAML had about 2000 individual and institutional members in 45 countries throughout the world.

The association operates through a network of Professional Branches (divided by type of library, such as archives, broadcasting, music teaching institutions, public, research), Subject Commissions (grouped by type of activity, including audio-visual materials, cataloguing, bibliography, service and training) and Working Groups for specific projects. They all meet at IAML's annual conferences (or, every third year, a congress with general assembly). Two earlier groups, the Commission on Phonothèques and the Music Information Centres branch, split off to form their own associations: the International Association of Sound and Audiovisual Archives (IASA), and the International Association of Music Information Centres (IAMIC).

Since 1954 IAML has published a quarterly journal, *Fontes artis musicae* (*FAM*), which focusses on topics in music librarianship and documentation, bibliography and musicology; it also includes reports of the association's activities and annual meetings. IAML maintains an internet home page and operates an electronic discussion list, IAML-L. The association's archives are housed at the Statens Musikbibliotek, Stockholm. IAML has national branches in 22 countries, which carry out similar work at the national level. Several have their own publications, periodicals or newsletters and web sites.

IAML's first president (1951–5) was Richard S. Hill; Vladimir Fédorov, perhaps the most influential of its founding fathers, was the first secretary. Between 1954 and 1975 Fédorov was also the editor of *FAM*; for a period he also served as president (1962–5). The other presidents have been Alec Hyatt King (UK), Folke Lindberg (Sweden), André Jurres (Netherlands), John H. Davies (UK), Harald Heckmann (Germany), Barry S. Brook (USA), Brian Redfern (UK), Anders Lönn (Sweden), Maria Calderisi Bryce (Canada), Catherine Massip (France), Don L. Roberts (USA), Veslemöy Heintz (Sweden) and Pamela Thompson (UK). In recognition of their many services, Fédorov and Heckmann were named honorary presidents for life.

At the time of IAML's formation, in the wake of World War II, the restoration of international contacts and provision of access to musical sources and information through international cooperation were its primary objectives, as were standardization in the area of cataloguing and classification of musical documents and improving the training of music librarians. To this end, a number of working commissions were established, a journal was started, and a large-scale project to make inventories of musical sources in print and manuscript before the year 1800, a successor to Robert Eitner's *Quellen-Lexikon*, was initiated: the Répertoire International des Sources

Musicales (RISM). It has since served as a model for three others ('the four Rs'), all produced by cooperation between national groups and an international centre responsible for collecting and coordinating the national contributions: *Répertoire international de littérature musicale (RILM)*, a computerized abstracting service and bibliography of scholarly writings on music throughout the world. Based at the City University of New York, it issues a printed annual volume, *RILM Abstracts*, and is available online and on CD-ROM.

The Répertoire International d'Iconographie Musicale (RIdIM) project exists to document visual materials relating to music. RIdIM publishes a newsletter, and since 1984 has sponsored a scholarly yearbook, *Imago musicae*. The RIdIM/RCMI (Research Center for Musical Iconography) is also located at the City University of New York. Most recently, the Répertoire International de la Presse Musicale (RIPM) has been established to abstract and index the contents of selected periodicals concerned with the music of the 18th to the 20th centuries. Since 1988 it has been published as a book series by UMI Research Press at Ann Arbor. There are international centres at the University of Maryland (USA) and Parma-Colorno (Italy).

Other IAML-assisted series include Documenta musicologica (Kassel, 1951–), which publishes facsimiles of printed and manuscript sources; Catalogus musicus (Kassel, 1963–), which presents the catalogues of library collections and historically important publishers; *Code international de catalogage de la musique* (Frankfurt, 1957–83, 5 vols.), a major effort to standardize cataloguing of music materials, now obsolete; and the *Directory of Music Research Libraries* (Kassel, 1967–), a sub-series (series C) of RISM. Individual publications include *Guide for Dating Early Published Music* (Hackensack, NJ, and Kassel, 1974) and *Terminorum musicae index septem linguis redactus* (Budapest and Kassel, 1978).

ANDERS LONN

International Association of Sound and Audiovisual Archives

[IASA] (Fr. Association Internationale d'Archives Sonores et Audiovisuelles; Ger. Internationale Vereinigung der Schall- und Audiovisuellen Archive).

Organization founded in Amsterdam in 1969 to function as a medium for international cooperation between [Sound archives](#). It has over 350 members in more than 52 countries, including representatives of the archives themselves, as well as other individuals involved with the collection, preservation and dissemination of recorded material. In addition

to an annual conference, the IASA publishes the biannual *IASA Journal* (formerly the *Phonographic Bulletin*) and a quarterly *Information Bulletin*; a membership directory is also available. Its specialist publications include *Sound Archives: a Guide to their Establishment and Development*, ed. D. Lance (Milton Keynes, 1983), and *Selection in Sound Archives*, ed. H. Wallace (Milton Keynes, 1984), a collection of papers given at the annual conferences. In 1999 *The IASA Cataloguing Rules* were published (Aarhus, 1999), and they are available, together with various technical guidelines and copies of the *Information Bulletin* (1997–) at the IASA website: www.llgc.org.uk/iasa.

International Bruckner Society.

See [Bruckner societies](#).

International Composers' Guild.

Organization formed in 1921 in New York by Varèse and Salzedo to assure performances of contemporary music. Membership was open to composers, who often performed their own music. Concerts were restricted to previously unheard works, a policy that so disturbed some members that they formed the [League of Composers](#). Before it disbanded in 1927 the guild gave first performances of Varèse's *Hyperprism*, *Octandre* and *Intégrales*, and American premières of Berg's *Kammerkonzert*, Schoenberg's *Pierrot lunaire*, Stravinsky's *The Wedding*, and Webern's op.5. Guest conductors included Klemperer, Reiner and Stokowski.

International Council for Traditional Music [ICTM].

An organization formed in London in 1947, under the name International Folk Music Council (IFMC), with the aims of furthering the study of folk music and dance, and of assisting in their practice, preservation and dissemination. The first meeting was attended by delegates from 28 countries, and since 1948 annual or biennial conferences have been held, bringing together specialists in all fields of folk music; early conferences

took place in Ghana and Israel as well as in Europe and the Americas. The first president of the IFMC was Vaughan Williams; he was succeeded by Jaap Kunst, Zoltán Kodály, and, after the latter's death in 1967, Willard Rhodes, professor of music at Columbia University, followed by Klaus Wachsmann (1973–7) and Poul Rovsing Olsen (1977–82). Maud Karpeles was honorary secretary from 1947 to 1965. The council's secretariat was in London until 1967 when it moved to the Danish Folklore Archives, Copenhagen; in 1969 it moved again, to Canada, where Professor Graham George of Queen's University, Kingston, Ontario, became honorary secretary.

The IFMC issued a journal (*JIFMC*) until 1968, which was superseded by a yearbook (*YIFMC*); it also produced numerous other publications, including bibliographies, directories, songbooks and bulletins. It had an active committee concerned with radio, television, sound and film archives, which met annually, in addition to a number of national committees and study groups. It was associated with UNESCO through its membership of the [International Music Council](#) and the International Union of Anthropological and Ethnological Sciences.

In 1981, the secretariat moved to Columbia University in New York, Dieter Christensen was appointed secretary general, and the council was renamed the International Council for Traditional Music. This reflected the expanded and less eurocentric scope of the council's goals and activities, which the term 'folk' alone no longer adequately described. The revised rules state that the object of the council is 'to assist in the study, practice, documentation, preservation and dissemination of traditional music, including folk, popular, classical and urban and dance, of all countries.'

Major conferences outside Europe have since been held in Korea (1981), the USA (1983), Hong Kong (1991), Australia (1995) and Japan (1999), in addition to those in European countries (Sweden/Finland 1985, the German Democratic Republic 1987, Austria 1989, Germany 1993 and Slovakia 1997). Smaller conferences – ICTM colloquia and ICTM study group meetings – are frequently held in all continents. The ICTM continues to have national committees and liaison officers as well as working more closely with national scholarly societies in many countries and with other international organizations, especially with UNESCO, to which the council is now directly affiliated. The council edits the UNESCO collection of traditional music and publishes the *Yearbook for Traditional Music* (until 1981 the *Yearbook of the International Folk Music Council*), a news bulletin and the *Directory of Traditional Music*. In 1995, the council had 1400 members in 89 countries and official representatives in 58 countries. Erich Stockmann succeeded Poul Rovsing Olsen as president in 1982, followed by Anthony Seeger in 1997 and Krister Olof Malm in 1999.

International Institute for Traditional Music [IITM].

An organization founded in West Berlin in 1963 with support from the Ford Foundation and the Berlin senate. It owed its existence to the efforts of Yehudi Menuhin, Werner Stein (the Berlin senator for art and science), Nicolai Nabokov (cultural advisor to mayor Willy Brandt), and Alain Daniélou, the institute's first director. Originally called the International Institute for Comparative Music Studies and Documentation, the institute was renamed in 1991. Its aim was to promote the study and understanding of minority and non-European musical cultures through ethnomusicological documentation, bilateral cooperative projects, publications, scholarly symposia, festivals, workshops and courses for teachers. The IITM published over 140 records in the UNESCO Collection series which are gradually being reissued on CD. Two new CD series were begun by the institute: *Musical Traditions around the World* (IITM/Smithsonian/Folkways) and *Living Musical Traditions* (IITM/Museum Edition Hamburg). The ethnomusicological journal *The World of Music* was published by the institute, and has been continued by the University of Bamberg. The Institute also published over 40 books, including numerous individual monographs on the music of other countries. In addition, detailed programmes documented the institute's concert events. The IITM initiated two new series of books: *Intercultural Music Studies* (now published by the University of Bamberg) and *Musikbogen: Wege zum Verständnis fremder Musikkulturen*. Scientific symposia were held regularly, while the institute's annual *Festival Traditioneller Musik* was dedicated to a different topic or geographical area each year. The IITM supported cooperative projects run in partnership with, among others, the University of São Paulo, the National Museum of Bamako (Mali), the Fundación Norte (Salta, Argentina) and the Institute of Musicology of the Slovakian Academy (Bratislava). The IITM was closed at the end of 1996 for financial reasons.

MAX PETER BAUMANN

International League of Women Composers [ILWC].

See [International Alliance for Women in Music](#).

International Library of African Music [ILAM].

It was founded in 1954 by musicologist Hugh Tracey at Roodepoort, near Johannesburg, South Africa, on the basis of the archive of recordings of traditional and popular African music which he had made since 1929 in Southern Rhodesia (now Zimbabwe), South Africa and elsewhere in southern Africa. His research was sponsored from 1947 by Eric Gallo with marketing rights, and about 1000 records were issued from 1929 to 1952 under the Regal (Columbia), Gallotone, Trek, Troubadour and HMV labels. Three recordings from this period became well-known: *Mbube (Wimoweh)*, by Solomon Linda, which was popularized by Pete Seeger and the Weavers; *Skokiaan*, by the Bulawayo Cold Storage Band; and *Masanga*, a song with guitar by Jean Bosco Mwenda from the Belgian Congo (now the Democratic Republic of the Congo).

In the early 1950s a series of recordings made in central, eastern and southern Africa from 1948 to 1970 was issued by Decca. It was continued by Gallo as the Music of Africa, extending to 25 records. From 1954, 213 records were produced in the Sound of Africa series. It covered 15 countries and 136 languages and dialects, and was eventually published in a library series; a catalogue was issued in 1973. After Tracey's death in 1977, his son Andrew became director and moved ILAM to Rhodes University, Grahamstown, where it continued to research and publish materials relating to African music but with an increased emphasis on teaching. Since 1980, ILAM has published the annual proceedings of the Symposia on Ethnomusicology and continues to publish the journal, *African Music* (1954–).

ANDREW TRACEY

International Musical Society.

Society active from 1899 to 1914; it sponsored a number of valuable periodicals (*SIMG*, *ZIMG* and *BSIM*). See [International Musicological Society](#).

International Music Centre

(Ger. Internationales Musikzentrum).

An organization founded in Vienna in 1961 to investigate and disseminate music through television, radio, film and records. It is a member of the International Music Council and the International Film and Television

Council, and has worked in cooperation with radio stations and with several other international organizations including the European Broadcasting Union, the International Council for Traditional Music and the International Society for Music Education. It has held congresses and seminars concerned with technical and ethical aspects of music in the media and it indexes and publishes information on the subject. It has organized competitions for dance, music theatre and early music productions. The centre's publications include *Films for Music Education and Opera Films: a Selective Catalogue* (Paris, 1962), K. Blaukopf's *Musik in TV* (Teufen, 1965) and *50 Jahre Musik im Hörfunk*, edited by K. Blaukopf, S. Goslich and W. Scheib (Vienna, 1973), as well as a monthly trade magazine, *Music in the Media*. It has set up databases on specific topics, including Mozart (1991) and Rossini (1992).

International Music Company.

American firm of music publishers. It was founded in New York in 1941 by A.W. Haendler (c1894–1979). The firm publishes solo instrumental music, chamber and vocal music and miniature scores of works in the standard repertory. After Haendler's death Frank Marx, executor of his estate, became head of the company, which is a subsidiary of Bourne Company.

FRANCES BARULICH

International Music Council

(Fr. Conseil International de la Musique).

A non-governmental organization created in 1949 by UNESCO (United Nations Educational, Scientific and Cultural Organization) to serve musical creation, performance, education, training, research and promotion on an international scale. This aim is pursued through the exchange of music and musicians between countries and continents, all cultures being regarded as equal; the use of the audio-visual media for the dissemination of music and for musical experimentation; close cooperation with other professional organizations and with the music industry; and the support of international agreements defending the rights of creative and interpretative musicians. Like UNESCO, the International Music Council is based in Paris. It was founded with the cooperation of four leading musical organizations: the International Society for Contemporary Music, the Fédération Internationale des Jeunesses Musicales, the International Musicological Society and the International Folk Music Council (now the International Council for Traditional Music). These were represented on the founding committee by Edward Clark, Marcel Cuvelier, P.-M. Masson and Maud Karpeles respectively; other committee members were Roland-Manuel (president), Harrison Kerr, Albert di Clementi, Goffredo Petrassi, Charles Seeger and C.S. Smith. Subsequent presidents have included Steuart Wilson (1954–7), Vladimir Fédorov (1965–6), Yehudi Menuhin (1969–75), Sir Frank Callaway (1980–81), Barry S. Brook (1982–3) and Jordi Roch (1994–7).

The council has 70 national committees throughout the world and has founded a number of subsidiary organizations, including the [International](#)

association of music libraries (1951), the [International Society for Music Education](#) (1953) and the International Institute for Music, Dance and Theatre in the Audio-Visual Media (1969). The International Rostrum of Composers, formed in 1954, is a forum at which representatives of broadcasting organizations meet to exchange contemporary music. In 1954 there were 16 broadcasts of the works selected; by 1995 this had increased to 600, primarily in Europe, the Americas and Australasia. A similar function is fulfilled for traditional music by the Asian Music Forum (1969), the African Music Forum (1970), the Arab Music Rostrum and the Rostrum for Latin American and Caribbean Music. The International Rostrum of Young Interpreters (1969) promotes outstanding performers, and the International Rostrum for Electroacoustic Music serves composers working in this field. Several independent organizations are affiliated to the International Music Council, including the International Federation of Musicians, the International Federation for Choral Music and the International Council of Organizations of Festivals of Folklore and Traditional Arts.

A series of congresses and symposia was held biennially from 1958; concentrating at first on general questions of musical culture the congresses shifted their emphasis during the 1970s to non-Western music. In 1975 a series concerned with the 'preservation and presentation of traditional music and dance' was initiated. A quarterly journal the *World of Music*, also concentrating on traditional music, was first published in 1967 in collaboration with the International Institute for Comparative Music Studies and Documentation (renamed the International Institute for Traditional Music); since 1970 several books have been published in the series Music and Communication. *Music and Tomorrow's Public*, a study published in 1975 in cooperation with the International Federation of Producers of Phonograms and Videograms, set out the future plans of the council. Nearly 200 recordings of traditional music have been produced in collaboration with the International Institute for Comparative Music Studies and Documentation in Berlin and Venice; they form the UNESCO Collection of Traditional Music. In the 1990s the organization began to prepare *The Universe of Music: a History*, a 12-volume worldwide history of music written by authors native to each region.

The Musicians' International Mutual Aid Fund was formed in 1974 to mark the 25th anniversary of the foundation of the council; it aims to contribute to the quality of musical life and the well-being of the musical profession in all cultures. Encouraging and coordinating the voluntary efforts of musicians, the fund organizes concerts and other events with the cooperation of broadcasting and recording organizations, awards study grants to young musicians and assists international tours by young performers, thus contributing to the fulfilment of the council's general aims. As with other areas of the council's activities the fund has particularly benefited musicians outside the Western tradition. The organization's general assemblies, held every two years in a different country, are always accompanied by a congress dealing with a specific topic.

H. Sass: *International Music Council 1949–1991* (Bonn, 1991)

International Musicological Society [IMS]

(Fr. Société Internationale de Musicologie, SIM; Ger. Internationale Gesellschaft für Musikwissenschaft, IGM).

Society founded in 1927 to replace the Internationale Musikgesellschaft (International Musical Society), which had been founded by Oskar Fleischer and Max Seiffert in 1899 with the aim of promoting international musical contacts, but which had ceased to exist with the outbreak of World War I in 1914. Musicologists met internationally for the first time after the war in Basle in 1924, and when Henry Prunières, speaking in 1927 at the Beethoven centenary celebrations in Vienna, suggested that the International Musical Society be reconstituted, the idea was enthusiastically received. In September 1927 a committee, chaired by Guido Adler, met in Basle and the International Musicological Society was founded.

Basle was chosen as the headquarters of the IMS. In addition to the general assembly and council, a secretariat was established to promote the aims of the society; its functions included the arrangement of international contacts between musicologists and the establishment of a bibliographical centre. Members were informed of the society's activities through a quarterly bulletin. A year after its foundation the society already had 181 members from 23 countries. In its early years the society maintained close relations with musical performance and composition, and the first international congress (Liège, 1930) was held in collaboration with the International Society for Contemporary Music. During World War II international cooperation almost ceased; however, the society was not dissolved, and its journal, *Acta musicologica* (*AcM*), which had replaced the bulletin in 1931, was still published.

In 1949 the society held a further international musicological congress in Basle, on the initiative of Ernst Mohr, who later became General Secretary (1952–72). The IMS also joined the International Council for Philosophy and Humanistic Studies, a new organization affiliated to UNESCO. Congresses were subsequently held every three years up to 1967 and every five years thereafter, bringing together individual members, institutes, libraries and associations. A report of each, with the exception of the sixth, has been published. The presidents of the IMS have been Peter Wagner, Dent, Jeppesen, Smijers, Lang, Blume, Grout, Féodorov, von Fischer, Reeser, Finscher, Mahling and Sadie.

The IMS journal *Acta musicologica*, published twice a year, contains reports and other contributions from all fields of musicological research. As the society expanded (it had 1200 members from 51 countries in 1994), the bibliographical duties originally assigned to the secretariat became unmanageable and were transferred to a group of long-term publications, produced in collaboration with the International Association of Music Libraries: [Répertoire International des Sources Musicales](#) (RISM), started in 1952 in order to catalogue the musical heritage that had survived the war; [Répertoire International de Littérature Musicale](#) (RILM), a computerized index of musicological literature published since 1967;

[Répertoire international d'iconographie musicale](#) (RIdIM), which was started in 1971 as an inventory of musical iconographical sources and also publishes the RIdIM newsletter and sponsors the yearbook *Imago Musicae*; and [Répertoire International de la Presse Musicale](#) (RIPM), which began its activities in 1983 and publishes inventories of music journals. The series *Documenta musicologica* publishes musical and music theory sources in facsimile. *Catalogus musicus* publishes catalogues of collections, musicians' libraries and publishers.

RUDOLF HÄUSLER/R

International Music Publications [IMP].

English firm of music publishers based in Woodford Green, Essex. It was formed in 1982 through a merger of the printed music operations of EMI Music Publishing and Chappell, and subsequently passed into the ownership of the Warner Music Group. In addition to being the largest publisher of popular and rock music in Britain, it also has an extensive educational catalogue, which includes materials in compact disc, video and multimedia formats. Besides its own publishing programme, it serves as the printed music channel for many major recording and publishing companies, and acts as the British distributor for several foreign catalogues, including Disney and Suzuki publications. The firm also maintains an archive service for some 250,000 out-of-print titles from the mid-19th century onwards, based primarily on the old Chappell catalogue.

International Society for Contemporary Music

[ISCM] (Fr. Société Internationale pour la Musique Contemporaine, SIMC; Ger. Internationale Gesellschaft für Neue Musik, IGNM).

Society founded on 11 August 1922 after the Internationale Kammermusikaufführungen Salzburg 1922, a festival of modern chamber

music held as part of the Salzburg Festival and organized by Rudolf Réti with the assistance of Egon Wellesz, Paul Stefan and some young Viennese composers. Over 20 composers were present, including Webern, Hindemith, Bartók, Kodály, Honegger and Milhaud. The participants were determined that this, the first international music festival after World War I, should be the first of a regular series of events enabling contemporary composers to maintain the contacts made in Salzburg and meet annually to become acquainted with recent musical events and trends. On its foundation the ISCM outlined its purpose as being a means of breaking down national barriers and personal interests and publicizing and promoting contemporary music 'regardless of aesthetic trends or the nationality, race, religion or political views of the composer'. These aims were to be pursued through annual music festivals in different countries. The first (1923) was restricted to chamber music; in 1924 and 1925 separate chamber and orchestral festivals were held, and from 1926 the festivals included various genres. The society's activities were also promoted by the autonomous national sections, numbering 46 in 1995. Each country is represented by one section (since 1992, also by additional associate memberships), although before World War II the USSR, Sweden, Spain and Czechoslovakia each had two sub-sections, for geographical or cultural reasons, and in 1983 Hong Kong was accepted as an independent sub-section of Britain.

The society's original headquarters were in London, where the first constitution was worked out by a conference in January 1923, under the presidency of E.J. Dent (1922–38, 1945–7). From its inception the ISCM was plagued by internal disputes concerning its purpose and operation. There was conflict between those countries that felt that it should promote avant-garde music (principally Germany before 1933 and Austria and Czechoslovakia before 1938) and those that considered any contemporary music to be worthy of the society's interest (principally France, Great Britain and the USA). Despite the internal weaknesses of the society, the pre-war ISCM festivals were most significant as forums for leading contemporary composers, providing the occasions for important premières, including those of Webern's *Five Pieces op.10* (1923), Berg's *Violin Concerto* (Barcelona, 1936) and Webern's *Das Augenlicht op.26* (London, 1938), as well as performances of music by Hindemith, Schoenberg, Stravinsky and others.

A threat to the society's existence was posed by Nazi Germany, which regarded the ISCM as 'culturally bolshevist' and part of an international anti-German conspiracy. In 1934 it founded a counter-organization, the Permanent Council for the International Cooperation of Composers, of which Richard Strauss was the first president. The German section of the ISCM had been banned in 1933; bans were enforced, from between 1938 and 1941, on the sections in the occupied countries; those in Italy (1939) and Japan (1941) were also banned.

After World War II the society became active once more. One of the most important aspects of the ISCM was the contact it afforded between East and West during the cold war. From the mid-1980s more countries from Latin America and East Asia joined the society, and after the fall of communism more countries from East Europe. In 1988 the first East Asian

festival was held in Hong Kong, and in 1993 the first Latin American festival took place in Mexico City. Among its most important postwar premières have been Boulez's *Le marteau sans maître* (Baden-Baden, 1955) and Stockhausen's *Kontakte* (1960). In 1949 a journal, *Music Today*, was published, although it did not continue beyond the first issue. Since 1991 a journal, the *World New Music Magazine*, has been published in Cologne. The work of the ISCM was reduced in significance by the development of new means of producing and reproducing music, and as a source of musical impetus the ISCM was superseded by the international summer courses in **Darmstadt**, by specialized new music ensembles, festivals and events and by the growth of broadcasting. Thus 'the growth and spread of serial music and other modern trends in many countries had taken place outside, even in opposition to, the society' (Dibelius, 1966, p.234).

In 1971 the society's statutes were revised in such a way as to enable it to resume some of its former importance, taking advantage of its independence from commercial or political factors, its internationalism, and the equality of its national groups – from which the smaller nations in particular may benefit (as may be seen in the stimulus the ISCM has provided to the development of new music in Sweden, the Netherlands, Switzerland, Finland and Norway). In 1975 the society's festival programme was broadened to embrace popular genres, in 1992 its statutes were again revised to enable countries to become associate members and in 1997 the rules were changed to enable the organisation of festivals without an international jury.

ANTON HAEFELI/REINHARD OEHLISCHLÄGEL

International Society for Jazz Research

(Ger. Internationale Gesellschaft für Jazzforschung).

Organization based in Graz. It was founded in 1969 by Friedrich Körner and Dieter Glawischnig. It is a society of musicologists, jazz scholars, anthropologists, teachers, performers and others interested in jazz, and its aim is the systematic exploration of jazz through musicological methods. Between 1969 and 1995, 27 volumes of the yearbook *Jazzforschung* and ten books in the series *Beiträge zur Jazzforschung* were published, and four international congresses were held in Austria and Germany. In 1995 there were about 300 members.

International Society for Music Education [ISME].

Society founded in Brussels in 1953 under the auspices of UNESCO by the International Music Council. Its purpose is to stimulate music education throughout the world, both as an integral part of general education and community life and as a profession. It implements its aims by organizing international conferences and seminars, notably a biennial world conference; promoting the international liaison of music educationists at all levels; cooperating with other international music organizations in musicology, performance, composition, folk music, youth music and music librarianship; cooperating with regional and national music education organizations, many of which operate as national sections of the ISME; cooperating with organizations representing other branches of education; and developing research in music education. The society's honorary presidents have included Kodály and Kabalevsky, and presidents have included Egon Kraus, Yasuharu Takahagi, Sir Frank Callaway and Lupwishi Mbuyamba. Members include 40 national music educators' organizations, 50 music education institutions and 1000 individual members. From 1960 to 1972 it published the *International Music Educator* twice annually, which was subsequently replaced by the *ISME Yearbook*. The society's aims have been influenced by the spread of recorded and

broadcast music, which has enabled greater emphasis to be placed on adult education; it has acted as an advisory body to UNESCO and has contributed to the worldwide survey *Music and Tomorrow's Public* (ed. E. Helm, Paris, 1975). The British section of the ISME is the [Schools Music Association](#).

International Society of Organbuilders.

A society formed in 1957 by a group of Dutch organ builders in Amsterdam and formally constituted at a conference in Strasbourg in 1960. Membership (about 270 in 1995) is open to firms making organs or organ parts, and the society aims to advance the profession by discussions and exchange of information, and the exchange of students and apprentices. Between 1969 and 1990 it published a review, *ISO Information*, in English, French and German, with about 1600 subscribers; since then it has published the more general *ISO News* and also an *ISO Yearbook*. Congresses are held every two years, each concentrating on the characteristics of organ building in the host country, as well as seminars and workshops. The society's presidents have been Henry Willis (iii and iv), D.A. Flentrop, Caspar Glattez-Götz and (from 1994) Mark Venning.

Interpretation.

A term used in musical parlance with reference to the understanding of a piece of music. It has often been used primarily to signify the way in which notation should be interpreted, as in Arnold Dolmetsch's *The Interpretation of the Music of the XVII and XVIII Centuries* (London, 1915), and the more recent, similarly titled books on the same topics by Donington and Dart (and also the discussion in recent editions of this dictionary), that is, the study of [Performing practice](#). The present article considers the more general use of the term, in particular the understanding of a piece of music made manifest in the way in which it is performed. (For discussion of the understanding of music by writers, critics or audiences, see [Reception](#)).

This concept of interpretation takes as starting-point the relevant definition in the *Oxford English Dictionary*, 'the rendering of a musical composition, according to one's conception of the author's idea'. It however may, and normally does, extend beyond the interpreter's conception of the author's idea and represent, rather, the interpreter's own idea of the music, possibly embodying understandings of what is taken to be latent in the score but also his or her own view of the best way of conveying that idea, in a particular performance, to the audience in the circumstances of that performance.

The notion of interpretation is relatively recent, and has acquired increasing importance because of the possibilities of comparison made available

through recordings. It had no currency before 1800, largely because of its dependence on the idea of a canonical repertory that is performed by different artists; no such repertory developed until the early years of the 19th century, the period of travelling artists, large commercial centres with concert halls and opera houses, and the aesthetic changes that led to the rise in the status of the composer and in turn to the idea of 'great works' that needed to be explained, elucidated and 'understood'. It is not a coincidence that the rise of the conductor, as the person who would 'interpret' the piece of music, by conveying his understanding of it at each performance, took place at exactly this time. The idea of personal interpretation was especially fostered and encouraged by Richard Wagner and his view of Beethoven's music (see [Conducting](#) and [Performance](#)).

For music in the Romantic tradition, or music performed in the light of that tradition, the term 'interpretation' is appropriate, since one common use and meaning of the term applies when something is disclosed or revealed. Moreover, musical performance characterizes the work it is of, even if in a purely musical way, through the very process by which it realizes that same work: the work is given life through its performances and is usually accessed only through them. The listener's perception and understanding of the work is thus inevitably affected by the manner in which a piece is presented by its performer. To the extent that the listener's contact with the work is mediated through those acts of the performer by which the piece is embodied, it is appropriate to regard performances as interpretations of the works they are of. An interpretation presents a vision of a work, a perspective on it, through the manner in which it is played.

The performing instructions added to and encoded in a score – along with unuttered ones that are understood, according to the performing conventions of the composer's time and provenance – carry the composer's instructions to the executant (see [Tempo and expression marks](#)). These always under-determine the full sonic detail of any actual performance, allowing the possibility of different renditions that are nevertheless equally faithful to the work. The performer inevitably must make many decisions concerning how the work is to be played. These apply not only at the micro level (affecting subtleties of attack, intonation, phrasing, dynamics, note-lengths and the like) but also at the macro level (concerning the overall articulation of the form, the expressive pattern etc.). The performer's interpretation is generated through such choices.

An interpretation is distinct from the performance in which it is embodied. Whereas a given performance is a unique event that might be reproduced (as by a recording) but cannot be re-enacted, an interpretation results from a series of decisions that can be repeated on different occasions of performance: different performances by a given player or conductor might embody the same or a very similar interpretation.

Most extended works lend themselves to a multiplicity of revealing, aesthetically rewarding interpretations; indeed, works are valued for their fecundity and flexibility in this regard. No single interpretation can be regarded as exclusively 'correct', although some may be reckoned incorrect, in some senses, if they manifestly defy the composer's instructions or understandings: this raises the issue of the propriety of

deliberately (or otherwise) setting aside the composer's performing instructions for the sake of an interpretation sought by the performer. The composer's instructions do however leave many crucial decisions to the performer, which is why performing is recognized as a vital and creative act. Performances very different in sound may be fully and equally accurate in instancing the work they are of, and each of these might express a different interpretation of the piece in question. Interpretations are often compared, and one may be judged superior to another because it provides a clearer, more interesting vision of the work.

Such terms as 'vision', 'account' or 'perspective', as applied to performance interpretations, may however be misleading. While a description or depiction is distinct from its topic, an interpretation of a musical work is not entirely separate from the work it is of, because the work is embodied and instanced within the interpretation. Further, such an interpretation has no propositional content (or none that departs from any verbal text that the work might have); the interpretation does not say anything about the work. It reveals it in a particular, purely musical light, but without describing it.

Critical interpretations – interpretations not realized in performance but written or spoken, whether by a non-performer or the verbalization of a performer of his or her understanding of a work – are distinct from performance interpretations. The latter may be informed, inspired or influenced by the former; and the former might be suggested by the latter. There is however no logically tight relation between the two; the one may or may not be compatible or consistent with the other: that is, a particular performance interpretation does not imply or entail any particular critical interpretation, or vice-versa.

It is difficult to determine the distinction between interpretation and licence in performance. It cannot be maintained that a performer is interpreting X's work if it is not actually X's work that he or she is playing; and if the performer does not follow the composer's work-determinative directions, reading them and the musical score in the light of the conventions, styles and practices they presuppose, it may be argued that the identity and status of the performance is called into question. While it may, then, be argued that ignoring the composer's work-determinative instructions and understandings is not an interpretative option to be ranged alongside the performer's usual freedoms, it would clearly be absurd to exclude, say, the performance on the piano of works written for the harpsichord by Bach, or even arrangements of works for forces different from those intended by the composer, from the realm of interpretation: transcriptions are different from the works they are of, and a performance of a Bach work arranged by Busoni becomes an interpretation of Busoni that incorporates Busoni's interpretation of Bach and inevitably also something of the performer's own interpretation of Bach. The act of interpretation is then widened, involving not merely the interpretation of the composer's vision of the work but more complex layers, including those of intermediaries and historical traditions of performance and instruments, as well as the presuppositions of the performer and his or her audience (which are associated with their period and the circumstances of their musical experience).

STEPHEN DAVIES, STANLEY SADIE

Interrupted cadence [deceptive cadence; false cadence; false close]

(Fr. *cadence rompue*, *cadence évitée*, *cadence trompeuse*; Ger. *Trugschluss*; It. *inganno*).

A [Cadence](#) in which the dominant chord resolves not on to the expected tonic but on to some other chord.

Interruption

(Ger. *Unterbrechung*).

In Schenkerian analysis (see [Analysis](#), §II, 4) the principal method of [Prolongation](#) applied to the fundamental structure ([Ursatz](#)) of a tonal piece, achieved by 'interrupting' its progress after the first arrival on the dominant; this interruption requires a return to the starting-point of the fundamental structure. The symbol for an interruption is a double stroke on the same line as the capped arabic numerals representing the melodic scale steps of the fundamental line ([Urlinie](#)), as shown in [ex.1](#). The dominant that immediately precedes the interruption is called the [Divider](#).

When the fundamental line encompasses a 3rd (as in ex.1) or a 5th, the interruption occurs after the arrival on 2. When it covers a full octave, however, a true interruption is impossible: for if it were to take place after either 7 or 2, the return to the octave would create the impression of an upper or lower neighbour (in C major, C–B–C or C–D–C); and if it occurred after 5, the subsequent return to 8 would produce consecutive octaves. It is possible, however, to divide the fundamental line at 5 by having the bass return to the tonic while the 5 is tied over ([ex.2](#)); this is the nearest equivalent to interruption when the fundamental line encompasses an octave (Schenker: *Der freie Satz*, 1935, §§76 and 100).

As a method of prolongation, interruption is of utmost significance for musical form, providing the structural basis of two-part song form and, by extension, of sonata form: the return to the starting-point of the fundamental structure corresponds to the beginning of the recapitulation in the musical foreground.

WILLIAM DRABKIN

Intertextuality.

A term, coined by the literary critic Julia Kristeva, that encompasses the entire range of relationships between texts, from direct borrowing, reworking or quotation to shared styles, conventions or language. It posits a view of texts, not as independent entities or forms of communication, but as responses to other texts, embedded in a perpetual stream of interrelated texts. Applied to music since the 1980s, it is a broader term than [Borrowing](#), which typically focusses on the use in one piece of one or more elements taken from another. Thus intertextuality embraces the use of a general style or language as well as of a borrowed melody. Moreover, while borrowing is a monodirectional relationship in which one piece borrows from another, intertextuality encompasses mutual relationships, as when two pieces draw on the same convention but neither composer was aware of the other piece.

Musical scholars have used the term in two main contexts: to avoid making historical claims where evidence is uncertain, and to facilitate discussions of musical meaning, especially from a semiotic perspective (see [Semiotics](#), [semiology](#)). To speak of 'borrowing' is to claim that a composer knew of a certain work and took one or more elements from it in fashioning a new one. When chronology is unclear, the available evidence may not support

such a claim. Thus scholars of the isorhythmic motet have used 'intertextuality' to describe similarities in isorhythmic structure that are clearly not accidental, when it cannot be established which motet was written first, or whether there may have been another work, now lost, on which both motets were modelled. Studies of the Renaissance mass and *Magnificat* have used the term to avoid the specific claims implied by 'parody', 'borrowing' and *imitatio*. In studies of more recent music, 'intertextuality' has been used for its breadth and for the connections it suggests to modern literary theory in general. By embracing everything from direct quotation to stylistic allusion and use of conventions, an intertextual approach can address the entire range of ways a musical work refers to or draws on other musical works. Interpreting those relationships as signs within a semiotic theory can illuminate the work's meaning, as can a study of the associations the other music may carry for the listener.

The related terms 'intertextuality' (Hertz, 1993) and 'intermusicality' (Monson, 1996) have been proposed to focus on the characteristics of music as a sounding art and to avoid the implications of the word 'textual' that music can be reduced to a text that must be read. The former allows discussion of relationships between music, the other arts and the realm of ideas, and the latter focusses on music as improvised, performed and heard.

J. PETER BURKHOLDER

Interval.

The distance between two pitches. The term ‘harmonic interval’ (as opposed to ‘melodic interval’) indicates that they are thought of as being heard simultaneously. Intervals are traditionally labelled according to the number of steps they embrace in a diatonic scale, counted inclusively: thus from C up to D or down to B is a 2nd, another step up to E or down to A makes a 3rd, etc. These names are applied in non-diatonic contexts so that an interval embracing five degrees of a pentatonic scale is still called an octave (from Lat. *octavus*: ‘eighth’) and an interval in 12-note music embracing six degrees of the chromatic scale is called a 4th. Qualifying adjectives as shown in [ex.1](#) lend precision to this terminology but the terms ‘major’ and ‘minor’ (or ‘greater’ and ‘lesser’) are also sometimes used to distinguish slightly different forms of semitone, whole tone etc. Some music employs intervals not included in [ex.1](#) because they are not represented faithfully by standard Western notation; 3rds intermediate in size between major and minor, for instance, are characteristic of scales used in some varieties of European folk music, in the art music of several Islamic countries etc.; melodically such an interval is likely to consist of a whole tone plus a step intermediate in size between a whole tone and semitone.

Apart from their musical context many intervals can be identified by their correspondence to a simple ratio of sound wavelengths or frequencies. (Before the development of wave theory in the 18th century, monochord string lengths provided, in effect, a means of discovering wavelength ratios.) An octave is identified by the ratio 2:1, meaning that the frequency of the upper note is twice that of the lower note. Notes an octave apart tend to sound so identical that they are said to belong to the same 'pitch class': they bear the same name (e.g. C₄; B₃; G₃); two intervals which together make up an octave are said to be 'inversions' of each other (for example, the minor 3rd is the inversion of the major 6th); and intervals an octave larger than those in ex. 1 are considered their 'compounds'.

The uniquely important role played by the octave interval can be partly explained by recalling that a single musical note usually contains a harmonically related set of frequency components. The note A sung by a bass, for example, will contain components with frequencies 110, 220, 330, 440, 550, 660 Hz etc. If the singer leaps to a, an octave higher, the new note will have components 220, 440, 660 Hz etc.; the frequency of each component will have doubled. It can be seen that the jump of an octave has in a sense introduced nothing fundamentally new: each component of the new note was already present in the original note.

When two notes an octave apart are sounded simultaneously, the harmonic components of the upper note coincide with the even harmonic components of the lower note, and the two sounds can blend to give the perception of a single pitch. If the frequency ratio is not exactly 2:1, the coincidence will be imperfect, giving rise to the amplitude fluctuations described as **Beats**. For example, if the octave A–a is 'stretched' to a ratio of 2.01:1, keeping the frequency of the first component of A at 110 Hz, the frequency of the first component of a will become 221.1 Hz. This will beat against the second component of A at 220 Hz, giving an audible amplitude fluctuation with a frequency of 1.1 Hz (just over one beat per second). The elimination of beats is used by organ tuners to establish true octaves.

Although medieval theorists emphasized the perfection of small whole number ratios, it is not in fact the case that musical octaves always correspond to an exact 2:1 ratio. Well-tuned pianos usually exhibit a degree of octave stretching, arising at least in part from the fact that the frequency components of a piano note are not strictly harmonic (see [Inharmonicity](#)). It is also well established that when asked to judge octave intervals in a melodic rather than a harmonic context, musicians tend to favour a frequency ratio slightly greater than 2:1.

The 19th-century acoustician Helmholtz explained the relative dissonance of musical intervals in terms of the extent of the beating between the two corresponding sets of harmonic frequency components when the notes are heard simultaneously. If there are many coincident frequency components the beating is reduced and the interval sounds relatively smooth. Thus a perfect fifth, with a frequency ratio of 3:2, is a smooth interval with low beating since the third harmonic of the lower note coincides with the second harmonic of the upper; the perfect fourth, with a frequency ratio of 4:3, is also relatively smooth since the fourth harmonic of the lower note coincides with the third harmonic of the upper note.

While the ratios 3:2 and 4:3 have been regarded almost unanimously as the ideal paradigms of a perfect 5th and 4th, there is no single ideal for major or minor 2nds, which in Western music derive their identity melodically far more than harmonically. Medieval theorists who favoured exclusively 9:8 ($3:2 \div 4:3$) for the whole tone were obliged to uphold 81:64 ($9:8 \times 9:8$) and 27:16 as the ratios of a proper major 3rd ('ditonus') and 6th, and it was only in the 16th century that the simpler 5:4 and 5:3 ratios became the standard European theoretical ideal. The change corresponded, albeit belatedly, to an earlier change in the practical status of 3rds and 6ths as consonant intervals (see [Harmony](#) and [Consonance, §1](#)). Elaborate codifications of intervals have been developed on the basis of ratios involving numbers even larger than 81 or prime numbers larger than 5, a vulnerable aspect of such theories often being their relation to practice. The 'blue 7th' of jazz, however, sometimes thought of as representing the ratio 7:4, is indeed characteristically produced on the cornet or trumpet by overblowing to the seventh natural note. And no doubt the harmonic distinction between 9:8 and 10:9 may be featured in certain kinds of music, such as in India, in which the scale is set out against the background of a drone.

The conventional scientific unit of measure for intervals, devised by A.J. Ellis in about 1880, is derived by dividing the 2:1 octave into a theoretical microscale of 1200 cents (100 cents = an equal-tempered semitone). Other such units are the millioctave (1/1000 of an octave) and the savart (named after Félix Savart, 1791–1841, but virtually identical with the 'eptameride' – 1/301 of an octave – proposed by Joseph Sauveur in 1701). The number of savarts in an interval of known frequency ratio is equal to 1000 times the logarithm (to the base 10) of the ratio; the number of cents is equal to the logarithm of the ratio multiplied by 1200/log2, or 3986.3. One savart is thus approximately 4 cents.

A tendency to divide the octave, 5th or major 3rd into equal quantities can be discerned in many kinds of music. The *slendro* and *pelog* scales of the

Indonesian gamelan sometimes approximate to a division of the octave into five or seven equal parts respectively. The 'neutral 3rds' alluded to above divide the 5th virtually in half. The mean-tone temperaments of Renaissance and Baroque keyboard music divided the major 3rd into two equal whole tones, while equal temperament divides the octave into equal semitones. To calculate the frequency ratios of such intervals (if they are to be precisely equal) involves roots of prime numbers and hence irrational numbers.

Intervals too small to be used melodically are encountered by theoreticians, experimenters and tuners of instruments with fixed pitches (such as keyboard instruments). The terms 'diesis' and 'subsemitone' have been used for the difference between enharmonic pairs (such as D \square +E \square) in any mean-tone temperament, an interval which, like the diesis used melodically in the ancient Greek enharmonic genre, is distinctly smaller than a semitone. Finer intervals of discrepancy are called 'commas' (one traditional rule of thumb being that a comma is one ninth of a whole tone) or 'schisma' (the most important schisma amounting theoretically to 1.95 cents, i.e. about one hundredth of a whole tone). Many Hindu theorists have considered the octave to be divided into 22 *śruti* usually deemed not to be of uniform size but all smaller than a semitone (see [India, §III, 1\(ii\)\(a\)](#)).

Table 1 gives the size in cents of intervals smaller than a tritone, according to various systems of intonation that have been proposed for Western music since the Middle Ages. In each column the various forms of the interval in question are listed in order of their size, decreasing for 4ths, minor 3rds and diatonic semitones and increasing for major 3rds, whole tones and chromatic semitones. Where a certain form of semitone has been used freely by musicians both diatonically and chromatically, it is listed here as a diatonic semitone. The intervals of each scheme make a single row across the table, except in three cases: just intonation, Pythagorean intonation, and the division of the octave into 53 equal parts. Intervals of just intonation are identified by the ratios 4:3, 5:4, 6:5, 9:8, 10:9, 16:15 and 25:24. In addition to the most characteristic intervals of Pythagorean intonation, the use of the Pythagorean apotomē as a diatonic semitone in some 15th-century keyboard music enabled major and minor 3rds impure by merely a schisma to be employed as well; thus the major 3rd labelled 'pure-schisma' occurred in Pythagorean intonation as the compound of eight pure 5ths and 4ths (e.g. E–G \square derived from the chain E–A–D–G–C–F–B \square +E \square +A \square ; see [Pythagorean intonation](#)). The 53-part octave division contains very close approximations to justly intoned as well as Pythagorean intervals. In the table, equal temperament is labelled '12-part division'; the system most commonly known as mean-tone temperament is labelled '1/4-comma temperament'.

MARK LINDLEY/MURRAY CAMPBELL, CLIVE GREATED

Interval class.

An understanding of interval whereby the order of the notes is left unspecified. If the two notes, each of which exemplifies a [Pitch class](#), are ordered (for example, if one comes after the other), the 'ordered pitch-class interval' between them is obtained by subtracting the first pitch-class number from the second, modulo 12: this ordered pitch-class interval is 10 from E₁ to C₁ (1 minus 3) but 2 from C₁ to E₁ (3 minus 1). Where the two notes are considered as a pitch-class [Set](#), without order, the 12 possible ordered pitch-class intervals reduce to seven interval classes, usually numbered from 0 to 6, so that each class is denoted by the smallest ordered pitch-class interval that belongs to it. Thus the set {C₁, E₁} exemplifies interval class 2.

Intonation (i).

In plainchant, the initial melodic phrase usually sung solo by the priest or cantor before the other voices enter. In particular, the term is used for the phrases 'Gloria in excelsis Deo' and 'Credo in unum Deum' at the beginnings of the second and third sections of the Ordinary of the Mass, which are sung by the priest, and to the notes preceding the reciting note in the Gregorian tones. When the latter are used for the psalms, the intonations are sung only for the first verse (which is sung by the cantor alone, the choir joining in after the colon). Subsequent verses omit the intonation and start on the reciting note. For the *Magnificat* and *Benedictus*, the intonations are slightly more elaborate and are used in each verse. Nowadays the intonation is often first played quietly on the organ to give the correct pitch to the singer. See [Inflection](#), and [Psalm, §II](#).

GUY OLDHAM

Intonation (ii).

The treatment of musical pitch in performance. It is usually thought of as the acoustical and artistic accuracy of pitch in singing or playing, but it has an indispensable role in musical expression through the deliberate inflection of pitch to shade and colour melody, to create excitement or tension, or as a means of characterizing a particular repertory or style of performance. In contrasting the intonation of the violin virtuosos Joachim and Sarasate (quite different, as one may hear on recordings), Bernard Shaw (1893) could have been describing the intonational art of much of the world's music: '[T]he modes in which we express ourselves musically ... , though in theory series of sounds bearing a fixed pitch relation to one another, are in practice tempered by every musician just as the proportions of the human figure are tempered by a sculptor'. The sounding of a given series of musical intervals is subject to the laws of acoustics, but undergoes also an elusive, more or less subtle shaping (Shaw's 'tempering') not unlike the shaping of precise rhythmic values by *tempo rubato*.

The perception of intonation is influenced by a number of often inseparable factors besides the most obvious one, the relative pitch of a musical note in context. These include ambient acoustics, loudness and tempo; timbre plays a particularly critical role (see Sethares), but perhaps the strongest influence is the ear's expectation, which is created by prevailing, culturally determined intonational norms.

The intonational basis of Western art music has undergone two drastic structural shifts since the time of the earliest polyphonic music, the intervals of which were constructed from the pure 5ths (ratio 3:2) and octaves (2:1) of [Pythagorean intonation](#). The admission of the pure major 3rd (5:4), in use in the British Isles by the 13th century, was momentous, and the sensuousness of its sonority should certainly be considered a humanistic attribute (medieval music theory permitted only musical intervals generated

from the trinity of the first three integers, proscribing five, which generates the major 3rd, in part because in ancient numerologies – particularly that of Plato – five was the first ‘human’ number). The 5:4 major 3rd opened the way, through a transitional period (roughly the 14th century), for the triadic sonorities of [Just intonation](#) and its keyboard surrogate, [Mean-tone](#) temperament, which together dominated intonational theory and practice until the mid-19th century. The next shift, which began in the early 18th century, was from mean-tone intervals through various irregular keyboard temperaments to 12-tone equal temperament (see [Temperaments](#), §§6–8); the change was due largely to the increasing dominance of keyboard instruments with their limited number of fixed pitches. In the 20th century intonation was dominated by the conservatory standard of Pythagorean-shaded 12-equal, but after about 1950 became increasingly inclusive and reformist, under the influence of non-Western music and, especially, of the early-music movement, which brought about a return to just and mean-tone intonation, along with a growing understanding that no one intonational basis fits all Western music.

Melodic and harmonic considerations pull intonation in opposite directions: in melody, towards the brightness of Pythagorean tuning, with its small diatonic semitones, high sharps and low flats; and in harmony, towards the just tuning of vertical sonorities, giving wide diatonic semitones, low sharps and high flats in melody. Zarlino (1558, p.163) was one of the few theorists to write about the practical intonation of his time: ‘Voices ... seek the perfection of intervals ... [and] can tune intervals higher or lower as desired and through this bring to perfection any composition’. Singers accustomed to tuning pure harmonic triads usually make the quite small adjustments that are necessary to reconcile the conflicting intonational demands of 3rd, 5th and octave. These are not mechanical nor even necessarily rational adjustments, but require intonational flexibility (lucidly described by Lloyd, [Grove5](#)); the intervals of a Palestrina motet sung in tune cannot be captured in a table of interval ratios. Roger North’s observation of 1726 still rings true:

if the sounding part [of music] had bin left to the Voice, which conformes to all truth of accords, whereof the ear is judge, there never had bin any suspicion of such majors, minors, dieses, commas, and I know not what imaginary devisions of tones, as some clumsye mechanick devices called Instruments have given occasion to speculate.

These devices were nevertheless called upon to replicate the intonational beauty of vocal music, as witnessed by the various experiments with vastly expanded keyboards, such as Vicentino’s 36-note-per-octave *arcicembalo* of ?1555 (see [Enharmonic keyboard](#)). Even with only 12 to 14 keys per octave keyboard instruments were able to reproduce in mean-tone much of the colour and sonority of just tuning, if not the modulatory range of, say, the vocal works of Marenzio or of Gesualdo, which carry the implications of the intervals of the pure triad to the very limits of the ear’s comprehension. Plucked fretted strings (lute, vihuela, guitar, etc.) have always been able to simulate the sonorities of mean-tone intervals quite well, having a certain degree of intonational latitude even with non-adjustable frets. Guitarists

regularly make slight tuning adjustments in order to improve the intonation of one key or another.

By 1700 the influence of keyboard instruments was such that their fixed pitches began to replace the voice and the monochord as intonational arbiter. Traditionalists maintained with Quantz (1752: XVII.vi.20) that it was the melodic instruments that gave the intervals 'in their true ratios' and recommended that tempered keyboard instruments defer in performance in order to avoid clashes. Others, pre-eminently Marpurg and Sorge, insisted that all intonation should conform to that of the keyboard. Theoretical treatises and methods for instruments and voice show, nonetheless, that just/mean-tone continued through 18th century as the standard of intonation; the main evidence is the persistence of the traditional distinction between the diatonic and chromatic semitones (see Chesnut, 1977; Barbieri, 1991; Haynes, 1991). In contrast to this established practice, a return to Pythagorean intonation began toward 1800, introduced first by virtuoso violinists for the sake of a more brilliant sound.

The rise of musical amateurism among the middle class in the 18th and 19th centuries also had considerable influence on intonational practice. Some violin tutors, including those of Geminiani (1751) and Spohr (1832), suggested that amateur players need not distinguish between the diatonic and chromatic semitones. The traditional modes were consolidated into the simplified system of tonality, with its 24 major and minor keys. The motive force in tonality and its linear formal strategies was above all the dynamic effect of the dominant triad. The edgy, unstable 3rds and 6ths of 12-equal impart energy to the dominant triad through the 'leading note' (a tendentious term inappropriate for the sub-semitone in general), which does not lead so much as it is pushed by its irritable harmonic relation to the fifth degree of the scale. What is intonationally useful for the dominant function is, however, a liability for the major tonic triad, in which a semblance of repose is called for. The harshness of bare triads can be mitigated considerably by the addition of 6ths, 7ths, 9ths and so on, creating sonorities that became familiar in 20th-century music, for example in popular and jazz piano styles. The intonational defects of 12-equal can also be concealed by changes of timbre, adjustments of dynamic levels or the use of vibrato. Though known since antiquity, 12-equal became a musical reality only with the commercial success of the metal-frame piano, and with the institution of universal standardized measurement necessitated by 19th-century industrial technology. Many 19th- and 20th-century musicians and theorists, from Helmholtz and Stanford to Hindemith and Kodály, rejected 12-equal as musically deficient, criticizing its inflexibility and lack of intervallic variety, as well as the 'clouding' effect of its clashing harmonics and spurious difference-tones; just intervals were the intonational basis of John Curwen's widely successful Tonic Sol-fa system for teaching choral singing. As absolute values, however, the intervals of 12-equal gained a pre-eminent position in 20th-century music theory; Schoenberg wrote that he 'always requested *tempered* intonation', and defined the semitone as precisely half a tone, 'without any relationship to harmonic questions'.

Although unrecognized in mainstream music theory, intervals derived from the 7th and 11th harmonics are quite commonly encountered in Western

music (see [Harmonics](#), Table 1). It is not unusual for a minor 3rd (most often from the third to the fifth degree of the major scale) to be divided into two roughly equal three-quarter tones, which closely approximate the intervals between the 10th, 11th and 12th harmonics. This division occurs in the Highland bagpipe scale ([Bagpipe](#), §3 (i)), in the vocal and Hardanger fiddle tradition of Norway, in the so-called *Alphorn-fa* note in some yodelling styles (see [Yodel](#), §3) in some Irish traditional music practice, and in the music of parts of southeastern Europe (see *also* [Blue note](#)). The 7th harmonic (7/4) occurs as a considerably flattened minor 7th added to a major triad in a *cappella* barbershop-style close harmony and jazz-gospel vocal ensembles. The intonational characteristics of particular performance styles – including those whose music is notated – are always learned and transmitted aurally. The slight mistunings of unisons, whether intended or unavoidable, is often considered a musical asset, an enrichment or enlivening of the sound. This added vibrancy, which is a calculated effect in a few organ stops (*piffaro*, *unda maris*, for example), occurs naturally in a section of stringed instruments or voices.

DOUGLAS LEEDY (with BRUCE HAYNES)

Intonation (iii).

The German term for the ‘voicing’ of organ pipes, i.e. the final skilful and artistic shaping of the mouth and languid to give a beautiful tone quality. See [Voicing](#), §1.

GUY OLDHAM

Intonazione

(It.: ‘intonation’).

(1) An introductory piece for keyboard that sets the pitch for a following sacred vocal composition. It is distinguished from other such pieces (preludes, entradas etc.) by its close relationship to the Venetian toccata. The term first appeared in Andrea and Giovanni Gabrieli's *Intonazioni d'organo* (1593; ed. in Bradshaw, 1972), which contains eight *intonazioni* and four toccatas by Andrea Gabrieli and 11 intonations by Giovanni. The *intonazioni* begin with sustained chords, continue with embellishing passages in both hands, and end with written-out trills starting on the upper note. All 19 are based on ‘ideal’ psalm tones, and both composers arranged their sets in a modal series. Giovanni's *intonazioni* use all 12 modes (modes 3 and 4 are combined in one composition), and are shorter (five to nine *battute*) and less brilliant than Andrea's, which use the eight-mode system. Each of Giovanni's is also transposed up or down a 4th or 5th, giving the following scheme: D (transposed to G with one flat); G with one flat (D); E (A with one flat); C (F with one flat); F (B \flat with one flat); G (C with one flat); G (C with one flat); A (D with one flat); A (D with one flat); F with one flat (C); and C (F with one flat). Andrea's eight compositions, because of their greater length (12 to 16 *battute*) and virtuosity, are not

transposed, but have a similar modal plan (except that mode 6 has a flat): D, G with one flat, E, E, C, F with one flat, G, G.

Bernhard Schmid (ii) reprinted Andrea and Giovanni Gabrieli's *intonazioni* in his *Tabulatur Buch* of 1607 (though with confused attributions), but subsequent collections of *intonazioni* were rare. The Venetian style of the Gabrieli's was developed in the few surviving later publications. Three anonymous *intonationes cromatiche*, possibly by Tarquinio Merula, appeared in the manuscript Lynar A2 (*D-Bsb*; first half of the 17th century; ed. in MMI, i/1, 1961). They range from 25 to 36 *battute* and are made up of block chords with figurations embellishing chromatic harmonies, dissonances and suspensions. They are, in effect, embellishments of chromatic toccatas, and the last two *intonationes* have a central imitative passage. The modes used are 3 (E), 4 (A with one flat) and 9 (A).

The 11 *introiti* and one *intonatio* by Christian Erbach (ed. in CEKM, xxxvi/5, 1977) are in their expansiveness closer to Andrea Gabrieli's toccatas than to his *intonazioni*. Erbach's *Intonatio secundi toni* (G with one flat) is 88 *battute* long and consists of three continuous sections – a central imitative passage surrounded by virtuoso passages with much motivic exchange; it closely resembles a Venetian toccata. Johann Kindermann's two *intonationes* in his *Harmonia organica* of 1645 (ed. R. Walter, Altötting, 1966) are imitative compositions. The one on *Gib frid zu unser Zeit* begins with an eight-bar introductory pedal point leading into a contrapuntal setting of the melody's first phrase; the other is an imitative psalm tone setting of the *Magnificat 4 toni* (on A).

Sebastian Scherer published intonation cycles on the eight tones in his *Operum musicorum secundum* of 1664 (ed. A. Guilmant, Paris, 1907/R), each tone having four separate settings, giving 32 intonations in all. The opening setting usually has chords surrounded by virtuoso passage-work and motivic writing; the second setting is a fugato; the third is like a chromatic toccata with sustained chords, suspensions, dissonances and occasional imitative writing; and the fourth is a fugato with dance-like rhythms. Although described as 'breves', the intonations average over 20 *battute* each. They are arranged according to the old church modes: D, G with one flat, A, E, C, F with one flat, G, G.

A single *Intonatio sexti toni* by Franz Provintz appears in a manuscript dated 1675–6 (*F-Pn Vm*⁷1817) and in its 'rows of diminutions' shows an Italian influence (Pirro). F.X. Murschhauser included two short *intonationes*, along with preludes and fugues, in his *Prototypon* (1703). The first, on D, is made up of broken chords, and the second of virtuoso display passages over a pedal point on G. Each is only ten *battute* long.

The ease with which organists could improvise such compositions, as well as the ease with which other genres, such as *Magnificat* fugues could assume the same introductory function (Nolte), account for the small number of *intonazioni* that have survived. Notated *intonazioni* were sophisticated realizations of a very simple improvisatory technique – the playing of a few chords to give pitch and mode to the singers. Both Banchieri (*L'organo suonarino*, 1605) and the anonymous author of the *Wegweiser* (1698) gave only a series of figured basses for their *intonationes*, to which performers undoubtedly added solid chords and, if

their skills allowed, *passaggi*. As late as 1739, Mattheson (*Der vollkommene Capellmeister*) noted that *intonationes* are 'best with only a few full chords, although certain broken chords moving up or down, or down or up, can also be used'. He added that 'they must as much as possible be unconstrained and played without marking the beat'.

MURRAY C. BRADSHAW

Intrada [entrada]

(from Sp. *entrada*).

An instrumental piece, generally for an ensemble, used to announce or accompany an entrance, to inaugurate some festive event, or to begin a suite. Intradas were also sometimes found within suites followed by a courante or a galliard, and *Kirchen-Intraden* served as intonations for choral pieces (e.g. those by Michael Altenburg, 1620). The term seems first to have been used in the sense of a contrapuntal entry, as in Valderrábano's *Fantasia sobre la entrada de una baxa* (*Silva de sirenas*, 1547), but shortly afterwards it is found with the meaning of a polyphonic prelude in Venegas de Henestrosa's *Libro de cifra nueva* (1557).

The term was also used for the stock piece that preceded and concluded the performance of a trumpet ensemble sonata during the 16th and early 17th centuries in Italy, the Holy Roman Empire and Scandinavia, as well as for a monophonic piece otherwise known as a toccata (see [Signal \(i\)](#) and [Tuck, tucket](#)). The trumpet ensemble equivalent of the instrumental intrada appeared towards the end of the 16th century but was known as the *Aufzug* (See [Aufzug \(i\)](#)). The influence of the *Aufzug* is seen in a collection consisting exclusively of five- and six-part intradas published in Helmstaedt in 1597 by Alessandro Orologio, an Italian trumpeter active in various German cities. Reimann divided the secular intrada as cultivated in 17th-

century Germany into four types: a processional type in march rhythm with fanfare motifs and repeated notes; a slower and more solemn pavan type; a faster dance type in triple metre; and a song type, homophonic and of a popular cast. Intradas are found later in collections of orchestral suites. Related types occur in Italy, France and England in connection with ballet and ballroom dances (Purcell's 'entry-tunes' and 'trumpet tunes', Italian *balli*, and the entrées of the French *ballet de cour*). The intrada went out of fashion towards the end of the 17th century, though the term continued to be applied sporadically by such composers as Gluck (*Alceste*), Mozart (*Bastien und Bastienne*) and Beethoven (op.25).

Intramède.

See [Intermède](#).

Introduction (i)

(Eng. and Fr.; Ger. *Einleitung, Eingang*; It. *introduzione*).

Term applied to the preparatory bars, generally in slow tempo, that are sometimes prefixed to extended quicker movements. Although chiefly associated with music of the Classical period the concept is much older than that. In Lamentations settings, for instance, the words 'Incipit lamentatio Jeremiae prophetae' are sung at the outset in a passage functioning as the musical equivalent of an illuminated title-page, designed to introduce the Lamentations proper (see for example those of Weerbeke (1506), GMB, p.54). In the Passions and other large-scale works of Schütz an Introitus fulfils the same function, although in the *Historia ... der Geburt ... Jesu Christi* this is actually headed 'Introduction oder Eingang'. Matthew Locke developed a similar feature in his chamber music (MB, xxxi, xxxii), with brief introductory passages to a number of the fantasias which, in conjunction with balancing conclusions, are used to articulate the formal design in some of his consort sets.

In the Classical period an introduction (comparatively rare in a minor-key work) might consist of anything from a chord or two functioning primarily as a call to attention, to a lengthy section with a definite thematic content developed and extended within an appreciable form. The first kind, found in several of Haydn's quartets (e.g. opp.71 no.3 and 76 no.1), had been used in the trio sonatas of Corelli (e.g. op.4 no.10) and had not outlived its usefulness even by the time of Beethoven's 'Eroica' Symphony. In Haydn's

Quartet op.71 no.2 the introduction is not a few chords but a complete phrase, and this development is carried much further in many of his London symphonies. The introduction to no.99 in E \flat for example, embraces clear thematic contrasts and a degree of development in its binary structure. It retains the essential characteristics of an introduction, however, in that its tonal scheme is completed only when the music is precipitated into the ensuing Vivace assai. Introductions on this extended scale are found in many of Mozart's orchestral divertimentos and serenades and in his Symphonies nos.36, 38 and 39; his 'Symphony no.37' is a symphony by Michael Haydn to which Mozart added a slow introduction. Beethoven's Symphonies nos.1, 2, 4 and 7, most of Schubert's, Mendelssohn's Third and all of Schumann's have introductions. Thematic relationships between the introduction and ensuing quick movement, evident in Haydn's Symphonies nos.97 and 103 (and already foreshadowed in miniature in the Corelli trio sonata previously mentioned), became more frequent. In Beethoven's *Pathétique* Sonata, phrases from the introduction recur during the course of the Allegro. Later, Tchaikovsky, in his Fourth and Fifth Symphonies, presented motto themes in the introductions which reappear not only in the movements that immediately follow but also in later movements. Finales too are sometimes preceded by an introduction (e.g. several Mozart serenades and his G minor String Quintet, Beethoven's First Symphony, Schubert's Octet, Brahms's Symphony no.1 and his Piano Quintet). The introduction became a common feature of the overture during the late 18th century and the 19th and sometimes appeared in piano sonatas and chamber works, particularly those conceived on a large scale; its advent has been associated with the rise of the public concert.

Sets of variations have often been provided with introductions which may or may not anticipate the theme to be varied (e.g. Beethoven's 'Kakadu' op.121a for piano trio, Chopin's on 'Là ci darem' op.2 for piano and orchestra and Dohnányi's Variations on a Nursery Song op.52 for the same forces); introductions to Strauss waltzes generally foreshadow some of the waltzes themselves and furnish material for the coda (e.g. *Geschichten aus dem Wienerwald*). Sometimes a work that is basically a single movement is given an increased stature by the provision of an introduction on a considerable scale (Schubert, Introduction and Rondo op.145 for piano; Chopin, Introduction and Polonaise for cello and piano op.3; pieces entitled 'Introduction and Allegro' by Schumann, Elgar and Ravel).

The term 'introduzione' is found in Beethoven's op.35 piano variations and in the Waldstein Sonata (where the section concerned effectually stands in place of the slow movement); Schumann's F \sharp minor Piano Sonata and Bartók's First String Quartet and Concerto for Orchestra provide further instances. Although the opening pages of *Tristan und Isolde* are often referred to as the 'Prelude', Wagner's score is actually headed 'Einleitung' here and in the other acts. Haydn's 'Representation of Chaos' in *The Creation*, a piece which anticipates Wagner's procedures in several respects, is similarly captioned.

In arias, songs and concertos instrumental passages or ritornellos preceding the entry of the soloist are sometimes loosely called 'introduction'.

MICHAEL TILMOUTH (1), JULIAN BUDDEN (2)

Introduction (ii).

In opera, a title often given to the opening number when it involves more than two characters. It could be more or less complex in structure: it became particularly elaborate in the hands of Rossini (*Il barbiere di Siviglia*, 1816, and *Semiramide*, 1823), but during the first half of the 19th century the commonest formula was that of the 'Introduzione e cavatina', consisting of an opening chorus, a recitative and 'cantabile' for the soloist, a *tempo di mezzo* with dialogue and finally a cabaletta with choral support (after which the stage empties). Examples include Donizetti's *Maria Stuarda* and *Lucia di Lammermoor*, Verdi's *Ernani* and *Il corsaro*, and Mercadante's *Il bravo*. With the rise of Italian grand opera in the 1870s the *introduzione* ceased to exist as a formal unit. A rich parody, however, is to be found in Sullivan's *The Gondoliers* (1889).

Introdutta

(It.).

See [Intermedio](#).

Introit (i)

(from Lat. *introitus*).

The first of the Proper or variable chants of the Mass. It is sung, as its name suggests, during the entrance of the celebrant and his ministers at the beginning of the Mass.

1. [Definition](#).
2. [Origins](#).
3. [Repertory and texts](#).
4. [Musical style](#).
5. [Later history](#).

JAMES W. MCKINNON

[Introit \(i\)](#)

1. Definition.

The 8th-century *Ordines romani* describe the introit as an antiphon and psalm that was sung by the Schola Cantorum as the pope moved in procession down the centre of the basilica from the secretarium (a room near the entrance where he vested) to a position before the main altar. According to *Ordo romanus I*, when the pope arrived at the altar he nodded to the singers, who then broke off chanting the psalm to conclude with the

Gloria Patri and a final repetition of the antiphon. Outside Rome, in subsequent centuries, the practice of singing a full psalm was replaced by the singing of a single verse, the probable reason being that the celebrant approached the altar from a sacristy in the vicinity of the sanctuary rather than from the secretarium at the church's entrance as at Rome. The verse sung was generally the first available from the relevant psalm, for example, the second verse if the antiphon itself derived its text from the first verse, or the first verse if the antiphon used a later verse or a text from some other source. A frequently encountered peculiarity in the early history of the introit is the *versus ad repetendum*, that is, the repetition of the one of the psalm verses after the *Gloria patri* and before the final repetition of the antiphon.

Introit (i)

2. Origins.

There is no evidence for the existence of the introit or of any other entrance chant in the Mass of the early Christian period. On the contrary there are passages from both St John Chrysostom in the East *In epistolam ad Colossos* (Homily III.4) and St Augustine in the West (*De civitate Dei*, xx.8) that describe the ceremony as beginning immediately with the readings after a brief greeting from the celebrant; Augustine spoke of a crowded church on the morning of Easter: 'I greeted the throng, and when all had become silent there was solemn reading from the Holy Scriptures'. It was not until the late 5th or early 6th century that an entrance chant, the Trisagion, was introduced at Constantinople. In subsequent centuries the Trisagion came to be preceded by a set of three Ordinary antiphons, and was itself replaced on feasts of the Saviour by the antiphon *Hosoi eis Christon*, and on feasts of the Holy Cross by *Ton stauron*, but Constantinople never adopted the Roman practice of a Proper chant that varied with each date in the calendar. As for Rome, it was long thought that a passage in the *Liber pontificalis* described the introduction by Pope Celestine I (d 432) of an antiphonal introit psalm: 'Constituit ut psalmi David CL ante sacrificium psalli antiphonatim ex omnibus, quod ante non fiebat, nisi tantum epistula beati Pauli recitabatur et sanctum Evangelium'. The passage, however, was edited in the second quarter of the 6th century (with the addition of 'antiphonatim ex omnibus') to reflect the practice of that time, and more importantly appears to refer to the gradual psalm rather than to the introit.

It is not known, then, precisely when the introit was introduced at Rome, only that it was some time before the end of the 7th century; *Ordo romanus I* shows it well established in the stationary liturgy by then. Its origins are a matter for conjecture. In all probability its introduction is somehow related to the stationary liturgy, fulfilling the need to provide a musical accompaniment to the solemn entrance of the pope into the stationary church of the day; while the form that it assumed, that is, an antiphonal psalm, may have been influenced by the antiphonal psalmody of the Roman basilican monasteries.

An entrance chant of some sort came to be adopted in virtually all the early medieval Western liturgies. The *Expositio* of Pseudo-Germanus, describing, it is thought, an early 7th-century Burgundian liturgy, mentions

an *antiphona ad prelegendum* without further description. This liturgy displays both Eastern and Hispanic traits so that the *antiphona* in question might have been either an Ordinary item like the Byzantine chant or a Proper item like the Mozarabic chant. The Mozarabic entrance chant, the *officium*, is similar to the Roman in that it has a large repertory of Proper antiphons sung in conjunction with psalm verses. The Ambrosian *ingressa* (as well as its Beneventan counterpart of the same name) was also a Proper antiphon, but it lacked the accompanying psalm verses.

[Introit \(i\)](#)

3. Repertory and texts.

There is a 'core repertory' of 145 introits, that is, those chants that were both in use at Rome during the mid-8th century and adopted at that time by the Franks. Additionally, there are four Roman introits that do not appear in the earliest Frankish sources, and six others that make their first appearance in the 9th-century Frankish manuscripts (see §5 for a discussion of these ten chants).

Introits have a fairly high proportion of non-psalms; they are surpassed in this respect within the Mass Proper only by the [Communion](#). Of the 145 core repertory chants, 101 have psalms and 44 non-psalms, one of which, *Salus populi*, can be classified as non-biblical, even if it is inspired by the language of the psalms. Within the *Temporale* 31 chants have non-psalms and 70 psalms. The non-psalms are concentrated especially within the two major festal portions of the ecclesiastical year, the Advent–Christmas season and Paschaltide. In the Advent–Christmas season there are ten non-psalms and only eight psalms introits, and during Paschaltide ten non-psalms and 11 psalms (including one on the penitential date of the Greater Litany). Of the 37 Lenten introits (including those of Septuagesima, Sexagesima and Quinquagesima Sundays) only six are non-psalms, all of which appear on days of special significance: *Misereris omnium* (*Wisdom* xi.24–7) on Ash Wednesday; *Laetare hierusalem* (*Isaiah* lxvi.10–11) on Laetare Sunday, a day of rejoicing during Lent; *Nos autem* (*Galatians* vi.14) and *In nomine Domini* (2 *Philippians* xviii.8 and 7) during Holy Week; and *Dum sanctificatus* (*Ezekiel* xxxvi.23–6) and *Sitientes venite* (*Isaiah* xv.1) on days associated with the pre-baptismal *Scrutinium*.

It would seem, then, that non-psalms were generally chosen for the introits of dates of particular significance, a pattern that can be observed also within the *Sanctorale* with chants such as *De ventre matris* (*Isaiah* xlix.1–2) on the feast of St John the Baptist and *Scio cui credidi* (2 *Timothy* i.12) on the feast of St Paul. The use of non-psalms for dates of special significance raises an interesting chronological question. Peter Wagner maintained that non-psalms introits were generally older than psalms ones because they appear on the most venerable feast days of the calendar. More recently, however, liturgical historians such as Antoine Chavasse have tended to look upon chants of the Mass Proper with non-psalms texts as representative of a later chronological layer. Yet it could be that in the case of introits neither position is applicable. If, as might well be the case, the bulk of the introit repertory was created after the time that non-psalms texts had come into regular use for chants, then the

employment of non-psalms might be entirely lacking in chronological significance and might simply indicate the greater care taken in selecting texts for dates of special significance.

Introit (i)

4. Musical style.

The introit psalm verse is sung to a set of eight psalm tones that are generally similar to those of Office psalmody but somewhat more elaborate. The first half of the verse, like a verse of Office psalmody, has an opening intonation figure and a closing cadential figure; while the second half of the verse, in this case unlike Office psalmody, has an opening figure in addition to the closing figure. (Some manuscripts provide closing figures of trope-like elaboration for special occasions.) The introit psalm tones are applied in a unique tri-partite manner to the concluding *Gloria Patri*. The middle part of the text, 'sicut erat in principio et nunc et semper', begins with the opening figure of the second half of the tone but ends with the closing figure of the first half. Communions and introits share this same set of psalm tones.

The Gregorian introit melodies are remarkably homogeneous in style; they do not vary in length nearly so much as communion antiphons, neither do they manifest the same degree of variation in melodic elaboration. Rather, they display a consistently neumatic style, with groups of between two and five notes on considerably more than half of a text's syllables. Thus they are much more elaborate than the typical Office antiphon, where the majority of the syllables are set to a single note.

Most introits have groups of repeated notes, either on F or, more often, on the C above. Observing this phenomenon and noting that several of the introit psalm tones recite on C, Apel was prompted to seek the origins of the introit antiphon in its psalm tone. However, F and C are the only notes subject to this sort of repetition, even when an introit's psalm tone recites on some other pitch, for example, on A. This would seem to suggest that F and C are pitches of special significance, whatever the mode of an introit, each functioning as a sort of tonal horizon. And the fact that several of the psalm tones recite on C would seem only to highlight the tonal significance of that pitch. This conclusion does not entirely preclude some sort of fundamental musical relationship between an introit antiphon and its psalm tone, but it does make it unlikely that the antiphon melody evolved as an elaborated psalm tone, particularly since the outline of the psalm tone, namely, a pair of recitative-like phrases, each with an opening and closing figure, is not at all apparent in the typical introit.

Connolly, also searching for the introit antiphon's musical origins, conducted a thorough comparison of the Old Roman and Gregorian melodies. He confirmed the general belief that the two bodies of chant were fundamentally related, but made the further observation that Old Roman introits were considerably more formulaic. He concluded from this that the Old Roman melodies, in their presently preserved state, must be closer than their Gregorian counterparts to the original melodies, which, he maintained, must have been still more formulaic in character. It may, however, be equally plausible that the Roman melodies, in the course of more than three centuries of oral transmission, lost a considerable

measure of their variety and individuality, as different generations of singers sought to maintain control over the repertory.

The individuality of the Gregorian introits may be their most remarkable trait. All 145 melodies of the core repertory are unique, that is, no melody is shared by two or more chants, even if there is a strong resemblance between the opening portions of *Da pacem* and *Statuit*. It is true that many introits share opening and cadential formulae; several mode-1 introits, for example, begin with the striking figure illustrated in [ex.1a](#); while the closing cadential figure of *Domine in tua* illustrated in [ex.1b](#) is found in several mode-5, 6, 7 and 8 introits. Such formulae, however, are encountered not only in introits but in most chant genres. 'Formula', perhaps, is not the best term for them; they might better be described as 'motifs' that serve to make up the common melodic language of Gregorian chant.

To summarize the musical evidence of the core repertory, it might be said that introits are puzzling by their very perfection; they lack the peculiarities of the other items of the Mass Proper that provide internal evidence of chronological layering. They are homogeneous in style, yet each is an individual melody. There is, moreover, a uniquely assigned introit for virtually every date in the *Temporale* and for a large proportion of the *Sanctorale*; this is a quality shared only with communions, whereas graduals, alleluias and offertories require much internal sharing to complete their annual cycles. And while the authors of the communion *Temporale* and *Sanctorale* resorted to the strategem of borrowing substantial numbers of Office responsories and antiphons, every introit appears to have been created with only a single purpose in mind. The mark of this borrowing by communions is the stylistic heterogeneity that the communion genre manifests in contrast to the introit's stylistic homogeneity. The individuality of each introit melody distinguishes the genre from graduals and especially from alleluias with their substantial use of model melodies. And finally introits lack entirely the sort of musical and textual layering that characterizes at least some portion of more than one of the other genres' annual cycles: for example, the alleluia's consistent use of its model melodies, particularly the *Dies sanctificatus* type, during Christmastide and on Paschaltide festal dates; the gradual's sequence of mode-2 followed by mode-5 melodies during the Advent–Christmas season; and the communion's use of Prophetic texts during Advent and on Christmas Day, and its sudden change to gospel texts for the post-Christmas dates. If such peculiarities of the other items of the Mass Proper indicate chronological layering, perhaps it can be said that their total absence in the introit suggests that the final state of the genre – whatever its use of earlier material – was achieved as the result of a single concentrated creative effort.

[Introit \(i\)](#)

5. Later history.

In addition to the 145 core repertory introits there are four Roman chants that do not appear in the earliest Frankish sources and six in the early

Frankish sources that were added to the Roman corpus. The four Roman chants are *Deus Israhel* for the Missa sponsalica (Nuptial Mass); *Rogamus te Domine* for the Missa pro defunctis (Mass for the Dead); *Benedicet te hodie* for the Ordinatio episcoporum; and *Elegit te Dominus* for the Ordinatio pontificorum. The latter two chants, while absent from the very earliest (unnotated) Frankish sources, begin to make their appearance in manuscripts of the late 9th century (both appear, for example, in the Silvanectensis manuscript of Hesbert's *Antiphonale missarum sextuplex*). In the following centuries, however, their appearance remains sporadic, suggesting that they never became part of the standard repertory. The other two chants, *Deus Israhel* and *Rogamus te Domine*, are even less well represented in the Frankish and later Gregorian sources. *Deus Israhel* is entirely absent from the published sources. *Rogamus te Domine*, while absent from the unnotated 9th-century graduals, does make an appearance in a small minority of Gregorian manuscripts; among the published sources it can be found in non-diastematic notation in *F-CHRm* 47 and *I-Ra* 123, and in diastematic notation in *I-BV* 40. The presence of *Rogamus te Domine* in scattered 10th- and 11th-century manuscripts, when considered in view of its absence from 9th-century Frankish manuscripts, raises interesting questions of transmission.

More interesting, perhaps, are the six chants added by the Franks to accommodate their expansion of the Roman liturgical calendar: *Benedicta sit* for the feast of the Blessed Trinity; *Memento nostri* for the fourth Sunday of Advent; *Narrabo nomen tuum* for the Vigil of the Ascension; *Omnes gentes* for the Vigil of Pentecost and the seventh Sunday after Pentecost; *Probasti Domine* for the Octave of Saint Laurence; and *Sicut fui* for the Natale pontificorum. The least problematic of these is *Benedicta sit*, a very precise contrafactum of *Invocabit me*, the introit for Quadragesima Sunday; it was added to the repertory in the 9th century as introit for the newly created feast of the Trinity and appeared thereafter in virtually all Gregorian sources. Its prominence has influenced some scholars to state that all new Frankish introits were similarly adapted from pre-existent chants, but this is not the case. There is no contrafactum for *Memento nostri*, the introit for the fourth Sunday of Advent, a chant made necessary by the addition of this Sunday (a 'Dominica vacat' at Rome) to the Frankish liturgy; neither is there one for *Omnes gentes*, even though its opening phrase has the same melody as the opening phrase of *Viri Galilei*, an early Frankish offertory for the Ascension.

Memento nostri and *Omnes gentes*, while both apparently original Frankish melodies, display different degrees of melodic stability in the later sources. It might be assumed that Frankish additions to the repertory would be less stable than items from the original repertory. *Omnes gentes*, however, is remarkably stable, while *Memento nostri*, though appearing consistently with substantially the same melody, manifests considerably more melodic variation than the typical introit. Various hypothetical explanations for this difference may be proposed, for instance, that the exceedingly clear tonal orientation of the mode-6 *Omnes gentes* assured its stability, or that its earlier establishment in the repertory than *Memento nostri* did so. *Probasti Domine*, however, the introit for the Octave of St Laurence, conforms to neither of these explanations. It appears in the earliest Frankish sources, manifests a clear mode-7 tonality, and is even based upon an earlier chant,

the introit *In virtute tua* for the feast of St Valentine. Yet it is radically unstable in the later sources, with at least three distinct melodies, or, perhaps better, three different arrangements of the same typical mode-7 phrases (the beginning of each is illustrated in [ex.2](#)).

Sicut fui, introit for the Natale pontificorum, has a similar history in the Gregorian sources to that of the Frankish-Roman *Benedicet te hodie* for the Ordinatio episcoporum and *Elegit* for the Ordinatio pontificorum; appearing first in the late 9th century, it is found thereafter only sporadically. That the three chants have similar assignments, namely, as common chants for either episcopal or pontifical occasions, suggests that there might be some liturgical reason for their similar histories. *Narrabo nomen tuum*, finally, is a curiosity among the Frankish additions to the introit repertory. It appears within the early unnotated sources only in the eccentric Rheinau manuscript, where it serves as the introit for the Vigil of the Ascension instead of the more usual *Omnes gentes*. Its melody may be lost since the only published source that has it is the non-diastematic *I-Ra* 123.

Intros continued to be added to the repertory after the 9th century, largely to accommodate new sanctoral dates and votive Masses. There is considerable regional variation, however, in the number of additions. Sources that follow the East Frankish tradition, for example, provide virtually no intros beyond those added by the mid-9th century, while Beneventan and especially Aquitanian sources supply them in abundance. *Salve sancta parens* for the votive Mass of the Virgin Mary makes its appearance in a large number of 11th- and 12th-century sources. It is very closely modelled on the introit for the Epiphany, *Ecce advenit*, which, again, has prompted some to conclude that late intros were generally contrafacta of chants from the core repertory. However, the majority of the later intros were newly composed, and those that are based on earlier models, for example, *Vir Dei benedictus* (the mode-6 version) on *Os iusti* and *Domine dilexi decorem* on *Domine ne longe facias*, do not follow their models as precisely as does *Salve sancta parens*.

The history of the plainchant introit in the later Middle Ages and the Renaissance has yet to be written; it is not possible to venture even the broadest generalizations about it. Among the later developments involving the introit, the most significant may have been the composition of introit tropes, a practice that flourished between the 10th and 12th centuries.

During the 15th and 16th centuries German composers in particular created polyphonic settings of the Mass Proper that included introits; the most outstanding examples of these were collected in the *Choralis constantinus* of Heinrich Isaac. More common, perhaps, were transcriptions of the Gregorian introits into the vernacular by reformist congregations; there are German, English and Finnish examples of this practice, and most notably Czech examples produced by the Utraquist party (see the splendidly illuminated manuscript *A-Wa 15503*). It is worthy of mention, finally, that from the Middle Ages into modern times the Sundays of the ecclesiastical year were frequently referred to by reference to their introit – thus Laetare Sunday or Quasimodo Sunday.

Introit (ii)

(from Lat. *introitus*).

Vocal polyphonic introits are not very common, but there are English examples from the Middle Ages, for example in the Worcester Fragments (ed. in MSD, ii (1957), nos.9, 64, both troped settings of *Salve sancta parens*). There are 15th-century settings from the Continent, for example in plenary masses such as Du Fay's *Missa Sancti Jacobi* and in the Trent codices, which include a lengthy cycle of Propers (*I-TRmn* MS 88, 113v–220r, with some interruptions, a total of 14 cycles). It is almost always present in requiem masses, frequently being joined to the Kyrie in post-Renaissance examples (e.g. Mozart, Verdi).

The instrumental introit replaces all or part of the sung liturgical introit of the Mass. Usually the plainchant of the antiphon was set in full as an organ piece, leaving the psalm verse and the doxology to be sung in plainchant. It is not clear whether the organ piece was meant to replace only one performance of the antiphon or two or three. There are three such settings in the Buxheimer Orgelbuch (see [Sources of keyboard music to 1660](#), §2(iii)), all for Marian votive masses. From the 16th century there are a number of examples in Hans Buchner's *Fundamentum* and in the tablature of Jan z Lublina; a Warsaw manuscript of about 1580, now surviving only in

a photographic copy, contained no fewer than 47. The form was little cultivated in France and Italy, and only one English example has survived. This piece (EECM, x, 20) is part of Thomas Preston's Easter Sunday Mass. The antiphon *Resurrexi* is first set in two parts with the plainchant heavily ornamented in the bass. The organ then answers the singers with the second half of the following psalm verse in a three-part setting with the plainchant in the middle. The Sarum rite at that point required the repetition of the antiphon before the doxology; both were probably intended to be sung in plainchant. A four-part setting of the antiphon concludes the piece.

Introit plainchants have only rarely been set since the 16th century. In Frescobaldi's *Fiori musicali* (1635) short introductory toccatas take the place of the introit. In the High Mass of the 17th and 18th centuries the introit, spoken by the priest, was often covered entirely by an elaborate (vocal) setting of the Kyrie. It re-emerged as an instrumental form, however, with the development of organ accompaniments to Low Mass, for which Liszt and Kodály provided short movements. The typical French 'organ mass' suites of Tournemire and others always begin with an introductory movement for the entry of the ministers, a distinguished example being that in Messiaen's *Messe de la Pentecôte* (1949–50). See also [Organ mass](#).

Invention.

Usually a short vocal or instrumental piece with no very special defining characteristics apart from novelty of material or form. The concept of *inventio* (Lat.) or *inventione* (It.), initially through the influence of writers on rhetoric, is not infrequently met with in musical treatises of the Renaissance, where it may refer either to the 'discovery' of music as such (Tinctoris, *De inventione et usu musicae*) or to the processes of its composition. An early example of its use for a collection of works is

Janequin's *Premier livre des inventions musicales ... contenant La Guerre ...* (1555). Italian examples are found in Cesare Negri's *Nuove inventioni di balli* (1604), Biagio Marini's *Sonate, symphonie ... con altre curiose e moderne inventioni* (1629) and in many later works, including Bonporti's *Invenzioni da camera* for violin and continuo (1712), which were copied by Bach (whose own inventions, however, owe nothing to them formally). It is sometimes used merely as an abstract noun (Vivaldi: *Il Cimento dell'armonia e dell'invenzione*, 1725) and sometimes as a collective noun (Viadana: *Cento concerti ecclesiastici ... nova inventione commoda per ogni sorte de cantori, e per gli organisti*, 1602). The earliest English example, for a specific piece, seems to be Dowland's 'Invention ... for two to playe upon one Lute' (*First Booke of Songs or Ayres*, 1597). The German word is 'Invention', but German composers often preferred the Latin form 'inventio', as in the preface to Kuhnau's *Frische Clavier-Früchte* (1696).

The word has obvious affinities with 'ricercare', with its connotation of 'seeking out' or 'finding', and it has been pointed out that certain textless ricercares of the 16th and 17th centuries, intended for practice in singing, may well be considered, in a sense, ancestors of Bach's inventions. Bach also preferred the Latin form, applying it ultimately to the 15 pieces in two-part counterpoint which he had originally called 'preambulum' in the *Clavier-Büchlein vor W.F. Bach* (1720). Two other autograph copies (one dated 1723) are known; in these the usual title is found. In addition there are found in all three manuscripts the 15 works in three-part counterpoint, originally called 'fantasia' and subsequently 'sinfonia'. It is convenient to consider these at the same time, since they are frequently referred to colloquially as inventions, together with a number of other keyboard works in two-part counterpoint, including the four duettos from the *Clavier-Übung*, part iii.

The title-page of the 1723 manuscript reads in translation:

Straightforward instruction, whereby lovers of the keyboard, and especially those eager to learn, are shown a clear method, not only (1) of learning to play distinctly in two parts, but also, after further progress, (2) of managing three obligato parts correctly and satisfactorily; and in addition not only of arriving at good original ideas [*Inventiones*] but also of developing them satisfactorily; and most of all of acquiring a cantabile style of playing while at the same time receiving a strong foretaste of composition.

Thus the works serve the dual purpose of providing technical practice and demonstrating the composer's art. The title 'inventio' may well stem from Bach's use of this word in his preface to denote 'original ideas'.

The key sequence of the 15 works in both sets is identical: C, c, D, d, E \flat ; E, e, F, f, G, g, A, a, B \flat ; b. There were lacking in this ascending order only another nine keys to arrive at the full set of 24 used in *Das wohltemperirte Clavier*, a scheme on which Bach was engaged at the same time.

The first four inventions and the eighth begin with imitation at the octave below; no.10 begins with imitation at the 11th below, while all the others

begin with both parts simultaneously. Only no.6 is in two repeated sections, but Bach made nos.8 and 10 fall particularly clearly into two halves by repeating their opening imitative passages in inversion in the dominant key. Double counterpoint is used extensively, but always unobtrusively and without pedantry. From all this it can be seen that there is no one 'invention form' for Bach and that the title has been applied to these little masterpieces quite casually.

The sinfonias are predominantly fugal, though in no case does a single part enter with the subject alone. Nevertheless nos.1, 3, 4 and 7–14 all begin with subject, answer and subject in the manner of a fugal exposition. No.6 differs only in that its second and third entries are both in the dominant, while in nos.2 and 15 there are only two entries, both in the tonic. No.5 is exceptional in that the imitation is confined to the upper two parts throughout over an ostinato bass. Most of them employ a certain amount of triple counterpoint, but the device is used extensively only in no.3, where the subject and two countersubjects are used in all six of their possible inversions, and in no.9, where four of the possible combinations are employed for the three themes.

The four duettos from part iii of the *Clavier-Übung* are much longer pieces with either fugal or concertante implications or both. The first, in E minor, which is in double counterpoint, has strong affinities with the Courante from the sixth Partita. The second, in F, is a da capo movement which is also a fugue, and no.4, in A minor, is a fugue too. A number of movements from the partitas are in two-part counterpoint, of which the Fantasia in no.3 is in ritornello form, though it is treated with a good deal of freedom. Finally, in the E minor fugue from book 1 of *Das wohltemperirte Clavier* there is a solitary example of a two-part fugue.

The term 'invention' has occasionally been revived in modern times, either to denote a composition in two-part counterpoint or in a more general sense (e.g. Blacher, *Zwei Inventionen für Orchester*, op.46). The most interesting examples are the 'inventions' (not so called in the score but sanctioned by Reich) in the third act of Berg's *Wozzeck*: on a theme (i.e. a theme, variations and fugue, bars 3–70), a note (bars 71–121), a rhythm (bars 122–218), a chord (bars 220–319), a key (bars 320–71) and an ostinato movement in quavers (bars 372–92).

JOHN CALDWELL

Inventionstrompete

(Ger.).

Generic term used from the mid-17th to the mid-19th centuries to refer to a trumpet provided with some kind of mechanism designed to increase its performing compass (see [Trumpet \(ii\)](#)). Similarly, the *Inventionshorn* was a horn provided with a system of sliding crooks to alter the pitch of the instrument; it was conceived by A.J. Hempel and first built in about 1753 (see [Horn, §2\(iii\)](#)).

Invernici [Invernizzi], Ottavio.

See [Vernizzi, Ottavio](#).

Inversion

(Ger. *Umkehrung*).

(1) The rearrangement of the notes of a chord built in 3rds so that the lowest note is not the root of the chord. [Ex.1](#) shows the three positions of the C major triad, each in both close and open spacings. If the lowest note of the chord is the 3rd of the triad it is said to be 'in first inversion' (see [Sixth chord](#)). If its lowest note is the 5th, then it is 'in second inversion' (see [Six-four chord](#)). The inversion of triads can be extended to 7th chords, where an extra position of the chord – 'third inversion', with the 7th as lowest note – is possible ([ex.2](#)). Much the same can be applied to 9th chords. In Roman numeral chord notation (see [Harmony, §2\(ii\)](#)), inversions are indicated by arabic numerals or letters: in a C major context, for example, the three chords in [ex.1](#) are either I, I6 and I6-4 or I, I_b and I_c, while [ex.2](#) shows I7, I7_b, I7_c and I7_d.

(2) The complement of an interval with respect to some fixed interval often assumed to be an octave. Within an octave, a 2nd inverts to a 7th, a 3rd to a 6th, a 4th to a 5th and vice versa; within a 10th, a 2nd inverts to a 9th, a 3rd to an octave, etc. This type of inversion is the basis of [Invertible counterpoint](#), where the functioning of different polyphonic parts as the bass part is dependent on the consonant intervals between them inverting to other consonant intervals.

(3) The mirroring of a succession of notes about a fixed note, usually the first note or interval in the succession of the most easily identified form of inversion because of its association with melodic contour. It is a common

feature of contrapuntal music, since it offers new thematic combinations, for whose workability a structurally sound original is usually a necessary and sufficient condition. For some writers the discipline of invertible counterpoint also includes counterpoint based on thematic inversion. This type of inversion has been extended by the theory of [Twelve-note composition](#) to include the inversion of the 12 pitch classes making up a set about a fixed pitch class. Thus the set used at the beginning of each movement of Schoenberg's Suite op.25, shown in [ex.4a](#), yields the set given in [ex.4b](#) when inverted about its first note.

WILLIAM DRABKIN

Inverted cadence.

[Medial cadence](#).

Invertible counterpoint.

The contrapuntal design of two or more parts in a polyphonic texture so that any of these parts may serve as the highest part or as the bass. Invertible counterpoint involving two (three, four) parts is called double (triple, quadruple) counterpoint.

The underlying principle of invertible counterpoint is the [Inversion](#) of intervals with respect to some fixed interval. For instance, [ex.1a](#) shows a cantus firmus (given in semibreves) with a note-against-note solution beneath, and in [ex.1b](#) the same two parts are inverted 'at the octave'. The lower part is moved up an octave, and the intervals between the two parts become the complements of those in the original setting: unisons become octaves, 3rds become 6ths and 6ths become 3rds.

The inversion of a consonant interval is not always consonant. For instance the 5th, inverted at the octave, becomes a 4th (which is treated as a dissonance in note-against-note counterpoint); the 6th, inverted at the 12th, becomes a 7th. This means that the choice of intervals between the parts of a passage in invertible counterpoint is restricted, dependent on the interval of inversion.

Moreover, not only must the concept of consonance and dissonance be respected, but the rules of [Part-writing](#) must also be observed. For example: at the interval of a 10th, consecutive 3rds and 6ths invert to consecutive octaves and fifths, and must therefore be avoided. [Ex.1c](#) illustrates the unsuitability of the 'solution' in [ex.1a](#) for inversion at the 10th; an alternative solution to the same cantus firmus – one which can be inverted at this interval – is shown in [Ex.2](#).

An exhaustive discussion of the applications of invertible counterpoint is found in S.I. Taneyev's *Podvizhnoy kontrapunkt strogogo pis'ma* (Leipzig and Moscow, 1909; Eng. trans., 1962, as *Convertible Counterpoint in the Strict Style*). The standard English textbook has been Ebenezer Prout's *Double Counterpoint and Canon* (London, 1891).

As a musical discipline, invertible counterpoint has remained within the domain of strict counterpoint since it was introduced by Vicentino in *L'antica musica ridotta alla moderna prattica* (1555). As a compositional technique, though, it was used infrequently until the Baroque era, when the bass was established as a fully developed line with a recognizable contour and a melodic identity of its own. In fugue the relationship of counter-subject to subject makes their invertibility almost an *a priori* condition; invertible counterpoint flourished in fugues and other compositions in a strict polyphonic style. In such works as Bach's Three-Part Invention in F minor, invertibility may be said to be used as a structural principle; and in works like *Die Kunst der Fuge* and the *Canonic Variations on Vom Himmel hoch* he lifted the technique to a level far above that of an 'academic' exercise.

For bibliography see [Counterpoint](#).

WILLIAM DRABKIN

Invitatory

(from Lat. *invitatio*: 'invitation').

A fixed psalm opening a service of the Divine Office. In the Roman rite the term is used only for the opening chant of Matins: Psalm xciv (Vulgate numbering; Psalm xcv, Hebrew numbering) sung in alternation with an antiphon. The term has also been used occasionally by modern liturgical scholars to refer to any opening chant of the Divine Office, regardless of its character and without reference to fixed or variable characteristics.

In the early Church, an invitatory was included at the beginning of Vigils (later known as Matins), at Lauds, Vespers and elsewhere. The text seems to have varied from one region to another, and perhaps also according to the particular service, among other factors. St John Chrysostom, describing the state of the liturgy in Antioch before 397, mentioned an invitatory consisting of Psalm cxxxiii (Hebrew numbering) and *Isaiah* xxvi.9ff, both of which have an 'invitatory' character resembling that of Psalm xcv. A similar diversity of usage, presumably deriving directly from these early traditions, appears in the services of the Christian East. Thus the texts mentioned by Chrysostom were later also sung in the Byzantine cathedral vigil and in many other Eastern liturgies.

The following discussion concentrates on the invitatory as it was known in the Roman and Benedictine liturgies of the Middle Ages. Despite some research into certain local traditions, no comprehensive study of invitatory tones and antiphons has yet been published; for this article a survey was made of those in a number of collections, primarily the following: *CH-SGs* 390–91 (antiphoner of c1000; facs. in *PalMus*, 2nd ser., i, 1900, 2/1970)/-*Fs* (12th-century antiphoner)*GB-WO*, f.160 (13th-century antiphoner; facs. in *PalMus*, 1st ser., xii, 1992/*R*)*The Sarum Tonal* (13th century, ed. W.H. Frere in *The Use of Sarum*, ii, Cambridge, 1901/*R*, and described in his introduction to *AS*, i, 1901/*R*, 62–4)*Liber responsorialis* (Solesmes, 1895/*R*), 6–26

The Latin text used for the invitatory psalm is that of the Roman Psalter, which differs in several respects from the later version of the so-called Gallican Psalter in the Vulgate. When chanted, it is divided into five sections, rather than the customary 11 verses; there is one additional phrase not found in the Gallican Psalter.

The tones, or melodies, to which the invitatory psalm is sung generally consist of formulae slightly modified to accommodate the five different sections of the text and the minor doxology (the latter treated as a sixth section). The internal structure of these formulae is usually tripartite. The invitatory antiphon seems to have been sung in full before the psalm, and after each of the odd-numbered sections. After the even-numbered sections and the doxology, only the final section of the antiphon was sung. [Ex.1](#) shows the invitatory tone (6th mode) used on weekdays (the ferial tone) with the antiphon for Friday, as they appear in the Worcester antiphoner (pp.192 and 69, respectively).

The number of tones used for the invitatory during the Middle Ages varied widely. Of the manuscripts containing them, some have very few, others about a dozen. Exceptionally, there may be as many as 20. Frere found that there were in the Sarum Use one tone each in the 2nd, 3rd, 5th and 7th modes, three tones in the 6th mode and five in the 4th mode; this arrangement seems to have been the usual one. One tone is classified in the Sarum Use as being in the 1st mode, but elsewhere as being in the 4th. There are usually no invitatory antiphons or tones in the 1st or 8th modes.

In most of the modes there was a fairly consistent linking of specific antiphons and tones; and some tones were reserved for festivals of a certain type. There are, for example, two antiphon melodies for the 5th mode: both were adapted to several different texts. One melody was sung at Ascension and Pentecost, the other on various Sundays. The ferial tone is one of the three tones in the 6th mode. Another was sung at Worcester and Salisbury at Easter, and at Salisbury on a few other days. The third was sung at Salisbury during Easter week and on saints' days between Easter and Pentecost. There is only one antiphon melody in the 3rd mode; it was used for the feast of St John the Baptist, occasionally on other saints' days, and for some Commons (this 3rd-mode tone and antiphon melody may be rather later additions to the repertory; at St Gallen they were used only for the feasts of St Gallen and All Saints, both relatively late additions to the local liturgy). The tone for the 7th mode was very similar to the tone for the responsory verses in that mode. There were many antiphons for this tone; some of their melodies resemble one another. In some manuscripts it was the tone for Easter and was used also on various Sundays and saints' days. The tone of the 2nd mode is apparently another late addition to the repertory; some of its associated antiphon melodies are thematically related. These antiphons occur mostly in the Proper Offices of

individual saints. In the Sarum rite there were also some 2nd-mode antiphons in the *historiae* – Offices sung after Pentecost, with texts taken from the books of the Old Testament read during that season.

Manuscripts contain an enormous variety of invitatory antiphons. However, only a handful seems to have been in general use on any particular day. The invitatory antiphons are different in this respect from the first few responsories of Matins, which remained constant almost everywhere. Because of the variety in use from one manuscript to the next, a reliable and comprehensive survey of the tones and antiphons for the invitatory will not be possible until a number of repertories have been studied, as the Sarum invitatories were by Frere. Their variety can be demonstrated by the following example dealing with a small number of the 4th-mode invitatories.

During most of the Middle Ages, the invitatory antiphon for Palm Sunday was *Ipsi vero*, and it is one of the few that were in nearly universal use on one particular day (see CAO, i–iii, 1963–8). Its text comes from Psalm xciv and it might be assumed, from its secure place in the liturgy and the conservatism manifest in the selection of its text (from the invitatory psalm itself), that this antiphon would always have been associated with a single 4th-mode tone which had come from the earliest layer of this chant's repertory. Yet in the manuscripts *Ipsi vero* is assigned several different tones. In the collection of invitatory tones in the St Gallen antiphoner it is listed with eight other antiphons (identifiable as in the 4th mode from other manuscripts) for the first of the tones given there. Among them are *Ecce venit ad templum* (Purification) and *Hodie scietis* (Christmas Eve), which were also nearly universal on their feast days. The exact nature of the invitatory tone in the St Gallen manuscript remains unknown; the notation of intervals there is not precise enough to permit identification of the melody.

In the Worcester antiphoner *Ipsi vero*, *Hodie scietis* and a number of other invitatory antiphons were assigned to a tone reserved in the Sarum tonary for one invitatory antiphon, *Adoremus regem apostolorum*, for the feast of St John the Evangelist. Furthermore, at Worcester *Ecce venit ad templum* and other invitatory antiphons, among them *Adoremus regem apostolorum*, were sung to a tone different from that for *Ipsi vero*. In the Florence antiphoner *Hodie scietis* does not appear; *Ipsi vero* and *Ecce venit ad templum* were assigned to a tone which is printed in the modern *Liber responsorialis* as a 4th-mode tone ending on D, but which in the Sarum tonary (apparently idiosyncratic in this respect) is said to be the tone for the 1st mode. This tone also appears at Worcester with the 4th-mode antiphon *Adoremus Dominum*, for use on the Sundays after Epiphany and Trinity (see [ex.2](#)).

It may be concluded that the repertory of the invitatory antiphons and tones was fixed only at a late date. The invitatory itself was not a late addition to the liturgy, however; it was mentioned in the Rule of St Benedict (c530), and is thought to have been taken over into the Roman cursus at the time of Pope Gregory I (*d* 604). Traces of the archaic pre-Gregorian Matins without an invitatory still remained in the liturgy at the time of Amalarius of Metz (early 9th century), who reported that there was a double service of Matins at Rome on Christmas morning, one of which lacked an invitatory. Indeed, the last three days of Holy Week still remain without an invitatory. A basic collection of Sunday and ferial antiphons and tones may have continued in use for a long time, with Proper antiphons and tones being introduced only gradually, at a late date.

The text for the ferial antiphon for Monday is 'Venite exsultemus Domino', and it was set at Worcester to a 6th-mode melody like those of the other ferial antiphons. In other manuscripts a different antiphon melody was used here, with a special 4th-mode tone (for this, see Ferretti, 248).

Of the small number of invitatory antiphons in widespread use on one feast day, most are in the 4th mode, and every collection contains more tones in this mode than in any other. Although the antiphon melodies given in [exx.3a](#) and [3b](#) are quite similar, the tones used with them are different in almost every way.

Some groups of invitatory tones seem to have been composed to complement a single antiphon melody, with invitatory tone and antiphon linked musically. Thus the 4th-mode tone for Christmas and its antiphon *Christus natus est* (LU, 368–71) are used with a slight change of words at Epiphany in the monastic cursus: the end of the tone (the music for the last

few syllables) is identical with part of the antiphon. This part immediately precedes the material used as the refrain, thereby providing a recurring musical cue for the singing of the refrain. The same is normally true in the 3rd mode. However, in some tones (see, for example, that for the 3rd mode in the Sarum tonary, p.xxi), the endings given for the odd-numbered and even-numbered sections are different; since the even-numbered sections are followed directly by the refrain, their ending matches that of the earlier part of the antiphon.

The tones and antiphons for the invitatory psalm remain inadequately understood. The basic repertory, whatever it may have been, seems to have been enlarged at different times. It may be difficult to distinguish the various layers among these additions, and to determine the stylistic principles in each of them, but the task should result in an improved appreciation of the changes in repertory and style of liturgical chant during the Middle Ages.

RUTH STEINER/KEITH FALCONER

Inzegneri, Marc'Antonio.

See [Ingegneri, Marc'Antonio](#).

Inzenga (y Castellanos), José

(*b* Madrid, 3 June 1828; *d*Madrid, 28 June 1891). Spanish composer. After studying with his father and at the Madrid Conservatory with Pedro Albéniz, he spent the years 1842–8 in Paris, where he was a composition pupil of Carafa at the Conservatoire. Through Auber's influence, he was in 1847

appointed a chorus master at the Opéra-Comique, but the next year was driven back to Madrid by the Revolution of 1848.

Although betraying French influences, his first zarzuela, the one-act *El campamento* (8 May 1851), dedicated to the Duke of Osuna, who had subsidized his Parisian studies, won immediate and lasting acclaim. In cooperation with Hernando he next composed the zarzuela *El confitero de Madrid* (7 November 1851) and with Barbieri, Gaztambide, Hernando and Oudrid the highly successful four-act *Por seguir a una mujer* (24 December 1851) and the fiasco *Don Simplicio Bobadilla* (7 May 1853). Apart from other unhappy collaborations, he independently composed three more failures in the 1850s, closing his zarzuela career with *¡Si yo fuera rey!* (6 September 1862).

In 1857 the Spanish government commissioned him to gather regional songs and dances, the first collection from Galicia (including Asturias) appearing in 1874 as volume i of *Cantos y bailes populares de España*, published by A. Romero in Madrid. In 1888 volumes ii (Murcia) and iii (Valencia) appeared. The third volume includes his valuable 'Relación y explicación históricas de la solemne procesión del Corpus Christi que anualmente celebra la ... ciudad de Valencia'. In 1890 the same publisher issued *Cantos populares de España: miscelánea para piano* with some overlap of contents from the 1888 volumes. These collections were reissued by Unión Musical Española several times in the 20th century, beginning in 1910, as *Ecos de España*. Inzenga also wrote *Impresiones de un artista en Italia* (Madrid, 1876), *La música en el templo católico* (Madrid, 1878) and a pamphlet *Arte de acompañar al piano*. From 1860 to his death he taught singing at the Madrid Conservatory.

ROBERT STEVENSON

Ioachimescu, Călin

(b Bucharest, 29 March 1949). Romanian composer. After studying composition with Niculescu at the Bucharest Academy, graduating in 1975, he became a sound engineer at Romanian Radio-Television in 1980. As well as attending classes in Darmstadt in 1980 and 1984, Ioachimescu refined his electronic techniques at IRCAM in Paris, taking a computer music course there in 1985. He directs the electro-acoustic laboratory of the Romanian Composers' and Musicologists' Union. Fascinated by the diversity of sound phenomena, Ioachimescu investigates the relationship between instrumental and electronic timbres. After his atmospheric modal works of the mid-1970s he began to incorporate synthetic elements, often involving harmonic spectra. With *Tempo 80* (1978) and *Oratio* (1979, 1981) he explores new sonorities ranging from fluid transparency to complex conglomerations of sound. Natural timbres are interlocked with electronically-produced sounds in *Spectral Music* (1985), while in *Celliphonia* (1988) Ioachimescu explores the relationship between two harmonic spectra with fundamentals a minor 3rd apart.

OCTAVIAN COSMA

Ioanne a Cruce Clodiensis.

See Croce, Giovanni.

Ioannidis, Yannis

(b Athens, 8 June 1930). Greek composer. He studied piano with Elli and Spiro Farandatos at the Athens Conservatory (1946–55); then at the Vienna Academy of Music he took lessons in organ with Karl Walter (graduating in 1959), composition with Otto Siegl (diploma and prize, 1963) and harpsichord with Eta Harich-Schneider. Having married a Venezuelan pianist, Nilyan Perez, he settled in Caracas and took Venezuelan nationality in 1968. In 1969 he was appointed professor of modern composition at the Institute of Culture and Fine Arts, Caracas, and in 1971 he became professor of harmony and organ at the Caracas Conservatory and was also appointed to teach and direct the choir at Caracas University. While at the Institute of Culture he conducted its chamber orchestra; in 1971 he founded the Caracas Chamber Orchestra, and he also appeared frequently as a guest conductor with Venezuelan symphony orchestras. He has been honoured with the Venezuelan Teresa Carreño National Music Award (1969) for *Figuras*, and second prize at the Louis Moreau Gottschalk Competition (USA, 1970) for *Metaplassis A*. In 1976 he returned to Athens, where he became one of the first, after Papaïoannou, to teach contemporary compositional techniques. He taught at the Orpheion Conservatory (1976–81), was choirmaster of the student chorus at the music department of Athens University (1978–82), artistic director and professor at the Nikos Skalkottas Conservatory (1981–9), re-established in 1982 the once prestigious Harodhia Athinon ('Athens Chorus') and succeeded Hadjidakis as artistic director of the Kratiki Orchestra Athinon ('Athens State Orchestra') (1982–9). He was later appointed art director and professor at the Philippos Nakas Conservatory (1989–93), and professor at the music department of Athens University (1991–3), where he taught counterpoint, form and analysis. In 1993 he founded the Moussiki Etaeria Athinon ('Athens Music Society') and established its conservatory, as professor of composition and artistic director. Since the free atonality of his *Duo* (1962), to which he has always adhered, he has avoided experiment as well as allegiance to any particular school, producing works of elegant structure in which linear writing occasionally evolves towards a style of rich textures ('Tropic', 1968). His statements have become increasingly direct and precise, attaining a higher level of musical perception and emotional depth in spite of their clarity and restraint (*42 syndoma kommatia*, '42 Short Pieces', 1968–9). He has written a series of essays *Grafta ya ti moussiki* ('Writings on music') (Athens, 1981–99) and *Music* (Athens, 1969), in addition to unpublished texts on harmony and counterpoint.

GEORGE LEOTSAKOS

Ioannotus, Camillus.

See [Zanotti, Camillo](#).

Ionian.

The name assigned by Glarean in the *Dodecachordon* (1547) to the authentic mode on C, which uses the diatonic octave species $c'-c''$ divided at g' and consisting of a fourth species of 5th (tone–tone–semitone–tone) plus a third species of 4th (tone–tone–semitone), thus $c'-d'-e'-f'-g' + g'-a'-b'-c''$. With this octave species identical with the C major scale, the Ionian mode, together with its plagal counterpart, the [Hypoionian](#), is essentially the same as the major mode of tonal music (see [Tonality](#)), in which the dominant lies a 5th above the tonic, or principal scale degree.

In the Middle Ages liturgical songs with a final written at c' were regarded as mode 6 transposed up a 5th. There were in principle no medieval modal forms with finals on C, but certain late-composed chants in mode 5 (e.g. the Marian antiphon *Alma redemptoris mater*) were often written a 4th lower in the Guidonian diatonic system, making them into authentic pieces on C. It is said that the C mode was called *tonus* (or *modus*) *lascivus*, the 'frolicsome' or 'wanton' mode, in the Middle Ages and considered apt only for secular music. However, there seems to be no direct evidence for this expression in theoretical sources. It appears to originate with Glarean's own reference to the 'lascivam petulantiam' ('frivolous wantonness') that

the Ionian mode possessed according to the ancients, and with his use of the terms *lasciva* and *lascivia* to designate the ‘wanton’ use of B \flat in chants of modes 5 and 6 (F modes) and 1 and 2 (D modes): this had the effect, in terms of his putatively reconstructed 12-mode system, of converting them from Lydian–Hypolydian and Dorian–Hypodorian to Ionian–Hypoionian and Aeolian–Hypoaolian transposed, respectively.

Glarean also classified polyphonic music according to 12 rather than eight modes, and regarded pieces composed round a tonal centre of F and set in *cantus mollis* (i.e. with a one-flat signature) as embodying the transposition of the Ionian or Hypoionian mode; most 16th-century musicians, however, seemed to consider them as embodying modes 5 and 6 of the traditional set of eight, which from the very beginnings of medieval modal theory had required the prevalence of b \flat over b \flat for their fourth degree above the final, f; thus b \flat corresponds to f' in the Ionian mode (see [Lydian](#) and [Hypolydian](#)).

HAROLD S. POWERS/R

Ion of Chios

(*b* c490 bce; *d* c422 bce). Greek tragic and lyric poet. He was active at Athens. He used a wide range of genres in poetry and was also noted for prose writings. The fragments of his tragedies (Nauck, nos.22–3, 39, 42 and 45) contain references to the music of Lydia – its psaltery players, hymns and auloi, and perhaps (the text is uncertain) a special type of aulos played together with the *magadis*. Ion described the Lydian aulos and the Mysian syrinx of Mount Ida (associated with the shepherd Paris) metaphorically as a cock, apparently to emphasize shrillness of tone, whereas according to Athenaeus's explanation (iv, 185a; Nauck, frag.42) the ‘deep [*barus*] aulos’ mentioned by him was Phrygian.

The few surviving lines of his lyric compositions, mainly dithyrambs, have no musical interest. A pair of elegiac couplets preserved in the *Harmonic Introduction* of [Cleonides](#), however, have attracted a good deal of attention. The texture is obscure but might be translated as follows: ‘Eleven-stringed lyre, having a ten-step order / three consonant roads of harmonia, / Formerly all the Greeks raised a meager muse, / strumming thee seven-toned by fours’ (Cleonides 12 = Edmonds, frag.3). Considerable debate has centred on the precise meaning of the terms and phrases in this fragment. Some scholars have proposed that the ‘lyre’ is actually one of the triangular harps portrayed occasionally in 5th-century representations (see Maas, and Maas and Snyder), while others believe the first phrase reflects the practice of expanding the number of strings found on members of the lyre family (especially the phorminx and kithara). Some scholars take the ‘three consonant roads’ as a reference to three tetrachords, while others think it refers to some sort of ‘junction of roads’. In any event, the couplets must refer to the increasing complexity or ‘polychordia’ of Greek music to which Plato later objected in the *Republic* (iii, 399c–d). This ‘new style’ was closely associated with the poet-composer [Timotheus](#) of Miletus, and it is noteworthy that in the Spartan decree (preserved by Boethius in his *De institutione musica*, i.1; the authenticity of the decree has, however, been

questioned), Timotheus is specifically charged with using an instrument having 11 strings.

WARREN ANDERSON/THOMAS J. MATHIESEN

Iorgulescu, Adrian

(b Bucharest, 6 July 1951). Romanian composer. He attended the Music Lyceum no.1 in Bucharest then studied composition with Stroe and Olah at the Bucharest Academy, graduating in 1974. Subsequently Iorgulescu taught music, joining the staff of the Academy in 1990 and becoming a professor in 1996. His doctoral thesis is entitled *Timpul și comunicarea muzicală* ('Time and musical communication', 1992). Vice-president then president of the Composers' and Musicologists' Union, in 1996 he co-founded the Romania Alternative Party and was elected to parliament. Post-serial techniques inform his earlier compositions, while in his String Quartet (1973) he combines these with melodic contours derived from folk

music. Iorgulescu pursues his exploration of new sonic resources in the series *Ipostaze* (1971–82). In its textural complexity and stylistic diversity *Alternanțe* (1985) anticipates his Symphony no.3 (1988), which derives material from a Bach chorale. An extensive use of repetitive cycles characterizes the String Quartets no.3 (1987) and no.4 (1992).

OCTAVIAN COSMA

Iovenardi, Bartolomé.

See Jovernardi, Bartolomé.

Iowa, University of, School of Music.

The University of Iowa opened in Iowa City in 1855 and early offered music instruction; the school of music, in the college of liberal arts, was formally established in 1919 under Philip Greeley Clapp, who was its director until his death in 1954. Much of the pioneering work in musical aptitude testing was done there by Carl E. Seashore, who joined the psychology department in 1902 and was twice dean of the graduate college (1908–37, 1942–6). The school was one of the first in the USA to award graduate degrees for composition. In 1995 the music building was named to honour Himie Voxman, director of the school from 1954 to 1980; Voxman was succeeded by David Nelson.

The school has almost 550 students and about 50 instructors. Degrees are offered in performance, music education, theory, composition and musicology. The library holds 80,000 books and scores, 3000 microforms, 13,500 sound recordings and videos and 300 journal subscriptions. Special

collections include 18th-century wind music on microforms, the Edwin Franko Goldman Band library and many English and Irish broadsides in the Piper folksong collection. In 1966 the school established a Center for New Music, and in 1980 an opera programme.

BRUCE CARR

Ipavec, Benjamin

(*b* Šveti Jurij, nr Celje, 24 Dec 1829; *d* Graz, 20 Dec 1908). Slovenian composer. He was a member of a musical family that included several gifted amateur composers, and he received his earliest instruction in music from his mother, a pianist and harpist. Educated in Celje and Graz, he also studied medicine in Vienna, and from 1871 to 1898 worked as a doctor in Graz. There he was for a time conductor of the student choral society Slovenija. He later took lessons in orchestration and counterpoint with Mayer.

Ipavec found it difficult to shake off certain Classical influences, so that even a late work like the Serenade for strings (1898) is still cast in a strong Classical mould, a tendency which can also be detected in some of his piano works. In his songs, however, he was able to create a true Romantic idiom; technically, and in their formal logic and expressiveness, these are his best works and the finest examples of Slovenian Romantic lieder. He also made valuable contributions to the Slovenian operatic stage with his operetta *Tičnik* ('The Aviary') and particularly with the lyric opera *Teharski plemiči* ('The Noblemen of Teharje').

BOJAN BUJIĆ

Ipleer, Joseph.

See Riepel, Joseph.

Iporre Salinas, Humberto

(*b* Potosí, 28 Dec 1915; *d* Potosí, 7 Nov 1985). Bolivian pianist and composer. He studied privately with Juan Manuel Manzano and Eisner at the Escuela Normal in Sucre. He taught in several schools and in the Tomás Frías University School of Fine Arts in Potosí. For several years he conducted the Orquesta Cóndor, an amateur chamber orchestra with which he performed several of his own works. Among his larger compositions are *La oración del mitayo*, the Suite for piano, later arranged for chamber orchestra, and *El sueño de la ñusta*. He also wrote patriotic and educational songs and a great number of popular songs, including *huaños* (*Potosino soy*, *El Chutillo* and *Chiri Huayrita*), *cuecas* (*Tu orgullo* and *Amorosa*) and *bailecitos* (*Potosina fiel y fina* and *Una palomita*), many of which were published in Buenos Aires.

CARLOS SEOANE

Ippolitov-Ivanov [Ivanov], Mikhail Mikhaylovich

(*b* Gatchina, nr St Petersburg, 7/19 Nov 1859; *d* Moscow, 28 Jan 1935). Russian composer, teacher and conductor. He was taught music at home and attended classes for the choirboys of St Isaac (1872–5). In 1875 he entered the St Petersburg Conservatory, where he studied the double

bass. In 1879 he graduated from the classes of Iogansen (canon and fugue) and Rimsky-Korsakov (special orchestration). In the period 1879–80 he attended meetings of the Balakirev circle, and from 1880 to 1882 he continued his studies with Rimsky-Korsakov. In 1882 he moved to Tbilisi, Georgia, where he directed the academy of music and the local branch of the Russian Music Society, also conducting at the Opera. In 1893 he was appointed professor at the Moscow Conservatory, where he remained until his death, teaching harmony, orchestration and composition, and directing the institution between 1905 and 1922. He also taught composition at the Tbilisi Conservatory (1924–5), which was reorganized under his guidance. His pupils included Sergey Vasilenko. He was also active as a conductor: he directed the Russian Choral Society (1895–1901), the Mamontov Opera (1898–1906), the Zimin Opera and the Bol'shoy (from 1925). His repertory with the Mamontov and Zimin companies (in which Chaliapin sang) included the premières of Rimsky-Korsakov's *The Tsar's Bride*, *The Tale of Tsar Saltan* and *Kashchey the Immortal*; he also revived *Boris Godunov* at the Bol'shoy. During the 1920s and 30s he worked for the radio and edited a supplement called *Muzika dlya vsekh* ('Music for All') for the magazine *30 dney*. He was married to the singer Varvara Zarudnaya.

Throughout a long creative life Ippolitov-Ivanov maintained the standards of the Russian academic tradition; as Asaf'yev pointed out, he profited at an early stage from the examples set by Rimsky-Korsakov and Tchaikovsky. His stylistic taste and technical thought, which had both been formed in the 1880s, remained practically unchanged throughout the Revolution and right up until the 1930s. Not possessing a dazzling creative individuality he made no attempt to establish an original style. From Rimsky-Korsakov, in particular, he borrowed the notion of a folksong-based programmatic nationalism, as his early 'spring overture' *Yar-khmel'* shows; he was also influenced by Balakirev in his interest in the oriental, displayed in his operas *Ruf* ('Ruth') and *Izmena* ('Treachery') as well as in the well-known suite *Kavkazskiye éskizi* ('Caucasian Sketches'). All that he inherited from Tchaikovsky was an elegance of phrasing and a song-like *arioso*; Ippolitov-Ivanov's opera *Asya* was composed mainly under the influence of Yevgeny *Onegin*. His last opera *Poslednyaya barrikada* ('The Last Barricade'), is set at the time of the Paris Commune. Other notable features of Ippolitov-Ivanov's music include influences of the folk music of Georgia (in *Caucasian Sketches* and *Iveriya*) and Armenia (in *Armyanskaya rapsodiya*). Folk borrowings of this type developed in his work after the Revolution, when he turned to Uzbek, Kazakh, Turkmen, Turkish and Arabic music.

WORKS

(selective list)

operas

Ruf [Ruth] (lyrical op/biblical scenes, prol., 3, D. Tsertelev, after A. Tolstoy and A. Ostrovsky), op.6, 1883–6, Tbilisi, 27 Jan 1887

Azra (3, P. Opochinin, after Moorish legend), 1890, Tbilisi Opera House, 16 Nov 1890 [score destroyed by composer]

Asya (lyrical op, 3, N. Man'ikin-Nevstruyev, after I. Turgenev), op.30, Moscow, Solodovnikov, 28 Sept 1900

Izmena [Treachery] (dramatic op, 4, 5 scenes, after A. Yuzhin-Sumbatov), op.43, 1908–9, Moscow, Solodovnikov, 4 Dec 1910

Ole iz Nordlanda [Ole from the Northland] (4, Ippolitov-Ivanov, after M. Jersen), op.53, 1915, Moscow, Bol'shoy, 8 Nov 1916

Zhenit'ba [The Marriage] (musical comedy, 4, after N. Gogol), op.70, Moscow, Radio Theatre, 18 Oct 1931 [Act 1 by Musorgsky]

Poslednyaya barrikada [The Last Barricade] (3, 4 scenes, N. Krasheninnikov), op.74, 1933, unpubd

INNA BARSOVA

Ira.

A term used in the Peruvian and Bolivian altiplano for one of a pair of hocketing [Panpipes](#), each played by a different male musician. The ira is considered masculine and typically leads the 'feminine' panpipes, the *arca*.

Iradier [Yradier] (y Salaverri), Sebastián de

(*b* Lanciego, Alava, 20 Jan 1809; *d* Vitoria, 6 Dec 1865). Spanish composer. He was appointed organist first of S Miguel Arcángel in Vitoria (1825) and then of S Juan Bautista, Salvatierra (1827), which he won through competition, gaining 'marks in excess of highest quality' in sight-reading, prepared works and accompaniment. He received a leave of absence of three or four months from S Juan Bautista in July 1833, but never returned. In 1839 he was appointed to teach solfège at the Madrid Conservatory, a post he held until 1851, when he was succeeded by Juan Castellano.

In 1847 he collaborated with Cristóbal Oudrid and Luis Cepeda in the production of the zarzuela *La pradera del Canal*. In Paris, in 1855, he taught singing to the Spanish-born Empress Eugénie. His Spanish songs, many exploiting the Cuban habanera rhythm, became immensely successful in both Europe and the Americas, and were performed by such famous singers as Viardot and Patti. *La paloma* (Madrid, 1859, Paris, 1864) remains perhaps the most popular Spanish song ever written. Bizet adapted his song *El arreglito* for the habanera in the first act of *Carmen*; apparently he thought it was a folksong. On learning his mistake – it had been published in a French translation, along with 24 other songs, in

Iradier's *Fleurs d'Espagne* (Paris, 1864) – he added a note in the vocal score of *Carmen* acknowledging the source.

BRUCE CARR/DIONISIO PRECIADO/ROBERT STEVENSON

Irakere.

Cuban jazz and popular dance band. It was founded in 1969–72 in La Habana, and is recognized as one of the most significant musical ensembles to have emerged in Cuba since the 1959 Revolution. Founding members include pianist and leader Jesús Chucho Valdés, vocalist and percussionist Oscar Valdés (no relation), saxophonist Paquito D'Rivera, trumpet players Arturo Sandoval and Jorge Varona, bassist Carlos del Puerto, guitarist Carlos Emilio Morales and drummer Enrique Plá. Growing out of the Orquesta Cubana de Música Moderna (1967), these musicians experimented with new sounds based on jazz improvisation and Afro-Cuban percussion and rhythms. In 1972 the group was officially established under the name Irakere (a Yoruba word meaning vegetation and growth).

Through the 1970s and 80s, Irakere gained international acclaim for its innovative compositions, dynamic musical fusions and also the dazzling virtuosity of its soloists. Important works include the *Misa negra* (the Black Mass, based on Afro-Cuban sacred music) and collaborations with Cuban composer Leo Brouwer, in addition to several dance-oriented albums. A recording of 1978 performances at the Newport and Montreux jazz festivals won a US Grammy Award. Despite several changes in personnel and the departure of many prominent original members, Irakere continues under the direction of Chucho Valdés and remains one of Cuba's most distinguished jazz ensembles.

LISE WAXER

Iran,

Islamic Republic of, [formerly Persia] (Per. Jomhuri-e-Eslami-e-Iran). Country in the [Middle East](#). It has an area of about 1.65 million km², of which a vast portion is desert, and a population of 76.43 million (2000 estimate). Most Iranians are of Aryan stock and speak an Indo-European tongue, Farsi (or Persian). The official state religion since 1501 has been Shi'a Islam, but there are also 850,000 Sunnis in Iran (mostly Kurdish, Baluchi and Turkmen people but also some Sunni minorities in Persian-speaking areas, e.g. southern Khorasan), as well as smaller groups of other faiths (over 100,000 Armenians and 60,000 Jews, about 20,000 Parsis, 20,000 Nestorians, 8500 Protestants etc.). Aside from [Kurdish music](#), little music research has been carried out among the religious minorities in Iran (e.g. Armenian and Assyrian Christians, Zoroastrians, Jews (although see [Jewish music](#), §III, 8(ii)) and Baha'is).

The name Persia is correctly confined to the period from 600 bce to 1935 ce, when the country was officially renamed Iran, but the name 'Persia' continued for some time to be used to designate the entire country (as well as the language). However, many scholars now prefer to use 'Iran' for the region throughout its history.

The vast territory of present-day Iran extends over a high plateau, separated from adjoining regions by the Zagros mountains in the west, the Elburz mountain chain in the north and the lower, more arid Eastern highlands in the east: most of the important urban centres lie to the north, west and south of the great Central desert ([fig.1](#)).

Iran, §I: Introduction

1. Introduction.

The long history of music in Iran can be traced at least as far back as 3000 bce. The evidence is archaeological and textual, and some of the sources are here assembled as a first attempt to construct a music history of the region from its origins to the Arab conquest in 651 ce. Although Iranian languages and culture spread far beyond the borders of modern Iran, including parts of Trans-Caucasia, Central Asia, north-west India and Mesopotamia (see Frye, 1962, p.3), this article concentrates on the music

of the heartland, the region between the lowlands east of the Tigris and west of the Indus.

Iran means 'land of the Aryans', and the name owes its origins to the tribes that arrived in the area in the early 3rd millennium bce. The name Persia comes from Parsa or Pars, a region roughly equivalent to the modern province of Fars, which, together with other areas of western Iran, was settled by Persian and Median tribes during the 1st millennium bce.

Geographically, ancient Iran was split into an eastern and western part by the deserts of Dasht-e Kavir and Dasht-e Lut ([fig.2](#)), and this division also affected culture, including music. This is noticeable as early as 2000 bce when western people, the Elamites, favoured string instruments while eastern inhabitants favoured Bactrian trumpets. The split still remained three millennia later when Islamic harps differed distinctly in eastern and western Iran (Lawergren, *MGG2*, 'Harfen', Abb.10).

The Elamites were the main western people between 2350 and 650 bce. Their territory lay on the plains surrounding the city of Susa and penetrated up the Zagros mountains where Madaktu and Kul-e Fara were prominent centres. [Mesopotamia](#), occupying the river banks of the Euphrates and Tigris and their tributaries, lay on the western border. Elamites and Mesopotamians (successively Sumerians, Babylonians and Assyrians) were ethnically distinct, spoke different languages and were often at war. The ebb and flow across the border between Elam and Mesopotamia is not always well understood, but around 2000 bce many cultural manifestations point to strong Mesopotamian influences on Elam, one example being the spread eastwards of bull lyres from the dominant power of Sumer.

Less understood are the early people of eastern Iran, but cultural features of the northern regions (Bactria and Margiana) appear to have travelled southwards between 2300 and 1600 bce into eastern Iran, but without crossing into the western region, for example, the Bactrian trumpets (see §2(iii) below). By the 9th century bce, new peoples, the Medes and the Persians (Parsans), had entered the region from Central Asia but continued moving westwards. During the 560s several Persian and Iranian groups led by King Cyrus II 'the Great' (559–529 bce) defeated the Medes and captured western Iran and Mesopotamia. In 546 bce Cyrus united all his lands into a single territory, known as the Achaemenid empire after Achaemenes, a mythical ancestor of the Persians. This empire, which by about 500 bce extended from the Balkans to northern Egypt and the Indus, lasted until it, in turn, was conquered by Alexander the Great (*d* 323), who destroyed its capital, Persepolis, in 330 and placed the region under Hellenistic control. Under Alexander's successors, Iran became part of the Seleucid empire. From 323 bce Iran was ruled by the Parthians to the north-east until 226 ce (for this period, see [Parthian Empire](#)), when the Sassanians, a people of southern Iran, created an empire based on that of the Achaemenids. It reached its fullest extent in the late 6th century and saw the establishment of Zoroastrianism as the chief religion, but fell to the Arabs in 642 ce.

Unlike Mesopotamia, ancient Iran has left few texts dating from the period under discussion. Although both cultures used cuneiform characters, this system of writing was not as well suited to the Elamite language as to

Sumerian and Akkadian in Mesopotamia. The few surviving Elamite texts are of little musical interest. Although Iranian literature gradually increased, it was written on perishable materials; numerous clay seals (*bullae*) have survived, but the enclosed texts are lost. Mesopotamian texts, however, survived, being largely written on clay. The Sassanian period has left fragments of writing in the Pahlavi language, but most information comes from later Muslim authors writing in New Persian or Arabic. Because of the paucity of contemporary texts, evidence of ancient Iranian music is based primarily on archaeological finds. Objects take the centre stage, but music and the contexts of music performance begin to emerge if a comparative approach is adopted, particularly with regard to Mesopotamia.

[Iran, §I: Introduction](#)

2. 3rd millennium bce.

(i) Arched harps.

The arched harp is one of the first complex instruments to appear in the archaeological records of Iran dating from about 3300–3100 bce; in Mesopotamia the earliest known evidence for such instruments is slightly later (c3000 bce), but, given the uncertainties of dating and the scarcity of the material, it is impossible to determine in which region this harp appeared first. Moreover, it is likely that the instrument had existed some time before it was depicted in art.

Iranian sources show different contexts for the use of arched harps from those of Mesopotamia. Iranian representations from the 3rd millennium bce depict harps played in complex rituals. The scene in fig.3a shows a harpist performing with a drummer, a singer and a wind player. The other objects are pots, and their large variety suggests an environment with more cultic overtones than a simple meal eaten by the person seated on the right.

The harp in fig.3b appears in a scene crowded with humans, deities, snakes, birds, animal parts and flora; the exact significance of this composition remains elusive (for an interpretation, see Porada, 1965, pp.41–2). The main figure is a seated goddess with snakes rising from her shoulders. The harp, which appears above her head, lacks a player, suggesting that the association between these instruments and religious rite was so strong in ancient Iranian society that the player was superfluous. It is likely that the harp had a symbolic function. Many of the elements, including the snake goddess (or god), are also present in fig.3c. In Mesopotamia, harps were shown in less complex rituals, as accompanying officiants who brought offerings to kings and gods (e.g. on the 'Standard of Ur'; Rashid, 1984, pl.11). Such musical 'presentation scenes' became popular throughout the Middle East west of Iran. After the 3rd millennium bce, arched harps disappeared from the Middle East, being replaced by angular harps (see Harp, §II, 3(v)).

(ii) Bull lyres.

Large lyres with a bull's head on one side flourished primarily in Mesopotamia but were also known in adjacent regions, including Elam. Many ancient lyres have been excavated at the southern Mesopotamian site of Ur (2450 bce; fig.4a; Rashid, 1984, pp.29–41; see *also*

Mesopotamia, fig.3), but pictorial evidence shows nearly identical instruments from other sites in Mesopotamia and Elam, including Susa (fig.4b). The Iranian sources, like those of Mesopotamia, display strong associations between animals and music, with some players taking the form of animals. The small size and poor quality of representations of bull lyres drawn outside Mesopotamia, however, makes it impossible to distinguish Iranian and Mesopotamian instruments. Since these lyres and their animal associations are similar throughout the whole region, it is difficult to be certain of their origin. Most likely, they first appeared in Mesopotamia since this region was militarily dominant and had elaborate rituals involving music on instruments that 'lowed like bulls'.

(iii) Trumpets.

Many small trumpet-like objects dating from between 2200 and 1750 bce have recently been brought to light by clandestine excavations near ancient oases in Bactria and Margiana in eastern Iran (modern southern Turkmenistan, Uzbekistan, Tajikistan and northern Afghanistan). The sizes and shapes of these objects are similar to gold, silver or copper 'trumpets' already known from documented excavations in more southerly parts of Iran (two from Astarabad, three from Tepe Hissar and one from Shahdad). The Bactrian objects belong to a wider assemblage recently defined as the 'Bactrian-Margiana Archaeological Complex' (BMAC; see Hiebert, 1994, p.376) and dated between 2200 and 1750 bce. Although the trumpet-like objects have not until now been considered part of that assemblage, they probably shared its general characteristics. The dates of the burials suggest that this kind of trumpet originated in the Bactria-Margiana region and spread gradually into the southern parts of eastern Iran (ibid., p.374).

The trumpet-like objects come in three basic shapes. All have a short tube expanding to a flared end, with a total length of between six and 12 cm and a tube diameter of about one cm. On one type the tube is decorated with reliefs of faces, often mounted several abreast (fig.5a–c). The second type has a bulbous sphere instead of heads (fig.5d–e). The third type has no face or bulb. The finely sculpted faces and the quality of the materials indicate that such instruments were élite objects. Some were made of gold or silver, others of copper-rich bronze. One of the Tepe Hissar finds (fig.5e) consists of two overlapping layers: an inner silver trumpet covered by an outer gold trumpet about one mm thick.

Although their shapes are trumpet-like, some scholars have suggested alternative interpretations: perhaps the objects were stands meant to be placed with their broad ends downwards, an arrangement that would bring the faces vertical; perhaps they were funnels or spouts. But such mundane objects seem unlikely considering the precious materials and the extraordinary workmanship. Hakemi suggested that a trumpet of the second type found at Shahdad may have been joined to a long wooden tube, which has since decayed (1997, p.635). Such contraptions are unnecessary, for the unaltered trumpets can produce a good sound.

Bactrian trumpets may not have been the first trumpets in the Middle East. A crudely sculpted object on a stone relief from Khafagi in Mesopotamia (Rashid, 1984, p.61) is probably earlier; it appears to be a 50 cm-long conical trumpet without the flared end.

In date and provenance the BMAC is close to the origin of Indo-Iranian mythology, in particular Zoroastrianism (Boyce, 1984, pp.1, 8, 11). Scholars have tried to connect Zoroastrian dualistic concepts to the visual symbols used in the art of the BMAC (Hiebert, 1994, p.374), but at present the association is entirely speculative. Bactro-Iranian trumpets may offer more solid evidence associated with the Zoroastrian myth about Yīma, mankind's first king, who reigned during a Golden Age when weather was fair and sickness and death were unknown. According to the myth, which has ancient roots but was committed to writing only about 1000 ce, at the onset of a severe winter Yīma's god, Ahura Mazda, ordered him to bring plants, animals and humans into a shelter. To help him, the god gave Yima two implements: a golden *sufṛā* ('trumpet', see Duchesne-Guillemin, 1979, pp.540–41) and a gold-plated *astrā* ('whip'). The myth implies that the instrument was used to call animals, a procedure still used by hunters when stalking their quarry and a task well suited to Bactrian trumpets with their high-pitched tessitura and flexible pitch. Moreover, many of the ancient trumpets are golden. The divine association could easily have caused them to multiply as cult objects. (The *shofar*, a much larger – and later – trumpet, is entirely confined to cultic use.)

[Iran, §I: Introduction](#)

3. 2nd millennium bce.

(i) Angular harps.

Arched harps disappeared from the Middle East, about 1900 bce, when angular harps spread throughout the region. Shapes and proportions were everywhere similar except in western Iran (Elam), where smaller models flourished during the 2nd millennium and larger ones during succeeding millennia. Angular harps could be played with vertical or horizontal strings. In either case, the harps had similar bodies but vastly different numbers of strings and playing techniques. Vertical harps usually had more than 20 strings plucked by both hands; horizontal harps had about nine strings struck with a plectrum held in the right hand and damped by the fingers of the left hand positioned behind the strings (Lawergren and Gurney, 1987, p.51).

The main sources of information are terracotta plaques. In Mesopotamia horizontal harps were shown only with the player and harp in profile. Vertical harps were shown both in profile, and as front views with the player and harp *en face* (fig.6a–b). However, the latter could not be depicted realistically, for the strings would have to be lined up into a thin sheet protruding towards the viewer, and these would easily be damaged. As a result, strings were hardly modelled at all, although the rib to which they were tied is always shown running along the front of the harp, and the protruding rod at the bottom is contracted into a short knob. Both side and front views, however, show the same playing position, size and shape of the instrument; they are certainly identical harps. Both views show harps with slightly waisted bodies. Elamite representations adopt the same pose as the Mesopotamian front views, but the harps are much smaller (fig.6c). Horizontal harps from Elam are also small, but depicted differently from their Mesopotamian counterparts (fig.6d): the harp is always shown from the side while the player faces the viewer (fig.6e). To produce this

composite pose, the harp body was turned parallel to the player's stomach. Unlike the Mesopotamian players of horizontal harps, Elamite harpists do not appear to line up their horizontal harps along the direction of movement, but this may, again, be an attempt to avoid a thin protruding part on the plaque.

In eastern Iran a horizontal harp is shown with normal size at this time (Shahr-e Sokhta, see [Harp](#) fig.4b) and the same large size is shown a millennium later at Kul-e Fara and Madaktu (see fig.7 below).

(ii) Lutes.

The first lutes appeared in 2300 bce in Mesopotamia, a millennium after the first harps; another millennium later lutes had become the dominant string instruments in western Iran.

Terracotta plaques from Susa often show lutenists as nude women and grotesque males. These may be musicians in a social class below those attached to courts and temples. The size of lutes increased during the 2nd millennium bce (Lawergren and Kilmer, *MGG2*, 'Mesopotamien', Abb.22–3). Depictions on Iranian bronze beakers from the 10th and 9th centuries bce show lutes that correspond to a length of 140 cm (see Muscarella, 1975, figs.5 and 12). During the 1st millennium bce the lutes largely disappeared from Iranian art, but the instrument must have survived nevertheless, since it reappeared in the 1st millennium in many different forms. It may have existed outside the realm of élite society, largely neglected by art.

See *also* Lute (ii), §1.

[Iran, §I: Introduction](#)

4. 1st millennium bce.

(i) Elamite harp ensembles.

Angular harps continued to appear on the art of this period and formed the core of Elamite royal ensembles at Madaktu and Kul-e Fara (fig.7). A depiction of the former occurs on an Assyrian wall relief from Nineveh (c650 bce; now in the British Museum) showing the banquet arranged to celebrate King Ashurbanipal's defeat of the Elamite army at the provincial town of Madaktu. The scene shows the exodus from Madaktu and departure of the Elamite court ensemble (fig.7b). At the rear 15 women and children wail and clap their hands; in the front are players of 11 melody instruments: seven vertical angular harps, two horizontal angular harps and two double pipes. Many instruments play simultaneously, possibly in some type of heterophony. Although Madaktu was only a provincial capital, it was large enough to support a substantial court ensemble. Susa, the main capital, probably had an even larger ensemble, but no depiction of it is known.

The largest collection of Elamite musical instruments is shown at the provincial site of Kul-e Fara (900–600 bce), which lies in a narrow valley surrounded by cliff walls carved with numerous reliefs. Three of the reliefs show groups of harps in various combinations. Although some of the carvings are severely eroded, surviving details allow several different kinds of harp to be distinguished (fig.7a). The first group (Kul-e Fara I) has been known for a century, but Kul-e Fara III and IV were published more recently (de Waele, 1989). Angular harps dominate, but there is a remarkable variety of combinations. Horizontal (H) and vertical (V) harps are grouped in the following patterns:

Kul-e Fara I: (square frame drum) + V + H

Kul-e Fara III: V + V + V

Kul-e Fara IV: V + V + H; V + V + H

Group IV is drawn on an uneven surface, and it is difficult to determine whether it shows a single group of six players or two sub-groups with three players in each. Since a leader seems to be at the front, the former interpretation is more likely.

Unlike other Iranian depictions of vertical angular harps (of which those of Madaktu are typical), those found at Kul-e Fara show different arrangements of the ornamental tassels hanging from the rod. Group IV lacks tassels altogether.

(ii) Royal and ritual music.

During the 3rd millennium bce, music was often shown in religious scenes, but sources from the next two millennia begin to show it in wider contexts. A metal bowl, dating from c650 bce, found at Arjan, Elam, shows a lively scene (fig.8) with a seated king entertained by an ensemble of musicians, dancers, stilt walkers and acrobats, while cooks prepare food and drink, and others carry jars or pots. The ensemble consists of a lyre, two angular harps, a set of double pipes, a lute and perhaps small percussion. It is thought to be a purely secular occasion, although the absence of texts to support this interpretation makes certainty impossible.

Perhaps the most remarkable scene of music-making in the ancient Middle East is found on a Hittite vase from Inandik dated a millennium earlier (see [Anatolia](#), fig.7). The scene has many features in common with that on the Arjan bowl but is interpreted as ritual activity. There are 15 instrumentalists playing six thick lyres (a giant one requires two players), two long-necked lutes and six pairs of hand-held cymbals. Statuettes of an ensemble (lute and cymbals) stand on top of a broad pedestal, and another pedestal (or altar) supports a pair of bull statuettes. Beneath is a depiction of a real bull with a knife at his throat. Acrobats bounce and tumble, while other participants cook and scurry about with jars and pots. A semi-nude couple copulate, an act interpreted as the sacred ritual of *hieros gamos* (Gk.: 'sacred marriage').

Whatever the interpretations of these two bustling scenes, they provide lively testimony on the contexts of ancient music in the Middle East. Many aspects of music-making were probably similar throughout the region, but

the written documents are relatively few and rarely permit general conclusions or regional differentiation. When there is ample textual evidence in one area (as with the use of music in Hittite rituals; see Gurney, 1977, pp.33–4), there may be no corresponding information in another – as with the lack of texts in ancient Iran.

(iii) Achaemenid period, 550–331 bce.

There is little contemporary information on music during this time. Drawing on later texts, Boyce concluded that minstrels had flourished and held privileged positions at court (Boyce, 1957, pp.20–21). Likewise, there is no pictorial evidence from Iran itself, but a musical artefact influenced by Achaemenid culture has recently emerged from China: a key used to tune the *qin*-zither during the Warring States period (5th–4th centuries bce) was decorated with a bull-man resembling the large bull-men atop architectural pillars at the Achaemenid capital of Persepolis (Lawergren, 1997, and 2000). Such long-distance musical influence on China was facilitated by horse-riders travelling along the east–west expanse of the Eurasian steppes.

Greek writers have left much information on the Persians of the Achaemenid period, some of which concerns music. Herodotus remarked on Achaemenid priests who did not perform their rites to ‘aulos music’ (*Histories*, i.132). Athenaeus mentioned a court singer who sang a warning to the king of the Medes of the acquisitive plans of Cyrus II. Xenophon, who visited Persia in 401 bce, tells of the great number of singing women at the Achaemenid court (*Cyropaedia*, iv.6.11; v.1.1; v.5.2; v.5.39). Athenaeus related that the Macedonian general Parmenius captured the 329 singing girls belonging to the court of Darius III (*Sophists at Dinner*, xiii.608) and that a royal officer at Babylon had 150 singing girls at his table (xii.530). Because Greek writers are fairly unanimous, they should probably be trusted in their account of the many singing girls. The tradition of women musicians entertaining men continued in the Islamic period by the tradition of [Qayna](#) girls. They were uneasily tolerated by the faithful, as was their music.

[Iran, §I: Introduction](#)

5. Sassanian period, 224–651 ce.

The evidence concerning music in this period is more substantial than that from earlier eras, in particular relating to the Zoroastrian religion, which had already been adopted as the state religion by the Achaemenids and restored by the Sassanians after a brief interlude of Hellenism under the Parthians (see [Parthian Empire](#)).

One Zoroastrian text has already been mentioned in connection with Bactrian trumpets (see §1(iii) above). It is part of the *Avesta*, the holy book of the faith, preserved orally and not written down until the 5th century ce; the oldest surviving copy dates to the 14th century. The earliest part of the *Avesta* is the collection of *gāthā*, some of which go back to the 2nd millennium bce (Boyce, 1984, p.8; Mallory, 1989, p.37). The language of these texts is similar to that of the Indian *Rgveda*, and other features, such as some deity names, are also shared. The correspondence indicates a common origin of tribes speaking Indo-Aryan languages, and their

homeland is considered to have been on the steppes of south Russia. One branch moved into north India around 2000 bce, when the Indus valley civilization (including its language) came to an end. Another branch probably entered the Bactria-Margiana region of eastern Iran (for indications of the language change there, see Hiebert and Lamberg-Karlovsky, 1992, pp.8–10). The *gāthā* were hymns similar to the Vedic *Samhitās*, which are known to have been sung or chanted (Gonda, 1975, pp.313–16).

Modern translations render *gāthā* variously as ‘hymns’, ‘poems’, or ‘psalms’. Although there is no direct evidence that the *gāthā* were sung, songs played a prominent role in early Zoroastrian imagination, and it is likely that they were chanted. The Zoroastrian paradise (*garōdmān*) was known as the ‘House of Song’ (Boyce, 1984, p.28), where music induced perpetual joy. Similar ideas also entered Mahayana Buddhism where *sūtras* glowingly describe music as one of the chief delights of Paradise (see Lawergren, 1994, pp.234–8). For Zoroastrians, this music begins when a righteous person dies. The soul of the deceased chants for three days outside the head of the corpse (Boyce, 1984, p.81). In the 5th century bce Herodotus claimed that Zoroastrian *magi* (priests) chanted at sacrifices (*Histories* i.132).

Although no instruments were used in formal worship, Zoroastrians used them to add a convivial element to the celebrations of holy days, ‘putting to rout, for a moment at least, the gloomy forces of darkness’ (Boyce, 1992, p.104). In the late 9th century ce a Muslim scholar observed that pillars were built before the time of *No Rooz* (New Year):

One column was sown with wheat, one with barley, another with rice, the other ones with lentils, beans ... millet, sorghum ... And the harvest thereof was never gathered but with song and music and mirth, which happened on the sixth day after the beginning of *No Rooz*. Among the presents which the kings of different nations gave to the Persian kings were the rarest wonders of their lands ... Ministers, chief scribes and private courtiers gave gold and silver bowls set with jewels and bowls of silver enriched with gold ... Wise men gave their wisdom; poets, their verses ... (trans. Boyce, 1984, p.70).

Some silver bowls associated with Zoroastrianism were decorated with musical scenes (see fig.10 below).

According to al-Mas'udī (*d* c957), music was greatly esteemed at court and the founder of the Sassanid dynasty, King Ardeshir I (*d* 241), gathered singers, virtuosos and others involved with music into a special courtly class. Two centuries later, Varahran V (421–39; also known as Bahram Gur) elevated this class to the highest rank (Christensen, 1936, p.31). He was fond of music and recruited 12,000 singers from India (said to be ancestors of the Loris). But music was cherished even more highly by Khosrow II (591–628), whose reign was a veritable Golden Age of Iranian music. He is shown among musicians on a large cliff relief at Taq-e Bostan in western Iran. The king stands in a boat shooting with a bow and arrows and is accompanied by a band of harpists, who sail in his boat and an escorting one; in addition numerous shore-bound musicians play on a

platform. It is a remarkable scene where the boats are shown at two successive moments on the same panel, and the harps are rendered in considerable detail.

There are many tales about the musicians at Sassanian courts. Since these were illustrated in hundreds of manuscripts centuries later, the stories are as important to Persian musical iconography as the Bible was to the European Middle Ages. Most stories were recorded in the *Shāhnāmeḥ* ('Book of Kings') composed by Ferdowsi about 1010. This national epic was based on old bardic tales preserved orally in eastern Iran at a time when the minstrel tradition had ceased in western Iran. Another source, Nezami's *Khamseh* ('Five poems') of 1190, is partly derived from the *Shāhnāmeḥ*. Of its five sections, two are concerned with music: *Haft paykār* ('Seven portraits') and *Khosrow va Shirin*. The former tells of Bahram Gur and his favourite mistress, the Greek harpist Āzādeh. They became the most popular musical image of Persia, being depicted in Sassanian art after 650 and in Islamic miniature paintings between about 1300 and 1600 (Ettinghausen, 1979, p.29).

Another story in the *Haft paykār* concerns Bārbad, the sweet-voiced lutenist who lived during the reign of Khosrow II. He outwitted the envious harpist Sarkash (also called Nakisā) and became the king's favourite. There are many other stories, such as the one about Khosrow II who fell in love with his singing girl Shirin, and some may be rooted in reality. Bārbad, for example, is generally assumed to have been an historical person. A variety of later texts affirm his fame as composer and lutenist and acclaim him the 'founder of Persian music'. According to one tradition he died from poisoning at the hand of Sarkash, who had stayed on as a minor court musician.

The Sassanians employed large number of instruments, many of which are known only in name. In the story known as 'Khosrow and his Page' the king asks: 'Which musician is the finest and the best?' and the boy diplomatically mentions the players of all instruments he knew: *chang* (which he calls the foremost), *vin*, *vin kannār*, *mushtaḡ*, *tunbūr*, *barbat*, *nād*, *dumbalak*, *rasn* and 16 others (Unvala, 1917, pp.62–3). The identity of the *chang* is known, but many others are as yet unidentified, and sound-similarities in translations cannot be relied upon. *Barbat*, for example, has often been translated *barbitos* (e.g. Boyce, 1957, p.23); but the latter is an ancient Greek lyre not used after 400 bce, and the *barbat* cannot be the *barbitos* (although the name may be of Greek origin, probably via Byzantium).

Iconographic sources provide more reliable information on instruments. Aerophones include the reed pipe (*sornā*; see [Surnāy](#)) and the double trumpet. The Chinese mouth organ (see [Sheng](#)), shown on a wall relief from Taq-e Bostan and a silver cup from Kalar Dasht in the Mazandaran (6th century ce; Archaeological Museum, Tehran), flourished briefly in Iran and, like some other foreign instruments and instrumental details, probably owed its introduction to traffic along the Silk Route; it comprised five, six or seven pipes in a wind reservoir with finger holes and reeds and was known in Iran as the *mushtaḡ*. String instruments were the horizontal angular harp (possibly *vīn*), the short-necked lute (*barbut*), which had between four and

six strings, and the *chang* – a ‘light vertical angular harp’, a type that could have been invented in Iran, Central Asia or China (see Harp, §1). The membranophones included the kettledrum (*kūs*), small drum (*tās*), frame drum and hourglass drum (*kūba*), which was related to Central Asian drums. To the idiophonic group belonged the forked cymbals (*chaḡāna*), related to Roman cymbals, and pairs of wooden clappers (or castanets, *chahār pāra*).

Although little literary evidence has survived from the Sassanian period, some insight into the nature of music may be gained from, for example, the writings of Qutb al-Dīn (Mahmūd ibn Mas‘ūd al-Shīrāzī; *d* 1311). According to him, seven musical modes were recognized during the Sassanian era, including *sakāf*, *mādārūs-nān*, *sāykād*, *sīsum* and *jūbarān* (Farmer, 1926). The names are probably corrupt and lack musical significance. Christensen (1936, p.38) tentatively translates some as ‘sixth’, ‘plectrum’ and a place name. Qutb al-Dīn also asserted that Bārbad (fig.9) composed seven royal modes (*khosrovāni*), 30 derivative modes (*lahn*), one for each day in the Zoroastrian month, and 360 melodies or airs (*dastān*), one for each day in the Zoroastrian year (neglecting the five intercalary days). Other Muslim writers (e.g. Nezami) name some of the tunes, but do not give the lyrics. Christensen has suggested (1936, pp.44–5) that a manuscript found at Turpan (Xinjiang province, China) contains the words of a poem composed and sung by Bārbad or one of his contemporaries. It is an odd text found in a trove of Manichaean manuscripts, and has the song *Khvarshēdh ī rōshan* (‘The shining sun’) written in the Pahlavi language used at the time of Bārbad. Its four lines, each with 11 syllables, reads:

The shining sun, the beaming full moon
resplendent and beaming behind the trunk of a tree;
the eager birds strut about it full of joy,
the doves and the colourful peacocks strut about.

The title is reminiscent of the name of a Sassanian melody, *Arāyishn ī khvarshēdh* (‘The beauty of the sun’), known from Muslim authors. The small difference, Christensen suggests, could have arisen when the Pahlavi text was combined with New Persian by Islamic writers.

Iran

II. Classical traditions

Very few countries have such a long history of national and political identity as Iran. As a great empire, Persia was a meeting-place of diverse cultural elements. Yet it maintained its own marked individuality. Famed for its creative genius, Islamic Persia has exerted powerful influences on other civilizations and, in turn, absorbed the impact of contact with other cultures. In music, the Persian element was the dominant ingredient in the amalgam known as the Islamic musical tradition of the Middle Ages. This tradition relied on ancient Greek theoretical concepts but leant heavily on pre-Islamic Persian musical practices. The musical nomenclature of the Middle East, whether in Turkic- or Arabic-speaking regions, is largely Persian, and throughout this vast region most musical instruments have had earlier Persian prototypes.

Iran, [§II](#): Pre-Islamic

1. History.

Persian classical music developed from the music of urban and courtly tradition. The first substantial historical evidence on music relates to the Sassanian dynasty (224–651 ce; see [§I](#) above). The Persians possessed a high musical culture where musicians enjoyed an exalted position at the imperial court. Emperor Khosrow II (ruled 591–628) was patron to many musicians, among whom were Rāmtin, Bāmshād, Nakisa or Sarkash and Bārbad. The most illustrious, Bārbad (fig.9 above), is known to have devised seven royal modes (*khosrovāni*), 30 derivative modes (*lahn*) and 360 melodies (*dastān*), corresponding to the number of days in the week,

month and the year of the Zoroastrian calendar. The nature and calendrical applications of these modes and melodies are not known, but some names have survived in the writings of early Islamic authors, such as [al-Kindī](#) (c801–c866), [Ibn Zayla](#) (d 1048), and particularly through the epic poem *Khosrow va Shirin* ('Khosrow and Shirin'), one of the five sections of the *Khamseh* ('Five poems') by Nezami (d c1203).

The Arab conquest of the Persian empire began in 642 and eventually resulted in the incorporation of Iranian nations within the greater Islamic Empire. With the ascendancy of the Abbasid dynasty (750–1258) and transfer of the seat of the Caliphate from Damascus to Baghdad, Persian political and cultural influences became dominant. The Arabs valued Persian culture highly and soon Persian musicians and musical scholars were to be found throughout the Muslim world. Among the outstanding were [Ibrāhīm al-Mawsilī](#) (742–804) and his son [Ishāq al-Mawsilī](#) (767–850), [Mohammad Rāzī](#) (d c923) and [al-Fārābī](#) (d 950). The last was the most celebrated of early scholars; his famous *Kitāb al-mūsīqī al-kabīr* ('Great book on music') contains discussions on musical instruments and on musical theory, including intervals, modes, scales and rhythmic cycles (see [Arab music](#), §1, 2(ii)).

[Al-Fārābī's](#) investigations were founded on theories expounded by classical Greeks, as were those of his illustrious follower [Ibn Sīnā](#) (Avicenna) (d 1037). In addition to discussing modes and rhythmic cycles, Ibn Sīnā considered the notion of harmonic consonance and dissonance, the concept of ethos (*ta'thir*) and the therapeutic effects of music. Significantly, the names of the 12 primary modes as described by Ibn Sīnā are still found among the modes of contemporary Persian classical music, although they do not necessarily identify the modal schemes of Ibn Sīnā's time. These 12 are *rahāvi*, *hosseini*, *rāst*, *busalik*, *zanguleh*, *oshāq*, *hejāzi*, *erāq*, *esfāhān*, *navā*, *bozorg* and *mokhālef*.

In the tradition of classical Greece, medieval Islamic scholarship concerned itself with music as an aspect of mathematical philosophy. As such, most men of learning took an interest in musical theory. In the succeeding period, the most important of many writers on music was [Safī al-Dīn](#) (d 1294). His *Kitāb al-adwār* ('Book of cycles') and *Risāla al-sharaffiyya fi al-nisāb al-ta'liyya* ('Sharafian treatise on intervallic relations') were highly influential in establishing a uniform theoretical basis for urban musical traditions throughout much of the Islamic world. His pupil [Qutb al-Dīn](#) [Mahmūd ibn Mas'ūd al-Shīrāzī] (d 1312) also wrote on musical theory and his *Durrat al-tāj* ('Pearl of the crown') was widely circulated. Other scholars of note were [al-Āmulī](#) (d 1352) and [al-Jorjānī](#) (d 1413). The last great theorist of this era was ['Abd al-Qādir](#) (d 1435) whose *Jāmi' al-alhān* ('Compendium of melodies') contains rare examples of musical notation.

From the beginning of the 16th century, however, with the reunification of the country under the highly nationalistic Safavid dynasty (1501–1722), Persia became increasingly isolated from the rest of the Middle East, where Ottoman rule was paramount. The Safavids established the Shi'a faith – a schismatic offshoot of Islamic orthodoxy – as the state religion, thereby creating an even greater separation from other Muslim states. The Shi'a religious leaders have generally maintained a hostile attitude towards

music; it was viewed with suspicion as its effect on the listener cannot be reasoned or theologically explained. Furthermore, music was generally seen as an accompaniment to frivolity and merriment, which could lead to impiety. The consequence of such proscriptive attitudes towards music was a gradual decline of musical scholarship from the 16th century to the mid-19th. Within urban settings, music was gradually reduced to a private, quasi-clandestine art where solo performance and improvisation became the dominant features.

The comparatively fallow period from the 16th century to the 19th gave rise to performing practices in which the individuality of modes became subordinated to a system where modes were linked into groups known as *dastgāh*. The system of 12 *dastgāhs*, which represents the classical tradition as known today, is largely a legacy of 19th-century practices. The definitive codification of this system is attributed to Mirzā Abdollāh (1845–1918), an eminent player and teacher of the *setār* (long-necked lute).

In the second half of the 19th century, European musical influences began to be felt. A Frenchman named Bousquet was employed in 1856 to organize a military band for ceremonial occasions at court. He was succeeded by Rouillon and Lemair, who established a music school to train conscripts to play Western wind instruments. The European marches and airs that these military bands performed were the first examples of Western music to be heard by the Iranian public at large. Through this music school, Western musical notation, theory, harmony and the very concept of a fixed and stable – as opposed to free and improvised – piece of music were introduced.

[Iran, §II: Pre-Islamic](#)

2. Theory of intervals and scales.

Numerous treatises on the theory of music containing discussions on intervals, methods of their measurement, modes and rhythmic cycles were produced between the 9th and 13th centuries. They were mostly written in Arabic, the scientific language of the vast Islamic domain. Within the Islamic community, there was a common thread of scholarly pursuit indicating that, on a theoretical level, music was based on shared principles, whether in Persia, Arabic-speaking regions, or Turkey. These theories relied fundamentally on the works of classical Greek authors from Pythagoras to Aristoxenus of Tarentum (see [Greece, §I, 6](#)). As music was not learnt or performed from notation, the measure of a true correlation between the theories expounded by medieval Islamic writers and the actual musical practices of their time cannot be reliably assessed. In theory, modes were conceived with tetrachordal arrangements of tones and semitones, corresponding to the Pythagorean whole tone of 204 cents and the semitone of one limma (90 cents). Other intervals, smaller than the whole-tone but larger than the semitone, were also in use. By the time of Ibn Sīnā (11th century), in a tetrachord of say c-d-e-f, there were, according to different methods of measurement, seven possibilities for a flattened *d* and five ways of achieving a flattened *e*. In the structure of various modes, however, no chromatic progressions from the natural to any flat version of a pitch were employed. Similarly, two versions of a flattened pitch were not used in succession.

In the 13th century, Safī al-Dīn re-evaluated the many theories, proposing only two possibilities for flat notes within each whole tone. According to his system, each tone (204 cents) could be subdivided into either limma (90 cents) or limma + limma (180 cents). Thereby, a tetrachord, having two tones and one semitone, yields seven possible pitches, and an octave composed of two conjunct tetrachords plus a whole tone contains 17 pitches, as shown in Table 1. (For a detailed discussion of medieval Islamic music theory to 1500, see [Arab music](#), §I.) This highly exacting scale system has given way to a more flexible system in the surviving Persian tradition. The degree of correspondence to past practices cannot be ascertained, but one can recognize traces of Safī al-Dīn’s 17-tone scale, albeit in a distorted form.

TABLE 1: Subdivision of the tetrachord into Pythagorean limmas (L) and commas (C) (Safī al-Dīn, 13th century)

open	Z ₁	Z ₈	sabb ābe	V ₁	V ₇	ba kha ns nsa ar r

In the 1920s [Ali Naqi Vaziri](#), a distinguished musician who had spent some years pursuing musical studies in France, proposed an artificial 24 quarter-tone scale as the basis for Persian music. His theory was not based on historical or scientific research but mainly derived from his abiding interest in submitting Persian music to the tempered tuning system to render it compatible with harmonization. To this day, many Iranian musicians believe their music is founded on a 24 quarter-tone scale, oblivious of the fact that no interval even approximating to a quarter-tone is used.

Vaziri organized a National School of Music and for some 20 years trained a significant number of musicians who became dedicated followers of his ideas. New pieces were composed within the framework of the traditional modes, but with an additional thin harmonic layer, a ‘progressive’ move seen as necessary for rescuing Persian music from stagnation. Naive and questionable as this aim was, it gained a considerable following. By the mid-20th century, Western influences had brought about a general acceptability and overwhelming popularity for music (both Persian and Western), effectively bypassing any religious objection that may still have existed (see §6 below).

In the mid-20th century, a Persian physicist and musician, Mehdi Barkeshli, attempted to establish, through scientific examination, that the contemporary tradition is still based on Safī al-Dīn’s 17-tone scale, but with the addition of one more possibility for the subdivision of the whole tone. According to Barkeshli, a whole tone is divisible into: limma (90 cents), limma + comma (114 cents), and limma + limma (180 cents). With each of the five tones in the octave yielding four possible pitches, and the addition

of the two semitones, his octave scale contains a total of 22 pitches. This scale concept is appealing for its implied connection with past theories but difficult to reconcile with the reality of Persian music today. All theories that set forth neatly ordered and precise intervallic structures would seem unrealistic if in practice the music involves string instruments with movable frets and bridges, or wind instruments of no standardized size, thickness or substance.

Later studies on the intervals of Persian music, carried out in the 1960s by Hormoz Farhat, have been concerned with the reality of music as known and practised today. His findings are based on measurement of intervals and analysis of recorded music. No attempt has been made to prove links with classical theories, nor has there been undue reliance on Western musical concepts. His studies showed that Persian music cannot be represented meaningfully by any octave scale concept. It is rather pointless to speak of 'the scale' of Persian music. Such abstractions have no practical applications and tend to mislead. It is the groupings of tones into melodic configurations, normally not exceeding a tetrachord or pentachord, that are significant. Another striking feature of Farhat's conclusions is that, in Persian music, intervals are often unstable; they tend to fluctuate, within a certain latitude, depending on the mode and according to the performer's taste and inclination.

Based on these conclusions, the whole tone is reasonable stable, approximating to the Pythagorean whole tone of 204 cents. The semitone, although more flexible, is usually close to the Pythagorean limma of 90 cents. There are two unstable intervals that lie between the semitone and the whole tone. The smaller one varies between about 120 and 140 cents ('small neutral tone'), and the larger of the two fluctuates between about 160 and 180 cents ('large neutral tone'). In most cases, the two types of neutral tone come in succession, combining to complete the interval of a minor 3rd. There is also a variable interval of between 260 and 280 cents ('plus tone'); it is appreciably smaller than the augmented 2nd. This tone has comparatively little application; where it is used, it follows, or precedes, a 'small neutral tone', together completing the range of a major 3rd. Whether these intervals represent deviations from the more exact intervals suggested by the classical writers and by Mehdi Barkeshli is open to question. Indeed the flexibility of intervals in modern Persian music is such that any number of theories can be broadly accommodated.

The traditional music is learnt by rote and, within the confines of the melodic dictates of each mode, is highly improvisatory. Musical notation is not used and can have little purpose. On the other hand, during the last hundred years compositions of pieces within the melodic frame of reference set by each mode have become prevalent (see below §4). In this context, Western notation has found wide application. Two additional signs, to express pitches lowered or raised by less than a semitone, were introduced by Vaziri early in the 20th century, and are commonly used. The *koron* indicates an approximate 'half-flat', and the *sori* a 'half-sharp' (see [Table 2](#)). The degree of lowering and raising of a tone is variable.

Iran, §II: Pre-Islamic

3. The modal system.

Persian classical music is represented by a corpus of amorphous pieces that are subject to extemporized renditions. They adhere to a modal principle that is defined by a set of pitches (*maqām*) and a certain melodic contour (*māyeh*). The pieces are collectively known as the *radif* ('row', 'line-up'). 19th-century performing practices have tended to place these pieces into 12 groups, known as the 12 *dastgāhs* (a large unit with inner components; [ex.1](#)). The pieces within each *dastgāh* are generically called *gusheh*, and they carry their own individual names. Some of the *dastgāhs* contain large numbers of *gushehs*, which represent numerous *maqāmāt*, while others are composed of only a few *gushehs*. The 12 *dastgāhs* are: *shūr*, *abu atā*, *dashtī*, *bayāt-e tork* (or *bayāt-e zand*), *afshāri*, *segāh*, *chāhārgāh*, *homāyun*, *bayāt-e esfāhān*, *navā*, *māhur* and *rāst* (or *rāst-panjgāh*). Five of the 12 are commonly considered as subordinate *dastgāhs* (*āvāz*). Four of these, *abu atā*, *dashtī*, *bayāt-e tork* and *afshārī*, are taken to be related to *shūr*; *bayāt-e esfāhān* is considered as a derivative of *homāyun*. This classification, however, is poorly reasoned as it is merely based on a measure of relationship in the pitch material of these *dastgāhs* and not on their melodic content, which is far more axiomatic to their identity.

The performance of a *dastgāh* usually begins with one or more sections called *darāmad* (introduction). It is in the *darāmad* that the mode (*maqām*) and the melodic character (*māyeh*) of the *dastgāh* are revealed. After the *darāmad*, selections from the *gushehs* that are constituent parts of the *dastgāh* are presented. They differ from the *darāmad* in their *māyeh*, and they may also present, through modulation, different *maqāmāt*.

Some *gushehs* belong exclusively to the repertory of one *dastgāh*; others may be found within the structure of more than one *dastgāh*. In the latter category, there are those *gushehs* that preserve both their modal and melodic identity and those that maintain only their *māyeh* but yield to the set of pitches (*maqām*) of the *dastgāh* where they are placed. Notable in this type are *gushehs* belonging to *dastgāh segāh*, all of which can also be performed in *dastgāh chāhārgāh*.

It is common to begin the performance of a *dastgāh* in a relatively low register of the instrument or voice. The *gushehs* that follow the *darāmad* section are usually chosen to give a gradual ascent to higher sound registers. This systematic rise in pitch level was more binding in 19th-century practices; it is not always maintained in more modern performance styles.

Given the fact that a *dastgāh* is comprised of pieces in different modes, a measure of organizational unity is achieved through periodic reference back to the opening mode of the *darāmad*, which properly identifies the *dastgāh*. This is done by a concluding melodic cadence, placed at the end of each *gusheh*, which has presented a distinct *maqām* of its own. This melodic cadence, which may be brief or lengthy, is called *forud* ('descent'), since it requires a modulation to the lower sound register of the *darāmad* section.

The entire performance process of a *dastgāh* is carried out, in the main, through extemporization. This occurs on the skeletal melodic material inherent to the mode of the *dastgāh*, as represented by the *darāmad* section, and extends to the various *gushehs* within the *dastgāh*. These melody models (*māyeh*) are not clearly defined, and no performer is able to isolate and tangibly represent them; nevertheless, they act as nebulous themes for an infinite number of variations. A broad understanding of the constituency of these *māyehs* is attained through years of training and immersion in a musical tradition that remains intriguingly arcane and non-specific. It is no wonder that many of the governing principles of Persian music remain controversial. A rendition of a *dastgāh* can vary greatly depending on the number of *gushehs* included and the degree of improvisatory freedom taken, and it may last just a few minutes or well over an hour.

[Iran, §II: Pre-Islamic](#)

4. Composed music.

20th-century performing practice of the 12 *dastgāhs* led to the creation of a new genre of composed pieces by known authors. The stimulus for this development came from Western music, which found increasing popularity. Whereas the traditional pieces from the *radif* are improvised variations on existing melody models, these 20th-century compositions were predetermined pieces of more or less fixed content, either written in Western notation or memorized.

In the main, there are four types of composed music. Three are purely instrumental: *pishdarāmad*, *reng* and *chāhārmezrāb*. The fourth, the *tasnif* or *tarāneh*, is a vocal genre. All four are composed in set metres, which distinguishes them from the improvised performance of the traditional *radif*,

which is essentially non-rhythmic. The most common metre is the compound duple; simple duple, triple and quadruple rhythms are also used. Melodically, most composed pieces begin with a theme suggestive of the *maqām* and the *māyeh* of the *darāmad*, followed by one or more sections referring to one or more of the prominent *gushehs* of the *dastgāh* for which the piece has been composed. The exception to this rule is the *chāhārmeZRāb*, which is usually a monothematic piece for a solo instrument.

The *pishdarāmad* 'pre-introduction' owes its origins to a growing interest in ensemble playing. Early in the 20th century, Persian musicians came in contact with Western orchestral music. The richness of orchestral sound was in sharp contrast to the soloistic/improvisatory modesty of Persian music, and it made a great impression. For ensemble playing, compositions with fixed melodic and rhythmic content were needed. Innovation of the *pishdarāmad* has been credited to Qolam Hossein Darvish (1872–1926). Although essentially an ensemble piece, true to the classical tradition, the *pishdarāmad* is monophonic and, as such, it can also be played by a single instrument. In melodic content it draws on the *darāmad* and some of the more striking *gushehs* of the relevant *dastgāh*. The rhythm is mostly in duple time, less commonly in triple or quadruple time. The tempo is normally moderate and the piece may last some two to five minutes.

The *reng* is a dance piece. There are some very old *rengs* by unknown composers, but hundreds of *rengs* have also been composed in modern times. In form, the *reng* resembles the *pishdarāmad*; it also draws on melodic material of the relevant *dastgāh*. It is, however, in a faster tempo, is nearly always in 6/8 time, and usually concludes the performance of a *dastgāh*. A *reng* can be played by an ensemble, but, having an older tradition than the *pishdarāmad*, is also very often played as the concluding piece for a solo performance.

Unlike the preceding two forms, the *chāhārmeZRāb* is exclusively a solo instrumental composition intended to display the performer's virtuosity. Its melodic content is simple and slight, with emphasis on fast and flowing movement around a fragmentary basic motif. A recurring rhythmic motif in 6/8 time is a common feature. However, modern *chāhārmeZRābs* have become more elaborate, sometimes involving rhythmic syncopation and melodic extensions requiring modulations. The *chāhārmeZRāb* is less fixed than the other compositional forms, allowing for some expansion through improvisation. The position of a *chāhārmeZRāb* in the course of a *dastgāh* performance is not fixed. It may be placed near the beginning as a part of the *darāmad* section, in which case it will derive from the basic mode of the *dastgāh*. Additional *chāhārmeZRābs* may be placed before or after one or more of the prominent *gushehs* of the *dastgāh*. In that case, they highlight the mode of that particular *gusheh*. The *chāhārmeZRāb* may also come towards the end, just before the *reng*, or at the end, in place of the *reng*. Contemporary instrumentalists (especially *santur* and *tār* players) tend to intersperse their rendition of a *dastgāh* with an ever-increasing number of such display pieces. The growing interest in a show of virtuosity, as opposed to the more contemplative nature of the older style of performance, is another unmistakable outcome of Western influences.

The *tasnif* is a vocal piece performed with instrumental accompaniment by a soloist or an ensemble. Its structure parallels that of the *pishdarāmad*, but it usually comes towards the end of a *dastgāh*, just before the *reng*. In modern times it is not uncommon for the same *tasnif* to open and close a performance. *Tasnifs* written in the early years of the 20th century have serious poetic content with a social and patriotic message. The works of poet-musicians such as Aref, Sheydā and Amir Jāhed exemplify this type of *tasnif*. In the 1930s and 40s most *tasnifs* were set to high-quality lyric verses by classical poets such as Rumi, Hafez and Sa'di. In the succeeding period of increased commercialization, *tasnifs* deteriorated in poetic and musical standard. A style of popular amorous ballad emerged, known as *tarāneh*. This genre, heavily diluted with Western elements, sometimes includes a thin layer of elementary harmony. Following the 1979 Revolution, composition of *tasnifs* gave way to more serious songs that conform to the ideological tenets of the clerical régime.

Iran, §II: Pre-Islamic

5. Musical instruments and vocal techniques.

Historically, a wide variety of instruments has been used in Persian music, although some are now obsolete (e.g. the *chang*). Evidence suggests Persia as the source of several musical instruments found outside the country. The Persian dulcimer (*santur*) is found in North India and Greece (*santouri*). The Persian word *Ney* ('reed') is applied to various flutes or pipes throughout the Middle East and North Africa. The Persian word *sornā* ('festive pipe'), distorted to *zurnā*, is applied to a similar instrument in Turkey and all countries in the Balkan peninsula (*shahnāī* in India; see *Surnāy*). The North Indian *sītār* bears a Persian name, although it differs in construction from the Persian *setār*.

There are many instruments of regional folk music not used in urban classical music (see §III, 3 below). Currently the most widely used instruments of classical music are: *setār*, *tār*, *santur*, *kamāncheh*, *ney* and *tombak* (fig.10). The *dāyereh* (frame drum) was formerly important.

The *setār* (fig.11a) is a long-necked lute with a small pear-shaped soundbox and four strings. Its name signifies 'three strings'; a fourth drone string has been added in more recent times. It has a range of two octaves and a 5th, and it is strummed with the nail of the right index finger. The more ancient name for this type of lute is *tanbūr* or *tunbūr*; the name *setār* found currency from the 16th century. Similar instruments used in the folk music of eastern Iran to this day are called *tanbūr*. The *tār* (fig.11b) has a tonal range identical with the *setār*. It has three double courses of strings (six strings in all); the first two courses serve a melodic function while the third course serves as a drone. The *tār* has a double interconnected soundbox covered with parchment. The larger resonating chambers, doubled melody strings and use of a metal pick (instead of the finger-nail) result in greater sonority, which has made the *tār* much more popular than the *setār*. However, it has not had a very long history in Persia.

The *santur* (fig.11e) is a small dulcimer with two layers of quadruple strings tuned in unison resting on movable bridges. It has a range of over three octaves and is played with delicate hammers made of rosewood. The *kamāncheh* (fig.10a and fig.11c) is a spike fiddle with four strings and a

range of about three octaves. Its soundbox is round and deep, with a skin-covered surface over which the bridge rests. *Ney* is the generic name for many types of flute. A wooden rim-blown flute called *ney-e haftband* has found its way into the classical tradition. It is obliquely held, with six finger-holes and one thumb-hole. The *tombak* (fig.10b), also called *dombak*, is a vase-shaped wooden drum, held horizontally on the lap and played with the fingers of both hands. As it is used for establishing rhythm, the *tombak* is also popularly called the *zarb* ('beat').

The *'ūd* (lute; fig.11d) is believed to be a later development of a pre-Islamic Persian instrument called *barbat*. It has been a prominent musical instrument throughout the Middle East and is still widely used in Turkey and Arabic-speaking regions. In Persia, however, since the Safavid period, the *'ūd* gradually lost favour with musicians. Reasons for this are unclear, but by the beginning of the 20th century it was barely known. In the second half of the century, attempts were made to revive interest in the *'ūd*. It now has some use, particularly in orchestral music although there are still very few proficient *'ūd* players in Iran. The same holds true for the *qānūn* (psaltery; fig.11f), which has also enjoyed a limited revival, mainly in some orchestral formations.

Several Western instruments have found a firm place within the Persian classical tradition. The violin has been adopted very effectively as it is capable of producing intervals other than the tempered semitone and whole tone. In fact, it has largely replaced the native fiddle (*kamāncheh*). Other Western instruments used in Persian music include the clarinet, flute and trumpet. The most incompatible instruments are those with fixed tuning, such as the piano, which is severely at odds with the pliable nature of Persian intervals. Nevertheless, the piano's majestic sound made it all too alluring to be overlooked. With some tuning alterations, it has been widely used, both as a solo instrument and in ensembles (with less than felicitous results).

[Iran, §II: Pre-Islamic](#)

6. Music education and performance.

The traditional approach to learning Persian music is through private instruction from a master-musician. The process is essentially centred on mastery of an instrument. Even singers usually study with an instrumentalist, singing as the teacher plays on his instrument. Learning to perform and to improvise are inseparable; the necessary knowledge of the musical system comes as a by-product of gaining proficiency in performance. This traditional practice is still widely followed, although music schools that use organized classroom teaching also now exist (see §7 below).

After discussing how to hold the instrument, the teacher is likely to begin lessons with a simplified version of a *darāmad* of one of the *dastgāhs*. As the pupil progresses, the various *gushehs* of the chosen *dastgāh* are introduced. It is all done by rote. Purely technical studies or dry exercises detached from the *dastgāh* repertory have only a marginal place in the teaching process. With continued work, the pupil becomes aware that the object is not to learn specific and unalterable pieces, but rather that it is a question of mastering mutable ideas for the improvisation of pieces that

have aspects of identity (tones, melodic configurations, range, limitations etc.), but no fixed formation or duration. Through this procedure musicians come to know the implied models of the *radif* repertory. They learn to improvise upon them and become imbued with an understanding that can be articulated in performance but not verbalized.

In this music the preponderance of extemporization has mitigated against the use of ensembles. Moreover, a monophonic music that utilizes a limited range of sound has little justification for the employment of an orchestra. Nevertheless, the inroads of Western music and the introduction of fixed compositions (see §4 above) have resulted in the formation of small ensembles combining Persian and Western instruments, e.g. *tār*, *santur*, *ney* and *tombak*, plus violin and clarinet. The *gushehs* that are subject to improvised rendition are played by individual musicians within the group. In vocal performances the singer leads in improvisation. He or she is followed closely by the accompanying instrumentalist (who must have considerable experience and an exceptionally retentive memory), resulting in an inadvertent imitative counterpoint.

Persian music has a unique vocal technique, which includes *tahrir*, a type of ornamentation with a quasi-yodelling effect and high falsetto notes. This difficult art has been declining since the beginning of the 20th century. Outstanding early 20th-century singers were Qamar and Tāherzāde.

Until the early 20th century, performance of Persian classical music was limited to special occasions in private gatherings, mostly in aristocratic homes or at court. Religious constraints tended to prohibit large public forums for musical presentation. Since then, Westernization and the advent of recording, cinema, radio and television have combined to give music a wider social application (see §7 below). Whereas in the past great performers were known by the social élite, today they are familiar to the bulk of the population. Outstanding performers of modern times, such as [ahmad Ebādi](#) (*setār*), [ali akbar Shahnāzi](#) (*tār*), [Asqar Bahāri](#) (*kamāncheh*), [abolhasan Sabā](#) (violin), [Farāmarz Pāyvar](#) (*santur*), [Hasan Kasāi](#) (*ney*), [Hoseyn Tehrāni](#) (*tombak*) and [Qolāmhoseyn Banān](#) (singer), gained recognition through their recordings, broadcasts and concert presentations, and have been revered by all.

[Iran, §II: Pre-Islamic](#)

7. Modern developments.

Increasing Westernization was the dominant feature of Iran under Pahlavi rule (1925–79). Significant strides were made in the promotion of music as a social force. Tehran was the hub of activity, but larger provincial cities also gradually benefited. In the 1930s a music conservatory was established in Tehran under the auspices of the Ministry of Culture and Arts, with theoretical and practical courses based on European models, and there was a state-funded School of National Music. In 1965 the University of Tehran organized a Music Department modelled on the American system, covering theory, composition, music education and study of different instruments of Western art music. A separate section dealt with systematic study of theoretical and practical aspects of Persian classical music.

Before the 1979 Revolution, radio and television stations aired all types of musical programmes and employed many musicians. In a lighter vein, composed songs of a hybrid Persian/Western type became increasingly popular. An ever-growing host of male and female singers captured the public fancy, stimulating a profitable record industry. These songs were taken up by professional entertainers, as were musical items from films (see §III, 5 below).

By the 1970s, Iran had a number of competent composers, conductors, pianists, violinists and singers of Western music, mostly trained abroad; some enjoyed international recognition. The Tehran SO, founded in the late 1930s, improved steadily. By the mid-1970s it had a hundred musicians under contract, performing regular concerts of the standard repertory and newly commissioned works. An opera company founded in the late 1960s staged works in the splendid Rudaki Hall, including a few by Iranian composers. The National Iranian Radio and Television maintained an excellent chamber orchestra, and there was also a ballet troupe.

The annual Shiraz Festival, held in the southern city of Shiraz and nearby ancient ruins of Persepolis, was another highly effective area of musical activity. The accent was on the Western avant-garde and authentic music from Iran (fig.12) and other parts of the East, with internationally known artists and groups.

With the 1979 Revolution and political takeover by the fundamentalist religious faction, all public music was initially brought to a halt. Music ceased to be broadcast, music schools were closed, and the Symphony Orchestra, opera company and ballet troupe were disbanded. However, within a few years the government came to realize that such draconian measures are untenable: music cannot be expunged from the life of a nation. Furthermore, the hardline position against music, when theologically scrutinized, was found to be largely groundless.

A considerable softening in policy has since occurred. The Tehran SO has been revived, music schools are functioning again and music is heard on radio and television. However, pop music of all kinds is held in disfavour, and women are banned from singing in public. At the same time, large numbers of Iranian expatriates (particularly in the United States) include many musicians continuing to produce and market a vast quantity of popular music.

On the private level, interest in music is greater than ever. Since the régime blocks so many avenues of pleasure, large numbers of people now find joy in the study of musical instruments, both Western and Persian. A real shortcoming is the lack of cultural exchange with the world at large, but that too will no doubt be re-established as Iran's self-imposed isolation is gradually, and inevitably, rescinded.

See below for bibliography.

III. Regional and popular traditions

1. Introduction.
 2. Ritual and ceremony.
 3. Instruments and ensembles.
 4. Sung poetry.
 5. Entertainment.
- Iran, §III: Islamic

1. Introduction.

Iranian civilization has long been sustained by complex interdependencies among settled and nomadic peoples, cities and their rural hinterlands. As musical instruments, performance genres and melody-types were transported from one environment to another, some were distinguished as 'regional', 'rural' or 'tribal'. The names of a great many classical *gushehs* refer to cities, regions or tribes. Similarly, within regional traditions, the principle of marking musical differences with geographic and ethnic names is widely applied, though on a smaller scale than in the classical *radif*.

The current political boundaries of Iran separate ethnic groups from their kindred in adjacent nations. The music of Pakistani Baluchistan [Pakistan](#), [Turkmenistan](#), [Azerbaijan](#) and the Kurdish regions of Turkey, Syria, Armenia and Iraq affords many parallels with that of corresponding groups within Iran. Musical practices in the Gulf region also share many common features, some of African origin (see [Arabian Gulf](#)).

Regional musical traditions are closely correlated with differences of language, and many performers have been bilingual or multilingual. Persian (Farsi) is the mother tongue of little more than half Iran's population, but most people are exposed to it. Sorani Kurdish, Kurmanji Kurdish and Baluchi are the other major Iranian languages. The most important Turkic language spoken in Iran is Azeri (Azerbaijani), dominant in the north-west; others include the language of the nomadic Qashqa'i of Fars province, the Turkmen to the east of the Caspian sea and scattered groups in northern Khorasan. Arabic is widely spoken in the south-west and in towns along the Gulf coast.

In regional traditions, knowledge of repertoires and performance techniques is often transmitted from master (*morshed* or *ostād*) to pupil (*morid*: 'disciple' or *shāgerd*: 'apprentice') in ways that resemble transmission of the classical *radif*. This applies both to instrumentalists learning a repertory of melody-types and rhythmic patterns and to singers specializing in some type of sung poetry. One specialist, the *naqqāl* (fig.13) might spend up to 12 years with an experienced master learning how to sing and recite the epic *Shāhnāmeḥ* ('Book of Kings') of Ferdawsi, which consists of more than 48,000 distichs. A *morshed* who recites poetry in a traditional gymnasium (*zurkhāneh*) acquires his arts of recitation and drumming from a recognized master. Long periods of study are made necessary by the esoteric aspects of much musical knowledge, whether these involve the trade secrets of service professionals or the spiritual insights attained by musicians who take pride in their status as amateurs. The value placed on amateur or semi-professional standing is one

consequence of the low social status traditionally assigned to service professionals.

There are several types of singing and instrumental music among the goods and services best provided by specialists from outside the immediate community. In cities, music for weddings and other festivities is often provided by members of religious minorities, notably Jews and Armenians, many of whom are also instrument-makers. Peasants may call upon musicians from nomadic or itinerant groups for entertainment at weddings, and certain villages have a high concentration of musicians available for hire. Within some tribal societies, the responsibility for playing certain instruments and for performing other services is vested in a relatively small endogamous group, e.g. the Tushmāl among the Bakhtiyari and the Ussa or Changiyān among the Qashqa'i. Musicians of many regions have acquired stylistic elements from the music of 'outsiders' such as the Godar of eastern Mazandaran (who number about 3000).

Regional differences are most pronounced with respect to instruments and ensembles, the ceremonial uses of voices and instruments, and the performance genres cultivated by specialists. Moreover, each region has several musical publics, and some are suspicious or simply unaware of the activities of others. This situation has limited the scope of information on musical instruments and performance genres given by Iranian and foreign authors. The first comprehensive survey of Iranian instruments was carried out in the 1980s and 90s by Mohammed Reza Darvishi, who is preparing a multi-volume encyclopedia of instruments.

Most Iranian performing arts allow performers to select stylistic options that either intensify or diminish the demands placed on listeners and spectators. The most accessible music has a constant metre, a fixed rhythmic pattern and a narrow melodic range. Performers may invite spectators to clap in rhythm, and in some genres all participants are obliged to sing the refrains. Soloists invariably depart from the simplest forms of any pattern, and then return at appropriate points of the performance.

[Iran, §III: Islamic](#)

2. Ritual and ceremony.

Ceremonial uses of voices and instruments vary significantly among the different regions, notably in relation to the functions assigned to specific instruments. Human responsiveness to divine ordinances can be thrown into vivid relief by the absence of instrumental sounds, as in the call to prayer (*azān*) and recitation or cantillation of the Qur'an. The effective coordination of group movements in a regular sequence can be underscored by use of percussion instruments. The semantic associations of particular instruments can be evoked as appropriate in ceremonial contexts. Instruments may also serve as surrogate voices, or as the primary vehicles for performance of a sacred repertory.

(i) Zekr.

The spiritual assemblies in which members of Sufi orders sing poetry and, in some cases, play instruments have long provided a favourable environment for the cultivation of poetry, music and other arts. In no other

type of venue have so many languages and stylistic levels been brought into play, though differences among the orders are expressed, in part, through stylistic preferences and through avoidance of styles deemed inappropriate. The term *zeker* (literally ‘remembrance’) applies both to whole ceremonies and to short formulae or pieces that are sung or spoken at appropriate points within a ceremony.

The sacred instrument of the Ahl-e Haqq order in southern Kurdistan and Lorestan is the *tanbūr* (long-necked lute, fig.14; see §3 below). It accompanies the singing of sacred texts (*kalām*) in the spiritual assembly (*jam’*) using modal entities termed *maqām* (or, more recently, *dastgāh*) and often named after important figures in the order’s history. Hewrami (considered a form of Kurdish by the Ahl-e Haqq) is the sacred language of the *kalām*, though other languages (e.g. Lori and Azeri) are also used in ceremonies. The group sits in a circle as *zeker*s from various sources are performed responsorially, sometimes with instrumental solos on the *tanbūr* interpolated into the sequence.

By contrast, the *zeker* ceremony of the Qāderi order in Kurdistan has two phases, during which participants are first seated and meditative then standing and singing as they move rhythmically. To introduce the entire ceremony, and during the ‘standing’ phase (*qiyām* or *here*), hymns and *zeker*s are sung to the accompaniment of large frame drums (*daff*). The techniques of alternating verses and refrains in a fixed-time cycle and of varying a melody that inexorably returns to its foundation enable singers to activate spiritual energies and to induce states of ecstasy. The purposes of the Qāderi assembly do not require the diversity of melodic resources evident in the rich Ahl-e Haqq tradition.

For further details on *zeker* (or *dhikr*) see [Islamic religious music, §II, 3](#).

(ii) Nowheh.

Responsorial singing also binds together the members of groups that have no connection with Sufi orders. In villages and some towns, members of a *dasteh* or *hey’at* meet regularly to sing verses (*nowheh*) that express their anguish over the martyrdom of the Shi’a *imāms*. The leader sings to a somewhat variable pulse; this contrasts with the group’s short, more metrical responses ([ex.2](#)), which are normally accompanied by rhythmic breast-beating (*sinehzani*) or by striking the shoulders with small chains (*zanjirzani*). The tempo gradually quickens as the leader’s singing rises in pitch and his phrase groupings lengthen.

Nowheh sinehzani is often performed during or after a mourning procession commemorating the martyred *imāms*. For these processions, the most important dates of the Islamic lunar calendar are the 9th and 10th of Muharram (Imām Hossein), the 28th of Safar (Imām Hassan) and the 29th of Safar (Imām Rezā). Men and boys walk in step, as cymbals (*senj*) and perhaps a drum, even trumpet and piccolo, are played. When the group pauses to sing *nowheh*, the instruments are silent, unless they relieve the singers with an instrumental rendition of a strophe.

In the city of Mashhad, on the major days of mourning, groups from many regions of Iran form processions that circle the shrine of Imām Rezā. In the city of Bushehr, each residential quarter traditionally mounted its own procession on the 9th of Muharram, accompanied by an ensemble of eight cylindrical double-headed drums (*dammām*), eight pairs of cymbals and one long serpentine conical trumpet (*buq*) made of reed, with an animal horn containing a blow-hole attached at the upper end. As processions encountered one another, the *buq* players were expected to coordinate the rhythms of their ensembles. (See also Iraq, §III, 1(ii).)

In the province of Gilan and parts of Mazanderan, an ensemble of ten long reed trumpets (*karnā*) performs exclusively in mourning ceremonies and the *ta'ziyeh* drama. The lead player thinks of religious verses appropriate to the occasion and imitates their rhythms and melodic contours with the two (occasionally three) pitches; the other nine play different pitches in a loose rhythmic unison as they 'catch' the leader's words.

(iii) Ta'ziyeh and Rowzeh.

Sung plays (*ta'ziyeh* or *shabih*) depicting events surrounding the martyrdom of Imām Hossein and members of his family (or, less often, the martyrdom of another *imām*) are performed in most regions of Iran. The *ta'ziyeh* reached its highest point of development in the late 19th century, when foreign dignitaries were regularly invited to witness the elaborate performances sponsored by the Qajar court. The efforts of the Pahlavi

shahs (ruled 1926–79) to discourage performance of the plays were more successful in the large cities than in towns and villages. Some prominent classical musicians have come from families known for their expertise in *ta'ziyeh* performance, and portions of the classical *radif* may have been adopted from *ta'ziyeh* melodies.

The *ta'ziyeh* dramas are produced both by circles of devotees and by professional troupes (who interrupt performances at strategic points to solicit donations from spectators). Knowledge of a role (*nagsh*) is sometimes transmitted orally from father to son, but considerable use is made of manuscript texts, which actors may even read during performance. A curator of texts (*noskhe-dār*) serves as a highly knowledgeable source of assistance to neophyte performers (e.g. Āmirzā Ali Paknefas of Qazvin, *d* 1994).

The use of singing serves to distinguish between the forces of good and evil. Soloists portraying the martyrs sing their parts, whereas their enemies do not sing but declaim their verses: singing is held to express human emotions that are sorely lacking in these evil characters. Drums and wind instruments often provide appropriate references to the battle between good and evil. Melodic patterns used for sung dialogues have clearly defined tonal functions and allow for interpolation of exclamations (ex.3). The melody of ex.3 changes direction at the caesura following the sixth syllable of each hemistich.

Rowzeh is an extended poetic narrative about the martyred *imāms*, performed by a specialized singer (*rowzehkhān*) at devotional gatherings, which are held at any time of the year in private homes, mosques and other public places. Texts are drawn from a large repertory of printed and manuscript collections dating from the 17th to the 20th centuries. The singer shapes and articulates conventional rhythmic and melodic formulae to elicit highly emotional responses from the listeners, many of whom weep profusely. (For further details on Shi'a religious music, see [Islamic religious music](#), §III.)

(iv) Daily life.

No form of sound communication is more important to the ordering of Muslim daily life than the call to prayer (*azān*). Qur'anic recitation and the singing of *monājāt* (prayers) and other religious verses in the home is an important part of personal religious observance.

Many urban men attend the morning or evening sequence of athletic exercises in a traditional gymnasium (*zurkhāneh*). These are led by a *morshed* who sings many types of verse (including short sections of the *Shāhnāme*, accompanying himself on a large earthenware goblet drum (*zarb*). The exercises are tightly coordinated with the drum rhythms. Late in the sequence a heavy rattle (*kabbādeh*) is lifted above the head and shaken; it has small metal discs attached to the links of a chain and weighs up to 24 kg.

As in many cities of Central Asia and South Asia, the *naqqāreh-khāneh* (literally 'drumhouse') once played a prominent role in time-keeping. An ensemble of kettledrums (*naqqāreh*), shawms (*sornā*) and long brass trumpets (*karnā*) used to play immediately before sunrise and after sunset from a tower (*naqqāreh-khāneh*). The institution survives (though without the trumpets) at the shrine of Imām Rezā in Mashhad (fig.15).

All over Iran vocal genres connected with stages in the life-cycle or with everyday activities used to be performed responsorially and antiphonally. Some are now sung by soloists with instrumental accompaniment, e.g. the *motk* sung by women in Baluchi mourning ceremonies. Singing to coordinate the movements of workers was highly developed in some regions (e.g. Gilan, Lorestan, Bushehr and Hormozgan), but in living memory many such genres have been abandoned.

Instrumental music is far more prominent in marriage celebrations than in funerals. The instrumental voices that best fit both contexts are those of two shawms, the *sornā* and the larger *karnā*. In Lorestani mourning ceremonies, melodic formulae played on the *karnā* (or *sāz-e chapī*) effectively recall the accomplishments of the dead.

(v) Therapy.

Healing ceremonies in Baluchistan and the Gulf region depend on the participation of skilled instrumentalists. In the Baluchi *gwāti* ceremony, various tunes are played on the *sorud* (double-chested fiddle) or *doneli* (double duct flute) until one pleases the spirit (*gwāt*) responsible for the patient's illness. This tune is repeated as the spirit takes full possession of the sufferer. More than one session (*le'b*) is usually necessary before the *gwāt* makes known his demands through the altered voice of the possessed patient. If healing takes place, it is attributed to divine grace, not to the *gwāt*.

Musical offerings and appeals to spirits are equally important in healing ceremonies of the Gulf region, which include the *zār*, *nubān* and *liwah*. The *tambire*, a bowl lyre with six strings, is the sacred instrument of the *nubān* on the island of Qeshm and elsewhere in the province of Hormozgan. It is normally accompanied by two large double-headed drums (*gap dohol*) and a belt-rattle sewn with sheep- and goat-hooves (*manjul* or *manjur*).

See also [Iraq, §III, 1\(iii\)](#) and [Arabian Gulf](#).

[Iran, §III: Islamic](#)

3. Instruments and ensembles.

Of the six primary instruments of 20th-century Persian classical music, *santur* (dulcimer), *tār* (double-chambered long-necked lute), *setār* (long-necked lute), *kamāncheh* (spike fiddle), *ney* (rim-blown flute) and *tombak* or *zarb* (goblet drum), all except the *setār* are also prominent in popular or regional traditions, where they are found in variant forms. In the 1980s and

90s the frame drum (*dāyereh* or *daff*) began to reclaim its former place in the classical ensemble, though current playing techniques are rudimentary in comparison to those of the *zarb*.

Before the 1979 revolution, urban popular musicians (*motreb*) exploited the virtuoso possibilities of the *tār* and *santur* in radio orchestras and entertainment troupes. The violin was readily assimilated in both environments, whereas its suitability for music based on the *radif* remains a controversial subject. Some urban popular ensembles adopted a *santur* with 14 quadruple courses of strings rather than the 9–11 courses of the classical instrument. The Azerbaijani *tār* (*tār-e qafqāzi* or *tār-e torki*) had a major role in the radio ensembles called ‘Azerbaijani orchestras’, which were active for several decades. In contrast to the Iranian *tār*, it is held against the player’s upper chest and has a shallower body, a thicker membrane for the soundtable, 22 rather than 25 frets, and five or six additional sympathetic drone strings (fig.16).

The *kamāncheh* (spike fiddle) and *ney* (rim-blown flute) are central instruments within both rural and urban musical practices. The *kamāncheh* with either three or four strings (fig.17) is found among the Qashqa’i and in Lorestan, Azerbaijan, Gilan, Mazandaran, the Turkmen plain and northern Khorasan. In Gilan and northern Khorasan, it shares a repertory of dance tunes with the *sornā*, and some musicians are proficient on both instruments.

The *ney* is commonly called *ney-e haftband* (*ney* with seven nodes), but oblique rim-blown flutes have many other regional names. They are virtually ubiquitous (except from Azerbaijan), as is their association with shepherds. The preferred rim-blown flute of a given region often has a substantial repertory. In most areas it is played solo or accompanied by a drum (*dāyereh*, *tombak* or occasionally small *naqqāreh*). Players of rim-blown flutes often hum or sing a fundamental pitch while playing. In the late 19th century, court musicians adopted the Turkmen technique of placing the *ney* against the upper teeth, using the tip of the tongue to direct the air flow.

The next most common aerophone is the *sornā* (shawm, often simply called *sāz*: ‘instrument’). Its wooden body (usually 30–45 cm long) has a cylindrical bore along two-thirds of its length, expanding into a small bell below the lowest finger-hole. Its melodic range rarely exceeds a 12th. The much larger *karnā* or *sāz-e chapi* of Lorestan and of the Bakhtiyari and Qashqa’i has a detachable lower section of copper or brass, somewhat longer than the wooden body; the total length of a *karnā* may reach 90 cm. One *sornā* or *karnā*, played with the technique of circular breathing, is normally accompanied by one or more drums, usually the *dahol* (but *dāyereh* in western Gilan and *naqqāreh* in eastern Gilan and Mazandaran). In Azerbaijan a second *sornā* may provide a continuous drone. The *sornā* of Minab (Hormozgan), a relatively large instrument with a range of two octaves, is accompanied on festive occasions by two types of *dohol* (the *gap dohol* or *mārsāz* and the smaller *jawrre*) and perhaps one or two *tombak*. The combination of *sornā* or *karnā* and *dohol* has long been associated with weddings and circumcisions, acrobatics, wrestling and

other games of prowess; it is heard in some *ta'ziyeh* performances, e.g. in Hormozgan.

Other aerophones have more limited distribution. The *bālābān* of Azerbaijan and Kurdistan (also called *nerme ney* and *mey*) is a cylindrical pipe of about 30 cm, played with circular breathing (fig.18a). The broad 10-cm double reed produces a warm, pliable tone. When a pair of instruments is used, one musician (the *damkesh*) plays a continuous drone. The drone function is inherent in the structure of the Baluchi *doneli*, a double duct flute related to those of the Indian subcontinent. The 'male' flute which plays the melody has up to 11 finger-holes, of which only the lower six are used: the 'female' has eight holes, some filled with wax to produce the appropriate drone.

Double clarinets are played mainly to accompany dancing, usually with *dohol* accompaniment. They are found in Khorasan, the Zagros mountains and the Gulf region. Two pipes of equal length (about 15–20 cm) are commonly tuned in approximate unison, but expert players occasionally tune them a 2nd or 3rd apart to raise the energy level of the music; often one pipe acts as a drone. In Khorasan, the *qooshmeh*, *dosāzeh* and *dobugeh* are usually made from bird bones (eagle or crane), having five, six or seven finger-holes. In Kurdistan, Azerbaijan and Lorestan, similar double clarinets are made of reed (*duzele*: 'two reeds'; see fig.18b). In the south-west, a similar six-holed reed instrument (*ney-jofti*, *qalam-jofti*) takes an important role in religious ceremonies, and it provides accompaniment for sung poetry and dancing. A double clarinet set within a block of wood serves as the chanter of the *neyanbān*, a bagpipe sharing much of the same repertory.

The cylindrical double-headed drum (*dohol*) is found in many of the ensembles described above. One skin is normally beaten with a large bent stick (*gorz*), the other with a thinner, more flexible stick (*tarke*). The diameter of each membrane invariably exceeds the length of its cylindrical body (e.g. in the ratio of 80:30 cm). In Hormozgan a group of three double-headed drums accompanies the *qalam-jofti*, entering in a prescribed order: *dohol* (played on both skins with the hands), *pipa* (played on one skin with a stick) and the small *keser* (played on one skin, with the hands, supplying variations of the basic patterns). Ensembles of drums playing complementary parts are highly developed in Baluchistan and the Gulf region, e.g. the Baluchi pair of barrel drums played with the hands (male *dorrokor* and smaller, female *tambuk*).

The frame drum (*dāyereh* or *daff*) occurs in many sizes, with or without attached metal rings. It has found its way into the most varied social situations, from the Sufi *zehr* to performances of street entertainers. It never lost its central role in the classical and popular idioms of Azerbaijan, and the best Azeri players display a high level of mastery.

The most important feature distinguishing long-necked lutes is the manner of sounding the strings: they are struck with the fingers of the right hand on the *dotār* (literally 'two strings') and Ahl-e Haqq *tanbūr*, plucked with a plectrum on the *tār* and Azerbaijani *sāz*. These instruments often accompany sung poetry. Every *asheq* accompanies his songs on the *sāz* (see §4(ii) below): with the *bālābān* and *qāval* (frame drum) or (in the west)

solo. In addition to accompanying singing, the *dotār* has regionally specific functions (e.g. participation in ceremonies of the Sufi Naqshbandi order in Torbat-e Jam). Khorasani players delight in producing dense sonorities, and ensembles of several *dotārs* have become common. The Turkmen *dotār* is often played with the Turkmen spike fiddle (*qijak*).

Various sizes of *dotār* are played in eastern Mazanderan, on the Turkmen plain and throughout Khorasan. The two strings, tuned a 4th or 5th apart, are often struck simultaneously. Similarly, the Ahl-e Haqq *tanbūr* has two strings tuned a 4th or 5th apart, the higher pitch doubled by a third string. Most modern *dotārs* have 14 frets yielding a chromatic scale, but in eastern Khorasan three-quarter-tone intervals are used as well.

Khorasani *dotārs* (fig.19) are some 100–110 cm in length; Turkmen *dotārs* are about 85 cm, having more elaborate melodic ornamentation since the frets lie close together. The *sāz* or *bāqlāmā* of Azerbaijan (also called *chogur*) is approximately the same length as the Khorasani *dotār*, but with a proportionally much larger sound cavity. It has three triple courses of steel strings; the melody is played on the upper course, and the lower two provide a rich drone. The 14 frets produce a chromatic scale with the option of two three-quarter-tone intervals.

Baluchistan has four distinctive chordophones, the most important being the *sorud* or *qheichak*, a double-chested fiddle with a skin soundtable over the lower section, four melodic strings and four to ten sympathetic strings (fig.20). Its large solo repertory is partly shared with the *doneli* flute. Melodies that are highly ornamented on the *sorud* are rendered in their simplest form on the *rubāb*, a short-necked waisted lute with a skin soundtable over the lower section, four melodic strings and 10–15 sympathetic strings (see [Afghanistan, §I, 6\(i\)](#)). The *sorud* is often accompanied by the *tanburag* (also known as *tanbire* and *setār*: ‘three strings’). This instrument is larger than the classical *setār* (about 125cm long) and has three strings. It is an accompanying instrument, providing a rhythmic drone. The *benju* is a plucked board zither introduced into South Asia from Japan, one metre long, with a mechanized keyboard. Its four drone strings serve as a substitute for the *tanburag*, a small plectrum effectively producing ornaments on the two melody strings. (See also [Pakistan](#)).

[Iran, §III: Islamic](#)

4. Sung poetry.

The ability to sing or recite classical Persian poetry is remarkably widespread and in no sense the exclusive prerogative of specialists. Passages from Ferdawsi’s *Shāhnāmeḥ* (‘Book of Kings’) were once sung in many settings: nomad encampments, village social gatherings, teahouses and gymnasiums. Most melody-types used for singing the *Shāhnāmeḥ* accommodate two lines, each with two hemistichs of 11 syllables in the quantitative metre – –/– –/– –/–.

(i) Lyric genres.

Singing for oneself, small groups of friends, children and other family members is common in most regions. Inhibitions make many people

reluctant to sing in public unless they are recognized as having good voices. Social gatherings in the Mukri region of Kurdistan may include an activity known as *gerelawije*, in which everyone present takes a turn in offering a song, and in Khorasan the instrumentalists hired to perform at village weddings provide accompaniment for any guest who wishes to sing *chāhārbeiti*.

Genres of lyric song emphasize such topics as the singer's loneliness, yearning for home or separation from his or her beloved, themes that are easily extended to praise of the singer's home, family and beloved. The beauty and unpredictability of nature are also major themes. Lyric genres are aptly sung by someone working or travelling alone, but the same verses remain appropriate when the singer has an audience of a few hundred guests at a village wedding. One of the primary functions of music is to alleviate the pain of the individual's condition by acknowledging and articulating it.

The literary form known as *dobeiti* is a couplet with 22 syllables in each line, almost always in the *hazaj* metre: – – –/– – –/– – (twice). It has a rhyme scheme of *AABA* or *AABB* for the four hemistichs and is often called *chāhārbeiti* ('quatrain'). Such couplets are usually sung to melody-types that can accommodate one full line, which allows singers to introduce subtle melodic variations in the second line and subsequent couplets (ex.4). A singer strings together a sequence of couplets, repeating lines, inserting refrains *ad libitum*, and interpolating vocatives and expletives at various points, often with elaborate ornamentation (*tahrir*). Most melody-types respect the division of the couplet into four hemistichs of 11 syllables each but do not impose a rhythmic pattern with a regular grouping of beats. Such melodies are sometimes described as 'non-metric', despite the fact that the poetic metre acts as a strong constraint, controlling the placement of ornaments and extended durations. In some verses the number of syllables is kept constant with no hint of a quantitative metre. Although instrumental accompaniment is not essential, the *dotār*, *kamāncheh*, *ney*, *ney-joftī* and *ney anbān* are capable of playing alternate strophes with ornamentation equivalent to that of the vocalist.

The varieties of *dobeiti* (or *chahārbeiti*) have many names, pointing to the subject matter, melody-type or manner of performance. *Gharibi*, a common term in several regions, emphasizes the singer's predicament as a stranger far from home. In the Talesh region of Gilan, the generic term is *dastun* and melody-types bear the names of localities (e.g. *kargānrudi*, *asālmī*, *māsāli*). In Fars and the Gulf region, the most important term is *sharve*, and many verses are attributed to named poets such as Fāyez Dashtestāni (1834–1911) and Maftun (1897–1962). Singing styles vary with respect to features such as emphasis on, or avoidance of, melodic climaxes in the *sharve*. In northern Khorasan the *āhang-e sarhaddi* ('tune of the Sarhadd region') is the preferred melody-type. Around Torbat-e Jam some of the same verses are sung in a number of genres, e.g. *sarhaddi*, *jamshidi*, *hazaregi* and *kucheh-bāqi*. (See [Afghanistan](#), §II, 2(i).)

The quatrains sung in Azerbaijan (*bayāti*, similar in form to the Turkish *māni*) usually have seven-syllable lines with the rhyme scheme *AABA*, as does the *ağit*, a lament for the dead. Some scholars believe that *bayāti* and *māni* derive from a process of interaction between the Persian *dobeiti* and older forms of Turkic poetry. *Qoshma* is the other major type of Azerbaijani quatrain: lines of 8 or 11 syllables have the rhyme scheme *AAAB* and the final line is sometimes a refrain. Rhythmic and melodic considerations occasion the expansion of some lines, elimination of others and addition of refrains or vocables during performances. The *qoshma* is easily extended into a strophe of five hemistichs with the rhyme scheme *AAABB*.

In Kurdistan, lyric genres are not arranged in quatrains. The most popular Kurdish songs, known as *gorāni* or *stran*, are short and relatively easy to learn. Their refrains are sometimes longer than the verses. *Lawik*, *heyrān* and *qetar* are common genres calling for elaborate ornamentation as the melody gradually descends within an interval of a 4th or (more often) 5th. The distinctive melodic profile of each genre make it easy to recognize in instrumental performances. Singers make extensive use of syllables such

as *leyley*, *lolo* and *loyloy*. These genres are often followed by a *pashbend* ('suffix', 'after-verse') in a dance rhythm.

Baluchistan, like Kurdistan, is exceptionally rich in lyric genres, which lend themselves to instrumental adaptation. *Zahirok* and *liku*, like the Persian *gharibi*, express yearning for home or anguish at separation from the beloved. The melodies may have a range of two conjunct or disjunct 4ths; they are highly ornamented and avoid any metric regularity. Both genres are often accompanied on the *sorud*, which provides introductions, interludes and conclusions, plus a constant drone. The metric genre known as *sawt* is usually sung to instrumental accompaniment and treats many topics. It has an unusually large repertory of melodies; a single song may contain phrases based on several different species of tetrachords.

(ii) Narrative genres.

Several types of professional and semi-professional performers have long been recognized for their large repertoires and skill in holding an audience. These include the Persian *naqqāl*, Baluchi *shā'er* or *pahlawān*, Kurdish *beytbij*, Azerbaijani *āshiq*, Turkmen and Khorasani *bakhshi*. Prior to the 1979 Revolution, an elaborate wedding celebration (*toy*) in Turkic-speaking areas was incomplete without performance of stories (*dāstān* or *hikāye*) that include quatrains sung to instrumental accompaniment.

Other major venues for performance of narrative genres were upper-class homes and, from the 17th century onwards, teahouses (most of which were closed after the 1979 Revolution). The traditional patronage base of the great Iranian storytellers did not survive the social changes of the 20th century, although in current times a festival of traditional arts may bring together outstanding performers in most of the categories described.

Baluchi verse narratives (*sheyr*) used to be performed by a poet-singer (*shā'er*) at gatherings of the ruling khans, and occasionally at marriage celebrations. Extensive stories such as 'Chāker and Goharām' might last as long as ten hours. They primarily tell of heroic deeds and historical events, but include tales of lovers who overcome various obstacles to their union. The singer is generally accompanied by *sorud* and *tanburag*. He should effectively combine three performance styles, moving from expressive singing (*alhān*, pl. of Arab. *lahn*: 'melody') to rapid declamation (*dabgāl*) or short metric songs (*sāzenk*); instrumental interludes are inserted at prescribed points. At the highest level of mastery, the poet-singer is termed *pahlavān* ('singer of heroism').

A Kurdish *beytbij* may sing throughout the epic (*beyt*) without instrumental accompaniment or may combine sung poetry with spoken prose. Presentation of a long *beyt* may extend over several evenings. Topics range from stories of ill-fated lovers to warfare between Kurdish princes or Kurds opposing Ottoman or Persian armies. Narrative poems by modern Kurdish writers such as Abdollah Guran (1904–62) often carry political implications; they are sung throughout Kurdistan in a style similar to the *beyt*. Traditionally semi-professional, the *beytbij* acquires his art through extended study with a master (*westa*). 'Ali Bardashani, the celebrated *beytbij* active at the Bābān court under Abdolrahmān Pasha (ruled 1789–1812) was said to have received assistance from supernatural beings

(*jindōkān*), and in return he supposedly sang at their weddings. Other early singers are also remembered by name.

Each strophe of a *beyt* generally has a variable number of lines of varying length, with a common rhyme. Successive strophes are often linked by a repeated word, phrase or thought. Although the parlando singing style avoids regular grouping of beats, the variation and expansion of short rhythmic and melodic ideas lend coherence to the singer's discourse. Melodies generally descend within the range of a 4th or 5th.

The most richly developed narrative repertoires are those of the Azerbaijani '*āshiq* and Khorasani *bakhshi*, memorized from manuscripts or inexpensive books and occasionally enlarged with new items. Versions of some Turkic narratives (e.g. the love story 'Tāher and Zohrā') are known to storytellers over a wide area extending from Xinjiang in China, through Uzbekistan, northern Afghanistan, Turkmenistan, northern Iran, Azerbaijan and Turkey. Musical presentation is particularly appropriate for two lovers' exchange of strophes; prose narration explains the situations that motivate the lovers to sing and the strophic melodies are echoed in instrumental interludes. Most strophes are quatrains with lines of 8 or 11 syllables (the latter divided 4 + 4 + 3 or 6 + 5), grouped into larger sequences by common refrain lines and common melody-types. In Azerbaijan each tune (*havā*) has a proper name. Names are less important in Khorasan; some tunes accommodate verses in three languages (Khorasan, Turkic, Kurmanji Kurdish and Persian).

In western Azerbaijan an '*āshiq* accompanies himself on the *bāqlāmā* (*sāz*), and likewise every *bakhshi* sings to his own *dotār* accompaniment. The '*āshiq* and *bakhshi* also perform genres with religious connotations, some employing quantitative metres (derived from the classical Persian *aruz* metrical system and linked to specific melody-types) rather than the syllabic metres of Turkic folk poetry. A well-known example, transcribed from the singing of Asheq Hassan Eskandari (b 1947), is a strophe from the much-loved sequence *Heydar Bābā-ye Salām* by Shahriar (1904–89). Shahriar's strophe has five hendecasyllabic lines (divided 4 + 4 + 3) with the rhyme scheme AAABB.

For further details on the '*āshiq* see [Azerbaijan](#); for the Turkmen *bakhshi* see [Turkmenistan](#).

[Iran, §III: Islamic](#)

5. Entertainment.

Several types of performance described by 17th-century European travellers (Olearius, Chardin and Kaempfer) remained current in Iranian cities until the aftermath of the 1979 Revolution. By the 1990s, however, some had been abandoned. An example is the role of the *luti*, who sang and danced to his own *dāyereh* accompaniment, often transgressing the norms of 'proper' behaviour. Some performed as transvestites or sang verses praising opium and mocking the authorities. Another type of

traditional entertainer, *Hāji Firuz*, was an actor with a blackened face who performed on the streets at the Persian New Year. He would recite verses in a high-pitched voice to *dāyereh* accompaniment. A high-pitched vocal style was also used in forms of puppet and marionette theatre (e.g. *pahlavān-kachal* and *kheimeh shabbāzi*), which are now rare.

In the 1960s, prior to the Revolution, a troupe of popular entertainers (*dasteh-ye motreb*) would include players of *tār*, violin, *sornā*, *zarb*, *dohol* and *dāyereh*, alongside dancers with finger cymbals, acrobats and actors, one of whom played female roles. Such troupes performed improvised comic skits at weddings and circumcisions in rural areas, and in cities they typically entertained crowds near bus stations. For several decades after the first Persian sound film (1934), films with musical numbers were a significant source for professional entertainers. Films with music in *motrebi* idiom are no longer produced.

These performers (*motreb*) enjoyed none of the artistic prestige carried by the cognate term, *mutrib*, in Arabic-speaking countries: in Iranian culture *motreb* carries derogatory connotations. Clowning is characteristic of the *motreb* and was highly valued at the Qajar courts (1779–1925). 20th-century rulers have not cultivated a taste for comedy and satire, although it remains strong in the population as a whole.

In some cities, notably Shiraz, Jews predominated in the profession of *motreb*, but numbers have declined dramatically through emigration to Israel. *Motrebs* do not work alone, since many solo lines require a response. Duos are common (e.g. a violinist and singer who also plays *dāyereh* or *zarb*); they are also less likely than larger groups to attract unfavourable attention.

Several regional traditions of instrumental music have gained a new respectability through the appearances of outstanding performers at festivals. The traditions have varying norms for linking together the components of a performance. In Lorestan the duo of *sornā* and *dohol* customarily begins with *sangin se-pā* ('three steps, heavy') and concludes with *shāne-shaki* ('shaking shoulders'). Duos in northern Khorasan (*sornā* and *dohol kamāncheh*, and *dohol* or *qooshmeh* and *dāyereh*) are less likely to follow a prescribed sequence of pieces. They may freely mix the main dance-types (e.g. *do qarseh*, *enaraki*) with other familiar melodies (e.g. *Kōroḡlu*). Hemiola rhythms are extremely frequent in instrumental music at all stylistic levels throughout Iran.

Iranzo y Herrero, Agustín

(*b* Allaga, bap. 28 Aug 1748; *d* Alicante, 27 Sept 1804). Spanish composer. He was a choirboy at the Pilar cathedral of Zaragoza, where he studied under Bernardo Miralles. In 1768 he applied, unsuccessfully, for the post of *maestro de capilla* at Las Descalzas Reales, in Madrid; in 1773 he was appointed *maestro de capilla* of the collegiate church of Alicante, a post he retained until his death. Over 100 of his religious works, including masses, motets, Lamentations and villancicos, are extant (in Alicante Cathedral). Although his theoretical works (including *Defensa del arte de la música*, Murcia, 1802, and numerous articles) show him to be violently opposed to Eximeno's innovations, in his compositions he boldly abandoned the secular Italianate style of the 18th century in favour of a more severe style for his religious music, with carefully wrought forms and much harmonic interest. His music continued to be sung long after his death.

JOSÉ LÓPEZ-CALO

Iraq, Republic of

(Arab. Jumhuriya al 'Iraqia).

Modern Iraq covers the region of ancient [Mesopotamia](#) between two great rivers, the Tigris and Euphrates. With its first royal cities, discovery of writing and advanced overall culture, this country gave birth to the oldest cradle of civilization. Situated at the north-eastern end of the Arab world, Iraq, with an area of 438,317 km², is an important meeting-place of the various cultures of the Middle East (Persian, Turkish and others).

The country has rich agricultural plains, mountains, deserts and marshes, with cities and towns built along the rivers. The population has recently grown from about 11 million (1975) to some 23·11 million (2000 estimate). Arab Muslims form the majority (75%). Kurds form the second most important ethnic group, and there are also Turkmens (mainly around Kirkuk), Gypsies (*kawliyya*) and blacks (in the South). 95% of the population is Muslim (Sunni and Shi'a sects and some heterodox groups). There are Christians of the Chaldean, Nestorian and Armenian churches.

Other religious groups are the Yezidis and the Sabaeens (known as Christians of St John). A very ancient Jewish community existed until 1950.

II. Art music and related traditions

III. Vernacular traditions.

IV. Modern developments

SCHEHERAZADE QASSIM HASSAN

Iraq

I. Geographical and historical background

From a socio-cultural and musical point of view, Iraq can be divided into four main geographical regions (fig.1). The central plains of ancient Mesopotamia lie at its core. The lower basin of the rivers Tigris and Euphrates stretches from Baghdad to the marshes of the south-east, with their cities Nasiriyah (on the Euphrates) and Amarah (on the Tigris). The marsh region is inhabited by Shi'a Muslims and Sabaeens.

The mountainous north borders on other Arabic-Turkish and Persian cultures. This region houses important minority ethnic communities and sects: the Sorani (eastern) and Bahdini (western) Kurds, and Turkmens. It is the home of the ancient Syriac Christian Church and of the Muslim sect and Yezidi other minor sects such as the Shabak and Sarlia.

The desert region comprises three-fifths of Iraq, divided between *al-jazīra* (north-west) and *al-bādiya* (south). Bedouin inhabitants are nomadic (Shammār and 'Iniza tribes) and semi-settled, the latter occupying areas adjoining the fertile plain. On the upper Euphrates, the ancient towns of Anah, Rawah and Hit represent a blend of Bedouin culture with pastoral and rural sedentary town populations of tribal origin.

Finally, the extreme south-eastern region, where the two rivers unite to form the Shatt al-Arab, is influenced by the Gulf and traditions from the Arabian peninsula. It is populated by Arab rural people and city dwellers and by people of African origin. Basra is the major city, and Zubayr is a small town.

The music of Iraq has been documented from very early epochs. Archaeological excavations have uncovered information about music of the Sumerian, Akkadian, Babylonian and Assyrian periods (5th to 1st millennium bce). At the royal cemetery of Ur, three examples of the first lyres of human civilization were found, dating to c2600 bce. Silver flutes, a great number of multi-shaped terracotta rattles, bronze bells, cymbals and clappers made of bronze and shell were also found. Hundreds of reliefs, plaques, murals, stelae, cylinder seals, vases and statues show Mesopotamian musicians playing a wide variety of musical instruments. Scholars have also deciphered cuneiform texts dealing with many aspects of musical theory and practice.

The other important historical period for music was under Abbasid rule (750–1258), when Iraq was the centre of an Islamic multi-ethnic empire and the meeting-point of cultures from Greece, the Middle East and other parts of Asia. Its influence stretched westwards to North Africa and Spain.

The first important Arabo-Islamic musicological treatises derive from the Abbasid period, and most significant scholars lived, wrote or studied in Baghdad: [al-Kindī](#) (d c874), [al-Munajjim](#) (d 912), [al-Fārābī](#) (d 950), [al-Isfahānī](#) (897–967) and [saḥī al-Dīn](#) (d 1294).

The catastrophic collapse of Baghdad under the Mongol onslaught shattered its elaborate cultural life and marked the beginning of successive periods of foreign domination by Turkmen tribes, Persians and Ottomans. Musical erudition regressed to such a point that concrete evidence of musical life is scarce, although traces of Turkish and Persian influence are evident in the urban secular classical repertory. (See also [Arab music](#), §I.)

The secular music traditions, instruments and dances of all Iraqis derive from Arab, Kurdish and Turkmen cultures. To a lesser degree, in the extreme south, they may belong to traditions of the [Arabian Gulf](#). Each region of Iraq has its own specific musical features with regard to the secular and sacred functions of music, instruments, dances, and the role of the musician. At the same time, there are characteristics common to the whole of Iraq. Vocal expression is dominant in all Iraqi music, and improvisational free-rhythmic singing and metric songs (including dance-songs) play important roles. The boundaries between art and folk, secular and religious music are not clearly delineated, and interrelations, mutual influences and overlapping repertoires are common.

[Iraq](#)

II. Art music and related traditions

The art music of Iraq revolves essentially around the Arab modal system called *maqām* (see [Mode](#), §V, 2). Its repertory serves as a formal and melodic reservoir for religious, ritual and secular art music, for instrumental improvisations and sometimes even for arranged music. Prior to the mid-1930s (with the creation of the Fine Arts Institute and formal teaching of written theory), local art musicians were not conscious of the theoretical concept of *maqāms* as melodic modes. A complex oral verbalized theory existed, and from the 1950s this was combined with the written tool of Arab music theory.

Iraqi Bedouin and rural popular music is, in fact, based on a number of tetrachords known in Arab music, while Iraqi art music (Iraqi *maqāms* and religious vocal genres) is based on the combination of similar or different tetrachords forming a modal scale of one or two octaves with possible changes of some degrees.

1. Iraqi art music ('maqām').

The local performance tradition, *al-maqām al-‘irāqī* represents an important secular repertory of many semi-improvisational compositions, linking classical and popular poetry and based on a sophisticated unwritten traditional theory. It is believed that the oldest extant repertory, transmitted orally, dates back at least four centuries, probably with some even earlier features.

According to early 20th-century ideas, the seven basic modes or *maqāms* (*maqāmāt asliyya*) are *rāst*, *beyāt*, *segāh*, *ajam*, *nawā*, *hijāz* and *sabā*. All

others are 'derived' *maqāms* (*maqāmāt far'īyya*). In inventories dating from the 1970s, *chahārgāh* replaces *nawā* as a basic *maqām*. In the 1960s and 70s the Iraqi *maqām* repertory numbered some 50 individual *maqāms*. Since then the tradition has undergone certain changes (see §IV below). However, the total number of *maqāms* in the repertory has always been subject to variation. New *maqāms* may be introduced and others may be dropped or altered (because they resemble others or because they are difficult to perform). During the 1990s important *maqāms* continued to be performed in small gatherings, but they were otherwise avoided (for large or non-connoisseur audiences).

Each *maqām* in the repertory has a particular preconceived multi-parameter scheme concerning its modal, melodic, rhythmic and formal organization. The performer is expected to respect its traditional framework and to enhance its formal skeleton with personal improvisations, ornamentation and musical developments.

Different *maqāms* make variable use of the following elements. *Tahrīr* currently designates the opening of a *maqām*, sung on vocalizations (syllables, words or phrases) and preceding the beginning of the sung verse. *Badwa* has the same function as *tahrīr* but differs in its very brief opening. *Jaisa*, a descending cadence, marks the end of the first part of the *maqām*. *Meyāna* is the 'middle' formal melodic part in tripartite *maqāms*, sung in a high register. *Sayha*, also in a high register, is (unlike *mayāna*) musically undeveloped. *Qarar* designates either a descending movement to the lower degree or any sung portion in that register. *Quta'* or *awsāl* are melodic pieces occurring in any part of the *maqām*, serving as modulations or structural bridges to higher or lower registers, as aesthetically embellishing sections or as a means to enhance or change a prevailing mood. In general, their place is predetermined, but some are used freely.

In the early 20th century, the secular *maqām* repertory was performed in five cycles termed *fusūl* (sing. *fasl*). The remaining *maqāms* were sung outside the order of the secular cycle, either in religious cycles or as independent, important *maqāms*.

Other forms play a role in *maqām* performance: instrumental rhythmic introductions and solo improvisations, as well as vocal genres. Singers also use free poetic verses followed by popular melismatic songs (*ubūthīyya*). A *pesta* (metred song) normally follows each *maqām*, preparing the audience for the one to follow.

Melodically, the Iraqi *maqām* repertory draws on the music of all communities living in Iraq. Within it, one finds melodies from Arab rural and Bedouin people, and from Kurds and Turkmens. Melodies from outside Iraq also appear: Turkish, Persian and Arabic material from other parts of the Arab world.

Three sung poetic forms are used in Iraqi *maqām* proper: (1) the *qasīda* (classical Arabic ode); (2) the *takhmīs* (quintary verse based on two hemistiches of a known *qasīda*, with three added hemistiches); (3) *mawwāl* (a major colloquial poetic form, also called *zheiri*). Classical texts are used by 33 Iraqi *maqāms*, and some 20 *maqāms* employ the *mawwāl*.

In secular performances, the Iraqi *maqām* is accompanied by *al-shālighī al-baghdādī* (the Baghdad ensemble). This consists of the *santūr* (hammered dulcimer) and *jūza* (four-string lute or fiddle with coconut resonator; fig.2) accompanied by two or three drums: *tabla* (single-headed drum), *duff zinjārī* (frame drum with discs set into the frame) and *naqqāra* (double kettledrum). Occasionally a large frame drum replaces the *naqqāra*. The traditional role of the *shālighī* ensemble was to anticipate and lead the singer. Some singers prefer to avoid this constraint, choosing to perform with *al-takht al-sharqī* (the oriental ensemble). *Al-takht al-sharqī* performed Arab art and light music in Egypt and the Levant and was introduced into Iraq in the 1920s. It consists of the *qānūn* (plucked zither), *nay* (end-blown flute), *ūd* (lute) and two types of drum, one being a frame drum.

The Iraqi *maqām* is generally performed by a specialist singer known as *qārī' al-maqām*. Nowadays other types of singer (*mutrīb* or *mughannī*) perform some *maqāms*, but only real specialists can perform the complete repertory. The best representative of the old school of *maqām* singing was Rashid al-Qundarchī (d 1945). Other important 20th-century masters were Ahmad Zaydān (d 1938), Muhammad al-Gubanshī (1901–89) and his disciple Yūsuf 'Umar (1918–87), perhaps the last important *maqām* singer (fig.3). At present the tradition is in decline, due to lack of patronage.

Before the emergence of modern music and life-styles, the Iraqi *maqām* was the main form of entertainment for city-dwellers in Baghdad, Mosul and Kirkuk. It could be heard everywhere and was performed at weddings, circumcisions or any secular occasion. Concerts were organized in music-lovers' homes. Until the 1940s, well-known singers performed for large audiences in a number of public coffee-houses. Certain *maqāms* were also performed in the traditional gymnastic houses (*zūrkhāna*) to accompany muscular exercises.

Ever since its creation in 1936, the national radio station has regularly broadcast *maqām* singing, and from 1950 there have been weekly programmes on the national television. Today *maqāms* are performed on stage, in concert halls and other modern multi-functional gathering-places (notably, the Museum of Popular Art in Baghdad, on Fridays) but seldom in traditional circumstances.

2. Islamic religious chanting.

Qur'anic recitation (*qirā'a* or *tilāwa*), call to prayer (*adhān*), supplication (*du'ā*) and glorification (*tamjīd*) are types of religious chanting performed in mosques. They are not regarded as singing (*ghinā'*), although they use melodies that follow the rules of the melodic modes used in the Iraqi *maqām*. Indeed, Qur'anic reciters usually excel in *maqām* singing, and thanks to them hundreds of Iraqi melodies have been preserved.

Recitation is normally performed solo. Collective recitation is used in teaching and in some Baghdad mosques on the eve of Friday. During recitation of the whole Qur'an, sometimes as many as 30 reciters might successively perform. Alternation between two reciters is common during mourning ceremonies.

Qur'anic recitation has its own local Iraqi style. As elsewhere, it varies between a simple form with limited-range melodies (*tartīl*) and more developed forms which include improvisation, ornamentation, repetition and changes of register. In the Iraqi school of recitation, a good voice is of prime concern, followed by knowledge of melodies (*anḡhām*) and mastery of the linguistic science of recitation (*tajwīd*). An Institute of Melodic Studies (*ma'had al-dirāsāt al-naghamiyya*) exists for teaching these. The rules of *tajwīd* (correct recitation) are also taught in the Institute of Melodic Studies (Ma'had al-dirasat al-naghamiyya). In the 1970s the noted religious scholar, prayer leader and *maqām* specialist Shaykh Jalāl al-Hanafī (b 1915) opened a centre for teaching Qur'anic recitation to women in a 13th-century Baghdad mosque (Jāmi' al-Khulafā').

The Iraqi school of Qur'anic recitation has always been known for using melodies, and in Iraq the use of melody has not been a polemical issue for religious debate. But Qur'anic recitation is not supposed to lead to secular ecstasy or to a possible confusion between purely secular singing and religious recitation. Consequently, religious orthodox authorities sometimes criticize Qur'anic reciters for the beauty of their execution, if it diverts the intent of worshippers.

3. The Prophet's birthday ritual ('mawlīd').

This widespread and popular ritual, *al-mawlīd al-nabawī*, is practised in both sacred and secular urban life. Two versions apply to diametrically opposed types of occasion. *Mawlīd farah* (happy anniversary), based on the text of Ahmad bin Hasan al-Bakrī, is performed on the Prophet's anniversary or any happy occasion (marriage, circumcision, benediction, fulfilment of a wish or return from Mecca). *Mawlīd kidir* (sad anniversary), based on the text of Barazanchi, is organized on solemn national and state occasions and to commemorate death.

A *mawlīd* ceremony is performed in four cycles (*fusūl*), each composed of a succession of several predetermined *maqāms*. Vocal parts are performed either by a religious sheikh or by a secular *maqām* singer who enjoys greater freedom of interpretation here than in secular contexts. The soloists relate the life and deeds of the Prophet in classical odes (*qasīda*) or *mawwāl* poems in vernacular Arabic, with intermittent frame drum accompaniment.

Group singing of colloquial metric songs (called *tanzila*, *madih* or *shughul*) follows, with continuous frame drum accompaniment. *Tanzila* songs usually glorify the Prophet and his family, but they may touch on contemporary social events. An extremely emotive part of the ritual is preserved for popular vocal forms called *fragiyyāt* (songs of separation). Performed in dialect, these include the rural *ubuthiyya* and Bedouin *rukbanī* or 'atābā.

In many historical circumstances, *al-mawlīd* rituals have been transformed into platforms for social or anti-colonial protests. A most important performer and composer of *tanzila* songs was [mulla 'uthmān al-Mausīllī](#) (1854–1923).

4. Sufi ritual ('dhikr').

The two main Sunni Sufi local orders, *Qādirīyya* and *Rifāʿīyya*, use music, poetry and dance as a means to help attain mystical ecstasy in their quest for union with God. The *Qādirī* rituals (*dhikr* or *tahlīla*) are sung without musical instruments and can be performed in mosques. One to four solo cycles, based on some parts of the Iraqi *maqām*, are sung by the sheikh or a secular performer. This is followed by metric praise-songs *madīh* (pl. *madāʿih*) performed by the chorus of *maddāha* (glorifiers), while devotees perform dance movements with vigorous respiratory exercises based on a repetitive vocal ostinato invoking God. This results in an impressive polyrhythmic and polymelodic effect.

The *Rifāʿī* ritual differs in that it involves musical instruments and techniques of body mortification. A classical ode (*qasīda*) is sung in turn by each glorifier, while the others vigorously beat their frame drums between the lines of sung text. Depending on the intensity of the ritual, the number of frame drums can increase, in addition to cymbals and a kettledrum.

The Mawlawīyya (Mevlevi) order dwindled in Iraq after the fall of Ottoman rule, but some aspects of its traditions persist in other orders. The *nay* (end-blown flute) and kettledrum were used by the Talabīyya order in Kirkuk, and some *malawī* dancers regularly perform in *Qādirī* rituals. Since the 1991 Gulf War, the Kurdish Kasnazaniyya has become the most prominent order in Baghdad, though it was originally based in the north. This order combines *Qādirī*-style singing with *Rifāʿī* techniques of body mortification. (See [Islamic religious music](#).)

5. The Baghdad ʿūd school.

The relatively recent creation of this school of ʿūd-playing is based on concepts of music that were previously foreign to Iraqi traditions. It was the product of a unique encounter between the Arabo-Ottoman ʿūd and Western music technique derived from the cello. Its founder was Director of the Fine Arts Institute, the King of Iraq's cousin, Prince Muhieddin al-Din Haidar (1888–1967) [al-Sharif] of Hijaz in Saudi Arabia, a virtuoso ʿūd player in Turkish style. He opted for a fundamental change in the status of the ʿūd from a traditional instrument for accompanying the voice to a solo concert instrument.

He taught the ʿūd according to the methods and techniques of the violin family. He changed the ʿūd's left hand technique, the position of the fingers on the neck (introducing permanent use of the 4th finger), imposed the systematic use of positions and designated strings, and added a sixth single string to the instrument (in addition to its five double strings). These changes increased the instrument's technical facility and speed of playing.

For many decades, these technical advances were unpopular, rejected by major traditional players and the general listener. Exponents of the Baghdad ʿūd school were criticized for being unable to play in a traditional group and for not knowing the local music. Not wanting to be marginalized, ʿūd soloists began using local melodic material based on the Iraqi *maqām*, and they started performing traditional improvisations.

Among al-Sharif's many disciples were [Salman Shukur](#) (b 1921) and the brothers [Djamil Bashir](#) (1921–77) and [Munir Bashir](#) (b 1930). Most

important from the younger generation are Ali al-Iman (*b* 1940s) and Nassir Shemma (*b* 1963; fig.4). The activities of the Baghdad *ūd* school resulted in a gradual increase in acceptability of instrumental solos in general. Important soloists on other instruments are: Salem Hussayn (*b* 1923), Khudair al-Shibli (*b* 1929), Hassan al-Shakartchi and Bahir al-Ridjab (*b* 1951) on the *qānūn*; Khidr al-Yas (*b* 1930) on the *nay*; Hashim al-Ridjab (*c* 1921) and Muhammad Zaki (*b* 1955) on the *santūr*; Shaubi Ibrahim (*b* 1925) and Dakhil 'Arran (*b* 1960) on the *jūza*; Jamil Bashir and Ghanim Haddad on the violin. Some percussion players also developed great virtuosity, among them Ahmad Jirgis and Sami Abdul Ahhad.

2. Musicians.
3. Songs.
4. Instruments.

Iraq, §III: Folk and vernacular traditions

1. Social contexts.

(i) General.

Music is part of the events of social life, both secular and religious. Its importance varies according to the occasion. Secular songs with religious themes and moral ideas are performed by all communities and can figure within any vocal genre. Songs accompany the daily work of shepherds, masons, farmers and women. Between birth and death any circumstances – such as graduation from school, return from pilgrimage or fulfilment of a wish – may also imply the use of music.

In some life-cycle celebrations, such as baptisms among the Yezidi, the religious chanter (*qawwāl*) sings indoors with the sacred instrumental duo, while secular musicians play in the outer space. Marriage and circumcision ceremonies and calendar feasts are major and complex multiform occasions in which private indoor and collective outdoor festivities are held simultaneously. They have a very wide spectrum of music with a broadly based repertory and may last for as long as seven days.

In urban centres women hold private celebrations where female professional musicians (*mullāyāt*) perform popular songs accompanied by drums and tambourines. (Before the 1950s Jewish professional musicians (*daggagāt*) were available, and they used kettledrums in addition to other drums.) Women in the audience participate with responsorial singing, hand-clapping, dancing and ululations. Wealthier families invite Gypsy groups or well-known Iraqi *maqām* singers, or they may even organize sacred rituals. More recently, local pop singers have come to dominate such festivities.

In rural areas, festive occasions feature collective open-air dances. *Dabka* is the generic term for any secular communal dance performed respectively by men, women, or men and women together. The dancers form a semicircle holding each other by the shoulders or waist, tapping their feet on the ground. Among Arabs of the upper Euphrates, the collective dance

is called *shūbī*. Both *dabka* and *shūbī* are performed to the music of a solo singer accompanied by drum and shawm (*tabl wa zurna*) or double clarinet (*mitbaj*). In the extreme south, the *'ardh* and *samrī* dances are performed by two groups of dancers who sing antiphonally, accompanied by a round shallow double-headed frame drum (*tabl al-'ardh*) or other drums. In central Iraq, a dance originally connected with warfare, the *sās*, is often performed at marriages, circumcisions and other feasts. Two dancers on foot or on horseback brandish swords (or staves) and shields, accompanied with purely instrumental music from the drum-shawm duo and two kettledrums.

Professional Gypsy musicians (*kawliyya*) are the most important element of any Arab festive occasion. The main professional musicians of western, southern and central Iraq, they perform in families and enliven any type of Arab festivity, catering essentially for male audiences. A female soloist dances while singing pieces from the rural and Bedouin Arabic repertory or some urban *maqāms*. A male accompanist plays the wooden monochord spike fiddle (*rabāb*) or a modern metallic version of that instrument. Extremely popular is the *hasha'* 'scorpion' dance (fig.5), in which either the dancer's head and shoulders are flung back or she crouches on her knees, moving to the rhythm of the participants' hand-clapping and verbal interjections of '*hasha'*' ('lie down!'). All central and southern styles are characterized by use of regular rhythmic patterns and brilliant, fast, ornamental and strongly rhythmic sequences.

In mourning ceremonies, the Qur'an is recited for three days in men's gatherings. Sometimes a *mawlid* or a *dhikr* may complete the mourning ceremony. Women's ceremonies last seven days. A female mourner (*addāda*) poetically recites the merits of the dead person and expresses the sorrow of separation. The women's extreme grief is released by the short and punctuated guttural sounds they produce responding to the mourner's singing. They also beat their chests and faces and perform a mourning dance (*shaina*). Bedouins usually mourn in silence. However, in certain cases, *marāthī* (eulogies) are recited by men.

If the dead person was a child, a youth, an unmarried person or was newly married but without children, the family simulates marriage festivities. The ensemble *al-mūsīqā al-sha'biyya* (popular music), with its brass instruments of military origin together with the drum and the shawm, is invited to precede the burial procession. Marriage songs are performed around a coffin surrounded by decorated trays with candles. All Iraqi religious communities observe this practice.

Apart from life-cycle ceremonies, sociable gatherings are an important context for popular music performed by amateurs for pleasure, to entertain themselves and their friends. In the north, Turkmen and Kurdish amateur musicians meet in the evening after work to sing songs about love and separation and epics accompanied by the long-necked lute (*tunbūr*). In rural areas of the central and southern Euphrates, musicians play music in the communal gathering place (*mudīf* or *diwāniyya*). They perform poetic creations and *ubuthiyya* songs, which have great emotional impact. Similarly, Bedouin people of the western desert region sing and play the fiddle (*rabāb*) in the *mudīf*. In the south-east Amarah region, rich feudal

sheikhs might hire musicians to entertain visitors with various types of song (*mhamadaoui*, *ubūthīyya* and *pesta*) for several nights on end.

(ii) Shi'a popular religious ceremonies.

Shi'a Muslims commemorate the martyrdom of the Prophet Muhammad's grandson Imam Husayn at Karbala (central Iraq) in 680 ce with wide-scale and complex ceremonies. They begin on the first of the month of Muharram, continuing for a period of ten to 40 days. Many thousands of pilgrims arrive at Karbala and Kadhimain from all over the Shi'a world. Ceremonies feature collective responsorial and antiphonal singing, ritual dances, theatrical presentations, body mortifications and instrumental music.

For the first ten days, there are mourning gatherings (*al-qirāyāt al-husayniyya*). The martyrdom story is developed on a daily basis, with specific focus on a character or major event. Each day several narrators circulate from group to group repeating the story of the day. At women's mourning gatherings a specialist female narrator (*mullāya*) declaims in a highly dramatic style. Participants weep loudly, striking their faces, chests and thighs according to her instructions, and assistant *mullas* perform a mourning dance (*jūla*). At men's sessions, which are held in a public place used by devotees, participants beat their chests and heads or twirl in circles as the male narrator (*qāri'lqāri' husaynī*) declaims.

Passion plays (*tashābah*) portray the historic events surrounding the death of Husayn. They are organized during this ten-day period, either concurrently with the recitation sessions or separately in the street. They are staged with costumes, horses and other decorations. Specific melodic rhythmic motifs and musical instruments symbolize the major characters of the drama. An ensemble of 'sad instruments' plays when the drama concerns Husayn, and long trumpets adopt the scornful tones of his enemies with 'Umayyad melodies'.

Events culminate on the tenth of Muharram, 'Ashūrā ('the tenth'). Thousands of participants from different regions and countries form processions. In each procession group (*dasta*) the people respond to a solo lead singer, beating their chests in rhythm to the words or scourging their backs with metallic chains to the accompaniment of the instrumental ensemble (fig.6). Here there is no prescribed melody: Bedouin, rural and even pop melodies can be heard alongside Bahraini, Indian or Persian melodies sung by pilgrims.

(iii) Rituals of spirit possession.

These rituals are practised by the African-derived population in Basra. A musical ceremony, *dagg* (pl. *dgūg*), which implies music, songs, ritual dances and a specific ensemble of musical instruments, is regarded as an offering made to conciliate the good spirits and is never addressed to an evil spirit. Depending on the type of spirit, which varies according to its nature and familial or tribal origins, one of a number of musical traditions is prescribed. In all musical ceremonies, solo singing alternates with mixed group responsorial singing. Repetitive rhythm, provided by African-type drums, is a fundamental element of any possession ceremony. The six-

string lyre (*tambūra*) appears only in the most widespread and important ceremony, which is called *al-nūbān*.

Iraq, §III: Folk and vernacular traditions

2. Musicians.

Social attitudes towards musicians are equivocal. They are regarded as indispensable for the communal expression of joy, and their talent is recognized and appreciated. At festivals and social gatherings the very best musicians are sought out.

Amateur musicians command respect, but it is traditionally deemed to be degrading for professional musicians to provide entertainment for remuneration and to depend on the whims of others. The situation changed somewhat in the 1970s, when modern institutions gave musicians diplomas, job security and welfare support. The male professional drum and shawm duo (*tabl wa zurna*) is common throughout Iraq. These musicians perform solely in a secular context, at popular dances and festivities.

In the north, professional instrumentalists are often drawn from the Yezidi sect or minority ethnic groups. They provide musical accompaniment to the various collective dances. The amateur '*āshūq* ('mystic lovers') or *shu'arā' al-'ishq* ('poets of mystic love') are itinerant, travelling from village to village singing religious songs and chronicles of their people. They compose words and music and play the long-necked lute.

Among the true Bedouin nomads of the west, there are no professionals. The three terms used to designate the musician relate to the text rather than to the music itself: *al-shā'ir* ('poet'), *rā'ī al-qasīd* ('guardian of the poem') and *al-adīb* ('man of letters'). Professional musicians, *al-qāsūd* ('he who searches') or *al-shā'ir al-mutakassib* ('poet who expects to be paid'), are found among the semi-settled tribes and among the Sliba, the only tribe willing to perform at other people's festivities for financial gain. Among the peasant populations of rural regions, the very act of earning a living from music automatically excludes the individual from his group. The peasants play for their own enjoyment. For celebrations they may hire the professionals of the region: Gypsy musicians or players of the drum and shawm.

In the Basra region of the south-east, contrary to Mesopotamian soloistic traditions, musicians play collectively in ensembles. The black inhabitants of Zubayr have polyrhythmic *shadda* ensembles with multiple drums and frame drums. Another type of instrumental group is known as the *khasshāba* ensemble of Abūl'-Khasib, and essentially employs hourglass drums. In both these ensembles, singers, instrumentalists and hand-clappers have a complex division of musical parts. They are remunerated communally for their performances, but as individuals they are not professional musicians.

Iraq, §III: Folk and vernacular traditions

3. Songs.

Throughout Iraq there are two types of song: melismatic and rhythmically measured or metrical. Melismatic songs are solos in free rhythm, which facilitates improvisation, whereas metrical songs are sung in unison, responsorially or antiphonally (with a soloist). Some metrical songs are dance-songs.

(i) Melismatic.

In the north, among the Kurds, Turkmens and Assyrians, the most prevalent melismatic form is the epic song, usually performed without instrumental accompaniment. It begins with a high-pitched cry that gradually descends; when the singer runs out of breath, the group sustains the tonic as a murmured drone, enabling the soloist to pause before continuing. Common themes are love, separation, war, history and diverse social events.

Among urban Turkmens the most popular unmetred song types are the *quriat* and *ghazal*, performed in *maqām* style. Kurdish *lauk* and *hairan* songs are based on unmetred poetic prose. Intense vibrato and regular changes of register are stylistic characteristics of the *hawra* songs.

Among Bedouin and rural Arabs, poetic structure determines the song type. Bedouin in particular sing for the pleasure of the words, not for the musical sound. The 'Bedouin ode' (*qasīd badawī*) is similar to the classical *qasīda*. As in other well-known forms, the *hadī* and *hijaynī* camel songs, short phrases are repeated several times, their compass rarely exceeding a 4th or 5th.

Semi-settled Bedouin sing the '*atābā*, the *swehlī* and the *nayel* (also known as '*rabāb* songs'). The '*atābā* is attributed to the Jibur tribe of the Tigris region and also found around the Euphrates, a strophic quatrain based on classical prosody with *aaab* rhyme scheme. Short sung phrases alternate with longer melismatic passages within the limited tonal range of tetrachords. In the Tigris region the '*atābā* is followed by the *swehlī* (based on two unrhymed hemistichs) or the *nayel* (rhyming two-lined verses). The latter is said to have been invented by a woman, and is especially sung by boatmen and horticulturalists. Bedouin songs are concerned with love, separation, incitement to battle and Bedouin life, e.g. sheep-shearing, well-digging or the harvest (among the semi-settled tribes).

In the Mesopotamian plain there are two main melismatic song types: the *ubuthiyya* and *mawwāl*. The *ubuthiyya* ('that which gives pain') is called 'the lady of all singing'. It is popular among urban, rural and Gypsy populations of the middle and southern Euphrates around Nasiriyah, and also in the Tigris region of Amarah (under the variant term, *athiyya*). It is a quatrain, composed in colloquial Arabic, based on classical prosody with a rhyme scheme *aaab*. The first three hemistichs are monorhyme ending with a homonym, while the last line, identifying the *ubuthiyya*, should end '-*eyya*' or '-*iyya*'.

Melodically the *ubuthiyya* is based on different Iraqi *naghms* of *maqāms* also known in urban music. Iraqi specialists identify more than 30 styles of *ubuthiyya*, whose names relate to geographical locations, ethnic groups, tribes etc. The vocal lines are extended melismas of quite a limited melodic

range (within a tetrachord or a 5th). Each strophe is followed by a collective murmured drone on the tonic, called *wanna* (moaning). Sometimes rhythms are produced with a string of beads on a tray or table or, recently, the single-headed drum. The *ubuthiyya* is also popular in Baghdad, within the *mawlid* ritual and *maqām* evening (see §II, 3 and 1 above). It has its own urban composers, singers and styles.

The *mawwāl*, a speciality of Amarah, is one of the most popular genres of sung poetry throughout the country. The term also designates any free improvisational style of singing (including poetic forms other than the true *mawwāl*). Sources state that this genre originated in Baghdad during the Abbasid period. The *mawwāl* poetry known in Iraq is *mawwāl baghdādī*, also called *zheirī* (after one of its poets) or *mawwāl musaba* ('seven-line' *mawwāl*) because it consists of seven lines (in aaabbba rhyme scheme). *Mawwāl* poetry uses colloquial Arabic with particular metres often derived from classical prosody. It is sung within about 20 Iraqi classical *maqāms*.

Mawwāl is difficult to sing: the unity of its seven unseparated lines must fit into long melismatic improvised melodies. It may be performed with a collectively sustained murmured tonic (without instruments) or with a single instrument or (for urban *mawwāls*) an ensemble. Nowadays many contemporary urban pop singers perform parts of the *mawwāl* with interspersed fast rhythmic passages.

(ii) Metrical.

Each melismatic song is usually followed by a syllabic song, generically termed *pesta*. These refrain songs are either performed by a chorus or antiphonally, with a singer and chorus. *Pestas* are composed in colloquial regional uninflected Arabic and are not usually based on classical metres. *Pestas* can take different forms such as the *tawshīh* and *murrabba* in urban centres. Strophes are usually interchangeable and independent in meaning.

In rural areas, women compose and perform *pesta*s, but it is not an exclusively female genre. The best known is a two-line verse called *darmī* or *ghazal banāt* (girls' love songs). This allows for a great variety of musical interpretation within a light rhythmically measured song style. These songs are usually concerned with love, separation, life's hardships, exploitation and oppression, and other subjects relating to women's experience. Many urban *pesta*s also use this poetry.

Metric dance-songs known as *shūbī* regroup some ten styles that have certain common characteristics: binary rhythm, concentration on amorous themes and formal poetic structure designed to be sung. The main styles are: *shimālī*, *mollāya*, *maymār*, *za'lān*, *il manī*, *mejana*, *waweliyya* and *abū m'anna*. They are based on a four-line strophe with aaab rhyme scheme, each verse preceded by a rhyming two-line refrain containing the name of each song style as the last word of the first line. The solo singer performs short melodic sentences, and the dancers respond. Musical accompaniment is provided by the double clarinet, and rhythmic sounds from hand-clapping, finger-snapping and the dancers' feet on the ground. *Shūbī* styles are performed by settled populations of tribal origin.

The *hosa* is a chant inciting courage, honour and chivalry during tribal wars, national, political and other solemn occasions and even marriage festivities. It is performed responsorially by a male leader (*mihwal*) and a group who dance tapping their feet rhythmically on the ground. In the west, the Bedouin *hosa* is sung with the *rabāb* and based on short-line quatrains. The rural *hosa* has different poetic metres.

In the Basra region, most songs of the black population are pentatonic and use vernacular Arabic with some African words. They are performed by a male soloist integrated into the mixed responsorial group. The *shadda* style of Zubayr reflects both classical Arabian *sawt* singing and the polyrhythmic Gulf style with communal hand-clapping that supports the vocal line.

Iraq, §III: Folk and vernacular traditions

4. Instruments.

The great variety of instruments in Iraq is distributed according to different ways of life (nomadic or settled), and cultural and geographical conditions. In specific cases, ethnic origin and religion are operational factors.

The north has the greatest variety of aerophones: the *nay* (reed or metal end-blown flute, also common in other regions), the *shabbāba* (wooden flute) played by the Yezidis and the *masūl* (duct flute) played by shepherds and young people. The Turkmens of Kirkuk use the *bālābān* or *qarnāta*, a particular type of straight cylindrical shawm with a broad double reed. It serves the same purpose as the *zurna* (conical double-reed aerophone), which is common throughout the country and is always accompanied by the *tabl* (double-headed cylindrical drum; fig.7). The most characteristic instrument of this region is the *tunbūr* or *sāz* (long-necked lute), which is used only among the Turkmens and the Kurds. It accompanies songs performed at social gatherings, indoor and outdoor, and at the esoteric secret ceremonies of heterodox Islamic sects such as the Shabak and the Sarlia. The Yezidi allow the use of the long-necked lute in sacred places such as the valley of Lalech (north-east of Mosul), where the presence of the secular *tabl wa zurna* duo is not allowed.

Among the nomadic Bedouin, the chief instrument is the *rabāb*, a one-string fiddle with a rectangular body. The *rabāb* with concave sides is used by semi-settled tribes. Gypsies use the latter or, more often, a metal oildrum called *galan*. The *rabāb* is played in the tribe's main tent (*mudhif*) and anywhere Bedouin go. The coffee pestle and mortar is also used for its rhythmic quality: every Arab sheikh depends on an expert who pounds the beans to a rhythm that identifies the chief and the tribe and serves to summon members of the tribe to discuss matters of the day.

In rural Mesopotamia, three instruments are common. The *mitbaj*, a double clarinet with six finger-holes on each pipe, is used by shepherds and to lead the communal dances at important festivities. The *tabl*, *drnga* or *khishba* (single-headed drum made of wood or clay) and *duff* (frame drum with discs), usually played by women, are the main rhythm instruments. Among amateur singers, the use of instruments is regarded as shameful, but when rhythm is needed the singers keep time with their string of beads or beat an ordinary tray or any other object.

In Basra there is a wide variety of membranophones: *tabl*, *kuenda* (kettledrums of different shapes and sizes) among the blacks, *msondo* (big single-headed drums in the shape of a truncated cone) and *pīpa* (drum on a pedestal; fig.8). The latter, sometimes accompanied by the six-string *tambūra* (lyre) or *lapinka* (conch), are used in black ensembles ('*did*'), which perform for entertainment and for the rituals of spirit possession. The *kasar* (small double-headed drum beaten with a stick) is played by black women in their own possession ceremonies to signal the end of the trance. Influenced by the music of the Gulf, the inhabitants of Zubayr play the *mrwasī*, a small double-headed drum about 13 cm in diameter, which accompanies the vocal type *fann al-sawt* ('art of the voice') and the *tabl al-'ardh*, a double-headed frame drum used for the '*ardh*' dance of Bedouin origin.

Iraq

IV. Modern developments

During the second half of the 20th century, traditional music was affected by fundamental changes within Iraqi society. These include significant migration from rural areas to cities, the growth of urbanization and literacy, and a general redistribution of wealth. In the 1970s, traditional music faced difficult changes and challenges.

In 1969 the Ministry of Information and Culture created a new children's school of music and ballet to exist alongside the old Institute of Fine Arts, which had been established in the 1930s. The aim of the new school was to form a generation of young educated musicians, learning essentially Western music from elementary to secondary levels. In 1971 the Ministry opened the Institute of Iraqi Melodic Studies to provide a six-year training in Iraqi and Arab music.

An attempt to preserve and encourage traditional music led to the creation of the first Centre for Traditional Music in 1971, on individual initiative and hosted by the radio station. It undertook the first-ever documentation and classification of Iraqi music through the systematic collection of field recordings. In 1977 it was annexed by the Ministry of Culture (within the Department of Music, which had been established in 1973). At that time, the Centre for Traditional Music had already recorded, documented and catalogued 4000 audiotapes and assembled a collection of musical instruments and 78 r.p.m. records.

The Department of Music's principal aim was to centralize government policy and gradually regroup existing musical institutions and activities. Cultural policy tended to encourage the establishment of national dance and music troupes. The older Al-Rashid dance group, created with the advent of cinema and theatre, was renamed the National Troupe of Folk Dance. It presented stylized stage performances of Iraq's local folkdances. Similar troupes were established in Basra and Erbil. In 1975 a state traditional music ensemble was founded to represent Iraq's urban rural and Bedouin musics. These various national troupes presented regular concerts at home and in capital cities abroad. One of the most important official achievements of the Department of Music was the establishment in 1977 of a workshop for making lutes ('*ūd*).

Besides traditional music, European-style symphonic music was being taught at the Institute of Fine Arts. The National Symphony Orchestra, founded in 1959, began to provide regular concerts of European Classical and Romantic music, and occasional performances of local compositions arranged for orchestra. A few Iraqi composers have been trained in the Western idiom, the most important being Farīd Allahwerdī (*b* 1924). Pianists Beatrice Ohanissian and Agnes Bashīr have composed some symphonic poems. In 1969 the Ministry of Culture and Information created a children's school of music and ballet to reach Western music from elementary to secondary levels.

Around the 1970s, with the advent of mass media, musicians from remote regions came into contact with many styles of arranged music: Western, popular, Arabic and foreign variety music. Professional musicians and decision-makers saw the acculturation of regional styles as a sign of progress and encouraged it. Songs were less vulnerable to change, but Western instruments or traditional Arab instruments from other regions often replaced local instruments, and the size of small traditional ensembles grew considerably. Harmonization and orchestration were encouraged, although outside media and official circles genuinely original styles prevail.

The musical policy of the 1970s did not foster the traditional transmission of the urban Iraqi *maqām* music through its great masters. Today patronage of the Iraqi *maqām* through private concerts has been seriously affected as a consequence of widespread financial impoverishment following the 1991 Gulf War and subsequent economic sanctions. Most of the great masters have died without comparable successors taking their place. In the aftermath of the war, Iraqi *maqām* specialists withdrew and announced the end of the traditional music. Yet, after its seeming disappearance, it recovered and once again regained its place as an emblem of Iraqi cultural identity.

Since the 1991 Gulf War, an important local popular song movement has emerged. It combines traditional vocal aesthetics with contemporary instrumentarium, including use of electronic instruments. New Iraqi singing stars are considered among the most popular stars in the entire Arab world.

Ireland, §I: Art music

1. To 1700.

Although the distinction between 'art' music and 'traditional' music obtains with reasonable clarity in Ireland after the Battle of Kinsale (1601) and the defeat of the Gaelic aristocracy, it reflects an ethnic divergence and the pre-eminence of English norms over an oral Gaelic culture that thereafter was preserved and developed in severely polarized circumstances. The fragmented polity of modern Ireland, no more clearly expressed than in the counter-claims of Gaelic and Anglo-Irish perceptions of high culture, has determined the understanding of orally transmitted music as a corpus of ethnic melodies, with its roots in the culture of Gaelic Ireland. The concept of 'art music' incorporates the norms of European (English, German, Italian) musical patronage assimilated as part of the colonial status quo, especially after the Battle of the Boyne (1690). This is the music treated here; the history and development of Gaelic music is addressed in §II.

The sources for music in pre-Christian and early medieval Ireland are few: although later writings (e.g. the *Annals of the Four Masters* and Geoffrey Keating's *History of Ireland*) attest to the function of music in bardic culture, the absence of notation and technical information makes it difficult to determine the nature of secular chants to which Gaelic poetry was recited. Manuscripts from the 10th century to the 15th that record versions of Irish mythology frequently include references to the magical, incantatory powers of music, but little is known about this music, except that it was pre-eminently verbal. The modern phrase 'abair amhráin' ('speak a song')

connotes the pervasive alliance of the musical and the verbal in Gaelic culture. The symbolic force of music in this culture (its magical and narrative-emotional significations in particular) is also an abiding theme in the later annals.

Iconographical evidence from shrines, stone crosses and statuary of the 9th century to the 14th confirms the use of harps, horns and pipes, all of which receive attention in the literature of this period. The social status of the harpist in early modern Ireland is further indication of the prominence of music as an adjunct to the tradition of bardic poetry.

The complete absence of notation from all Irish liturgical manuscripts before 1000 makes it extremely difficult to trace with exactitude the history and development of music in the Celtic rite. Synodal reforms in the 7th century strongly suggest the adoption of Roman liturgical practices in Ireland, alongside which older, Celtic-Gallic traditions survived until the enactment of decrees that followed the Anglo-Norman invasion of 1172 and the introduction of the Use of Sarum. Early sources of the Celtic rite, including the Stowe Missal (c800) and the Antiphony of Bangor (7th century) identify those parts of the liturgy that were chanted and confirm the distinctive use of hymns in mass and office. Traces of the rite persist in Irish 15th-century antiphonals which predominantly reflect the Sarum liturgy. Although earlier Irish sources, including the Book of Drummond (11th or 12th century), reflect Roman practices outright, it may be that Celtic rather than Roman chant was initially employed for the singing of the new liturgy. There is also evidence to suggest that the Celtic chants were accompanied by a small, eight-string harp (*ocht-tedach*).

Sporadic but instructive comments from visitors in the 12th century (including Gerald of Wales) and from more settled residents in the 16th (Edmund Spenser) allow us to trace the perception of music in Gaelic culture prior to its decline in the 17th century. Gerald's remarks are disinterested, insofar as he was concerned with the technical prowess and civilizing influence of musicians, but Spenser's famous antagonism towards bardic culture in *A View of the Present State of Ireland* (1596) exemplifies that reading of Irish music as an instrument of political resistance which was to endure in the minds of British and Irish commentators thereafter.

Sources for music in the cathedral foundations of Armagh, Cork, Dublin, Kilkenny and Waterford are scant until the beginning of the 17th century. It is clear that the immediate post-Reformation period saw a more continuous appointment of organists, vicars-choral and boy choristers, but not until the early 17th century did composers begin to contribute regularly to the cathedral repertory. Thomas Bateson, organist at Christ Church Cathedral in Dublin from about 1608 to 1630, was required 'to teach and instruct four choristers to sing sufficiently from time to time to serve the choir during his natural life'. Little of his sacred music survives. The music of other composers attached to the Dublin cathedrals, Christ Church and St Patrick's, around the end of the 17th century (including Ralph and Thomas Roseingrave) is more plentifully preserved.

[Ireland, §I: Art music](#)

2. Since 1700.

The development of art music in Ireland after the Restoration was strongly indebted to English models. In Dublin, before the building of Crow Street Musick Hall in 1731, the principal venues for concert music were the cathedrals and larger churches. Mr Neale's Great Musick Hall in Fishamble Street, built by the Charitable Musical Society in 1741 and the following year playing host to the first performance of Handel's *Messiah*, was converted into a theatre in 1777. The gardens in Great Britain Street, designed in 1749 by Bartholomew Mosse, Master of the Lying-in Hospital, were modelled on London's Vauxhall and were used for summer concerts until 1791. The Rotunda Room (1764) was another popular location for concerts.

Although the cultivation of opera in Ireland was slow to develop, the performance of *The Beggar's Opera* in March 1728 established a busy tradition of ballad opera. Works by Arne, Shield, Thomas Coffey and J.F. Lampe were among the most popular operatic mainpieces or afterpieces sung between the acts of spoken plays. From 1760, visiting companies from London and the continent presented serious operas in Italian and English at the Smock Alley and Crow Street theatres.

The stable conditions enjoyed by the Anglo-Irish Ascendancy after the Williamite wars produced a corresponding measure of musical continuity throughout the 18th century within the Pale, the region of Dublin and its hinterland. The 'Protestant Interest in Ireland' did not espouse a taste for serious opera in Italian, but it patronized other forms of high musical culture, and a number of gifted musicians – among them Matthew Dubourg, Johann Sigismund Kusser (or Cousser), Francesco Geminiani and Tommaso Giordani – settled for long periods in Dublin: Kusser and Dubourg were both Masters of the King's Musick in Ireland. The distinctive feature of Ascendancy musical life, apart from the popularity of ballad opera, was the promotion of major choral works (oratorios, odes and anthems) for charitable purposes, including the support of hospitals and the relief of prisoners in the city gaols. The choirs of St Patrick's Cathedral and Christ Church Cathedral provided the mainstay of these performances, with distinguished soloists from London.

Attempts towards the end of the century to narrow the divide between Gaelic and Ascendancy musical cultures vividly illustrate the differences between them. While Joseph Cooper Walker in his *Historical Memoirs of the Irish Bards* (1786) sought to identify Turlough Carolan (1670–1738) as the true focus of Irish musical endeavour, Charles Burney contemptuously dismissed the role of the Irish bard as 'little better than that of piper to the *White Boys*, and other savage and lawless ruffians' (1787). A small number of collections of ethnic music had been published during the 18th century, beginning in 1724, but it was not until the appearance of Edward Bunting's *General Collection of the Ancient Irish Music* (in three volumes, 1797, 1809 and 1840) that the anglophone community attempted to absorb, or at least countenance, the native repertory. Thomas Moore's *Irish Melodies*, which appeared in ten volumes between 1808 and 1834, drew freely, but not exclusively, on Bunting's publications. Whereas Bunting (and the collectors who succeeded him) laboured to preserve the ethnic integrity of this repertory, Moore politicized it from within the folds of the colonial establishment; and though Bunting resented this projection of Irish music,

its appeal gathered momentum throughout the 19th century. When Moore's interpretation of Irish melody was cross-blended with the ballad tradition (through the efforts of Young Ireland and the musical exhortations and compositions of Thomas Davis in particular), the polarized condition of ethnic music as the intelligencer of nationalism (as against the colonial status of art music) was complete. Charles Carter, Philip Cogan, John Stevenson and Thomas Cooke are among a number of important Anglo-Irish composers to have arranged Irish airs in the idiom of contemporary art music after the turn of the century. With the passing of the Act of Union in 1801, the cultivation of music within the art tradition notably decreased. Choral societies were established in Dublin from 1810 onwards and enjoyed considerable popularity in the Victorian period, while the dearth of professional orchestras was partly redeemed by the surge of amateur playing fostered by the Robinson family and by Robert Prescott Stewart, among others.

After the closure of the Crow Street Theatre in 1820, the Theatre Royal (opened in 1821) became the focus for presentations of grand opera in Italian as well as English grand opera, the latter represented by, for example, Balfe's *The Bohemian Girl* (1843), Wallace's *Maritana* (1845) and Benedict's *The Lily of Killarney* (1862). Balfe and Wallace were Irish, though their careers were made abroad. Meanwhile, the improved condition of Roman Catholics after emancipation (1829) was reflected in the music associated with the devotional reform in Ireland. Paul Cardinal Cullen's steady drive towards the romanization of the Catholic liturgy inspired a musical resurgence of striking conservatism: the restoration of plainchant, Roman polyphony and modal-polyphonic pastiche predominated. The strong ties between the Irish Society of St Cecilia (1878) and similar societies in Europe reflected religious and sometimes scholarly interests which were unaffected by the colonial-ethnic divide in Irish music. 'Cecilianism' strongly appealed to a largely urban Catholic middle class, which sought a musical idiom worthy of its strongly held beliefs. One of its chief proponents was Edward Martyn, better known as co-founder of the Irish Literary Theatre and sometime president of Sinn Féin.

The foundation of the Feis Ceoil and Oireachtas festivals in 1897 illustrates the division that continued to characterize music in Ireland at the close of the century. Although the Feis did nurture ethnic music to a degree, it quickly became apparent that two kinds of music – however nationalistic the motivation of the Feis – required two kinds of festival. Efforts to merge the resources of European art music and the indigenous repertory faltered, despite the prominence of Irish folk music as a symbol of the Celtic Revival. Music functioned in Irish poetry and drama as a powerful metaphor for the literary imagination (notably in Yeats), but the development of Irish music itself was negligible. John F. Larchet's incidental music for plays given at the Abbey (including Synge's *Deirdre of the Sorrows*, 1910) and Robert O'Dwyer's Irish opera *Eithne* (1909) reflect efforts at synthesis which only partly succeeded. Stanford's editions of Irish music (collected by George Petrie) and his somewhat superficial admixture of Irish melodies and symphonic texture compare uncomfortably with the literary productions of the Celtic Revival. The early compositions of Arnold Bax were directly inspired by Yeats and the Revival, but remained

exceptionally free of the burdens of folk-music quotation. Esposito, like his pupil Larchet, continued to espouse the possibility of stylistic integration, but selfconsciously wrote two kinds of music which 'respectively' cultivated a late Romantic European demeanour and an ethnically imbued vocabulary.

After 1922 the cultural oppressiveness of the ethnic repertory worsened. While critics recognized that a cosmetic arrangement of Irish melodies was a poor substitute for a wholly developed, yet manifestly Irish, art music, the blatant politicization of Irish traditional music as a 'priceless' national resource continued to inhibit composers. As late as 1951 Brian Boydell could write that 'music in Ireland ... is in a shocking state'. Boydell's concern was with the striking lack of musical infrastructures throughout the country, a lack repaired in significant measure by Radio Telefís Éireann (RTÉ) and by the improvement in educational facilities and opportunities for performance which followed upon the economic growth of the 1960s. The postwar expansion of the Radio Éireann orchestras and the increased transmission of art music were vital steps forward. Festivals of choral music (Cork) and contemporary music (Dublin), and recital series fostered by the Royal Dublin Society, the Music Association of Ireland and several amateur organizations, contributed to a new climate of commitment to art music which blossomed in the 1980s with a National Concert Hall and the RTÉ (radio channel for art music) FM3. The Dublin International Organ Festival (founded in 1981) and the GPA Dublin International Piano Competition (founded in 1988) are representative of later developments.

The presentation of regular seasons of opera did not begin until 1941, with the founding of the Dublin Grand Opera Society, based at the Gaiety Theatre. The Wexford Opera Festival, established in 1951 by T.J. Walsh, explores little-known works and has acquired an international reputation. Touring companies such as the Irish National Opera (1965) and Opera Theatre Company (1986) have significantly advanced both opportunities for young Irish singers and the dissemination of wide-ranging, if thinly spread, repertory. Dublin remains without an opera house. Perhaps as a result of the sporadic condition of operatic performance in Ireland, few Irish composers have succeeded with this genre. Stanford's *Shamus O'Brien* (1896) perpetuates a stage-Irishry which the literary revival finally repudiated. Since World War II a number of composers have written substantial operas to English texts, including Gerard Victory (*Chatterton*, 1967), A.J. Potter (*The Wedding*, 1981) and Gerald Barry (*The Intelligence Park*, 1988).

The 1960s witnessed the brilliant but unresolved career of Seán Ó Riada (1930–71). Ó Riada's crisis of artistic growth, in which he abandoned art music for a highly successful revival of the ethnic repertory (see also §II, 7), originated in that colonial-ethnic fissure that has been the signature of music in Ireland for three centuries. Although younger Irish composers, notably Gerald Barry, Raymond Deane and John Buckley, have escaped the anxiety of his influence, none has overcome the paradox of a vibrant ethnic musical tradition which appears to undermine the enterprise of original composition. The Contemporary Music Centre (Dublin) and the Irish Arts Council have in recent years done much to disseminate the work

of Irish composers, not least by the circulation of scores and tapes, and the recording of works in collaboration with RTÉ.

The state of music education in the Republic of Ireland leaves much to be desired, particularly in primary and secondary schools where less than one per cent take music as a subject in final state examinations. The provision for tertiary education is considerably better: there are undergraduate music courses in Cork, Dublin, Limerick, Maynooth and Waterford, many of which afford opportunities to specialize in performance, composition or musicology. The first international musicological conference in the history of the state took place in 1995 in celebration of the bicentenary of St Patrick's College, Maynooth, jointly organized by the music departments at Maynooth and University College Dublin. The performance faculties of the Cork School of Music, the Dublin College of Music and the Royal Irish Academy of Music have significantly raised the standard of instrumental tuition since 1970. Youth orchestras, including the National Youth Orchestra, have likewise cultivated a high standard of performance.

[Ireland, §I: Art music](#)

3. Northern Ireland.

The formation of Northern Ireland as a political entity in 1921 did not immediately affect the development of art music there, but the founding of the BBC Northern Ireland Orchestra in 1924 gave Ulster its first professional ensemble of orchestral musicians. Amateur music-making was mainly vocal and choral, though in the postwar period interest in chamber music notably increased. The Ulster Orchestra was founded in 1966 and subsequently absorbed the BBC Northern Ireland orchestra, flourishing under a number of distinguished conductors (among them, Bryden Thomson and Yan Pascal Tortelier); it has also recorded works by Hamilton Harty.

Festivals of music in Belfast, including the Sonorities and Early Music festivals associated with Queen's University, and recital series throughout the province, attest to a vigorous professional calendar of art music supported by an impressive system of music education at all levels. Professional opera productions are limited to two short seasons per year, given by Opera Northern Ireland. The Education and Library Boards provide instrumental tuition to schools across Ulster; specialized instrumental tuition is also available in the Ulster College of Music, Belfast. The University of Ulster and Queen's University offer degrees in music which provide specializations in, among others, electronic music and analysis. An Irish Chapter of the Royal Musical Association was established at the University of Ulster in 1987: it has met annually since then in university and college campuses throughout Ireland.

Ireland, §II: Traditional Music

1. General.

The traditional music of the island of Ireland is an important part of Irish contemporary culture. Although its performers and audiences are in a minority compared to those of international popular music, most aspects of traditional music have enjoyed a revival in the second half of the 20th century, especially among younger people, which makes it unique in western Europe. It is also commonly performed and listened to in centres of Irish settlement abroad – chiefly Britain, the USA and Australia – and from the 1970s has been growing in popularity in continental Europe and North America among people who are not of Irish descent. The reasons for the strength of Irish traditional music are partly historical and social: political conditions have fostered the oral arts of song, instrumental music, dance and storytelling rather than the visual and plastic arts; traditional rural society, non-industrial and conservative, survived longer in Ireland than in western Europe generally; and the relative smallness of the country and its population enables easy access to all varieties of live performance. There seems also to be a particular affinity to music in the Irish national character.

Traditional music is a central element of Irish identity, and the state symbol of the Republic of Ireland is the harp. However, while music of oral tradition is common to the whole of Ireland and to both of its two politico-religious groupings, the Nationalist-Catholic majority and the Unionist-Protestant minority, it has been falsely perceived in recent years of political disturbance within Northern Ireland as being associated only with the Nationalist minority there.

Reflecting the predominant social and cultural strains in modern Ireland, its traditional music is largely Celtic (Gaelic or Irish) and British (English and Scottish) in origin. Its main contemporary forms are songs in Irish and English and instrumental airs and dance tunes. Apart from its functional roles in dancing and marching, the music is now primarily recreational, whereas in the past it also had mythic, supernatural and seasonal ceremonial significance. It shares many of the characteristics of the traditional music of western Europe and is related to the music of other Celtic regions, especially Scotland. Musical ties are close also with other parts of Britain and with North America after centuries of invasion, settlement and emigration. Irish emigrants have also influenced the music of Australia. Direct relationships which have been claimed with the music of North Africa, India and the Middle East are, however, based on superficial resemblances.

Monophonic melody is predominant, although harmonic and percussive dimensions have developed in recent years with the introduction of instruments that allow for these dimensions. Most tunes, vocal and instrumental, are heptatonic, with pentatonic song airs common in the

northern province of Ulster. It has been estimated that more than half are in the Ionian mode, followed in order of frequency by the Mixolydian, the Aeolian and the Dorian modes. Phrases are mostly even in number and equal in length. The tradition is often considered to be essentially one of solo performance, but small and large instrumental groups are common (see §6 below). Transcriptions of song texts and staff notation or a variety of alpha-numeric or tablature music notations have been increasingly used by performers over the last 200 years, but only as an aid to memory or for teaching and never in performance. Some level of literacy is now common.

Traditional Irish music is of rural more than urban origin, a reflection of an earlier population distribution, but many items and forms of the repertory have come from towns and cities, or through them from abroad. Much is now performed and commercially produced in urban areas. Local and regional performance traditions once existed, some of which favoured song and others instrumental music. While such styles can still be heard, especially in singing in the Irish language and fiddle playing, they are generally in decline or have disappeared because of factors such as the end of rural isolation and the growth of telecommunications.

[Ireland, §II: Traditional Music](#)

2. History.

Information on early Irish music, which was entirely music of oral tradition, derives from speculation on the facts of archaeology and history, and on passing references to music in literary and other writings. Until the 20th century, when Ireland began to come under the influence of North American and Irish American culture, all Irish musical history concerned musical trends and ideas coming from the east, often through Britain, that combined with native creativity to produce new forms and new music. The first people came to Ireland over 9000 years ago, during the middle Stone Age or earlier. Their artefacts were generally stone, bone and wood, and later pottery, but no musical instruments survive. After millennia of human occupation about which little is known, but during which the technologies of farming and metalworking were introduced, the earliest musical instruments are found: side- and end-blown bronze horns, the earliest of which belong to the 2nd millennium bce, and which may have been used for ritual purposes. The country was predominantly Celtic in culture from about the middle of the 1st millennium bce to the 17th century ce. Continental Celtic musical practices such as the singing of war- and praise-songs and the playing of lyres may have existed also in Ireland at the beginning of the Christian era, and an aristocratic oral-music tradition performed by professional musicians of high status for wealthy patrons certainly co-existed with vernacular traditions.

During the 1st millennium ce Ireland was brought into contact with Christian religious music introduced by missionaries from the 5th century, and forms of Scandinavian music practised by Viking invaders and settlers from the 9th century, the only identifiable remains of which are bone whistles. When French-speaking Normans invaded the country from Wales in the 12th century they found a distinctive Irish harp which seems to have been a development of an earlier instrument. Used in instrumental music, song and recitation performance, and with a lively playing style in which melody

was accompanied by the bass strings, the harp remained the chief instrument of Ireland until the 17th century. Other instruments played in Ireland in the Middle Ages include: the *tiompán*, a small string instrument whose exact nature is unknown; *fidlí*, early fiddles; *cuislí* or mouth-blown pipes; *piopaí* or mouth-blown bagpipes which were used in warfare as well as for recreation; and the *trumpa* or jew's harp. The Normans themselves introduced dance-songs and songs of *amour courtois*, traces of which survive in contemporary Irish-language song, influenced later by English songs and continental literature. 'Callino', an air preserved in Dublin in a lute book of the last quarter of the 16th century, is the earliest known notation of an Irish melody.

The modern era of Irish traditional music had its beginnings in the 17th century, a period of transition in Ireland during which aristocratic Gaelic society diminished and the middle and lower classes became the main performers and patrons of traditional music. It does not now seem possible to detail the influence which the aristocratic oral poetry, music and song traditions must have had on the vernacular traditions. The long-standing cultural unity which had existed between the north of Ireland and Gaelic-speaking Scotland came to an end during the century, and large-scale settlement by English and English-speaking Scottish colonists in Ulster aided the spread of English-language song, including the classical ballads. British culture and urban civilization generally began to gain ground in the country, although the majority of the population was still Irish-speaking and lived on the land. The harp declined with court music, the mouth-blown bagpipe disappeared and the modern fiddle was introduced.

The bulk of the current repertory, including that of Irish-language song, originated in the 18th and 19th centuries. A large body of songs in English were composed on English and Gaelic models, and texts were circulated on ballad sheets as well as orally. The reel and the hornpipe were introduced from Britain and thousands of melodies were composed in these new forms, as well as in the older jig forms which had been in use since at least the 16th century. The bellows-blown uilleann pipes were developed and replaced the harp as the classical instrument of Irish traditional music; the baroque flute came into the hands of traditional players, and outside musical influences such as Italian instrumental music were felt as musicians catered to a new type of wealthy patron. A growing interest in traditional music among the educated urban classes led to the collection of older materials, their preservation and publication. By the early 1840s there was a population of over eight million people in the country which included the greatest-ever number of Irish composers, singers, instrumentalists and dancers. This situation was radically altered by the Great Famine of the 1840s and the subsequent emigration which reduced the population of Ireland by half within five years. Music was badly affected and only began to recover in the final decades of the 19th century when new instruments such as the accordion, concertina and metal whistles were taken up; it was at this time that social dances based on continental quadrilles spread throughout the country. Increasing population mobility led to the decline of local and regional style.

The Irish diaspora has developed its own music traditions abroad, especially in Britain and the United States, since the 19th century.

The work of preservation begun by the early collectors was greatly aided by the invention of sound recording, and since the 1890s tens of thousands of commercial and field recordings have been made. A national Gaelic revival beginning in the 1890s gave prominence to traditional music, especially to Irish-language song, and the establishment of uilleann piping clubs rescued the instrument from extinction. The harp was revived in a modified form which is still played, although it is not nearly as important as it once was. The revival influenced the cultural character of the new 26-county state established in 1922. Irish songs were included in school curricula, although traditional music was not generally taught in the schools, and the state helped fund publications of traditional-music collections. No such recognition or aid has been given to traditional music in the six-county state of Northern Ireland until recently. Traditional music was generally in decline between the World Wars, affected by heavy emigration from the countryside and economic recession, but this was countered by the spread of gramophones and radio, which made the music available to new audiences, especially in the towns and cities. These and later forms of telecommunication, such as tape recording, brought about a profound change in the transmission and nature of Irish traditional music.

Increased interest after World War II led, among other manifestations, to the establishment in 1951 of Comhaltas Ceoltóirí Éireann (the Association of Irish Musicians), an organization for the promotion of traditional music through teaching, performance and competition. A song-focussed revival in the late 1950s and the 1960s preceded the revival of instrumental music in the 1970s. Playing has since become widespread with a high level of virtuosity; instruments such as the concertina which had diminished to the local level became again national, and a cottage industry of instrument-making has grown up. The uilleann pipes, which were being played by only a few players such as [Leo Rowsome](#) of Dublin, experienced a revival. There are now hundreds of musicians who play the instrument to a high standard all over the world, and it is increasingly to be heard in international music. Influenced by technological advances such as LPs and CDs, tape recording and television, the revival and renewal of older traditions has continued strongly until the present day, and new and experimental performance styles and new instruments are found alongside older ones. Traditional instrumental music is to an extent now part of youth culture and is commonly played with great vigour and dash. General levels of virtuosity have hardly ever been as high, but a certain homogeneity of style is now found in a music that well into the 20th century showed a great degree of variety and local distinctiveness. Earlier local styles are preserved on recordings of performers such as the singers [Elizabeth Cronin](#) of Cork or [Joe Heaney](#) (*Seosamh Ó hÉanaí*) of Galway, or the fiddle player [padraig O'Keeffe](#) of Kerry.

[Ireland, §II: Traditional Music](#)

3. Composition, performance and transmission.

Composers of Irish traditional music, always performers, share the conservative tastes of their own communities, but are usually forgotten as compositions spread and are altered by others. Far more men than women are known to be composers of melodies, although women are better represented among known composers of song. Instrumental music is

composed on instruments, but little is understood of the traditional method of composition. In some cases it seems that a stray fragment of melody is developed in accordance with the norms of the tradition, as was the case with the 20th-century fiddle player and composer Ed Reavy of Cavan and Philadelphia; at other times the composer tries to evoke a mood or commemorate an event. There has been a recent decline in song composition, but instrumental melodies of individual character continue to be made, and there has been a considerable increase in tune composition since the 1980s. New pieces are often quickly recorded and thus fixed in form, and the accelerated rate of transmission made possible by mass communications has led to swift acceptance of some modern compositions into the body of the tradition. Some composers of the past received material reward from patrons, but in the last few centuries the rewards have been self-satisfaction and community respect. Even today, with increasing copyright registration on commercial recordings, there are few financial rewards from composition. Some professional arrangers of traditional pieces have, however, profited in the 1990s from a commercial boom in sales of the music.

Being largely the music of non-professionals, traditional music is normally performed during leisure hours at night, weekends and during holiday periods. The domestic music occasions of the past, which often mixed singing, instrumental music and dancing, have largely been replaced since World War II by more specialized performances in venues open to the public, particularly public houses, where informal 'sessions', gatherings of musicians performing for their own enjoyment, take place. The seeds of session-playing can be seen in music-making on fair days in the past and among early congregations of emigrant musicians in the United States and Britain. More organized performances such as cabarets are held in tourist areas, and concerts are commonly held throughout the country. Live music can also be heard at festivals, ranging from informal weekends to structured week-long summer schools. Comhaltas Ceoltóirí Éireann has branches throughout Ireland and abroad, at which music is played regularly. It also organizes competitive regional *fleadhanna ceoil* (music festivals), which culminate in an annual all-Ireland *fleadh*. Session performers are people of all ages and social classes, and music sessions are generally a mixture of experienced players and learners, men and women, people of rural and urban backgrounds, playing instruments of all sorts. At the same time, friends and people of similar levels of ability will organize more private sessions. A good deal of performance now takes place at summer schools and at weekend festivals throughout the year, and there has been an explosion in the number of these since the 1970s. Best known is the Willie Clancy Summer School organized annually in memory of an influential Clare piper. Performers and their core audiences share a common experience of the music and by and large a common musical taste. In the past, public performance and competition were the domain of men, with women performing more in the home, but this changed in the later 20th century as women played an increasingly public role in Irish society. While musical competency was widespread in traditional culture, there were always performers who were recognized as having special abilities. Being able to convey the meaning of a song well, or having outstanding technique on an instrument, were admired qualities, and some performers have become legendary through a combination of

musical abilities and strong personality. Examples of well-known figures are the 18th-century harpist-composer [Turlough Carolan](#) (Toirdhealbhach Ó Cearbhalláin, 1670–1738), the first composer of Irish traditional music whose compositions survive in any number, and the 20th-century virtuoso uilleann piper [Seamus Ennis](#) (Séamus Mac Aonghusa, 1919–82), who formed a bridge between the older traditions and new enthusiasts in the 1950s, especially through his work on radio and television. Musicians of the travelling community – such as the Donegal fiddle-players John, Mickey and Simey Doherty, the Wicklow pipers Johnny and Felix Doran, or the Cork singer [Margaret Barry](#) – have played an important part in disseminating music, and Travellers have preserved older items abandoned by settled people, as well as developing styles of performance suitable for the open air.

Traditional transmission processes of absorption, imitation and tutoring continue, especially within families (for instance, the Potts family of Dublin, the Crehans of Clare, or Muintir Uí Bheaglaoidh of Kerry) and have been greatly augmented in the second half of the 20th century by the mass communications media, especially sound recordings. Formal instrumental classes and festival workshops have been a response to increasing demand in the same period, but songs are still learnt by listening and imitation rather than formal instruction. A large number of instrument tutors as well as sound recordings have been published since the 1970s, and instructional videos began to be produced in the 1990s. The formal education system at the first and second levels makes almost no provision for the teaching of traditional music in Ireland, although university music departments are increasingly providing courses of study which include instrumental instruction.

[Ireland, §II: Traditional Music](#)

4. Songs and singing.

The contemporary singing tradition is less vigorous than that of instrumental music. This is in part due to the invasion of the traditional singing venues of the home and the workplace by television and the transistor radio, the decline in neighbourly visiting and the recent transfer of traditional music to the crowded and noisy public house. It is also a result of the loss of some older functions. Traditional songs, particularly when performed unaccompanied, are increasingly heard only in specialized clubs and festivals.

Songs in the Irish language are still commonly performed on Irish-language radio and on commercial recordings, and in the shrinking *gaeltachtaí* (Irish-speaking districts), which are largely on the west coast and in the south. Decreasing numbers of older songs are sung, and modern compositions, although numerous, are in modern international idioms. Love songs predominate, and there are many songs on national and local themes as well as songs in praise of locality. Many older genres such as the heroic lay, the keen or death lament, the work song, the lullaby invoking magical powers and the *aisling* or political vision-song, are now obsolete. Almost all songs are lyric, expressing intense personal feelings in everyday but poetic language and imagery and sometimes using such European poetic conventions as the pastourelle. Although narrative songs are rare, narrative

is often implied, and sometimes a prose preamble, *údar an amhráin* (the story of the song), supplies background material. Author attribution is more common than in English-language songs.

Narrative and lyric songs are both plentifully supplied in the English language. The oldest form of these, the imported British classical ballad, has almost disappeared, but there is a large surviving body of later songs created in Ireland with distinct Hiberno-English roots that incorporate Gaelic features such as internal assonance. Their concerns are generally those of Irish-language song, but they deal more with emigration and the events of the late 19th century and the 20th. Politically sectarian songs are still composed in the north of Ireland. Since the early 19th century, songs of literary origins have passed increasingly into oral circulation, and many national political songs are of this type.

The songs of both languages are strophic, metrically uniform and in accented metres, often with an alternating verse and chorus. The most common metres are 3/4, 4/4 and 6/8. Intonation sometimes varies at the third, fourth and seventh degrees. While most songs are sung within a range of one to one and a half octaves, Gaelic airs have a larger range and favour an *AABA* structure. English-language songs more often have an *ABBA* structure. Melodies cross the language divide, and more texts exist than melodies although some melodies exist in a large number of versions.

In performance both languages are sometimes heard on the same occasion, and there are a few macaronic songs that alternate between languages. Stylistic differences arise from regional and personal differences, not from languages or genres. Although there are suggestions in early literature of ancient instances of choral singing, the singing tradition has long been monophonic and is still normally unaccompanied. Verbal text is more important than music, but while the ability to convey the meaning of a song is more valued than a good voice, a musical voice is highly regarded in a singer, as is a good memory. The general singing style is understated and conversational. Song tempos are never very fast, but faster songs are performed in strict time. Slower songs are relaxed and more variable in rhythm. Simple ornaments such as grace notes, turns and slurs, and other embellishments, such as producing a nasal tone or adding extra syllables may be added. Rubato singing in the Irish language, especially the highly decorated and high-pitched tense style of County Galway, is often called *sean-nós* or 'old-style' singing, a relatively recent term.

Until the mid-20th century, music for dancing was sometimes provided by lilters, men or women who vocalized dance tunes, solo or in unison duet, to standard vocables. Also known as dydeling, mouth-music or in Irish as *portaireacht bhéil*, liltering is sometimes still performed to entertain listeners.

[Ireland, §II: Traditional Music](#)

5. Instrumental music.

Instrumental music may comprise a small number of pieces such as the older harp tunes which were composed to be listened to, or 'slow airs' which are song airs played instrumentally with rubato, but the vast bulk of instrumental music consists of fast dance music.

Almost all types of Irish dance music share a common symmetrical structure. Tunes usually consist of two parts, one lower in pitch (the 'tune') followed by a higher (the 'turn'). Each part is made up of an equal number of bars – eight in the case of all tune types except set dances – and each part is usually played twice, often with variation, before moving on. When a tune has been played two or three times, a second and usually a third tune is nowadays played in the same way, as a suite. Some tunes have three or more parts; the extra parts are usually variations of the first two. Most tunes comprise three or four distinct motifs in a variety of contrasting and repeated patterns. A certain degree of variation, from a single note to a whole part, can occur, but generally performers do not vary their own versions greatly once they have fixed them to their satisfaction. Ornaments common to all instruments are single cuts, double cuts, short rolls, long rolls and triplets.

Dance music is usually notated and played in keys of one or two sharps. Occasionally three sharps are used, especially in fiddle music, and rarely one flat. Most tunes fall within a range of two octaves. Pitch is fixed only when instruments which are manufactured to a fixed pitch, such as the whistle or accordion, are played; instruments such as the fiddle are tuned at a level that sounds pleasant to the player. Intonation is like that of the modern scale, but the notes C and F especially fluctuate when played on instruments which are not fixed in pitch. Dynamics were little used in the past but have been gaining in popularity in recent years. While strong regional styles can still be heard in the case of the fiddle, most instrumental styles are now based on the influence of individual players and personal taste rather than on locality. The pace of playing began to increase in the 1980s partly to cater for dancers in a new revival.

The main types of dance music in order of popularity are the reel, jig and hornpipe, all of which can be played for solo dancers, groups of dancers or for listeners. Less common are the polka and slide, which are played for group dancing, and the set dance, played for solo dancing. There are some other minor types of dance tunes of localized currency such as the barn dance and the fling.

The reel (*ríl*) is performed in a fast forward-moving style, in 4/4 rhythm. The typical bar has eight quavers divided into two groups.

The jig (*port*), the oldest form of dance music now played, is usually performed at a more moderate speed and in a more relaxed manner. There are several types of jigs, each deriving its name from dance movements, and distinguished from one another by rhythm. The double jig is in 6/8 rhythm, the typical bar having six quavers in two groups. The single jig is also normally in 6/8 rhythm, but the typical bar has two crotchet-quaver figures. Single jigs in 12/8 are called slides. The slip jig or hop jig is in 9/8 rhythm and the typical bar has nine quavers in three groups. Some jigs were once ancient marches.

The hornpipe (*cornphíopa*), like the reel, is in 4/4 rhythm, but it is played more slowly and deliberately, and is more heavily stressed. The typical bar has eight quavers in two groups, and triplets are a common feature.

The polka is in 2/4 rhythm, with a fast infectious dance sound, and the typical bar contains two groups of two quavers. Many of the 'polkas' played in Ireland, especially in Counties Kerry and Cork, are not of the 19th-century European ballroom type but are simpler tunes, some of which were originally song airs.

A group of slow-paced dance tunes, about 30 in number, are used for special *solo* exhibition dances, called 'set dances' because fixed or 'set' steps accompany each tune. Set dances can be in 6/8 time like the double jig, or in 4/4 time like the hornpipe, and can be unusual in having parts of different lengths, from six to 12 bars. They should not be confused with a type of quadrille-based *group* dance called 'set dances' which are performed to 'sets' or groups of different tunes.

There is no musical connection between a tune and its title (or titles), if it is titled at all. Song airs are named from the title of the Irish or English song lyrics with which they are associated. Older instrumental melodies often took their titles from the name of a patron (for instance, *Ye Lord Mayo's Delight*), but dance-tune titles, which are most commonly in English, refer to the ordinary lives of people, such as their occupations, pastimes and locales (for instance, *Trim the Velvet*, *The Humours of Cloyne*, *The Dairy Maid's Wish*).

[Ireland, §II: Traditional Music](#)

6. Instruments.

The primary musical instruments are international melody instruments, some of which have developed specifically Irish forms: wind instruments, such as the pipes, whistle and flute; string instruments, especially the fiddle, but also the banjo and mandolin; and free-reed instruments, such as the accordion, concertina and harmonica. Percussion instruments were not played much until recently. Even when harmony can be produced, as on the uilleann pipes and accordion, only simple harmonies are used, and often none at all. But the trend in the 20th century has been towards increased harmonization and the introduction of accompanying instruments such as the piano and guitar. Musicians also ignore many of the other potentialities of instruments: players of the fiddle, for instance, rarely move from the first position on the fingerboard.

The triangular, wooden Irish harp (*cruit* or *cláirseach*; see [Irish harp](#)) was, in its earliest known form, of medium size strongly constructed of willow, and with metal strings plucked with the finger nails. Its size and the number of strings have varied greatly over the centuries. Today it averages about 90 cm in height, and is strung with about 30 gut or nylon strings plucked by the fingertips. It normally rests on the player's right shoulder. Most harpists are now women, although formerly they were mostly men. Mostly song airs and moderately paced instrumental harp pieces are played, but fast dance tunes are becoming more popular. There are no old harp styles and little old traditional technique remains.

Two types of [Bagpipe](#) are in use: the mouth-blown 'warpipes' and the bellows-blown uilleann pipes. The former, particularly important in Northern Ireland but not widely played, is the outdoor Scottish Highlands bagpipe introduced in the late 19th century partly as an imitation of an obsolete

medieval Irish type. It is learnt and played in clubs which organize marching bands and competitions, and solo performance is not the central feature of this music culture. The indoor uilleann pipes (*píob uilleann*) are a uniquely Irish form of the bagpipe, and are more widespread in the south and midlands area than in the north (see illustration). They were originally known as the 'Irish pipes' or 'union pipes'; the present term was coined only at the turn of the 20th century and comes from the Irish word *uille* ('elbow'). Distinguishing features are a wooden chanter with a two-octave range (usually D–D²), a bag blown by bellows held under the elbow, and three closed chanters called regulators which can provide harmony or counterpoint when their keys are pressed. The instrument also has three continuously sounding drones. The pipes are expensive and, with seven double or single reeds, difficult to keep in tune. They are played as a solo instrument more than any other instrument, and most pipers are male. There are two basic styles of piping on the chanter: open style (flowing and fast, with notes produced by putting down the fewest possible fingers); and tight or closed style (staccato and fast, with alternative fingerings that offer moments of silence between notes). Most players mix the two styles. Special techniques include 'cranning' (playing of multiple grace notes in quick succession) and sliding from one note to the next.

The **Fiddle** (*fidil* or *veidhlín*), with its bow, is identical to the modern violin. Traditional musicians prefer the term 'fiddle' to 'violin' to distinguish their music and their style of playing from other musics. Probably the most popular traditional instrument, the fiddle is played equally by men and women, and is felt to be particularly compatible with the flute, button accordion and uilleann pipes. It is played with a relaxed left-hand grip on the neck of the instrument. Bow strokes are generally short and light, producing a quiet mellow tone. Local styles range from the northern Donegal style (usually quick, with little ornamentation and a different bow stroke for most notes) to the more relaxed and ornamented southern styles such as those of Counties Sligo and Clare (where several notes can be sounded with each movement of the bow). Many contemporary players develop their own personal styles. Special techniques include double stopping and bowed triplets.

The Irish **Tin whistle** (*feadóg stáin*) is a short end-blown duct flute of metal alloy with six finger-holes, and a light, pure tone. Originally conical in shape with a wooden duct, it has been almost replaced since the 1960s by a cylindrical type with a moulded plastic mouthpiece. Two octaves are available; the higher octave is produced by blowing harder. Whistles come in several keys, from B to G; those in D are the most popular. Relatively inexpensive and the common beginners' instrument, the tin whistle has a relatively low status, but is perfectly suited to the music, and some players have brought it to a virtuoso level. Special techniques include tonguing and sliding from one note to the next.

The flute (*fliúit* or *feadóg mhór*) used for the playing of Irish traditional music, known as the concert or wooden flute, is the simple-system cross-blown wooden flute developed in France in the late 1600s. Most flutes played in late 20th-century Ireland were English or German 19th-century instruments, but modern Irish-made flutes are also now played. Normally in the key of D, it can also have one or more padded metal keys to produce

flat or sharp notes, and it usually consists of three sections that are fitted together. Traditional playing styles range from a hurried, puffing choppy northern style, found mostly in Counties Sligo and Roscommon, to one that is smooth and rolling, centred on Counties Clare and Limerick, but the flute is now widely played throughout the country, and the styles are generally mixed. Special techniques include tonguing and sliding from one note to the next. Flute and drum marching bands playing flutes in different keys and in harmony, a tradition derived from 18th-century British military bands, are found in Northern Ireland.

The **Accordion** (*cairdín* or *bosca ceoil*) that is normally played is the double-action button accordion with two rows of melody keys. Often known as the 'box', it comes in different basic keys. Instruments with rows tuned to B and C are currently the most popular, though some prominent players favour C and D instruments. An earlier form of the instrument, the diatonic ten-key melodeon, has been popular in Ireland since the late 19th century, and has been revived in recent years. Most accordions were made in the 20th century and imported from Germany, Italy and Britain, but French accordions have been gaining in popularity recently. The accordion's loud rhythmic sounds are particularly suited to dance music. Special techniques include the production of long notes by pulling the bellows and use of the left-hand basses to add colour to the melody. Piano accordions enjoyed a vogue for about 30 years beginning in the mid-1930s.

The **Concertina** (*consairtín*) popular in Ireland is the double-action Anglo-German concertina with about 30 buttons, which has undergone a revival in recent years. Traditionally, the instrument has been associated with women more than men. Its relatively small, delicate, rhythmic sound is well-suited to dance music. Some special effects such as 'droning' and 'chording' are employed.

The **Bodhrán** (from *bodhar*, 'dull-sounding' or 'having a deafening sound'), a circular hand-held drum, is the principal Irish percussion instrument and is sometimes referred to as a tambourine. The instrument, which may at one time have been a winnowing tray, was used for centuries as a drum by men taking part in seasonal rituals, and it has only become widespread for music accompaniment since the 1950s. The most common size is approximately 46 cm in diameter. It is shallow, with a single skin attached to the wooden frame or rim. The skin may be of goat or other animal, and it is struck with a short wooden beater or with the fingers. Held by the rim or a crossbar with the left hand and struck with the right, when played sitting it is rested upright on the knee. The rhythms played by the *bodhrán* sometimes double or triple the beats of the music. Apart from the different sounds produced by the stick and the hand, the sound can be changed by striking the rim occasionally with the stick. A new *bodhrán* tradition has come into existence in the late 20th century, and modern techniques include altering the skin tension with left-hand pressure to produce different pitches, damping the skin with the palm of the left hand and playing cross-rhythms.

Several instruments are less widely accepted. Some are not felt to be fully in character with the nature of the music, while others are not portable or are hard to obtain. The four-string plectrum tenor **Banjo** was taken up as a

melodic instrument by Irish musicians in the USA early in the 20th century, especially as a band instrument, and spread in Ireland beginning in the 1930s. It has a strong, driving sound. The eight-string [Mandolin](#) had a brief vogue in the 1960s and 70s for accompanying singing and for the playing of slow airs. The guitar was introduced into traditional music during the 20th century, at first among Irish musicians in North America to accompany melodic instruments, then in the song revival of the 1950s to accompany singing. It is now commonly used to accompany dance music, and is played fairly percussively using a pick. Keyboard instruments, chiefly the piano, but also the harpsichord and electronic keyboards, have been adapted to Irish music since the 1700s. In the 1960s the Greek [Bouzouki](#) was introduced into Irish traditional music and has been generally accepted. A playing style has evolved which is a mixture of chords and melodic runs, and flat-backed Irish forms of the instrument and different tunings are found. The free-reed mouth organ (*orgán béil*) has been played in Ireland since the 19th century. It requires considerable physical effort to play, but it is very suitable for dance music. The fife and piccolo are played in a variety of keys. They are used with drums in marching bands in Northern Ireland, and occasionally in dance bands. Lesser-played percussion instruments include: the giant ritual [Lambeg drum](#), beaten with canes and played in parades across the north of Ireland; the bones, two sections of cowbone held in the hand and clacked against each other; and the domestic spoons, held with backs together in one hand and played against the other hand and the knees. The bones and spoons are used to accompany dance music.

[Ireland, §II: Traditional Music](#)

7. Groups and bands.

In spite of the respect accorded the solo player, Irish traditional music is primarily a social music, and traditional musicians frequently play together in different combinations, in unison. The earliest groups were small, playing in small venues such as farmhouses or taverns for small numbers of dancers and using whatever instruments were available locally. But as the music began to be played in larger venues such as dance halls, from the end of the 19th century in Irish North America and from the beginning of the 20th century in Ireland, the groups became increasingly larger and rhythm instruments were introduced so that dancers could hear the beat more distinctly. Tenor banjos, double basses, pianos and drum kits formed part of the line-up together with the older fiddles, flutes and accordions. Sound recordings of these groups influenced the structure of groups in Ireland. By the early 1930s these dance ensembles, which remained popular until the 1960s, were known as ceili bands because they played for ceili dances (from *céilithe* or social occasions of the Gaelic League). They went into decline in the 1960s with changes in dancing fashions, although they underwent a small revival in the 1990s; their playing is especially in demand for social set dances.

Session playing – large and small informal groups of musicians playing for their own enjoyment for hours on end, often in a pub – spread in popularity during the 1950s. It continues strongly to the present and has become a standard social setting for the performance of music. The instruments used depend on the musicians present. The composer [Seán Ó Riada](#) introduced

a new style of group playing in the early 1960s when he formed Ceoltóirí Cualann, a 'folk orchestra', with traditional melody instruments paralleling the strings-woodwind arrangement of an orchestra, and using the *bodhrán*. Also in the early 1960s three- or four-member 'ballad groups' developed. Under the influence of the North American folk revival, these singing groups specialized in English-language songs and accompanied themselves on guitars, mandolins, whistles and banjos. The Clancy Brothers, Tommy Makem and the Dubliners were among the most famous groups of this type. As instrumental playing gained ground again in the 1970s, most ballad groups faded away, but some added traditional melodic instruments such as fiddle and uilleann pipes and became mixed vocal and instrumental groups. Electronic instruments such as electric guitars and keyboards were increasingly introduced into traditional group playing from the 1970s onwards, and acoustic instruments were amplified. Among groups using this instrumentation, [Planxty](#) and later the Bothy Band enjoyed great popularity, especially in continental Europe and North America. Although both groups have disbanded, they continue to have an influence through their recordings. Some professional groups, for example Clannad and Altan, have moved from playing traditional music to playing popular music with traditional roots.

[Ireland, §II: Traditional Music](#)

8. Dancing.

Traditional dance has always been intimately connected with traditional music in Ireland, but there is no information on the nature of Irish dancing (*damhsa* or *rince*) until recent centuries, although it seems to have resembled European dance in general. Some Irish country dances of the 1600s were performed at a rapid pace and employed sticks and swords. Jigs were also danced from as early as the 1600s, as were open-air long dances or dances involving lines of people, and open-air ring dances with large groups. From the 1700s to the present the main traditional solo dances have been step-dances: jigs of various kinds, reels, hornpipes and special solo set or exhibition dances. Old open-air group dances were generally replaced by indoor European group dances such as minuets and cotillions in the late 1700s and quadrilles in the 1800s. There developed Irish forms which were also danced to the music of the jig, reel and hornpipe and other measures. Quadrilles evolved into the present-day set-dances, danced in squares by four couples. Versions of these survive and have had a huge revival since the 1970s.

Group dances called ceili dances were developed along traditional line-dance models from the 1890s to the 1930s during the Gaelic Revival, but are no longer as popular as formerly. Traditionally, dancing took place outdoors in fields and at crossroads during the summer, and indoors in the larger farm houses during winter. In 1935 a national Public Dance Halls Act required all public dances to be licensed, and effectively ended the small country-house dances which had already begun to decline.

Competition has always been a feature of traditional step-dancing. It has been highly regulated since 1931 when An Coimisiún le Rincí Gaelacha (the Commission for Gaelic Dances), a division of the Gaelic League, was founded to establish rules and standards and to organize competitions.

This movement gave rise to a large number of professional Irish dancing schools in Ireland and abroad and led to an elaborate formal development of steps, dances, costumes and competitions. World championships attract thousands of competitors. The majority of teachers and pupils in these schools are female, a contrast with the dancers of the past who were both male and female. Ballet and tap dance techniques have increasingly been incorporated into competition step-dancing in recent decades which has caused controversy. In the late 1990s, the stage shows *Riverdance* and *Lord of the Dance*, based on this type of dancing with newly composed music based on traditional idioms, have achieved an extraordinary degree of international popularity. Unregulated traditional step-dancing survives in pockets, especially in the west of Ireland, and lively upper body and arm movements are often part of this tradition which began to experience a revival during the 1990s.

[Ireland, §II: Traditional Music](#)

9. Collecting and publishing.

The first collection of Irish music was *A Complete Collection of the Most Celebrated Irish Tunes*, published in Dublin in 1724. Several other commercial collections appeared during the same century. The earliest surviving manuscripts of Irish traditional music belong to the late 1700s, when they were compiled by musicians for their own use. The first person to collect Irish traditional music systematically for preservation was Edward Bunting (1773–1843), an Armagh organist who notated and published the music of the last of the traditional harpists. Other collectors followed Bunting's example during the 1800s, among them George Petrie of Dublin (1789–1866) and Patrick Weston Joyce (1827–1914) of Limerick. Large manuscript collections such as those by the Cork musician William Forde (c1795–1850) and Dublin dental surgeon Henry Hudson (1798–1889) have not yet been published; the collection of the Kerry clergyman James Goodman (1828–96) was published in 1998. A great deal of Irish music was also published commercially during the 19th century in Ireland, Britain and the USA. Captain Francis O'Neill of Cork (1848–1936) gathered thousands of tunes from his fellow emigrant musicians in Chicago and from rare books and manuscripts, and published these during the early years of the 20th century. He was followed later in the century by Francis Roche (1866–1961) of Limerick and Breandán Breathnach (1912–85) of Dublin. Large-scale institutional collecting has been undertaken from the 1930s to the present time by such bodies as the Irish Folklore Commission (now the Department of Irish Folklore, University College Dublin) and Radió Éireann, the national radio station. In the second half of the 20th century there was an explosion of book publications of songs and tunes.

[Ireland, §II: Traditional Music](#)

10. Sound recording, radio and television.

The recording of Irish traditional music began on cylinders and discs in the 1890s, but little was recorded until the 1920s when hundreds of musicians and a few traditional singers were recorded on 78 r.p.m. discs in the USA. As these recordings filtered back to Ireland, notably those of the Sligo fiddle player Michael Coleman, they profoundly influenced the course of traditional music. Little was recorded in Ireland until the 1930s, and even

then it was material largely in non-traditional arrangements. In the late 1950s, many commercial recordings were issued on LP by new, small companies, and some authentic styles of traditional performance such as *sean-nós* singing in Irish were heard on disc for the first time. Interest in this material grew and has continued to the present time, along with an interest in new styles of performance and record production. In the 1990s audio cassettes and CDs became the standard formats. Reel-to-reel magnetic tape, in use since the 1950s, has been almost entirely confined to use in radio and in archival field recording. Large collections of these recordings survive and they represent the nature of traditional performance more accurately than commercial recordings. Hundreds of thousands of private performances have been recorded on audio cassette tape since the 1970s. Cassettes are extensively used for learning music, and they have been important in the modern transmission of the music.

In the USA and Canada, commercial 'Irish Hours' with popular and traditional performers have been a regular radio feature since the 1920s in most cities along the East Coast. In Ireland, where radio was completely state controlled until the 1980s, broadcasting began in Belfast in 1924 and in Dublin in 1926. The Belfast station, part of the BBC network, rarely broadcasted traditional music until the 1950s, but the Dublin station, 2RN, later Radió Éireann, featured it every second or third night from its inception as policy. All radio performances were broadcast live from the studio until the introduction of field recording, on discs in the 1940s and on tape in the 1950s, for both stations. In the 1970s the establishment in the Republic of *gaeltacht*-based national Irish-language radio widened the availability of Irish-language song, and some local commercial and community stations set up in the 1980s feature traditional music prominently. Field recordings have had a powerful educational influence in reviving interest in traditional music and have closely documented the music in the second half of the 20th century.

Although Irish television programmes were first produced in Belfast in the late 1950s, traditional music was not a regular feature of the medium until Raidió Teilifís Éireann, the state television of the Republic, began broadcasting in Dublin in 1962. Typically, programmes were filmed in a studio and had a recital format with a presenter and an invited audience. Location filming, more expensive, has been far rarer. Production and direction was the preserve of RTÉ employees until the 1990s when independent production companies became involved.

[Ireland, §II: Traditional Music](#)

11. Research.

Irish traditional music research has been confined mostly to a small group of interested individuals. An increasing number of third-level graduate and postgraduate studies are being carried out, especially in University College, Cork, and in the Irish World Music Centre of the University of Limerick. The larger libraries in Ireland, and also in Britain and the USA, hold important collections of printed traditional music. Public multimedia archives in Dublin include those of the Department of Irish Folklore of University College Dublin, Comhaltas Ceoltóirí Éireann and the Irish Traditional Music Archive.

Ireland [Hutcheson], Francis

(*b* Dublin, 13 Aug 1721; *d* Dublin, 5 Sept 1784). Irish amateur composer and violinist. He was the son of Francis Hutcheson, a Presbyterian minister who ran a private academy in Dublin, c1716–29, and then became professor of moral philosophy at the University of Glasgow. Francis the younger took the MA and the MD at Glasgow in 1744 and 1750 respectively. He was professor of chemistry at Trinity College, Dublin, from 1760 until 1767, and was twice president of the Royal College of Physicians of Ireland. He was on the music committee for the Rotunda Hospital concerts from 1774 until his death, and consultant physician to a number of Dublin hospitals. He was probably the 'Dr Hutchinson' who was a founder-member of Lord Mornington's Musical Academy (1757). There is continual confusion concerning the spelling of his name. When he was granted the degree of Doctor in Physic by the Board of Trinity College, Dublin in 1761, the Senate minutes described him as 'Hutchinson', though he signed the register 'Hutcheson'. During the same period there was a Francis Hutchinson, five years his junior, who graduated from Trinity College in the late 1740s.

Although content to appear under his own name as an amateur violinist, he adopted the pseudonym of Francis Ireland as a composer. He wrote

several vocal works of considerable charm and merit, of which the four-part madrigal *Return, return my lovely maid* is a particularly fine example. The Noblemen's and Gentlemen's Catch Club awarded him three prizes between 1771 and 1773, for his catch *As Colin one evening*, his glee *Jolly Bacchus* (Dublin, c1780) and his serious glee *Where weeping yews*. 11 glees and eight catches by him are printed in Warren's collections, and *The Gentleman's Catch Book* published in Dublin by Henry Mountain includes six items by him. He also published his father's *System of Moral Philosophy* (1755). (B. Boydell: *A Dublin Musical Calendar, 1700–1760*, Dublin, 1988)

BRIAN BOYDELL

Ireland, John (Nicholson)

(*b* Bowdon, Cheshire, 13 Aug 1879; *d* Rock Mill, Washington, Sussex, 12 June 1962). English composer, pianist and teacher.

1. Life.

A somewhat painful and unhappy childhood, followed by the early death of both parents, did much to form the lonely, introspective side of Ireland's personality. Throughout his life he was plagued by feelings of insecurity and inadequacy, which affected his creativity in a number of ways, not all of them negative. His acute self-criticism, his yearning for a spiritual home – the Channel Islands or West Sussex – and the related desire to escape from the present into a distant past, deeply affected much of his music and gave it its distinctive character.

His training was extensive and thorough. He entered the RCM in 1893 and for the next four years concentrated his attention on the piano, studying with Frederic Cliffe. During that time he became increasingly involved in composition and determined to study under Stanford, which he did from 1897 to 1901. Stanford's methods could be harsh, even cruel, and the sensitive Ireland suffered more than most, but he was not completely subdued and in later life he always spoke gratefully of Stanford's teaching. In 1895 he took his FRCO, and ten years later a Durham BMus. In 1932 Durham University honoured him with a doctorate; he had already received an honorary RAM and FRCM.

On leaving the RCM Ireland made his living mainly as an organist and choirmaster. He was at St Luke's, Chelsea, from 1904 to 1926, during which time he established himself in the front rank of the English composers of his generation. From at least 1920 to 1939 he taught composition at the RCM, where his pupils included Richard Arnell, Benjamin Britten, Alan Bush, E.J. Moeran and Humphrey Searle. For many years he lived at Gunter Grove, Chelsea, in what Eugene Goossens described as 'the quiet haven of a few intimate friends'. Friendship meant much to Ireland, especially after his disastrous marriage, which ended after only a year in 1928. The friendships with his pupil Helen Perkin, who inspired the Piano Concerto (1930), and with the writer Arthur Machen are of particular interest. He was much in sympathy with Machen's pagan mysticism, which is reflected in a number of works, notably the orchestral

poem *The Forgotten Rite* (1913) and *Legend* (1933) for piano and orchestra. Places, too, had a strong influence on his inner life: Chelsea, Deal, Chancetonbury Ring and several locations in the Channel Islands have close associations with his music. His retirement to Guernsey was cut short by the German occupation in 1940, and it was West Sussex that finally claimed him. Despite failing health, this closing phase in his life was perhaps the happiest. He was no longer composing – his last important work, the film score for *The Overlanders*, dates from 1946–7 – but he saw a revival of interest in his music, for which the newly-formed John Ireland Society (1960) was partly responsible.

2. Works.

Ireland's published compositions span a period of 50 years, from the two string quartets of 1897 – these were suppressed throughout his lifetime – to the overture *Satyricon* (1946) and the music for *The Overlanders*. The solid workmanship insisted on by Stanford provided a lasting foundation: in Ireland's best work a firm structural sense is combined with a deeply personal poetry. The accomplished Brahmsian manner of his youth – as, for instance, in the Sextet (1898) – was radically changed by the impact of Debussy, Ravel and Stravinsky. It was in the piano music that these influences worked themselves out, leaving Ireland with a feeling for harmony and sonority decidedly his own. In his mature work there is an English lyricism that is closer to Elgar than to Vaughan Williams, a chromatically embellished harmony that is quite distinct, and a balance of interest that shows strong roots in the Classical-Romantic tradition.

Although it was with songs and piano pieces that Ireland first came before a wider public, his most important early successes were in the field of chamber music: the Phantasie Trio (1906), the Violin Sonata no. 1 (1908–9, Cobbett Prize) and, in particular, the Violin Sonata no.2 (1915–17). This last is a landmark in the English music of that period, and both the Cello Sonata (1923) and the Fantasy-Sonata for clarinet and piano (1943) are likewise outstanding creations in their own genres. All three works are distinguished by their lyrical and structural qualities and also by the admirable, wholly integrated writing for the piano. Of the three piano trios, no.2 (1917), which is another one-movement 'fantasy', is the most impressive.

Ireland developed at a time when the piano could still be regarded as a sounding-board for the romantic temperament. His Piano Sonata (1918–20) is a large-scale, full-bodied utterance – 'one of the finest and most important since Liszt's' (Hill, 1946) – but it is not without certain weaknesses of expression, notably an excessive reliance upon semiquaver figuration, particularly in the middle of the texture, and a tendency to inflated climaxes. The leaner, more experimental Sonatina (1926–7) is likely to be thought the better work; but Ireland's most striking contribution is in the best of his shorter pieces, of which three broad types are readily discernible. The central vein is contemplative and includes such pieces as *For Remembrance* and *Soliloquy*, which seem to contain the very essence of Ireland's sentiment. On either side are the more Impressionistic, represented in different ways by *Amberley Wild Brooks* and *Le Catirooc* (from *Sarnia*), and the frankly sanguine, with simple, lively rhythms – for

instance, *Merry Andrew* and *Ragamuffin* (from *London Pieces*). Some of the richest pieces, notably *April*, do not fit comfortably into any of these categories but reveal Ireland's lyrical gift at its most impressive – a lyricism that is harmonic and textural no less than melodic.

The many songs are of unequal quality. While the best of them are among the finest by English composers this century, there are others in which a natural warmth of sentiment tends to spill over into sentimentality. The once popular *Spring Sorrow* and *The Bells of San Marie* seem somewhat faded, confined within the taste of their period. At the other extreme are the Five Poems by Thomas Hardy (1926) and the Songs Sacred and Profane (1929–31). Ireland's songs are usually as good as their 'accompaniments': faced with a poem that he liked, he was never at a loss for an eloquent voice part, but the magic really worked when his poetic feeling for the piano was fully engaged. There are also some very successful songs in the robust, boisterous manner of *I have Twelve Oxen*, in which the piano is strictly accompanimental.

Ireland's achievement in the orchestral field is small in extent but distinguished. The Piano Concerto, one of his richest and most rewarding works, is a classic of 20th-century English music and its posthumous neglect can only be deplored. It is individual in both form and content, and is capable of making a wide appeal. The *Concertino pastorale* for strings (1939) and *A London Overture* (1936) are also well worth reviving. In all three works there is a characteristic blend of outgoing and in-dwelling qualities of expression, and a combination of poetic fancy and precise craftsmanship that is unmistakable. The earlier of the two orchestral poems, *The Forgotten Rite*, has a very distinctive atmosphere, but the somewhat later *Mai-Dun* is less successful. Late in life, in the splendid score for *The Overlanders*, he showed how confident and vigorous a composer for orchestra he might have been (see the Suite, ed. Charles Mackerras, and Two Symphonic Studies, arr. Geoffrey Bush).

The choral work *These Things shall Be* was written in fulfilment of a BBC commission to mark the coronation of George VI. It was a challenging response, both humanist and socialist, and the music was designed to have a wide and immediate appeal: though full of personal fingerprints, it manages to suggest not only Parry but also Walton. Longmire wrote that in postwar disillusionment Ireland came to hate the work; at the time, however, it undoubtedly expressed his deepest hopes for humankind. The musical invention may well be noble and apt rather than inspired, but a fine performance can be a moving experience.

WORKS

(selective list)

vocal

Choral: *Vexilla regis*, S, A, T, B, SATB, brass, org, 1898; *Te Deum*, SATB, org, 1907; *Greater Love Hath No Man* (motet), Tr, Bar, SATB, org, 1911; *An Island Hymn*, TTBB, 1915; *These Things Shall Be* (J.A. Symonds), Bar/T, SATB, orch, 1937; *Ex ore innocentium*, Tr, pf/org, 1944; service settings, hymns, incl. *Love Unknown*, 1919; partsongs, unison songs

Song-Cycles/sets: [5] Songs of a Wayfarer (W. Blake, W. Shakespeare, D.G. Rossetti, E. Dowson, J.V. Blake), c1905–11; Marigold (D.G. Rossetti, Dowson), 3 songs, 1913; 2 Songs (R. Brooke), 1917–18; Mother and Child (C. Rossetti), 8 songs, 1918; 3 Songs (A. Symons), 1918–19; 2 Songs (A. Huxley, P. Sidney), 1920; The Land of Lost Content (A.E. Housman: *A Shropshire Lad*), 6 songs, 1920–21; 3 Songs (T. Hardy), 1925; 5 Poems (Hardy), 1926; 3 Songs (E. Brontë, anon., D.G. Rossetti), 1926; We'll to the Woods No More (Housman), 2 songs and 1 piano solo, 1927; 2 Songs (Symons, D.G. Rossetti), 1928; [6] Songs Sacred and Profane (A. Meynell, S.T. Warner, W.B. Yeats), 1929–31; 5 16th-Century Poems (W. Cornish, T. Howell, anon., N. Breton, R. Edwardes), 1938

Other songs: Hope the Hornblower (H. Newbolt), 1911; When Lights Go Rolling Round the Sky (J.V. Blake), 1911; Sea Fever (J. Masefield), 1913; The Heart's Desire (Housman), 1917; The Bells of San Marie (Masefield), 1918; Earth's Call (H. Munro), 1918; If There Were Dreams to Sell (T.L. Beddoes), 1918; I Have Twelve Oxen, 1918; Remember (M. Coleridge), 1918; The Sacred Flame (Coleridge), 1918; Spring Sorrow (R. Brooke), 1918; Hawthorn Time (Housman), 1919; Love is a Sickness Full of Woes (S. Daniel), 1921; The Merry Month of May (T. Dekker), 1921; The Vagabond (Masefield), 1922; What Art Thou Thinking of?, 1924; When I am Dead, my Dearest (C. Rossetti), 1924; Great Things (Hardy), 1925; Santa Chiara (A. Symonds), 1925; If We Must Part (Darson), 1929; Tutto è sciolto (Joyce), 1932

HUGH OTTAWAY

Irgens-Jensen, Ludvig (Paul)

(*b* Christiania [now Oslo], 13 April 1894; *d* Sicily, 11 April 1969). Norwegian composer. He studied literature and languages at the University of Oslo, during which time he also composed. Self-taught in composition and theory, he received his only formal music instruction in the piano. He made his *début* as a composer in 1920 with freely tonal songs in a late Romantic idiom. During the 1920s and 30s he simplified his style while retaining his music's lyrical aspects. Characterized by modal polyphony and classical ideals of form, but with strong expressive qualities, his music was quite different to that of his Norwegian contemporaries, and came to inspire others. He achieved fame through his prize in the Schubert competition for his orchestral work *Passacaglia* (1928), probably the most performed Norwegian orchestral piece from this period. In 1930 his dramatic symphony for soloists, chorus and orchestra *Heimferd* ('Coming Home') won the first prize in a competition for the 1930 St Olav Festival. Even though its text is closely linked to the national celebration, the work contains little Norwegian folk music; the composer's outlook was rather towards Europe. During World War II Irgens-Jensen composed music to poems by resistance poets, which was anonymously broadcast from London's free Norwegian Radio. He served on various boards, committees and juries. In 1945 he was awarded an annual grant from the Norwegian

national assembly, and in 1947 was elected a member of the Swedish Royal Academy of Music.

Irian Jaya.

See Melanesia, §II.

Iriarte [Yriarte], Tomás de

(*b* Puerto de la Cruz de Orotava, Canary Islands, 18 Sept 1750; *d* Madrid, 17 Sept 1791). Spanish poet and devotee of music. He was educated in Madrid by his uncle Juan, librarian to the king. While pursuing a successful literary career, he held government posts as translator and archivist. An ardent amateur musician, he is said to have studied with Rodríguez de Hita; he played violin and viola and was active in various musical circles of the city. His very popular didactic poem *La música* was first published in Madrid in 1779. Numerous reprints followed, and it was translated into French, Italian, German and English (by John Balfour in 1807); a facsimile reprint of the first edition was published in Barcelona in 1984. Its five cantos begin with a treatment of the elements of music – scales, melody, harmony, rhythm and tempo; canto II discusses expression – the styles of music which invoke or depict joy, tranquillity, militancy, sadness, wrath or terror. The section on church music – chant, polyphony, concerted works and the organ – mentions Morales, Guerrero and Victoria among earlier masters. In describing theatrical music – the past and present state of opera and the native zarzuela – Iriarte praised the operas of Gluck in particular. In the last canto, which describes social music, the symphonic and chamber forms, he gave special praise to Haydn, notably for his string quartets. The work is followed by explanatory footnotes and an essay on the merits of Spanish as a language for musical settings.

Iriarte's other literary works include many musical references. He also wrote poems and dramas for musical treatment, including the libretto to *Guzmán el bueno*, first performed in Cádiz in 1790, and later in Madrid in 1791. This work launched the Spanish vogue for melodrama, in which spoken drama is accompanied by instrumental music. For this production Iriarte also composed ten brief orchestral pieces (MS in *E-Mm*) which are interesting illustrations of his musical interpretations of the emotions. Unfortunately the numerous quartets and sonatas he is said to have composed have not been found.

ALMONTE HOWELL

Iribarren, Juan Francés de.

See [Francés de Iribarren, Juan](#).

Irino, Yoshirō

(*b* Vladivostok, 13 Nov 1921; *d* Tokyo, 23 June 1980). Japanese composer. In 1927 his family returned to Japan, where Irino studied economics at Tokyo University (1941–3), while playing the clarinet in a student orchestra and studying composition privately with Saburō Moroi. After graduation he worked at the Bank of Tokyo and briefly served in the navy, but in 1946 he made composing his profession, joining the Shinsei Kai group which he organized with Minao Shibata and Kunio Toda. He took second prize at the Mainichi Music Competitions of 1948 and 1949, and won the newly-founded Mainichi Music Prize in 1949, 1950 and 1954. From 1949 to 1954 he worked as a music editor for the publishing house Tokyo Ongaku Shoin, and he taught at the Tōhō Gakuen School of Music, where he was appointed lecturer (1952), assistant professor (1955), professor (1959) and director (1960). The school became a college in 1961 and Irino continued as director until 1970; in 1973 he was appointed professor of composition at the Tokyo College of Music.

Meanwhile Irino continued to receive many prizes, including the German Ambassador's Prize (1957 and 1959), the Otaka Prize (1958 and 1959) and the Italia Prize (1958). In 1957 he organized the Institute of Twentieth Century Music and started the annual festival for contemporary music with fellow composers. He received a French government scholarship in 1962 and visited Europe and the USA frequently thereafter; in summer 1968 he was visiting professor at the University of Hawaii. In 1967 he helped organize the Japanese-German Festival for New Music and at the same time he became chief administrator of the Amis de la Musique de 20ème Siècle, which sponsored a series of concerts. In 1972 he founded Japan Music Life, an association for the promotion of various musical activities in Japan, and in 1973 he took a group of musicians to Europe, the USA and Canada to perform traditional and contemporary Japanese music. He was made an honorary member of the Asian Composers' League in 1974.

Irino's early works, the orchestral and chamber pieces of before 1950, reveal a certain stylistic influence from late Romanticism, but his interests quickly turned to atonality. He made his first attempt at serial writing in the String Sextet (1950) and at 12-note serialism in the *Concerto da camera* for seven instruments (1951). The Sinfonietta (1953) combines Schoenbergian 12-note serial techniques with a Blacher-like organic rhythmic structure. These and other works distinguished him as the first Japanese to use 12-note methods as his major tool, and at the same time he applied his comprehensive knowledge of the music of the past in such works as the Concerto grosso (1957), *Ricercari* for chamber orchestra (1954) and the Divertimento for seven wind instruments (1958), all within atonal idioms.

Although he has written some choral works, Irino is primarily a composer of instrumental music, particularly for orchestra or chamber ensemble. In deploying such forces he displays a sensitive treatment of each instrumental timbre according to strict structures of his own devising. He has experimented with unusual combinations, as in the Suite for jazz ensemble (1960) and the Quintet for clarinet, alto saxophone, trumpet, piano and violin (1958), and quickly took an interest in traditional Japanese

instruments, writing the Music for Two *Koto* as early as 1957. It was not, however, until after 1966 that he began a more serious attempt at combining the idioms of traditional Japanese music with his own atonal and serial style, an attempt made, for example, in the Three Movements for two *koto* and *jūshichigen* (1966) and *Wandlungen* for two *shakuhachi* and orchestra (1973, commissioned by the Koussevitzky Foundation). The Irino Prize, established a year after his death, encourages the activities of young composers.

MASAKATA KANAZAWA

Irish harp (i)

(Irish *cláirseach*; Scots Gael. *clàrsach*).

The specific name for the regionally distinctive kind of harp made in Ireland and Gaelic Scotland between the 12th and 18th centuries. 14 instruments and fragments survive from the 14th century onwards. Characteristic structural features were: i) a resonator ('box') hollowed from a single block of wood (generally willow) to a thickness of about 1·3 cm on the curved belly, but with thicker sides; this was closed at the back by a wooden 'door'; ii) a curved forepillar, most of which was T-shaped in section; iii) a deeply curved neck; iv) 30–36 brass strings, attached at the left side of the neck to metal tuning pins and at the lower end to wooden toggles inside the box; v) horseshoe-shaped metal loops ('shoes of the strings') fixed round the friction area of each string hole in the belly.

14th- and 15th-century instruments were small and low-headed, the neck protruding slightly over the forepillar, and were diatonically or perhaps modally tuned. 16th- and 17th-century instruments were larger and high-headed. The harp was set at the player's left shoulder, the left hand playing in the upper register and the right hand in the lower. Strings were plucked with long fingernails, trimmed to a point. In his *Dialogo della musica antica e della moderna* (Florence, 1581) Galilei described an Irish harp which he had examined as having 29 strings, i.e. one less than the usual number on later Irish instruments. He also related the characteristic playing technique, which had been described to him by its Irish gentleman owner.

Outside Ireland, some Irish harps were used in the performance of non-Irish music. These instruments may have been tuned chromatically and

were not necessarily plucked with the fingernails in the manner of the Irish professional players. Praetorius provides the only written evidence of a partly chromatic tuning (*Syntagma musicum*, iii, 1620), but his discussion does not make reference to any idiosyncratic playing technique. His tuning pattern was perhaps received at second-hand or imperfectly understood, since it contains several repeated or misplaced segments. When allowance is made for these, a pattern comparable with partly chromatic tuning on other contemporary harp types becomes clear. With 43 strings, the overall compass was given as C–e^{'''}, the lowest octave having a flattened B, the second both b₁ and b₂; the third and fourth octaves completely chromatic and the highest four strings tuned c^{'''}, c₁^{'''}, d^{'''} and e^{'''}. The neck and forepillar of the Cloyne (formerly Dalway) harp, made in 1620 by local craftsmen for a member of the Fitzgerald family, are massive and elaborately carved with animals (derived from non-Irish sources), grotesque hybrids and lofty sentiments about music (see illustration). This is the only Irish instrument which displays evidence of a tuning pattern resembling that given by Praetorius. There are 45 pinholes in one rank in the neck, plus an additional seven set alongside the 15th to the 21st holes in the main rank. In the absence of the original box, the function and tuning of these is uncertain.

Late 17th- and early 18th-century Irish harps continued to be diatonically tuned; there was virtually no chromatic requirement in characteristic Irish harp repertory. By the late 18th century, the use of brass-strung harps played with long, pointed fingernails had ceased, except by the centenarian Denis Hempson. Exact replicas of some surviving instruments have confirmed that big-boxed, brass-strung Irish harps did indeed have the qualities attributed to them by Giraldus Cambrensis in the 12th century, namely a powerful low register and a sweet upper register, and by Praetorius, who wrote of their lovely resonance.

A few 18th-century notations, made at performances by some of the last professional players, contain traces of idiosyncratic musical structures and performing practices in which those characteristics were exploited. For example, the earliest source of the music of Carolan's praise piece *Fanny Dillon* is in *A Collection of the Most Celebrated Irish Tunes* (Dublin, 1724), arranged metrically for amateurs of the violin, flute or oboe. But nearly four decades later, Edward Bunting and James Cody notated from live performance a form in which alternating vocal and instrumental modules can be clearly identified. Bunting also made two notations of Carolan's *John Jones*, one from a fine but unidentified executant and one from a solo harp performance by Denis Hempson in 1793. This impassioned lover's complaint is pentatonic, and where the instrumental interlude in *Fanny Dillon*, addressed to a woman, is in the harp's middle and upper registers, that in *John Jones* is in the middle and lower registers. Complete performance of these long, highly personal pieces would have taken at least 15 minutes and the harp interludes would no doubt have varied in intensity to match the sentiments of the verses (see Rimmer, 1997). (See also [Harp](#), §V, 1(ii); [Cláirseach](#); and [Clàrsach](#).)

JOAN RIMMER

Irish harp (ii).

Since 1819 the term Irish harp has been applied to various small, lightly built, gut-strung harps used in solo and ensemble performances of Irish and other Celtic-derived music. These have curved forepillars but otherwise little in common with the older forms (see Harp, §V, 3(i)).

Irizar y Domenzain, Miguel de

(*b* Artajona, Navarra, bap. 18 Sept 1635; *d* Aug 1684). Spanish composer and music director. He trained as a choirboy at León Cathedral and, from 1650, at Toledo Cathedral, in both places as a pupil of the elder Tomás Miciezes. His professional career began in 1657 when he was appointed *maestro de capilla* of the cathedrals of Oviedo and S Domingo de la Calzada, and in August 1657 he was made *maestro de capilla* of the collegiate church of Vitoria. He applied for similar posts at Orense Cathedral (1664), the collegiate church of Roncesvalles (1666) and elsewhere, but stayed at Vitoria until 1671, when he obtained the position of music director at Segovia Cathedral, where he remained until his death.

Irizar left to the cathedral numerous autograph manuscripts of his own works (masses, psalms, lamentations, motets and villancicos) as well as copies of works by other important Spanish musicians of the time (Miciezes, Carlos Patiño, Cristóbal Galán and Juan Hidalgo among others). Some of these were copied on the reverse side of more than 400 personal letters he received between 1664 and 1684. This correspondence is of incalculable value to an understanding of how music and musicians circulated in the Iberian peninsula, and it allows us to reconstruct the personal contacts of a 17th-century Spanish *maestro de capilla*. As well as members of his family, his correspondents included other *maestros*, organists, cantors and copyists, from Avila, Córdoba, Madrid, Palencia, Pamplona, Toledo and elsewhere.

Irizar's works are exclusively sacred and show clearly the influence of his various epistolary contacts, especially the musicians of the Madrid royal chapels. In fact, adaptations of works, both sacred and secular, by composers active in Madrid at that time (Juan Hidalgo, Cristóbal Galán and Matías Ruiz) exist among his compositions. His music is predominantly polychoral, for two or three vocal choirs (he scarcely used instrumental choirs), and usually treats the voices homophonically, especially in the villancicos.

PABLO L. RODRÍGUEZ

Irman, Regina

(b Winterthur, 22 March 1957). Swiss composer, guitarist and percussionist. After gaining her teaching diploma in guitar (1982) at the Winterthur Conservatory, she chose to concentrate on percussion (diploma 1995). During this period she began to write her own music. As composition progressively became her main concern, she acquired a reputation that extended beyond both regional borders and her interest in the women's movement. She has often found inspiration for her works in poetry, particularly that of Anna Akhmatova, interpreting texts through

musical parameters without necessarily bringing the words themselves to the fore. *Ein vatter-ländischer Liederbogen* is a particularly successful example of her approach to the sometimes abstruse writing of Adolf Wölfli. She has also composed with micro-tonal intervals. She has received commissions from the Basle International Festival of Recorder Music and the city of Zürich, among others, and in 1991 co-founded mikro, a composers' self-publishing collective.

JEAN-PIERRE AMANN

Iron Maiden.

English heavy metal band. Formed in 1975 by Steve Harris (*b* Leytonstone, London, 12 March 1956; bass and vocals), their most successful line-up included David Murray (*b* London, 23 Dec 1955; guitar), Adrian Smith (*b* Hackney, London, 27 Feb 1957; guitar), Nicko McBrain (*b* Hackney, 5 June 1952; drums) and Bruce Dickinson (*b* Worksop, Nottinghamshire, 7 Aug 1958; vocals, 1981–93). Smith was replaced by Janick Gers (*b* Hartlepool, 27 Jan 1957) in 1990, and Dickinson, who had taken over from the vocalist Paul Di'Anno (*b* Chingford, London, 17 May 1959), was replaced in turn in 1994 by Blaze Bayley (Bayley Cook; *b* Birmingham, 19 May 1963). Dickenson and Smith rejoined the band in 1999, displacing Bayley. One of the most influential groups in heavy metal, it adapted harmonized guitar lines, fast tempos and high-pitched vocals from the style of Judas Priest, adding more complex song forms, more elaborate stage shows, and lyrical situations and themes derived from classical mythology and literary sources such as Poe, Coleridge, Tennyson and Shakespeare. Many of their songs featured riffs based on a repeated quaver-semiquaver-semiquaver rhythm, which became something of a signature device. Dickinson's powerful, almost operatically-styled voice and his on-stage athleticism also made them distinctive. Like most heavy metal bands, they received little radio airplay

and built their audiences through constant touring. Their album *The Number of the Beast* (EMI, 1982) established them as stars within the world of heavy metal fandom. Iron Maiden's lyrics often examine experiences of power, paranoia and conflict. They are noted for their bricolage of mystical symbols and references from many traditions, which are brought together as sources of power and spiritual depth in the present, and for their gruesome corpse-like mascot, Eddie. (M. Wall: *Run to the Hills: the Official Biography of Iron Maiden*, London, 1998)

ROBERT WALSER

Irshai, Yevgeny Markovich

(b Leningrad [now St Petersburg], 15 January 1951). Russian composer. He came from a family of musicians, and graduated from the Leningrad Conservatory in 1975, having studied composition with A.A. Chernov and V.A. Uspensky, and later the piano with P.A. Serebryakov (1978), then following a dual career as a composer and performer. From 1971 to 1991 he worked in a music school as a teacher of piano and composition, after which he moved to Slovakia. There he worked as an accompanist at the theatre of opera and ballet in Banská Bystrica (1991–2), and since 1992 he has taught composition and piano at the Ján Levoslav Bella Conservatory and at Matej Bel University. Irshai became a member of the Russian Union of Composers in 1979, and since 1993 has been a member of the Association of Slovak Composers and the Slovak Music Union. In 1994 Irshai returned to his career as a concert pianist, giving recitals throughout Europe (Hungary, Poland and Italy). A gifted writer, Irshai is also the author of short stories and essays.

Choral, vocal and chamber works predominate in Irshai's output: he has also written a significant number of pieces and songs for children (mainly settings of poems by Samuil Marshak). By nature a lyricist, he frequently turns to philosophical and ethical matters; his interest in classical Russian poetry stems from such concerns. Irshai has shown interest in original forms of settings of the mass as exemplified by his *Pominoveniye* (Prayer for the Dead) set to texts from the Jewish kaddish, the Catholic 'Lacrimosa', and the poems of M. Tsikinovsky.

Irshai has characterized his musical style as 'late post-conservatism'. The array of expressive means which he uses in his works is typical of the Leningrad/St Petersburg school, perpetuating the traditions of Shostakovich. Although he makes economical use of techniques developed by the 20th-century avant garde, Irshai remains within the confines of late Romanticism.

MARINA MOISEYEVNA MAZUR

Iruarrízaga (Aguirre), Luis

(*b* Yurre, Vizcaya, 25 Aug 1891; *d* Madrid, 13 April 1928). Spanish composer. He studied music in Yurre and in 1907 entered the congregation of the Hijos del Corazón de María in Madrid, where he continued his musical education while training for the priesthood. Essentially, however, he was self-taught in music. In 1916 he was appointed organist of the Santuario del Corazón de María, Madrid, a post he retained until his death. He was greatly interested in plainsong, and he visited the Benedictine monasteries at S Domingo de Silos, Solesmes and elsewhere in order to learn about proper performing practice. In addition, he made extensive studies of 16th-century polyphony and of the composers of the German Cecilian movement, particularly Haller. In 1917 he founded the journal *Tesoro musical* (renamed *Tesoro sacro musical* in 1925), in which he published many of his own compositions, works by contemporary Spanish

composers, early music, musicological studies and articles on topical matters.

Iruarrizaga's compositions are all religious and have been published in a three-volume complete edition (Madrid, 1944–9, 4/1964). They show an original style which has had many imitators. Simple melody is the basis, noble, beautiful and closely adapted to the text; the harmony is rich and up-to-date, but fundamentally consonant. He composed freely for solo voice and for chorus (usually in only two parts, but sometimes in three or four), with organ, harmonium or piano accompaniment.

JOSÉ LÓPEZ-CALO

Irving, Washington

(*b* New York, 3 April 1783; *d* New York, 28 Nov 1859). American writer. His experiences in Europe, first as a traveller (1804–6) and subsequently as a resident (1812–29) and diplomat (England, 1829–32; Spain, 1842–6), gave him a wealth of colourful material for his published collections of stories, verse, sentimental tales, history and folklore. He is perhaps most closely associated with the characters Ichabod Crane from 'The Legend of Sleepy Hollow' and Rip Van Winkle, a deft appropriation of an ancient German folktale, both of which first appeared in Irving's *The Sketch Book of Geoffrey Crayon*.

Irving was a flute player of some ability and an enthusiastic opera, concert and theatre goer. He heard more than 130 operas in Europe and was present at a performance of *Fidelio* in the Kärntnertortheater in Vienna on 23 May 1814.

Bristow's *Rip Van Winkle*, produced in New York in 1855, is regarded as the first American grand opera on an American subject; De Koven's setting of 1920 and Edward Manning's of 1932 are among the later operatic versions, and there is an early overture on the subject by Chadwick. 'The Legend of Sleepy Hollow' has also received several operatic treatments, one of the more interesting being that by Douglas S. Moore as *The Headless Horseman*, for which Stephen Vincent Benét provided a one-act libretto satirizing progressive education. Several composers have set stories from Irving's *The Alhambra*, and Dudley Buck composed a cantata on six scenes from *A History of the Life and Voyages of Christopher Columbus*.

JOHN McLAUGHLIN/MICHAEL HOVLAND

Isaac [Isaack], Mr

(*f* London, 1675–1718; *d* by 1728). English dancing-master and choreographer. Little is known about his life; he may have been confused with an earlier dancing-master in Paris, also named Isaac. In 1675 Mr Isaac danced in John Crowne and Nicholas Staggins's masque *Calisto* in Whitehall, London, and subsequently retained his connections with the English royal court. He was much sought after as a dancing-master (his pupils included the princesses Mary and Anne) and was respected by fellow dancing-masters as a mentor and patron. 22 of his dances survive in Beauchamp-Feuillet notation: 19 were published from 1706 onwards and reissued, with music by James Paisible, to celebrate Queen Anne's birthdays; one was published by Edmund Pemberton in 1711; two were published as New Year dances (1715, 1716) for George I. His *Collection of Ball Dances Performed at Court* (London, 1706) was commissioned to illustrate the Beauchamp-Feuillet notation system. Despite later claims by John Walsh, only one of them, 'The Marlborough', is known genuinely to have been a birthday dance for Queen Anne (1705). The other five are older, perhaps dating back to the 1680s or 1690s. Some of Isaac's dances were performed on stage. The notations reveal sophisticated use of rhythms, phrasing, floor patterns and step vocabulary. According to Musgrave, Isaac died in 1740; he may, however, have retired or died soon after 1718, and in 1728 he was described by Essex as 'the late Mr Isaac' (preface to *The Dancing Master*, London, 1728).

JENNIFER THORP

Isaac [Lelong], Adèle

(*b* Calais, 8 Jan 1854; *d* Paris, 22 Oct 1915). French soprano. She studied with Gilbert Duprez in Paris, making her début in 1870 at the Théâtre Montmartre in Massé's *Les noces de Jeannette*. In 1873 she first sang at the Opéra-Comique, as Marie (*La fille du régiment*). She also sang Gounod's Juliet and Mozart's Susanna, and in 1881 created Olympia and Antonia in *Les contes d'Hoffmann*. From 1883 to 1885 she was engaged at the Opéra, where her roles included Ophelia (*Hamlet*), Marguerite (*Faust*), Adèle (*Le comte Ory*), Zerlina, Marguerite de Valois (*Les Huguenots*),

Isabelle (*Robert le diable*), Thomas' Francesca da Rimini and Mathilde (*Guillaume Tell*). In 1887 she created Minka in Chabrier's *Le roi malgré lui* at the Opéra-Comique. She retired in 1894. Her brilliant, flexible voice was especially suited to Mozart.

ELIZABETH FORBES

Isaac, Bartholomew.

See [Isaack, Bartholomew](#).

Isaac [Ysaak, Ysac, Yzac], Henricus [Heinrich; Arrigo d'Ugo; Arrigo Tedesco]

(*b* Flanders or Brabant, c1450–55; *d* Florence, 26 March 1517). South Netherlandish composer. The Latin name-form 'Henricus', adopted here, is found in many documents and musical sources. Isaac was a prominent member of a group of Franco-Flemish musicians, including Josquin des Prez, Jacob Obrecht, Pierre de La Rue, Alexander Agricola and others, who achieved international fame in the decades around 1500, influencing the Italian and European Renaissance. His musical output is particularly large and varied. Through his notable link with the Habsburg dynasty he left his mark on German musical traditions, although he also lived and worked for a considerable time in Florence.

REINHARD STROHM (1, 2(i–ii, iv), 3), EMMA KEMPSON (2(iii))

[Isaac, Henricus](#)

1. [Life](#).

The composer's father was named Hugo, but he cannot be identified with the Hugo Ysaac who was registered for the MA degree at Oxford University during the period 1451–3 and whose later ecclesiastical career in England is known. Isaac's precise birthplace is unknown. In authentic documents, he styled himself 'de Flandria'; Aegidius Tschudi called him 'Belga Brabanti[n]us'. He might have come from the border area between the counties of Flanders (containing Ghent, Bruges and Ypres) and Brabant (with Brussels and Antwerp); but 'Brabant' or 'Flanders' often simply refer to the Flemish-speaking part of the southern Netherlands. In Italy, persons from that region were often called 'Tedesco' or 'de Alemania' (both meaning 'German'), as Isaac was as well. His date of birth is usually estimated as about 1450 or a little later; a document of 1514 refers to him as 'old'.

Nothing is known of Isaac's social background and youth. His general education seems to have been excellent, although he was a layman and apparently did not attend a university. He was an accomplished composer by the mid-1470s, when three motets by him were copied into an Innsbruck manuscript. The earliest known biographical document dates from 15 September 1484, recording a casual payment to him as 'Componist' at the court of Duke Sigismund of Austria at Innsbruck. This is perhaps connected with Sigismund's wedding to Katherine of Saxony in February 1484; the payment was made to Isaac by the organizer of the festivities, the humanist Hans Fuchsmagen. Isaac may earlier have come to the notice of Sigismund's cousin Maximilian (later king of the Romans and Emperor), who visited the Low Countries in 1477 on the occasion of his marriage to Mary of Burgundy.

By July 1485, Isaac was employed as one of the singers at the baptistry of S Giovanni in Florence, who also served Florence Cathedral and SS Annunziata (the Servite friary). A letter of 1514 states that the Medici family 'had sent for him as far as Flanders'. At that time Flemish musicians were regularly recruited by Italian patrons (for example, Piero de' Medici recruited in the southern Netherlands in 1468). It is possible, but unlikely, that Isaac first left the southern Netherlands as late as 1484. Lorenzo de' Medici (1449–92); 'il Magnifico', did not employ a formal chapel of singers, but Isaac belonged to his domestic circle of artists and musicians. He was expected to set songs by Lorenzo and his favourite poet Angelo Poliziano and to contribute generally to the musical life of the Medici household and the city. He may have taught music to Lorenzo's sons Piero and Giovanni (from 1513 Pope Leo X), who became his patrons. Lorenzo supported Isaac in various ways, for example by sending a manuscript of his music to Girolamo Donato, the Venetian ambassador in Rome; and a sumptuous chansonnier in which Isaac's works are prominently displayed (*I-Fn* B.R.229) seems to have been prepared under Medici patronage and originally intended for a foreign ruler, probably either King Matthias Corvinus of Hungary or Duke Sigismund of Austria. Isaac was in close contact with other Florentine musicians such as Bartolomeo degli Organi and Alessandro Coppini. He was a member of the confraternity of S Barbara at SS Annunziata, traditionally called 'dei Fiamminghi' on account of its many Northern members. Florentine documents (and later Austrian ones) often refer to Isaac as 'composer', sometimes as 'magister' or 'professor musices'. But he was not employed as an organist; documents concerning Lorenzo's organist Isaac Argyropoulos have been mistakenly referred to Henricus Isaac.

Lorenzo is said to have arranged Isaac's marriage (before 1490) to Bartolomea Bello (1464–1534), the daughter of a Florentine artisan. The couple lived in their own house in Florence, but later travelled together to Vienna and Konstanz. Although Isaac made three separate wills (all at SS Annunziata, where he wished to be buried), no children are ever mentioned; his wife seems to have been his sole surviving heir. A sister of Bartolomea married (c1492) the French musician Charles de Launoy (c1460–1506). Isaac composed *Quis dabit capiti meo aquam?* (to a poem by Poliziano), and possibly also the *Missa 'Salva nos'*, on the occasion of Lorenzo de' Medici's death on 8 April 1492. In September of that year, Lorenzo's son Piero took Isaac and his fellow musicians Charles de

Launoy and Pietrequin Bonnel to Rome for the coronation of Pope Alexander VI. But the singers of S Giovanni were disbanded in March 1493, and in November 1494 Isaac's Medici patrons were banished from Florence.

By November 1496 Isaac had found new employment with Maximilian I, king of the Romans. His appointment as court composer to Maximilian's newly established chapel in Vienna was confirmed on 3 April 1497. In the following years, he travelled with the chapel to Augsburg, Wels, Innsbruck and Nuremberg. When in 1497–8 Frederick the Wise, Elector of Saxony, visited the Tyrol with members of his chapel, Isaac received a gift of clothing (indicating that he served him), but he did not travel to Saxony in Frederick's service. Another important patron was Cardinal Matthäus Lang of Augsburg. Isaac's students included Adam Rener, Balthasar Resinarius, Ludwig Senfl and Petrus Tritonius, and he surely collaborated with the chapel organist Paul Hofhaimer, who had already served at the Innsbruck court since 1478.

Isaac was in Florence in August 1502 and some weeks later at the Este court of Ferrara, where he hoped to be employed. Josquin des Prez was chosen instead, although the court agent Gian d'Artiganova reported (2 September 1502) favourably about Isaac who 'would compose whenever asked' and not as he pleased like Josquin. Isaac was apparently again in Maximilian's retinue in the Tyrol in 1503, and he was with him at the Imperial diet at Konstanz in 1507, when he composed the occasional motets *Sancti Spiritus* and the six-voice *Virgo prudentissima*. Isaac stayed in Konstanz, perhaps with interruptions, from early 1505 until at least 14 April 1508, when the cathedral chapter decided to commission the *Choralis Constantinus* from him.

After 1506 Isaac joined the lay fraternity of the abbey of Neustift (Novacella) near Brixen (Bressanone) in the Tyrol. In 1510 Maximilian provided him with a benefice near Verona. Isaac was in Innsbruck in 1514, but in 1515 was allowed to live permanently in Florence while continuing to receive his salary, probably for compositions including parts I and III of the *Choralis Constantinus* and for diplomatic activities. The Medici family, restored to power in 1512, also favoured him. His motet *Optime divino* celebrates a visit of Cardinal Matthäus Lang to Pope Leo in December 1513. Following recommendations by Medici agents and the papal administration, he was appointed provost of the chapter of Florence Cathedral – a sinecure – in May 1514. He thanked the Pope for his patronage with the motet *Quid retribuam tibi, O Leo*. By December 1516 Isaac had become ill and made his third will; he died in Florence on 26 March 1517.

In the woodcut series 'The Triumph of Emperor Maximilian' (*Triumphzug*; 1516 and later), Hans Burgkmair portrayed the Imperial chapel performing on a carriage. A person wearing a laurel wreath, standing next to the *rector cappellae* Georg Slatkonja, was identified in a contemporaneous copy as 'Ysaac'. Although the identification has been challenged, this may be a portrait of the ageing composer drawn from life.

Isaac, Henricus, §2: Works

(i) The Ordinary of the Mass.

Isaac wrote 36 mass cycles that are known to survive today, as well as a handful that seem to have been lost. He also composed 13 independent settings of the Credo. His 16 masses based on borrowed melodies are comparable in number, quality and variety to those of Josquin, Obrecht or Agricola, but unlike them he composed at least 20 further cycles based on the corresponding plainchant of the Ordinary of the Mass, all but one of these for *alternatim* performance. Together with his cycles for the Proper of the Mass, Isaac's music for the Ordinary was his most characteristic and influential contribution to the music of his time.

Isaac's masses on borrowed melodies are difficult to date or localize. Source transmission and some slight documentary evidence suggest that eleven cycles had been composed by about 1492: *'Argentum et aurum'*, *'Chargé de deul'*, *'Comme femme'*, *'Een vrolic wesen'*, *'Et trop penser'*, the lost *'J'ay pris amours'*, *'La Spagna'*, *'Quant j'ay au cueur'*, *'Salva nos'*, *'Une musique de Biscaye'* and the four-voice *Missa 'Comment poit avoir joie'*. Four or five others may belong to the following decade: the six-voice *Missa 'Wolauff Gesell'* (after c1496), the *Missa carminum* (after c1496), *'Virgo prudentissima'* (possibly performed 1503) and possibly *'T'meiskin was jonck'*. The mass *'La mi la sol'* is based on a motet composed in 1502. The *Missa 'Misericordias Domini'* is also late, but it appeared in the company of four early masses in Petrucci's *Misse Henrici Yzac* (1506).

Seven of Isaac's masses are based on polyphonic chansons from the Franco-Flemish tradition: the rondeaux *Comme femme* (Binchois), *Quant j'ay au cueur* (Busnoys) and *Een vrolic wesen* (Barbireau), the virelais *Chargé de deul* (anon.) and *Et trop penser* (Bosfrin ?= Josquin) and the Dutch song *T'meiskin was jonck* (Obrecht). A mass by Isaac, now lost, on the well-known rondeau *J'ay pris amours* (anon., ?by Caron) was mentioned in 1490. Monophonic secular tunes include the internationally known basse danse *La Spagna*, the *chanson rustique Une musique de Biscaye* (this bears no relation to Josquin's canonic song setting or to his mass on the same tune) and the popularizing song *Comment peut avoir joie*. The last also carried the German words *Wohlauf Gesell, von hinnen*; Isaac's four-voice mass setting existed before 1490 and probably implies the French text, but the six-voice mass has the German title in its unique source, an Innsbruck manuscript (*D-Mbs Mus.ms.3154*). The *Missa carminum* strings together a number of German popular songs in the manner of Obrecht's and Pipelare's *Missae carminum* on French and Dutch chansons and an older Austrian tradition of *Liedermessen*.

Isaac used multiple sacred cantus firmi (a technique familiar in the Low Countries and in Germany) in the *Missa 'Salva nos'*, which is chiefly based on an antiphon but also quotes several short invocations from the chants of the Mass. Three sections (the second Kyrie, 'Cum Sancto Spiritu', the second 'Osanna'), based on the plainchant phrase 'et requiescamus in

pace', were incorporated into Isaac's motet *Quis dabit capiti meo aquam?* on the death of Lorenzo de' Medici; probably both the mass and the motet were intended for the funeral ceremonies. A mass for the Assumption of the Virgin Mary was performed at Innsbruck on 26 September 1503 in a meeting of the Imperial and Burgundian chapels; this may have been Isaac's six-voice *Missa 'Virgo prudentissima'*, which is given the rubric 'de assumptione beate marie virginis' in a Burgundian choirbook (*B-Br* 6428). Isaac's mass is related neither to his own four- and six-voice motets nor to Josquin's similarly titled *O Virgo prudentissima* (on a poem by Poliziano). Likewise, Isaac's mass '*Argentum et aurum*' shares only its cantus firmus with his motet, probably composed earlier. Staehelin (1977) identified a musical antecedent for the *Missa 'Misericordias Domini'* in the anonymous frottola *In focho, in focho la mia vita passa*, suggesting that Isaac's intermediate model was a lost motet by Mouton, based on the frottola. The only demonstrable case in which Isaac elaborated one of his own shorter works into a mass is the *Missa 'La mi la sol'*, based on his 'motet' composed in Ferrara in 1502.

Isaac employed all the formal and technical devices for which the Franco-Flemish mass composers of his generation are celebrated. Manipulation of the cantus firmus is rare: retrograde occurs in the second 'Osanna' of '*Argentum et aurum*' and in the 'Et incarnatus' of '*T'meiskin was jonck*'; a notable example of mensural artifice is seen at the beginning of '*Argentum et aurum*', where all the voices sing the same melody at different levels of duration in exclusively dotted notes. Isaac used canon less frequently than Josquin (see the masses '*Comme femme*', '*Comment poit avoir joie*' and elsewhere), but he often conducted the cantus firmus in canon. 'Parody' (borrowing several voices simultaneously from a polyphonic model), paraphrase, migration of the cantus firmus between the voices and ostinato are frequently found. Isaac avoided large-scale constructive devices, but achieved coherence through modal unity and the pervasive use of borrowed material. The texture of his counterpoint varies greatly: imitative writing in three or four voices predominates, but may be coordinated with ostinato or, very often, a 'pedal-point' texture with the cantus firmus in long notes. A simple chordal declamation or rapid *parlando* is occasionally found in the early masses, but on the whole there is more syllabic word-setting in the later works. Like Obrecht, Isaac favoured repetitive and sequential passages, which might result in static harmonies when the motivic substance is triadic as in the masses '*Comment poit avoir joie*', '*Argentum et aurum*', '*Et trop penser*'. The textures of the last two are playfully ornamented and patterned; many sections resemble textless 'instrumental' fantasias. In the *Missa 'La mi la sol'* an eight-note ostinato is treated with great melodic versatility and modal coherence.

Isaac's masses, to a significantly greater extent than those of Josquin or Obrecht, were used as quarries for secular music-making. Three-voice sections in particular circulated widely, sometimes appearing with their original titles (e.g. the 'Benedictus' from *Missa 'Quant j'ay au cueur*' or the Christe from '*Chargé de deul*'), sometimes with new words or with no words at all. Isaac may have deliberately encouraged secular use of these mass sections by composing them in a style resembling that of the chanson. The song settings *T'meiskin was jonck* and *Een vrolic wesen* were mistakenly ascribed to Isaac, apparently because he wrote masses

based on them, while one of his settings of *Fortuna desperata* was labelled 'Sanctus' as if it had been extracted from a mass on that tune. In the *Missa 'La Spagna'*, the three-voice second Agnus Dei gives the borrowed melody complete in the bassus, all in perfect longs; a separate copy in an early Italian source has been regarded as the model for the mass, though such a strict technique would be atypical for a self-contained composition. Some masses employed an extremely simple mode of recomposition: the six-voice *Missa 'Wolauff Gesell'* largely re-uses the counterpoint of the four-voice *Missa 'Comment poit avoir joie'* on the same tune, and the 'motet' *La mi la sol* is incorporated *en bloc* into the Credo of the mass of that name.

During his Habsburg service from 1496, Isaac contributed largely to the genre of mass cycles based on the corresponding chants of the Ordinary of the Mass, composed for particular categories of feasts such as apostles, the Virgin Mary and so on. Most of the plainsong melodies used by Isaac are found in the printed *Graduale pataviense* (Vienna, 1511), a source approximating the usage of the Imperial chapel (see §2(ii) below). Although individual mass sections based on the chant of the Ordinary were as common in central Europe around 1450–90 as they had been in England and France somewhat earlier, few composers before 1500 wrote complete cycles (Martini, *Missae dominicalis* and *ferialis*; Urrede (Wreede), *Missa de Beata Virgine*; La Rue, *Missae de Beata Virgine, ferialis, paschalis* and *pro defunctis*; Agricola, *Missa paschalis* on 'German' chants). With at least 20 cyclic settings, Isaac monumentalized a regional tradition formerly with little prestige and elaborated it in the most modern styles.

Except for the *Missa ferialis*, all Isaac's plainchant masses were designed for *alternatim* performance: alternate verses were composed in vocal polyphony, leaving the others to be chanted or played on the organ. In one source Isaac's works are called 'Missae ad organum', and there is evidence that alternation between vocal polyphony and organ versets was the Imperial chapel's practice (see Mahrt), which Maximilian may have brought from Flanders. It appears that six-voice *alternatim* masses were among the first works Isaac composed for Maximilian's chapel. A chapel choirbook copied about 1510 (*D-Mbs* 31) preserves the six-voice *Missae solemnis, de Beata Virgine* and *de apostolis* together with the six-voice cantus-firmus mass '*Virgo prudentissima*'. A six-voice *alternatim* *Missa paschalis*, in a somewhat different and possibly earlier style, occurs in Netherlandish and central-German sources. Isaac also composed five-voice cycles for the same four feasts as well as for martyrs, confessors and virgins. These seven masses survive uniquely in an important choirbook of the Bavarian ducal chapel (*D-Mbs* 3), copied by Ludwig Senfl from Imperial exemplars. A further five-voice *Missa de Beata Virgine* is independent from the others; its plainchants for the Kyrie and Gloria are found only in graduals from Augsburg and Basle.

Isaac composed four-voice *alternatim* *Missae solemnis, paschalis, de Beata Virgine, de apostolis, de martyribus* and *de confessoribus*; probably all later works. Together with the through-composed *Missa ferialis*, they appear as a set in several sources. These works could be used by smaller choirs for many ritual occasions and circulated much more widely than the five- and six-voice cycles. Five of the four-voice masses (all but the *Missae de Beata Virgine* and *ferialis*) were printed in the third volume of the

Choralis Constantinus (1555), with an additional *alternatim* Credo for all but the *Missa de confessoribus*. A distinct *alternatim* *Missa paschalis ad organum* is scored for lower ranges and may have served a special purpose. A doubtful four-voice *Missa de Beata Virgine* incorporates material from the authentic six-voice cycle, but its Sanctus and Agnus Dei are probably by a different hand. Isaac also composed a three-voice *Missa de Beata Virgine*, but it is doubtful whether the existing work is by him or Senfl.

A Bavarian chapel manuscript (*D-Mbs* 53) presents 13 four-voice plainchant-based Credos by Isaac, which complement the four-voice *alternatim* masses. Their style is often surprisingly simple, perhaps reflecting popular appreciation of the chants. Only the twelfth of these Credos is an early work (?c1480-90), based on a number of borrowed chants all connected with feasts of the clergy and Eastertide processions.

Isaac's *alternatim* mass settings display a vast musical panorama of Mass plainchant. All the cantus-firmus procedures of the time are present, although paraphrase, migration, transposition and ornamentation predominate over scaffolding or canon techniques. The chant melody often appears in imitation between two voices, especially in the six-voice works. The modes, ranges and melodic styles of the plainchant influence the polyphonic settings and their degree of musical unity. Skilful organ versets based on the alternate verses would have highlighted Isaac's own contribution. The forms of his *alternatim* masses are episodic and narrative – sometimes epigrammatical in the shorter verses – rather than architectural.

[Isaac, Henricus, §2: Works](#)

(ii) The Proper of the Mass.

Polyphonic settings of the Proper of the Mass stand at the very beginning of Western music-writing (*Musica enchiriadis*) and are among the earliest compositions in fixed rhythm (Notre-Dame organa). It is probable, however, that in most churches such items were sung in improvised counterpoint. Some repertoires seem to have been completely lost, such as the Mass Propers in 'discant' prescribed for the Ste Chapelle of Bourges in 1405. But hundreds of 15th-century Proper settings survive, either in isolation (mostly introits and sequences) or in cycles combining some selection among introit, gradual, alleluia, sequence, tract, offertory and communion. In some cases such Proper cycles were combined with polyphonic Ordinary cycles to form 'plenary cycles' or *Missae plenae*, such as those of Reginaldus Libert or Du Fay. By the late 1430s the Habsburg chapels were receiving many such settings from Western Europe, and individual items and cycles began to appear increasingly in Central European sources like Trent MS 88 (*I-TRmp*, c1460), which contains three-voice Proper cycles for weekly votive Masses and high feasts, some by Du Fay but others of Austrian and Italian origin. The Imperial chapel under Friedrich III (*d* 1493) probably used polyphonic introits and sequences regularly.

Isaac wrote settings of the Proper well before 1508: for example, his four-voice sequence *Sanctissimae Virginis* survives in an autograph datable about 1500 (*D-Bsb* 40021). 11 introits and two sequences for six voices, appropriate to the highest feast-days of the Imperial ritual, probably

originated alongside the six-voice *alternatim* masses and may have been intended for Imperial ceremonial occasions around 1503–8. Other individual settings seem to have been composed for Augsburg and other centres.

The resolution of the cathedral chapter of Konstanz on 14 April 1508 to commission 'several *Officia* [Proper cycles] for the highest feast-days' from Isaac was mediated by Georg Slatkonja, master of the Imperial chapel. Isaac completed the requested works (and perhaps more) by November 1509. Pätzig has shown that the music composed for the Konstanz commission comprised only the 25 cycles printed in the second volume of the *Choralis Constantinus* (1555); he suggests that the 48 cycles in the first volume and the 25 in the third were composed for the Imperial chapel, since they correspond to the appropriate items in the *Graduale pataviense* of 1511. It has been objected that the printed gradual does not always exactly match Isaac's text or cantus-firmus melody, but it is a source representing the liturgy of Vienna Cathedral rather than that of the more eclectic Imperial chapel.

Since the cycles in the first volume of the *Choralis Constantinus* provide music only for Sundays throughout the year, but not for feast-days, they must have been conceived as part of a larger scheme, probably about 1505–7. The most important feasts are still omitted from the third volume; these were probably provided for by the six-voice Proper items mentioned above. The Konstanz cycles in the second volume were probably ill-suited to the Imperial chapel: they differ in scoring and cleffing, and only three individual sections from the second volume were re-used in the first. Throughout the *Choralis Constantinus* the settings are usually for four voices. In the first two volumes the plainchant intonation is normally in the discantus, but in the third it is in the bassus. The cycles typically consist of polyphonic settings of the introit (without 'Gloria Patri'), alleluia or tract, sequence (if present) and communion, never of the gradual or offertory.

The last part of Isaac's life seems to have been continually occupied with the composition of Proper cycles, but the fragmentary nature of the third volume of the *Choralis Constantinus* suggests that this labour remained uncompleted. Isaac's pupil Ludwig Senfl, a member of the Imperial establishment from 1508, collected and copied much of the music later published in the first and third volumes of the *Choralis Constantinus* (see Bente). He seems not to have had access to the cycles numbered 1–25 in the work-list (might they have been composed before 1508?), but only to numbers 26–42 from the first volume. In 1531 Senfl assembled many of the cycles later published in the third volume, together with many of his own, into four choirbooks of the Bavarian chapel (*D-Mbs* 35–8), giving them the title *En opus musicum festorum dierum* and apparently with a view to publication. Evidently this project was superseded by that of printing the *Choralis Constantinus* itself, announced in 1537 by the Nuremberg editor Hans Ott (in his preface to RISM 1537¹) who had obtained much of the material from the Munich chapel. Senfl may have edited the collection; certainly he provided the introit and gradual for the first cycle in the third volume, and completed the last item, the sequence for St Ursula *Virginalis turma sexus*, which Isaac had died in the midst of composing. The publication did not take place until after the deaths of both Ott and Senfl;

the first volume appeared in 1550 from the press of Ott's usual printer Formschneider on behalf of Ott's widow. Formschneider printed the second and third volumes in 1555 at the expense of the Augsburg merchant Georg Willer, who dedicated them to Hans Jacob Fugger.

The monumental scale of the *Choralis Constantinus* reflects the growing wealth and prestige of courtly musical institutions, which regularly furnished themselves with the most refined and up-to-date music. Had it been completed, Isaac's project for the Imperial chapel would have provided elaborate polyphonic Propers for about 100 days of the year. It forms a parallel to the literary and pictorial monuments Maximilian was commissioning about this time to exalt his reputation: the *Weisskunig*, *Teuerdank* and *Triumphzug*. The heraldic and humanistic prestige of these works is matched by the dignity of the ancestral ritual and plainchant in Isaac's cycle of cycles. Though smaller in scale, the music for Konstanz Cathedral was an analogous undertaking.

Isaac is not in any obvious sense a 'monumental' composer. His immense task entrusted to him alone rather than a team of musicians was probably made easier by excellent pay and good working conditions; many settings perhaps originated in his Florence home and were first tried out by Italian singers. His solutions to the task of clothing the chant in polyphony demonstrate his stunning versatility in many idioms of counterpoint, sonority, word-setting and musical structure, his readiness to be inspired by the melody and words of the plainsong, his emphasis on the immediate sounding moment rather than underlying hidden structures. Virtually no music is reused literally, even where the chant melodies are identical or similar; even though the counterpoint may be formulaic, the cantus firmus may take a unique shape each time. The characteristics of the divers plainsong genres are often given polyphonic analogues: long, melismatic tract sections in reduced scoring, compact introit verses, declamatory and rhythmically energetic sequence verses. The greatest mensural and textural variety is to be found in the multisectional sequence settings, in which the number of voices varies between two and six. The flexibility of cantus-firmus technique exceeds even that of the *alternatim* masses. The chant melodies may be set out in long note-values or as declamatory points of imitation, but they usually soon merge into a web of similar melodies. Individual motifs of the cantus firmus, such as pitch repetitions or large leaps, are often taken up in the counterpoint to amplify their dramatic force. Strict canon and mensural complexity are more frequent than in the *alternatim* masses, especially in the music for Konstanz Cathedral. Above all, Isaac responded to the individuality of his texts and their rhetorical structures, and many cases of text-illustration and modal expressivity can be found. Triple-metre proportional sections are often illustrative, or joyful and dance-like. Occasionally Isaac quoted extraneous tunes (e.g. in cycle no.54 for Easter the *cantio Christus surrexit*, the antiphon *Regina caeli* and the sequence *Victimae paschali laudes*). The three volumes of the *Choralis Constantinus* vary little in style, although in the third volume, where the chanted intonations are consistently in the bassus, the cantus firmus is more often at the bottom of the texture and simpler in rhythm.

Besides Konstanz, Vienna and Munich, Isaac's Proper cycles were cultivated in the chapels of Saxony, Württemberg and the Palatinate, and

they were expanded by similar compositions by other composers such as Sixt Dietrich and Clemens Hör. Excerpts were quoted by the theorists Sebald Heyden and Heinrich Glarean. Besides Senfl, another pupil of Isaac's, Adam Rener, began to compose similar cycles for the Saxon chapel at Torgau after 1507. Although the *Choralis Constantinus* probably had no influence on Francesco Layolle's composition of the Lyons *Contrapunctus* (1528), it may have a bearing on Corteccia's cycles for Florence in the 1540s. The Wittenberg printer Georg Rhau published two collections of Proper cycles by a wider circle of composers in 1539 and 1545, for use in the Lutheran service; though the Imperial and Catholic implications of Isaac's project were no longer relevant to many of its purchasers, the publication of the *Choralis Constantinus* in the 1550s demonstrates the continuing authority of his achievement.

[Isaac, Henricus, §2: Works](#)

(iii) Motets.

Over 50 motets by Isaac are known to survive in a wide variety of manuscript and printed sources. Their creation covered most of his career, and they correspondingly display a great diversity of styles. Some are firmly rooted in the Franco-Flemish tradition, some are Italianate, and some approach the German tradition exemplified by his music for the Proper of the Mass. Isaac's reputation in the present is not so dependent on his motets as, for instance, Josquin's; no comprehensive modern edition has yet appeared, and there are serious problems of dating and attribution.

The genre of the motet in Isaac's time was rather loosely defined. The vast majority of motets were composed to Latin texts, but they might be secular or religious, public or intimate. Aspects of style and form distinguish the motet, on the one hand, from works for substitution in the liturgy such as settings of the Proper of the Mass, hymns or the Magnificat, and on the other from songs, so that we can recognize, for example, sequence motets not for liturgical substitution (e.g. *Inviolata*), secular motets (e.g. *Quid retribuam tibi*) and sacred songs (e.g. *Christ ist erstanden*). Most of Isaac's motets are settings of plainchant where the texts of the free voices and the cantus firmus are the same; others are based on borrowed tenors with different words, and some have no cantus firmus at all. Some textless works resemble motets more than songs and will be included here.

The largest group of Isaac's motets is that in which the cantus firmus gives its words to the motet as a whole. By far the largest genre of chant models is the antiphon; responsories, sequences, hymns and psalms also occur. In what seem to be his three earliest surviving works (copied as a group c1476 in the Innsbruck manuscript *Mbs* 3154), Isaac constructed the entire cantus firmus as a scaffold and stated it more than once. In *Argentum et aurum*, the chant melody proceeds in equal breves and migrates from the discantus to the bassus and finally to the tenor. In *Ecce sacerdos magnus*, the cantus firmus is given in canon, first between the upper pair of voices and then between the lower pair; each phrase ends with pervading imitation of the chant; *Inviolata, integra et casta es* is similar. Another early work is *Salve regina* (i), whose cantus firmus is notated as if for chant, to be interpreted as equal breves in diminution (semibreves in relation to the other voices) – a not uncommon procedure in the late 15th century.

Most of Isaac's chant-based motets, however, transform the plainsong into a flexible mensural melody through a sensitive melodic and rhythmic elaboration. The chant may be in the discantus, the tenor, or occasionally in the bassus. In the antiphon motets *Gaude Dei genitrix* and *Sancta Maria Virgo* the plainsong migrates through the texture. Often, the cantus firmus is assigned to a pair of voices, as in the responsory settings *Accessit ad pedes*, *Quae est ista* and *Discubuit Jesus*, where it is imitated between discantus and tenor, or in the monumental five-voice *Regina caeli*, in which it appears in canon between the two lowest voices and is paraphrased in the others. The works mentioned are transmitted chiefly in relatively late German sources; some of the chant melodies show Central-European peculiarities. A different approach was taken in *Salve regina* (ii): each of its ten sections opens with references to the antiphon melody but quickly dissolves into florid counterpoint with repetitive and patterned textures. The section 'Ad te clamamus' circulated widely in Italy after 1490 as a separate piece under various titles.

A number of Isaac's plainchant motets are divided into two or three sections or show other characteristics of the motet tradition such as syllabic, chordal declamation, fermata chords or changes of texture to emphasize textual divisions. The Marian antiphon settings *Alma redemptoris mater*, *Ave regina caelorum*, *Ave sanctissima Maria*, *Anima mea liquefact est* and *Tota pulchra es* belong in this group. In most of these motets the chant is loosely paraphrased and may appear in any voice. A striking texture is found in *Tota pulchra es*, in the Phrygian mode with a low tessitura (*E-c*"); at the beginning of the second section, 'Flores apparuerunt', the altus sings a long, ornamented melody against sustained notes in the outer voices. Pervading imitation is infrequent in Isaac's motets, but it characterizes the three-section antiphon motets *Ave sanctissima Maria* and *Anima mea liquefacta est* as well as a few other Italianate works. Longer biblical texts, for which Isaac paraphrased the recitation tones, are set in the psalm motets *Quid retribuam Domino* and *In convertendo*, the psalm compilation *Illumina oculos meos* and the *Oratio Jeremiae prophetae*. Several works have unidentified cantus firmi, most notably *Sub tuum praesidium* (composed in 1505 for the Konstanz organist Martin Vogelmayer), *O Maria, mater Christi*, *Hodie societates* and *Parce, Domine*, which employs the same unknown melody as Obrecht's setting. *Recordare Jesu Christe* seems to be a Protestant contrafactum of the responsory *Recordare virgo mater* (with trope, 'Ab hoc familia', of which the chant is also used in Isaac's setting).

Isaac's tenor motets employ a borrowed cantus firmus whose text is distinct from that of the other voices; they are usually laid out in two sections of contrasting mensuration. *Angeli, archangeli/Comme femme* (for six voices) and *O decus Ecclesiae* (for four) are early works. The former, with its climactic form, resembles the paradigmatic five-voice tenor motets of Johannes Regis, with which it is found in the Chigi Codex (*I-Rvat* Chigi C.VIII.234); it combines a compilation of antiphon texts for All Saints with the tenor of Binchois' chanson. The incipit of *O decus Ecclesiae* (an antiphon for St Dominic; no further text is preserved) is probably not original; the tenor is an ascending and descending hexachordal scale, entirely in breves, resembling examples in pedagogical texts. Alternatively it might have been intended as a heraldic composition. *Palle, palle* is a

similar textless work composed over a tenor ostinato symbolizing the Medici coat of arms (see Atlas, 1974). The occasion for which it was written is uncertain (though it must be dated before 1494, by which time it had been copied into the chansonnier *I-Rvat* C.G.XIII.27), but it can be linked to a wider tradition of symbolic-heraldic *Wappenmotetten* (see Staehelin, 1997). The hexachordal subject or *fantasia La mi la sol, la sol la mi* was the basis of the textless motet of that title, composed in two days in Ferrara in 1502. Presented as a progressively accelerating ostinato in the tenor, the subject also enters the free voices and gives a Phrygian cast to the modal sonority.

Some of Isaac's tenor motets were composed for specific occasions. The six-voice *Virgo prudentissima* seems to have been composed in 1507, when Maximilian was preparing for his forthcoming coronation as Emperor, and it may have been performed at the diet of Konstanz. The free voices sing a poem in hexameters invoking the Virgin and archangels on the ruler's behalf in the name of the Imperial *rector cappellae* Georg Slatkonja; the cantus firmus in the second altus is an antiphon that begins with the same words. *Optime divino/Da pacem/Sacerdos et pontifex* was composed to celebrate the meeting of Cardinal Matthäus Lang and Pope Leo X in December 1513. The primary text refers to the singers of the Imperial chapel, and in each of the two sections the two cantus firmi are stated simultaneously.

Many of Isaac's motets without cantus firmus are also occasional compositions. *Quis dabit capiti meo aquam?*, the funeral motet for Lorenzo de' Medici (d 1492), has been mentioned above; Poliziano's words allude to a psalm text. The motet has no cantus firmus apart from the transposing ostinato 'et requiescamus in pace' adapted from the *Missa 'Salva nos'*. Another humanistic funerary epigram, perhaps for the composer Alexander Agricola (d 1506), provides the words for *Nil prosunt lacrimae*. *Sancti Spiritus assit nobis gratia* uses a humanistic poem that incorporates some liturgical words (e.g., its opening is that of a sequence); like *Virgo prudentissima*, it was composed as an exhortation to the diet of Konstanz in 1507 and may have been performed at its opening on Whitsunday. *Quid retribuam tibi, O Leo*, Isaac's thanksgiving to Leo X (c1514), is intimately scored for three voices. The second section, 'Argentum et aurum non habeo', seems to allude in both words and music to Isaac's mass and motet on this antiphon and to assert his poverty.

The text of *Quis dabit pacem populo timenti?* consists of 12 lines from Seneca's tragedy *Hercules Oetaeus*. This quotation set with processional splendour, functions as a new reference to authority – classical rather than contemporary. The motets *Prophetarum maxime*, a prayer to St John the Baptist, patron saint of Florence and its baptistery, and *Salve Virgo sanctissima*, a devotional motet apparently influenced by the idiom of the *lauda*, are similar in style. The three-voice motets *Gratias refero tibi* and *Gentile spiritus* are transmitted with incipits only, and their texts cannot be identified, while the words to the four-voice *Sive vivamus (= Ave regina caelorum)* are clearly contrafacta. The textures and techniques of all three are comparable to some 'songs without words' (see below), but their forms ally them to the motets.

[Isaac, Henricus, §2: Works](#)

(iv) Songs.

Isaac's songs participate in more than one tradition, reflecting his eventful career and many skills. Songs were distinguished from other genres of the time by their normal use of strict repetitive forms and vernacular language, but they might be sacred as well as secular, or they might combine vernacular song-texts and forms with plainchant *cantus firmi*. Textless performance by voices or instruments was always an option (as indeed it was for mass sections and motets), and some songs were conceived from the outset without words. Isaac embraced all of these possibilities. Three main stylistic principles inform his songs, sometimes supporting one another and sometimes conflicting: the *cantus-firmus* principle, elaborating a pre-existing melodic pattern without much regard to the words; the principle of word-orientated setting of poetry; the principle of ostinato or sequential repetition and virtuoso ornamentation. (The last has often been identified as an 'instrumental' idiom, but this probably underestimates the vocal culture of Isaac's time.)

Many of Isaac's 35 or so settings of French or Dutch words are derivative of pre-existing chansons. The re-use of individual voices (discantus or tenor) of well-known songs predominates, often with added technical twists such as dual-speed rhythms and ostinatos as in *Le serviteur*, *Tart ara* and *J'ay pris amours*. *Helas, que de vera* is a reworking of the entire polyphonic texture of Caron's rondeau. The anonymous *Fortuna desperata*, which although it has an Italian text is analogous in status to a French rondeau, was employed by Isaac five or six times as a basis for experimentation with modal transposition or combination with other tunes (e.g. the litany formula *Sancte Petre*). Other chansons derive from the repertoire of popularizing monophonic songs known as *chansons rustiques*. The original chansons may have *ABA* or refrain forms, though these may be obscured by the counterpoint of the polyphonic setting. Isaac followed Busnoys and Caron in blending the repetitive pattern characteristic of the *chanson rustique* with ostinato accompaniment. In *Je suys malcontent* (= *Serviteur suis*) he used a tune also set by Martini in *O intemerata* (= *Der neue pawir schwantcz*), which was probably French in origin. *En l'ombre d'ung buissonet/Une musique de Biscaye/Sustinuimus pacem* is a tour de force of combination. *En lo'ombre* and *Maudit soyt* had their *chanson rustique* tunes broken into two parts in the manner of motets, and in the latter case the sections are presented in reverse order.

In Florence, where many of Isaac's French songs originated, he also contributed to local song traditions. *A la battaglia*, a mildly pictorial battle-piece, was sung in 1487 with a political text referring to Florentine military campaigns, but it may also have been played in a *Sacra rappresentazione* of 1489. *Nè più bella* is a *canto carnascialesco* performed by three goddesses riding a float in the Carnival pageants (other such songs by Isaac are lost). Civic, theatrical or processional use is possible for *Hor'e di maggio*, *La morra* and various textless pieces; the quodlibet setting of Florentine popular songs, *Donna, di dentro*, is only implicitly theatrical. *Morte che fai* (if authentic), on a *strambotto* by Serafino dall'Aquila, would be Isaac's only contribution to a Neapolitan courtly idiom. Isaac's other Italian songs are more intimate, some using the *barzelletta* poetry of Lorenzo de' Medici's circle. They are simpler in style than the French

songs, often homophonic but not always observing Italian word-accents. These pieces inhabit an artistic world somewhere between the Florentine civic songs, the North Italian courtly (frottola) repertoires and the earliest madrigals.

Isaac's German songs are conventionally categorized as 'Tenorlieder', although the use of a pre-existent melody in the tenor was widespread throughout Europe. They fall roughly into two groups. The popular song arrangements are comparable to their French counterparts, using more artifice than any of the Italian-texted songs. The kaleidoscopic ostinato textures, pervasive imitations and complex forms of *Es wolt ein Meydlein*, *Greiner*, *Zancker* or *Mein Mütterlein* revive the spirit of Busnoys' *chansons rustiques*. The cantus-firmus settings *In meinem Sinn* and *Ain frewlich Wesen* (really Flemish songs with Germanized titles) also belong in this group, as do the *Leise* settings *Christ ist erstanden* and *In Gottes Namen*; an autograph copy of the latter survives (in *D-Bsb* 40021). Simpler approaches characterize the devotional hymns *Süsser Vater* and *Maria Junckfrow* (stylistically related to the famous *Maria zart*).

The second group comprises settings of courtly love songs (*Hofweisen*), a genre that was rapidly becoming fashionable around 1500. The only contemporary with a similar formative influence on it was Paul Hofhaimer. Isaac's settings are usually in four voices; they have dense textures with few rests and brief strettos rather than stretched-out imitation. All the voices may be texted; melismatic passages alternate with chordal (although not always simultaneous) declamation. The songs are usually in the old refrain form *AA'B* (ballade, *Kanzonenstrophe*, 'bar form'), unlike French or Italian courtly songs of the time. The elegiac tone of the poems, their predictable scansion and the musical phrase structures rather resemble the style of the earliest Italian madrigals. Some pieces have detachable melodies in the tenor, which may also have been used by other composers (e.g. *Ich stund an einem Morgen*).

Probably Isaac's best-known German songs, the two settings of *Innsbruck, ich muss dich lassen*, have problematic aspects. The poetic form *AABCCB*, which so memorably determines the shape of the melody, is neither a popular scheme nor a *Kanzonenstrophe*. Staehelin (1989) suggests that a pre-existent *Hofweise* – perhaps beginning 'Zurück muss ich dich lassen' – was used, but no copy of the melody from before Isaac's time is known. Isaac's setting (i), with the melody in the discantus and an expressive but rhythmically simple harmonization, resembles his Italian songs and many mass sections; its earliest sources date from the 1530s. In the second setting (ii), first found in the 1520s, tenor and altus sing the melody in canon, as is more usual in German songs. The bassus of a four-voice setting, of uncertain authorship, survives as well from about 1510. Who composed the melody itself? Stylistic analogies connect it with the Italian *lauda* or frottola idioms, with some *Hofweisen*, and with certain French songs such as *Helas que de vera* or *Comment poit avoir joye*. The opening rhythm is a familiar cliché in Franco-Italian songs from Florence, some of them by Isaac himself. For these reasons, Isaac seems to be the composer of the melody and at least of its Italianate setting (i), whereas the canonic setting (ii) and the anonymous bassus fragment might be Germanized, more contrapuntal adaptations.

Isaac's manner of handling pre-existing melodies was much imitated by the next generation of German composers, and a number of his lieder, motets and mass sections circulated widely and were intabulated by German organists and lutenists throughout the 16th century. For these reasons, as well as on account of delayed transmission (e.g. the Nuremberg anthologies, RISM 1539²⁷ and 1544²⁰, with suspiciously many new ascriptions to Isaac), there are graver problems of authenticity among Isaac's German songs than in any other genre he cultivated. There are also problems of national genre, such as occur when German sources give songs without complete texts, implying the ad hoc underlay of German poetry to an originally foreign song. For example, *Ach, hertzigs K., Zart liebste Frucht* (incipits only), *Al mein Mut* (text formally irregular) and *Erst weis ich* (whose text may have been added by Hofhaimer) may all have been originally French rondeaux.

Many Italian and German sources transmit music of all kinds without text, allowing for the substitution of local verse in this way. Songs, motets and mass sections might also be performed without words, either by voices (vocalizing or solmizing) or instruments. Travelling instrumentalists were widely involved in the transmission of vocal pieces by Isaac, trading them as 'songs without words' (Edwards, 1981). Generic titling also occurs: that is, the use of well-worn or generic title such as 'Helas', 'Serviteur', 'Martinella' or simply 'Carmen' to denote a 'piece without'. Isaac also seems to have conceived a number of works as textless compositions from the start, usually abandoning the characteristic song forms. *En l'ombre* and *Maudit soyt* had their *chanson rustique* tunes broken into two parts in the manner of motets, and in the latter case the sections are presented in reverse order. *La morra* (named after a popular game) and *Martinella* (whose name comes from an analogous composition by Johannes Martini) are independent works in *chanson* style with Italian names. *Der Hundt*, which also quotes a German popular song, is linked with a group of pieces bearing animal names, collected for instrumental performance, in the Glogauer Liederbook. Some pieces circulated without title in Italian manuscripts and in German sources were given the generic designation *Carmen* ('song'). Undoubtedly the strangest of Isaac's wordless songs is *La la hö hö*, with its motet-like two-section form and enigmatic title. It turns out to be based on a dervish song (see Staehelin, 1991), perhaps heard in Vienna during a Turkish diplomatic visit. Isaac elaborated the brief tune as a migrating ostinato, similarly to his procedure with many a Western popular tune, for instance the pilgrims' song *In Gottes Namen faren wir*; indeed, the two songs share a comparable religious imagery, connecting bodily motion (dancing in *La la hö hö*, marching in *In Gottes Namen*) with the praise of the Almighty.

Isaac, Henricus

3. Significance and reception.

In the group of North European composers who were his contemporaries – Josquin des Prez, Jacob Obrecht, Alexander Agricola, Pierre de la Rue, Gaspar van Weerbeke – Isaac's reputation is second only to that of Josquin, a modern ranking seemingly confirmed by the dissemination of his works in surviving manuscript copies. His astonishing productivity and creative flexibility have already been mentioned; he is consistently

documented in the role of a 'composer' and must have projected himself as such, showing the opinion that all musicians of his time were essentially performers to be exaggerated. Isaac is the earliest composer by whom we have ascertained musical autographs. His success in setting a dervish song in four-part polyphony does not necessarily mean that he had intercultural interests, but suggests that he had a perceptive ear for unusual performances and rituals. In his music, episodic form and engaging spontaneity contrast with the grand gestures of full-voiced ceremony. His attachment to ecclesiastical plainchant seems incongruous with the fact that he, unusually, was a married layman who did not have to sing the offices in church. His career is more memorable than those of many contemporaries; his personal association with two of the greatest Renaissance patrons, his music on humanist texts and his voluntary choice of Florence as his permanent home place him at the centre of the so-called musical Renaissance. Isaac is unique, furthermore, in that he influenced not only the Franco-Flemish and Italian musical traditions, but also the Central European one (thus anticipating Lassus). As if in gratitude, German-speaking musicians of several centuries (particularly the 19th) have cherished him as the composer of *Innsbruck, ich muss dich lassen* (which, contrafacted as *O Welt, ich muss dich lassen*, was naturalized as a Lutheran chorale and set by J.S. Bach); at the same time, they searched feverishly for the presumed German folksong behind the famous setting. A few Latin-texted works, and the name rather than the music of the *Choralis Constantinus*, have been the only other tokens of the composer's almost mythical image among Germans.

The historical foundation for this reception was the 16th-century acceptance of the Catholic polyphonic repertoires that Isaac dominated in his lifetime by the German-speaking courts (Catholic and Protestant) and by the churches and schools of the Lutheran Reformation, a process in which Isaac's followers (such as Ludwig Senfl) and admirers (such as Henrich Glarean) were instrumental. The Romantics were able to regard Isaac almost as a 'national' forerunner of Bach. Romanticism and Austro-German nationalism motivated his critical appraisal by Guido Adler's Viennese circle in the 1890s, resulting, for example, in Anton von Webern's critical edition of the second volume of the *Choralis Constantinus* (Vienna, 1909), which he prefaced with a remarkable essay on Isaac's counterpoint. After the Nazis had exploited Isaac's music (and banished Webern's), he has not yet found his proper place again in the international circuit, although Anglo-American as well as Swiss, German and Austrian musicologists and performers have knit together some of the threads. Isaac's *Missa 'La mi la sol'* was copied in (together with much Spanish music) Guatemala in the 16th century (*US-BLI Guatemala music 4*), which highlights not only the breadth of his fame but also his link with Habsburg colonialism. The fact that the manuscript is now in the possession of a library in the USA continues this historical pattern.

Isaac ben Moses.

See Duran, Profiat.

Isaack [Isaac], Bartholomew

(bap. Windsor, 22 Sept 1661; bur. London, 9 Oct 1709). English singer, organist and composer. He was the son of William Isaack, sexton and later verger of St George's Chapel, Windsor. He was a choirboy in the Chapel Royal from at least 18 May 1674 to autumn 1676, when his voice broke and he was discharged. He was appointed organist of St John's College, Oxford, on 14 July 1682, and became a vicar-choral of Christ Church Cathedral, Dublin, in 1684. He joined the choir of St Patrick's Cathedral the following year, but was dismissed in 1687 for neglect; he enlisted the support of James II, claiming that he had become a Catholic, but to no avail. Nothing more is known of him for certain until 26 July 1705, when he was appointed organist of St Saviour, Southwark (now Southwark Cathedral), although he was probably the 'Isaac' who applied unsuccessfully for posts in other London churches in June 1702 and March 1705. He wrote some songs for the semi-opera *The British Enchanters*, put on in February 1706 at the Haymarket Theatre. On his death he was succeeded at St Saviour by his nephew William.

Isaack was a minor but competent follower of Purcell. His small surviving output consists of songs, anthems and Anglican chants, as well as a ground in A minor for three violins and continuo, closely modelled on Purcell's *Three Parts upon a Ground* z731. He was confused until recently with his brother William (1650–1703), a Windsor and Eton choirman who copied the huge collection of Restoration church music in the manuscript *GB-Cfm* Mu.117 as well as a number of scores of large-scale works by Blow and Purcell. Peter Isaack (*d* 1694), probably another brother, was a Chapel Royal choirboy who went on to obtain cathedral posts in Dublin (1672 and 1692) and Salisbury (1688). It is not known whether the Windsor Isaacks were related to the London dancer and dancing-master Mr Isaac.

PETER HOLMAN

Isaaco, Isacchino.

See [Massarano, Isacchino](#).

Isaacs, Gregory [Cool Ruler]

(b Kingston, Jamaica, 1951). Jamaican reggae singer and songwriter. He began his career as part of the Concordes, before making his first solo recording for Edward Seaga's WIRL Records. In 1973 he formed his own labels Cash and Carry and African Museum but continued to record for producers such as Gussie Clarke, Niney the Observer, Alvin Ranglin, Phil Pratt, Bobby Digital and Stevie and Clevie. While the majority of Isaacs' original material is in a romantic rock style, sung with his supple croon and studded with suggestively emetic groans, occasionally he has also recorded Rasta- and politically orientated material. His albums from the late 1970s are considered to be among reggae's finest, particularly *In Person* (Trojan, 1975), *Extra Classic* (Conflict, 1977), *Mr Isaacs* (Cash and Carry, 1977) and *Cool Ruler* (Virgin, 1978). In 1980 he appeared in the film *Rockers* which was filmed in Kingston.

His first release for Island Records, *Night Nurse* (1982), became an international hit and as the 1980s progressed he continued to enjoy success, notably with *Rumours*, although his widely publicized problems with drugs were taking their toll on his voice. He continued to record with the digitally-produced rhythms of the 1990s but his previously mellifluous voice sounded cracked and gritty. Isaacs is best known as reggae's most prolific and controversial figure; he has recorded over 300 albums and many singles and served a number of sentences in Jamaica's General Penitentiary.

ROGER STEFFENS

Isaacs, Mark

(b London, 22 June 1958). Australian composer, pianist and conductor. After studies in classical music and jazz he was awarded the Don Banks Fellowship (1984) and went to the USA for further study. His CD *Encounters* was recorded in New York with jazz musicians Dave Holland and Roy Haynes on a subsequent trip in 1988 but was not issued until 1995. In 1994 Isaacs played the solo part in the first performance of *Litany* (1991) with the St Petersburg State SO. In 1996 he won a prize at the Tokyo International Competition for Chamber Music Composition, was awarded a two-year fellowship by the Australia Council and received the MMus from the Eastman School of Music. Isaacs has received commissions from the Australian Chamber Orchestra, Australia Ensemble, the Sydney String Quartet and the Sydney Metropolitan Opera Company, among others. He has conducted major orchestras in Australia and is the founder of Grace Recordings. While his classical works reflect his interest in jazz, his jazz compositions and performances reflect classical influences. His evocative works display a keen sense of lyricism.

RUTH LEE MARTIN

Isabella Leonarda [Leonardi, Anna Isabella]

(*b* Novara, 6 Sept 1620; *d* Novara, 25 Feb 1704). Italian composer.

Christened Anna Isabella Leonardi, she came from a prominent Novarese family. In 1636 she entered the Collegio di S Orsola, an Ursuline convent, where she remained for the rest of her life. A document of 1658 identifies her as music instructor as well as 'mother and clerk' for her congregation. By 1676 she had attained the rank of mother superior and by 1693 *madre vicaria*; in her last years she served as 'counsellor'. She may have studied with Gasparo Casati (*maestro di cappella* of Novara Cathedral, 1635–41), who included two of her compositions in his *Terzo libro di sacri concerti* (RISM 1640³). Cotta called her 'la Musa novarese' and printed a sonnet by A. Saminati Lucchese, comparing her musical talent to the military prowess of Emperor Leopold I.

Leonarda was a skilful, versatile composer whose approximately 200 compositions include examples of nearly every sacred genre. In her concerted masses and psalm settings, sections for full chorus alternate with solo passages and instrumental ritornellos. Her sacred non-liturgical works frequently have intensely emotional Latin texts, some of which may have been written by Leonarda herself. Four-voice compositions in this genre are conservative: imitative writing is pervasive and the organ provides the only instrumental accompaniment. Works for one to three voices are more modern, closely resembling chamber cantatas in form and melodic style. Many employ instrumental ritornellos and vocal refrains. In her numerous solo motets the sensuous lyricism of the arias balances the intense dramatic expression of the recitatives. Some arias are strophic, but most employ forms utilizing varied repetition. The solo motets reveal the composer at her most expressive: word-painting abounds, and occasional Neapolitan 6ths, augmented 6ths and diminished 7ths enrich the harmonic vocabulary. The vocal writing shows occasional flashes of coloratura, particularly in concluding 'Alleluia' sections.

Leonarda's instrumental works (op.16, 1693) are apparently the earliest published sonatas by a woman. Her sonata for solo violin and continuo is one of her most advanced works harmonically, yet it is technically conservative. In five of the ensemble sonatas she varies the texture by giving solo passages to each of the string instruments.

STEWART CARTER

Isabella of Castile.

Queen of Spain and patron of music, one of the [Catholic Monarchs](#).

Isacco Argiropulo.

See [Argyropoulos, Isaac](#).

Isaiah the Serb

(*fl* end of the 15th century). Serbian scribe and composer of Byzantine chant. Active at the monastery of Matejče, Macedonia, he is known chiefly from *GR-An* 928, an *akolouthia* which he compiled, at least in part, during the latter years of the 15th century. In it he included psalm settings of his own and of other Serbian composers. In addition, he showed himself to be a competent writer of chants with bilingual texts (Slavonic and Greek) and purely Greek hymns. A mode 2 *polyeleos Servikos* attributed to him appears twice in the manuscript, once with a Church Slavonic text of the Serbian redaction and once with a Greek text. He also composed a Greek Trisagion displaying some novel features of form and style. Isaiah's settings show that he was highly inventive and capable of introducing new and imaginative elements while conforming to basic traditional principles of Byzantine composition. (D. Stefanović, ed.: *Stara srpska muzika* [Old Serbian music], Belgrade, 1974–5)

DIMITRI CONOMOS

Isaksson, Madeleine

(*b* Stockholm, 1956). Swedish composer. She studied the piano (Gunnar Hallhagen) and composition and electro-acoustic music (Gunnar Bucht, Sven-David Sandström and Pär Lindgren) at the Royal College of Music in Stockholm, graduating in 1987. Contact with Xenakis, Ferneyhough and Emmanuel Nunes convinced her to continue her composition studies in France, where she has settled. In addition to Nunes and Ferneyhough, important influences have been Giacinto Scelsi, Helmut Lachenmann, Morton Feldman and John Cage. She is a member of the Swedish Composers' Guild and has regularly received important commissions.

Isaksson's music is largely acoustic, with an ascetic sensitivity to unusual sound combinations, reinforced by her use of micro-intervals. She aims at

a homogenous body of sound, although she often strives to use the extremities of the vocal and instrumental ranges. Each voice or instrument asserts its individuality, but with balance and restraint. Her forms are carefully designed through sketches that show timespan, register and sound. She speaks of her pieces as naked, vulnerable, empty landscapes where sounds seed themselves, take root and sprout. Creation for her is an organic process, involving the deconstruction then synthesis of elements.

MARGARET MYERS

ISAM.

See [Institute for Studies in American Music](#).

Isamitt (Alarcón), Carlos

(*b* Rengo, 13 March 1887; *d* Santiago, 6 July 1974). Chilean composer, ethnomusicologist and painter. He studied music at the Escuela Normal in Santiago, where he took a teaching diploma (1904). Subsequently he studied composition with Brescia and Allende at the National Conservatory and the violin with Saint Lo Priore privately. He also studied painting and drawing at the Santiago School of Fine Arts, which he directed in 1927–8. Between 1924 and 1927 he was in Europe, continuing his education and attending conferences. Among the posts he held in later years were those of general director of arts education at the Ministry of Public Education, professor of music education and methodology at the National Conservatory and president of the Association of Chilean Composers. In 1957 he was elected vice-president of the Chilean Instituto Indigenista, and in 1965 he was invited to permanent membership of the Chilean Academy of Fine Arts. Other honours include the Chilean National Arts Prize (1966) and a gold medal and diploma from the Institute of Musical Research at the

University of Chile (1967). He received further awards for his compositions and paintings, as well as grants for ethnomusicological research, chiefly among the Araucanian Indians. This work, most of it conducted during the years 1931–7, resulted in a collection of hundreds of transcriptions and recordings. Isamitt's compositional style reflects to some extent his interest in indigenous music, but from 1939 he also used 12-note methods, the first Chilean to do so. He published many articles on music and the visual arts in Latin American periodicals.

Isbin, Sharon

(*b* Minneapolis, MN, 7 Aug 1956). American guitarist. She studied the guitar with Jeffrey Van in Minneapolis, and while at Yale University she was coached by Rosalyn Tureck. She also studied with Oscar Ghiglia, Alirio Diaz and Segovia. She won first prizes at the Toronto International Guitar Competition (1975), the Munich International Competition (1976), and the Queen Sofia competition in Madrid (1979). Her New York début was at Alice Tully Hall in 1979, following débuts in London (1977) and Tokyo (1978). She taught at the Manhattan School of Music, 1979–89, and in 1989 founded the guitar department at the Juilliard School; she also teaches at the Aspen Music Festival. Isbin has established an international

reputation as a recitalist and concerto soloist, and has toured South America, Japan and Israel as well as the USA and Europe. She has made many recordings, including a significant disc of American guitar concertos by Corigliano, Lukas Foss and Joseph Schwantner, all of which were written for her. She has contributed many articles on the guitar, and together with Rosalyn Tureck has published an edition for guitar of the Bach lute suites.

Iseler, Elmer

(*b* Port Colborne, ON, 14 Oct 1927; *d* Caledon, ON, 3 April 1998). Canadian conductor, teacher and editor. The founder, in 1955, of the Festival Singers of Canada, he conducted this choir in recitals and workshops throughout Canada and in the USA and Europe, and contributed greatly to Canadian choral singing. His appointment as conductor of the Toronto Mendelssohn Choir in 1963 enabled him to work full time in this field. In 1972 he appeared with his choirs at the BBC Promenade Concerts and elsewhere in Europe. In 1978 he left the Festival Singers of Canada and founded the Elmer Iseler Singers, a group which rose to prominence in Canada. In 1997 he left the Toronto Mendelssohn Choir but continued to lecture extensively on choral music. A staunch supporter of Canadian composers, he also performed a great deal of other 20th-century music.

GILES BRYANT

Iselin, Ludwig

(*b* Basle, 2 July 1559; *d* Basle, 20 Dec 1612). Swiss lutenist. He was the son of the Basle lawyer Ulrich Iselin and Faustina Amerbach, daughter of Bonifacius Amerbach. From 1574 he studied at universities in Basle, Geneva, Bourges and Padua. He received the doctorate of law from Basle on 20 May 1589 and was subsequently appointed professor there. During his early student years he copied two songbooks of German lieder, odes and motets (*CH-Bu* F.X.21 and F.X.25–6) and compiled two lutebooks in German tablature (*Bu* F.IX.23, dated 24 November 1575; F.X.11), the first with a section of elementary lute instruction and the second with advice on some finer aspects of lute playing, including instructions for tuning two or three lutes of different sizes for simultaneous performance. The books are

particularly interesting as they contain pieces popular among students at that time. Apart from a few sacred and secular German songs, they are mostly dances: German and court dances with *Nachtänze*, passamezzos with saltarellos, galliards, and so on. The titles of many of them indicate vocal origins; others bear such descriptive nicknames as *Studenten Tantz*, *Königstantz*, *Des Printzen Tantz* and *Strasburger Tantz*. The songs and dances are both set in chordal fashion with moderate embellishment. Iselin probably copied the pieces from other lutebooks, although he may have intabulated a few himself.

Isfahānī, al- [Abū' l-Faraj 'Alī ibn al-Husayn]

(*b* Isfahan, 897; *d* Baghdad, 967). Arab man of letters, historian and poet. He lived in Baghdad and in Aleppo. As a writer on music he belongs to the school of Ishāq al-mawsilī (see [Mawsilī, al-](#), (2)), whose *Kitāb al-aghānī al-kabīr* ('Great book of songs') was the main source for al-Isfahānī's principal work of the same name, which is said to have taken him 50 years to write. This comprehensive book covers Arab cultural history from pre-Islamic times to the early Abbasids, with emphasis on poetry and music. Its latest published edition comprises 24 volumes. Its arrangement follows that of *Al-mi'at al-sawt al-mukhtāra* ('The 100 selected songs') compiled by Ishāq's father, Ibrāhīm al-Mawsilī (see [Mawsilī, al-](#), (1)) and others, which was accessible to al-Isfahānī in the edition of 'Alī ibn Yahyā al-Munajjim (*d* 888), a pupil of Ishāq al-Mawsilī. The texts of the songs are accompanied by notes on the compositions and their melodic (*nagham*) and metrical modes (*īqā'*). Each of the main song texts is followed by the biography of a poet or musician often with an historical excursus; almost 100 musicians and singers from the late 6th century to the 9th are treated in this way (Shiloah, 1979). The detailed biographical data of Ibrāhīm and Ishāq al-Mawsilī alone convey a lively and convincing picture of the status of court

musicians in Baghdad between c775 and 850. Soon after its completion the book was so renowned that Caliph al-Hakam II (961–76) of Córdoba sent al-Isfahānī 1000 gold dinars with a request for a copy. It is still the vital source for descriptions of early Arab musical history. His other books on music and musicians are lost. A monograph on slave musicians (*Kitāb al-ghilmān al-mughannīn*) was still known in Aleppo in the 13th century. Quotations from a book on female slave singers (*Kitāb al-imā'*) have survived in the section on musicians (volume x) of the encyclopedic *Masālik al-absār* by Ibn Fadl Allāh al-'Umarī (d 1349). Abū l-Faraj himself quotes, in the *Kitāb al-aghānī* (viii, pp.374f), a treatise he wrote to explain the 'basic rules of notes' (*Risāla fī 'ilal al-nagham*) as understood by Ishāq al-Mawsilī and his school.

ECKHARD NEUBAUER

Isham [Isum], John

(*b* c1680; *d* London, bur. 12 June 1726). English organist and composer. He served for some years as deputy organist for William Croft in London, and on 22 January 1711 was elected organist of St Anne's, Soho, on Croft's resignation. In July 1713 he graduated BMus at Oxford, and on 3 April 1718, in succession to Maurice Greene, he was elected organist of St Andrew's, Holborn, with a stipend of £50 per annum, upon which he resigned his place at St Anne's. Shortly afterwards he was chosen organist of St Margaret's, Westminster, a post he held in conjunction with that at St Andrew's until his death. In 1706 he and William Morley (who was also to take an Oxford BMus in 1713) published *A Collection of New Songs* (six of which are by Isham). One two-part song, *Bury delights my roving eye*, became so popular it was included by Hawkins in his *History*. Isham wrote at least ten other songs, which were published singly. The words of two anthems (*O sing unto the Lord* and *Unto thee, O Lord*) are included in *Divine Harmony* (London, 1712), the first Chapel Royal wordbook. His most substantial work is the ode *O tuneful God and all ye Sacred Nine*, which, though not actually identified as such, must have been his BMus exercise (score and parts in *GB-Ob*). A recently discovered receipt shows that, while organist of St Margaret's, he also copied music for Westminster Abbey.

Issāq al-Mawsilā.

See [al-Mawsilā](#), (2).

Ishchenko, Yury Yakovlevich

(*b* Kherson, 5 May 1938). Ukrainian composer. He graduated from Shtoharenko's class in the Kiev Conservatory (1960), and also undertook postgraduate work with him (1961–4). From 1964 he taught in the department of composition at the conservatory (from 1981 as senior lecturer and from 1991 as professor), lecturing on orchestration, the study of musical instruments, and taking composition classes. His students include the Ukrainian composers Zagaykevych, Ovcharenko and Runchak in addition to composers from Abkhazia, Lebanon, Mongolia, Russia and Vietnam. In 1969 he was a laureate of the All-Union young composers' competition, then in 1977 he defended his dissertation for the degree of Candidate of Science on the subject of the dramatic use of timbre in the symphonies of Lyatoshyns'ky. In 1991 he was awarded the title of Honoured Representative of the Arts of Ukraine. His work is broad and

varied in terms of themes and genres; it leans on the traditions of Lyatoshyns'ky, Revuts'ky and Shostakovich.

YELENA ZIN'KEVICH

Ishii, Kan

(*b* Tokyo, 30 March 1921). Japanese composer, brother of Maki Ishii. A son of Bac Ishii, one of the leading Japanese ballet dancers, he was educated to become a composer of ballet music, opera and orchestral works. He studied the piano at the Musashino School of Music (1939–43), served in the navy during the war and then worked as a pianist in his father's company. His Prelude for orchestra won first prize in the 1949 Mainichi Music Contest and his ballet *Kami to bayādere*, choreographed by his father, was first performed in Tokyo the next year. After further studies with Orff in Munich (1952–4) he took a professorship at the Tōhō Gakuen School of Music (1954–66). He won a prize at the 1958 government-sponsored Art Festival for the *Symphonia Ainu*, which embodied his new interest in nationalist primitivism, and his ballet *Marimo* was in 1966 performed to great acclaim in several cities of the USSR. Also in that year he was appointed professor of composition at the Aichi Prefectural Arts University, Nagoya. He has also served as head of the Japan Composers' Federation (1964–70) and president of the All-Japan Chorus League. Returning to Tokyo in 1986, he became a professor at Shōwa Music College. His music is highly emotional in quality and shows the strong influence of Orff.

MASAKATA KANAZAWA

Ishii, Maki

(*b* Tokyo, 28 May 1936). Japanese composer, brother of Kan Ishii. During the years 1952–8 he studied composition privately with Ifukube and Ikenouchi and conducting with Watanabe. He attended the Berlin Hochschule für Musik (1958–61) as a pupil of Blacher and Rufer. After his return to Tokyo in 1962 he became active as a composer and as an organizer of concerts of new music; he also worked frequently in the NHK electronic music studios after 1965. He took part in the planning of the Japanisch-deutsches Festival für Neue Musik (1967–72), and was invited to participate in the Berliner Künstlerprogramm (1969) with a grant from the Deutscher Akademischer Austauschdienst. He is active as a composer, conductor and organizer in Japan, Europe, the USA and China. His works have been featured in events including the Festival d'Automne in Paris (1978), the Berliner Festwochen (1981), the Eté Japonais in Geneva (1983) and exhibitions devoted to his music in Tokyo (1989) and The Hague (1992). His works show an awareness of contemporary Western techniques and skilful coordination of sound and silence. In several cases Ishii has synthesised traditional Japanese and Western elements, but in *Sō-gū II* the interaction is achieved in a more straightforward manner by the simultaneous playing of *Dipol* for Western orchestra and *Shi-kyō: Musik für Gagaku*. His prizes include the German Critics' Prize (1988), the Kyoto Music Grand Prix (1990) and an Emmy award (1995).

MASAKATA KANAZAWA/TATSUHIKO ITOH

Ishiketa, Mareo

(*b* Wakayama, 26 Nov 1916; *d* Tokyo, 22 Aug 1996). Japanese composer and teacher. He studied composition with Kan'ichi Shimofusa and in 1939 graduated from the Tokyo Music School, where he was appointed lecturer in 1946. The next year he joined the Shinsei Kai, a group of composers led by Shibata and Irino, and in 1952 he was made assistant professor of composition at the Tokyo Music School (renamed the National University of

Fine Arts and Music in 1949), then full professor (1968–83). His music, particularly for voices and chamber groups, reveals a personal style of lyricism, influenced both by Impressionism and Japanese traditional music. He published *Gakushiki-ron* ('Musical forms', Tokyo, 1950).

MASAKATA KANAZAWA

Isicathamiya.

An *a cappella* choral music performed primarily by Zulu men in South Africa. The word derives from the Zulu root *-cathama*, which means to stalk like a cat. *Isicathamiya* refers to the characteristic choreography in *isicathamiya* performance, which involves very light footwork often executed in a semi-crouched position with the toe of the foot barely skimming the floor. *Isicathamiya* choirs (ranging from four to over 20 singers, including at least one soprano and one alto, the leader usually singing tenor while the rest sing bass) perform at all-night weekend competitions (*ingoma ebusuku*) in hostels in and around Durban and Johannesburg. Each choir sings three songs; the entrance starts outside the hall and continues until all singers are in position on the stage. The performance proper consists of one song, usually lasting about 15 minutes, with a recessional that takes the performers back out of the hall. Choir members are formally dressed in exactly the same way, this being one of the criteria with which they are judged.

Isicathamiya began in the area of the coal mines in the KwaZulu-Natal midlands during the 1920s and 30s, but it is clear that some features such as polished uniforms, often with white gloves and spats, are rooted in earlier performing practices, in particular, 19th-century American blackface minstrel shows. But indigenous musical practices cannot be undermined in determining the history of *isicathamiya*. Choral partsinging is arguably the basis of all music-making among the Nguni peoples (Zulu, Xhosa and Swazi), who historically inhabit this eastern region of South Africa.

JANET TOPP FARGION

Isidore of Seville

(*b* ?Cartagena, c559; *d* Seville, 4 April 636). Spanish archbishop, encyclopedist, theologian saint and doctor of the church. The youngest of Severianus's four children, Isidore was probably born in Cartagena, Spain, shortly before his family fled to Seville. His early education was overseen by his elder brother Leander, whom he succeeded to the episcopal see at Seville in about 599. As archbishop, Isidore presided over the fourth Council of Toledo, which sought to achieve doctrinal and liturgical uniformity throughout Spain and parts of southern France.

The largest of Isidore's works is his encyclopedic *Etymologiarum sive Originum libri xx*, an investigation of the principal terms employed in all branches of knowledge. Chapters 15 to 23 of book 3 deal exclusively with music, which is defined there as 'the skill [*peritia*] of modulation consisting of tone and song'. In his discussion of the Quadrivium (bk iii, chap.24), however, Isidore closely followed [Cassiodorus](#) in defining music as 'the discipline which treats of numbers in relation to those numbers which are found in sounds'. He again followed Cassiodorus in discussing 'the three parts' of music: harmonics, rhythmic and metrics (iii, 18). He went on, however, to describe 'the threefold division' of music (iii, 19), this time following [Augustine of Hippo](#):

Moreover for every sound which forms the material of songs, there is a threefold nature. The first is the harmonic, which consists of singing; the second, the organic, which is produced by blowing; the third, the rhythmic, in which the music is produced by the impulse of the fingers.

Isidore appeared to follow St Augustine again, at least in part, when he wrote (iii, 15) that 'unless sounds are remembered by man, they perish, for

they cannot be written down'. This statement has sometimes been interpreted to mean that musical notation was unknown in the early 7th century, or at least in Isidore's circle.

The statement most widely quoted by later writers on music is perhaps: 'Music moves the feelings and changes the emotions' (iii, 17).

Isidore manifested a different and somewhat more practical concern with music in vi, 9. There, and in closely related passages in his *De ecclesiasticis officiis* (i, 3–7, 9, 13–15; ii, 12), he dealt with the role of music in the Divine Office. Comparison of these passages with surviving manuscripts for the Mozarabic rite makes it clear that he referred specifically to that rite. His definitions of antiphons and responsories are, however, relevant to other Christian rites as well:

Antiphon, from the Greek, is defined as a reciprocal utterance: namely, two choirs singing alternately or from one to the other. This type of singing, it is said, was invented by the Greeks. Responsories were invented long ago by the Italians and are called by that name because to the singing of one person the choir responds in consonance. Formerly, each one alone sang the responsory. Now sometimes one, sometimes two or three sing together, a choir of many responding.

Jacques Fontaine's great work on Isidore and his sources shows, however, that this contrast between theoretical and practical concerns is not as pronounced as Gurlitt and others have claimed. Although Isidore paid his respects to the Hellenistic tradition of music theory, as transmitted in an already impoverished form primarily by Cassiodorus and other late writers, he did not hesitate to omit from his writings a complex and detailed mass of inherited theoretical paraphernalia which no longer bore any relevance to his practical experience with music as a churchman. When his sources and his experience clashed, he allowed his experience and his own imagination to prevail, as shown not only in his omissions from the sources but also in his sometimes subtle modifications of them as well. Thus, Isidore may be seen to have borne witness to a further step in the decline of an ancient tradition of music theory and to the very first glimmerings of a new tradition.

Isidore's writings on numerous subjects influenced a broad range of writers and thinkers throughout the Middle Ages. In addition to the *Etymologiae* and the *De ecclesiasticis officiis*, his works include the *Differentiarum libri*, *De natura rerum*, *Allegoriae*, *De ortu et obitu patrum*, *Liber numerorum*, *Mysticorum expositiones sacramentorum seu quaestiones in vetus Testamentum*, *De fide catholica*, *Sententiarum libri tres*, *Synonyma*, *Historia Gothorum*, *Historiae Vandalorum et Sueborum*, *Laus Spaniae*, *De viris illustribus*, and the *Regula monachorum*.

DON M. RANDEL (with NILS NADEAU)

Isis.

Ancient Egyptian form of the Mediterranean mother-goddess. Sister and consort of Osiris, she was equated with Demeter by Herodotus (ii.59.2, ii.56.5). Her worship spread to Greece during the Hellenistic period and reached Italy in approximately 100 bce. Roman poets of the time of Augustus made reference to praise (*laudes*) offered twice daily to Isis (Tibullus, i.3.31) and services held at night (Propertius, ii.33.2). Frescoes at Herculaneum and Pompeii, both buried by the eruption of 79 ce, show

scenes of ritual dancing and antiphonal singing in her honour (Witt, pls.23, 26).

The north African rhetorician Apuleius (*fl* c160 ce) was the first writer to comment in detail on the role of music in the worship of Isis. He described a chorus singing hymns to the accompaniment of the tibia and syrinx, and noted an *oblicus (obliquus) calamus* which 'reached to the right ear' of the piper (*Metamorphoses*, xi.9). This cannot have been a double aulos of the Phrygian kind, with one bell-shaped mouth, nor is it likely to have been a transverse flute (see Wille, p.65). Apuleius must have been describing a *monaulos* (see [Virgil](#)), with a reed mouthpiece set into the single tube at an angle and a recurved bell. Such an instrument appears on a Roman bas-relief (Witt, pl.30; not identified). Other archaeological evidence indicates that worshippers of Isis at Rome also used drums, cymbals and even trumpets.

Literary sources repeatedly make clear the special importance of the sistrum (a Latin transliteration of the Greek *seistrōn*, from *seiō*, 'shake'; more properly *crepitaculum*). Apuleius noted that this was shaken in triple rhythm (*Metamorphoses*, xi.4). Isis was regularly shown holding a [Sistrum](#) (Plutarch, *On Isis and Osiris*, 376c–e) and her priests carried it, originally as a means of putting to flight Set, the evil twin brother of Osiris. It was the most distinctive token of the worship of Isis.

In the time of Augustus, Tibullus (i.3.24) and perhaps Ovid as well (*Amores*, iii.9.33–4) credited the sistrum with powers of healing, although in the hand of an angry goddess it could cause blindness (Juvenal, *Satires*, xiii.93), and Lucan associated it with mourning (*Pharsalia*, viii.832; c60 ce). Other writers of the Augustan period used it to symbolize Egyptian decadence: so Virgil, in the *Aeneid*, of Cleopatra summoning her troops with its rattle instead of a trumpet-call (viii.696).

Isla, (Diego) Cristóbal de

(*b* Berlanga de Duero, Soria, bap. 15 Sept 1586; *d* Palencia, shortly before 1 Dec 1651). Spanish composer. A choirboy at León Cathedral (1594–1602), he later studied at the collegiate church in Berlanga with Juan de Avila (until 1607) and with Sebastián López de Velasco (in 1607) while both were *maestros de capilla* there. From 19 April 1611 to 26 January 1615 he was *maestro de capilla* of Huesca Cathedral, from 31 January 1615 to 15 April 1616 of Burgo de Osma Cathedral, and from then until his death of Palencia Cathedral. During his time at Palencia he won constant praise for his education and care of the choristers, and was raised to the rank of canon. In 1645 Mateo de Molina became the cathedral's first salaried harpist. Isla was one of the first in Spain to specify a continuo of organ, harp and (string) bass for polychoral works, and influenced a school of polychoral composers headed by his pupil Tomás Micieres.

ROBERT STEVENSON

Island.

Jamaican, later British, record company. It was set up in Kingston in 1959 by [Chris Blackwell](#), the son of a plantation owner and heir to the Crosse & Blackwell fortune. Initially Island concentrated on jazz. Its first release was by the pianist Lance Hollywood. Island moved to Britain in spring 1962 and established itself as one of the most experimental and influential independent record labels. Tapping in to the burgeoning ska scene, Island released a series of seminal records by artists such as the Skatalites and Toots and the Maytals and was instrumental in popularizing these with white mainstream audiences. In 1963 nearly 100 singles were released on the Island label, and in 1964 it had its first international success with the ska hit *My Boy Lollipop* by Millie.

In 1964 Island diversified into rhythm and blues and signed the Spencer Davis group. It also began licensing releases from the American rhythm and blues label Sue, which in its British form included recordings by James Brown and Etta James. By the late 1960s, having licensed its Jamaican catalogue to Trojan, Island was on the cutting edge of contemporary rock. Through deals with labels such as Chrysalis and EG, its roster included Traffic, Free, Mott the Hoople, Jethro Tull and King Crimson; in 1971 Roxy Music, previously unrecorded, joined their ranks. However, Island's biggest catch was Bob Marley and the Wailers, with Marley becoming the first superstar of reggae in the late 1970s. In the 1980s its biggest successes came with Grace Jones, Robert Palmer, Steve Winwood and U2. In 1989 Blackwell sold his company to A&M records, but the label stayed true to its roots in innovation by capturing artists such as P.J. Harvey, Pulp and Tricky, while continuing its association with U2.

- Islamic religious music, §I: General

1. Introduction.

The consideration of religious singing and instrumental music in the context of Islam is fraught with complexity and ambiguity. Strictly speaking, the words 'Islamic religious music' present a contradiction in terms. The practice of orthodox Sunni and Shi'a Islam does not involve any activity recognized within Muslim cultures as 'music'. The melodious recitation of the Holy Qur'an and the call to prayer are central to Islam, but generic terms for music have never been applied to them. Instead, specialist designations have been used. However, a wide variety of religious and spiritual genres that use musical instruments exists, usually performed at various public and private assemblies outside the orthodox sphere.

General terms relating to music within Islamic cultures require some clarification. The word *samā'* is used to distinguish between licit (*halāl*) and illicit (*harām*) music as understood by the schools of Islamic religious law and in discussions between representatives of the law schools and Sufi orders. The Arabic word *ghinā'* (literally 'song') has sometimes been used

generically for musical practice. The traditional term *mūsīqī* (which is classical Arabic) has been used in writings dating from the 9th century, is a loan and theoretical concept inherited from the ancient Greeks. In the countries of Islam it was rarely used in the sense of singing and instrumental music: reference to musical practice was made through a series of individual terms. The modern Arabic term *mūsīqā* is not representative of the traditional Islamic understanding of 'musical practice', but has connotations more akin to the Western sense of 'music'. Current usage of the word *mūsīqī* in modern Persian is similarly general. 20th-century scholars have used some of these terms in attempts to elucidate categories of music that have been accepted or rejected according to Islamic (Shari'a) law (see Al-Faruqi, 1985; Nasr, 1997). See [Table 1](#).

Since its birth in the 7th century, Islam has spread over a vast geographical area stretching into China, South-east Asia, Russia, many parts of Africa and elsewhere (fig. 1). From an early period orthodox jurists expressed hostility to certain kinds of music in principle, and the legal status of music has been continually contested and discussed. Sufism evolved as the mystical branch of Islam and some Sufis actively opposed the extremist puritans. Their musical practice, inspired by the message of Islam and personal religious experience, had a broad influence. Another important development was the music of commemoration and lament specific to the Shi'a sects (see §III, 1 below).

The many forms of Muslim musical religious expression present considerable diversity, and they are often strongly local in flavour. However, there are significant unifying factors: the consistent presence of Qur'anic recitation and, within that, the influence of Egyptian style; the importance of Arabic as the language of divine inspiration in the Qur'an; and the widespread use (albeit in varied ways) of *dhikr*, repetitive vocalizations of names of God (see §II, 3 below).

Religious and devotional musics are variously performed by professional, semi-professional, amateur, male and female adults (and occasionally children) in solo or group styles. Some are accompanied by musical instruments or include dancing. With very few exceptions, instrumental music is not performed in mosques, where only certain types of religious recitation and singing are permitted. Other performance settings include shrines, Sufi lodges, Shi'a religious meeting-places, homes and encampments, streets, concert platforms and recording studios.

Our present knowledge and understanding of religious and devotional music within Muslim cultures is patchy and incomplete. There are many areas where research has not been undertaken; some regions have been closed or inaccessible, and the musical role of women has not been adequately studied. From the 1970s onwards, sweeping changes precipitated by Islamization (also known as 'fundamentalism') and globalization have compounded the situation with fresh impulses and reactions. This survey draws upon available material and does not claim to be comprehensive.

[Islamic religious music, §1: General](#)

2. The legal status of music.

There is no statement in the Holy Qur'an explicitly condemning music. Evidence in the Traditions of the Prophet Muhammad (Hadīth) clearly demonstrates that on occasion he listened to music with pleasure, but these texts are open to many interpretations. From an early period, Islamic jurists felt concern about the perceived dangers of music and began to differentiate between admissible (*halāl*) and inadmissible (*harām*) music, both sacred and secular. Between these categories there is an intermediate zone consisting of material not expressly forbidden (see above, 'controversial' categories, [Table 1](#)). The simple chanting of the Qur'an and the call to prayer have an uncontested lawful status, and certain types of devotional singing have been variously tolerated within the different Islamic law schools.

A rejection of music was expressed immediately after the Prophet's death, and the jurists' condemnation extended to court musicians of the Umayyad dynasty (661–750). Concern about inadmissible music increased in the 9th century, when Sufi communities introduced dance and spiritual audition (*samā'*) into their ecstatic rituals. In Islamic thought, the basis of hostility to music lies in its power to stimulate the 'lower passions' (*nafs*). Individuals such as Ibn Abī al-Dunyā (d 894) theoretically condemned almost all instrumental and vocal music, yet [Majd al-Dīn Ahmad al-Ghazālī](#) (d 1126) and [Abū Hāmid Muhammad al-Ghazālī](#) (1058–1111) defended the practice of listening to music, including its usage by the Sufi orders. Arguments in favour of music have stressed the individual's ability to listen (*samā'*), drawing close to the Divine. An extensive literature in Arabic, Turkish and Persian discusses admissible and inadmissible music with constant reference to verses of the Qur'an and the Hadīth. The most exhaustive collection of learned opinions is contained in the *Kitāb al-imta bi-ahkām* ('Guide to the application of the rules for listening to music', c1300) by Kamāl al-Dīn al-Adfuwī.

See also Arab music, §§I, 3(iii) and II, 2.

No universally acceptable agreement about the legal status of music was ever reached, leaving interpretation open. This has led to ambiguities. In Iran at the beginning of the 1979 Revolution, the broadcasting and public performance of music was banned. Yet, shortly before his death in 1989, Ayatollah Khomeini pronounced that music was admissible, except in the case of women singing to men and as long as it did not incite sensual passions.

Islamic religious music, §I: General

3. Qur'anic recitation.

The sacred words of the Holy Qur'an pervade the experience and practice of Islam. Great importance is placed upon the proper articulation of its sound patterns in the original Arabic. In all Islamic cultures, Qur'anic recitation is performed by lay people, in a plain style, and by prayer leaders and specialist Qur'an readers, sometimes in a highly embellished form. Islamic education prescribes that children learn to recite the Qur'an by memory, a task requiring concentration upon rhythmic aspects of vocalization.

Qur'anic recitation has many applications. Verses are silently recited within the ritual prayer (Arab. *salāt*) performed five times daily by pious Muslims. Public recitation precedes congregational prayers and occurs within most religious rituals, and the entire Qur'an (*khatm al-qur'ān*) is performed during the month of Ramadan and for commemoration of the dead. At the Topkapi Museum in Istanbul, teams of reciters provide continuous recitation of the Qur'an inside the room housing important relics of the Prophet Muhammad. Although usually performed solo, collective recitation occurs; for instance in some Iraqi mosques on the 'eve' of Friday, or in Liberia, where collective recitation for the dead is termed *fidao*.

As a unique and divine text, the Qur'an is set apart from other religious texts and praises. Specialist Arabic terminology is used. *Qirā'a* designates Qur'anic recitation; *qāri'* is a trained reciter (both words derived from the same Arabic root as Qur'an). *Tilāwa* is a general formal term for all Qur'anic; in pre-Islamic Arabia it simply designated recitation of poetry. *Tartīl*, another term for recitation, especially implies slow deliberate attention to meaning, for contemplation. *Tajwīd* is the exact science of correct recitation.

For 300 years Egypt has been regarded as the centre of Qur'anic recitation both for accuracy and artistry, and its Qur'an readers are very respected and highly paid. There two styles are distinguished: *murattal* (ex.1), a plain style used in private devotion and for teaching, and *mujawwad* (ex.2), an embellished style reserved for public audition, performed by specialists trained in *tajwīd* (sharing the same Arabic root as *mujawwad*). *Tajwīd*, the system of rules regulating the correct oral rendition of the Qur'an, governs many parameters of sound production. These include precise duration of syllable, vocal timbre and pronunciation, with characteristic use of nasality and special techniques of vibration. Echoing silences between text sections

add to the dynamic nature of presentation. Public Qur'anic recitation has a distinctive sound which has been profoundly influential as an aesthetic ideal.

Qur'anic recitation has developed considerably since the time of the Prophet Muhammad (570–632), who apparently enjoyed the mellifluous recitation of the holy words. By the mid-7th century, simple chanting was extended into a kind of conventional artistic concert performance. This reached a peak between the 9th and 12th centuries. Verses of the Qur'an were sung like secular poems to existing tunes, including folksongs and dance-songs: the court reciter of the Abbasid caliph Hārūn al-Rashīd (786–809) made the Qur'an sound almost like secular song. Florid styles of recitation spread to many cultural centres in the eastern Caliphate, North Africa and Muslim Spain. Orthodox legists condemned this as *qirā'a bi-l-alhān* ('recitation to secular melody'). Such extreme secularization has not recurred, but the artistic limits of Qur'an reading are still discussed.

Today the science of recitation (*tajwīd*) is taught in specialized schools. These may exist for women as well as men, and in Egypt, Malaysia and Indonesia female Qur'an specialists have attained prominence. Qur'anic recitation has always been orally transmitted; notation is opposed. As a consequence, personal and regional variants developed. A significant aspect of *qirā'a* is the lack of regulations with regard to melody, except that it must enhance comprehension of the text and not be based on secular material.

The relationship between Qur'anic recitation and local traditional musical idioms is open. In West Africa, South Asia and South-east Asia, lay people generally modify the *qirā'a* towards the tonal idioms of their local traditions. In many areas Qur'anic chanting takes the form of a recitative mostly independent of the Arab art music tradition (*maqām*). But some complex and richly ornamented melismatic styles show a pronounced influence of the *maqām* tradition in their tonality and melodic construction. In countries including Egypt, Turkey, Syria, Iraq and Iran, chanting is taught in the tonal tradition of certain *maqāms*. Iraqi Qur'anic reciters usually excel as secular *maqām* singers (also known as *qāri'*), but when reciting the Qur'an they do

not follow the formalized melodic ordering of the Iraqi *maqām*. Learning the Qur'an is sometimes the first stage of a secular singer's musical education.

International communication networks are strengthening the impact of Egypt and Arabia within global Islamic culture through education, travel and the export of materials including audio-cassettes of Qur'anic recitation. Egyptian reciters visit other Muslim countries to perform during Ramadan, and Arabization in style is evident in parts of Africa, South Asia and elsewhere.

See also Egypt, §II, 1; Iraq, §II, 2; Saudi Arabia.

Islamic religious music, §I: General

4. The call to prayer

(Arab. *adhān/azān*). The *adhān* is performed five times daily, loudly and in public, a prominent aspect of Muslim soundscapes. Its deliberately attractive sound invites Muslims to perform the ritual prayer (*salāt*), regulating daily life and creating sacred time within it.

The Prophet Muhammad is said to have instituted the vocal call in order to distinguish Islamic practice from those of other religions. The first prayer-caller (muezzin, *mu'adhdhin*) was Bilāl, an Abyssinian slave and early convert to Islam. The post of muezzin soon attracted great respect, and important mosques came to employ as many as 20 muezzins at a time; in the Ottoman empire they formed their own guild. The call has not always been exclusively vocal. From the 10th century in some urban areas, military/ceremonial bands, variously called *tablakhāna*, *Naqqārakhāna*, *mehterhane* or *naubāt*, sounded the prayer times on a daily basis. By the 19th century this practice had mostly died out, but in the shrine of Imām Rezā at Mashhad, Iran, a remnant of this tradition (consisting of drums and horns) sounds out at dawn and dusk (see Iran, §III, 2(iv), fig.15). In West Africa a prayer-drum (*tabula*) was later replaced by a vocal call.

The vocal call consists of seven or (in Shi'a areas) eight passages, with repetitions and certain variations according to the time of day and importance of the specific prayer. It is chanted once from the minaret, then again (called *iqāma*) inside the mosque, directly preceding congregational prayer. Nearly all branches of Islam allow it to be sung. The text must be clearly understandable and its pronunciation impeccable.

The musical form has no rules. Styles vary from calls at a measured pace on a single note, or within a narrow range centred on one note, to richly melismatic chants with a wide range. Regional schools may assert rules based on the choice of certain *maqāms*; these seldom gain general acceptance, but sometimes melodic structures are related to the *maqām*. Rhythmic structure is influenced by the length of the syllables in the text. Melismas seem to be associated with particular words and formulaic endings. Textual repetition often leads to repeated musical phrases

differing only in their final note. Unusually, the call may be collective (see Syria, §4(i)).

Broadcasting, commerce and international travel have spread the influence of the Egyptian call, considered the model and widely imitated. The use of audiotapes as a substitute for muezzins is causing a decline in variety of the *adhān*, and loudspeakers often produce harsh distorted sounds. In cities where Muslims are in a minority, amplification of the *adhān* has caused neighbourhood conflict: use of calls broadcast on the radio creates a non-intrusive abstract communal Islamic context for worship. Western media representations often debase the *adhān* as a 'sound-bite' introducing any aspect of Muslim culture.

Islamic religious music, §I: General

5. Calendrical and weekly observances.

The Islamic lunar calendar is punctuated by two major events affecting the entire Muslim community: the annual pilgrimage to Mecca (Makkah) in Saudi Arabia and the holy month of Ramadan. These culminate in two major festivals (*ʿĪd*): *ʿĪd al-Adhā* (Festival of Sacrifice) and *ʿĪd al-Fitr* (Festival of Charity) respectively.

Military and ceremonial bands with drums, shawms, trumpets and cymbals previously used to sound out important times of the day and year. Some examples of this tradition remain, especially marking the beginning of festivals. In Morocco, Thursday evenings (the beginning of Friday, the Muslim day of rest and prayer) are announced with trumpets (*naʿfīr*) and shawms (*ghayta*). Similarly, in 1975 an ensemble of four large cylindrical drums (*tabl*) and a shawm (*alghaita*) were documented playing in front of the sultan's palace in Dosso, Niger, announcing the beginning of Friday as a weekly musical event attended by the general public. Thursday evening is also the traditional time for weekly Sufi gatherings.

The Friday midday congregational prayer takes place in principal mosques ('Friday' mosques). The structure of observances may vary, and it is quite common for supplicatory prayers (*duʿā* or *munājāt*) or praises to Allah (*tasbīh*) to be sung. At the Umayyad Great Mosque in Damascus, the main Friday prayers include specific types of solo and choral singing (see Syria, §2(iii)(b)).

The month of fasting during Ramadan has a special musical character (see §(ii) below). Within Shi'a communities the months of Muharram and (to a lesser extent) Safar are devoted to mourning, with specific types of singing and ritual (see §III, 1 below). Joyous celebrations and instrumental music are proscribed, and Shi'a professional musicians are not normally available.

(i) Pilgrimage to Mecca (hajj).

Islamic treatises state that Mecca pilgrimage songs (*tahlīl*) are admissible. They may be sung on departure for Mecca, at the various stopping-points in and near Mecca, or they may be used to greet pilgrims on their return home. They are mostly choral, or solo with a choral refrain, sung by women or men according to local tradition. In Egypt they are accompanied by the

mizmār baladī consisting of shawms (*mizmār*) and a drum (*tabl baladī*). Formerly military bands hailed departing pilgrims and even accompanied prominent individuals to Mecca, using a *tabl al-hajj* ('pilgrims' drum').

At the Festival of the Sacrifice (*ʿĪd al-Adhā*), a wealth of chanted prayers and festival invocations may be sung in mosques, at private gatherings or during the visits to cemeteries that are customary during the two principal Muslim festivals. In Turkey specifically composed pieces of Sufi origin are still performed: the *bayram tekbiri* (festival declamation) by Itri (d 1711/12) is used in festival ceremonies, and the *bayram salati* (festival prayer) by Hatib Zakiri Hasan Efendi (c1600) is sung either from the minaret or inside the mosque. Elsewhere there are festival pieces in other styles: Algerian Tuareg women perform songs for *ʿĪd al-Adhā* to the rhythm of a mortar drum (*tinde*).

(ii) Ramadan.

The beginning and end of the fast, the nightly prayer-times and the time for pre-dawn breakfast used to be announced vocally and/or with musical instruments throughout the month. In Anatolia and other areas, ceremonial *naqqārakhāna* bands were replaced with large cylindrical drums (*davul*) or by the drum and shawm (*davul-zurna*). In Morocco pairs of trumpets (*naḥr*) are blown in the streets or from the minarets.

At night the mosques are ablaze with light, and each evening congregations gather to hear a chapter of the Qur'an recited. Qur'anic recitations are also organized in homes, with invited guests. In Turkey composed songs glorifying God (*temcīt*) are sung from the minaret between the nightly hours of prayer. Many old Turkish compositions (*ilahī*) are intended for specific nights of the holy month. Children sing Ramadan evening processional songs, questing for sweets and coins (see [Arab music, ex.17](#), from Egypt). In parts of North Africa, families sing religious songs as they gather for their evening or pre-dawn meal. Ramadan music by modern Egyptian composers also exists. Secular theatrical shows and concerts used to be common, but increased religious disapproval and the advent of television and video culture has weakened live evening entertainment traditions.

The beginning of *ʿĪd al-Fitr* is marked with loud public sounds: ceremonial bands, cannon-fire, gunfire or (today) modern sirens. Celebratory songs are especially found in Muslim parts of Africa.

(iii) Ceremonies for the Prophet.

The anniversary of the Prophet's birthday (*mawlid*) is celebrated on the 12th of Rabī 'al-awwal. Observances vary considerably from region to region, and *mawlid* ceremonies are performed at other times of the year (see §II, 4 below). The Prophet's miraculous ascent to heaven (*mi'rāj*), described in the Qur'an, is celebrated in mosques, and especially by members of Sufi and heterodox sects.

[Islamic religious music, §I: General](#)

6. Prayers, praises and devotional songs.

A restricted range of devotional singing is admissible inside the mosque. The frequency of sung prayers and their position in communal devotions within mosques depends on the authority of the various law schools. Forms include the *takbīr* chanting of *Allāhu akbar* ('God is great'), *tasbīh* (praise of God) and supplicatory prayers (*du'ā* and *munājāt*). Styles range from plain recitation to highly decorative delivery. *Madīh* designates sung praises (for God or the Prophet). *Tawshīh* and *ibtihāl* are free-rhythm unaccompanied solo vocal improvisations on religious poetic texts performed at festivals, ceremonies or special events such as the opening of a mosque. *Ilahi* ('for God') is a general Turkish term applied to devotional invocations. In Turkey numerous art compositions have gained acceptance in the mosques through the influence of the Sufi orders, for instance the festival pieces mentioned in §5(i) above.

The *na't* is an important form glorifying the Prophet: in Turkey it sometimes precedes daily prayers. When the Timurid theoretician 'Abd al-Qādir (d 1435) collected song texts for all occasions as an appendix to his treatise *Jāmi' alhān* ('Compendium of melodies'), his list began with *munājāt* texts and *na'ts*. Serious and devotional, *na'ts* and *munājāts* may be performed unaccompanied or as an art music genre (but in the latter case not in mosques).

Madīh praise-songs are commonly performed by itinerant singers. Northern Sudan has a famous *madīh* tradition going back to Hajj El-Mahi of Kassinger (c1780–1870), who composed about 330 religious poems of which handwritten copies survive. They are performed by pairs of male singers with the accompaniment of two frame drums (*tār*), at religious festivities, at markets or outside mosques. (See [Sudan](#) and Yemen, §I, 1(v).)

Classical poetic forms common in Muslim devotional music are the *ghazal* and *qasīda*. *Ghazal*, an elevated form of love song treating secular and/or divine love, is used throughout Muslim Asia; within North Indian semi-classical music, it is more romantic than religious in tone (see [India](#), §IV, 3(ii)). The *qasīda* (classical Arabic ode) is an extended vocal form sometimes applied to religious themes in the Arab world. *Muwashshah*, the technically complex song of Arab-Andalusian tradition, has sacred connections, but is less frequently performed.

Wedding songs are an important admissible expressive outlet for women; many have religious content, invoking the blessings of God and the Prophet.

[Islamic religious music](#)

II. Sufism and popular Islam

1. Sufi music.
2. Popular Islam.
3. Dhikr and sufi ritual.
4. 'Mawlid'.
5. The Mevlevi ayin.
6. Chishtī Sufism.

[Islamic religious music](#), §II: Sufism and popular Islam.

1. Sufi music.

Sufism (Arab. *tasawwuf*) is an umbrella term applied to mystical practices that developed beyond the normal obligatory duties of Islam, both within and outside organized Sufi orders (*tarīqa*).

As a result of doctrinal controversy about the legal status of music (see §1, 2 above), early Sufi music avoided secular tunes and employed only reed-pipes, flutes and drums. Within many traditions, the frame drum (*duff*, *tār*, *mizhār*, *dāire*) remains the sole instrument used in communal rituals. From an early period the vocalization of the names of God (*dhikr*) became important (see §3 below). Ecstatic movements of the body were recognized as expressions of spontaneous emotion caused by experience of the divine, and head and arm movements, sometimes combined with simple steps, became incorporated into Sufi rituals. The Mevlevi order was the first to make dance as important as the *dhikr* (see §5 below). From the 14th century other orders adopted dance, as depicted in Persian miniature paintings (see fig.2). In Syria the *samāh* dance accompanied classical *mūwashshah* metric verses (see [Syria](#), §2(ii)(a)).

From the 16th century the use of musical instruments and dancing was abandoned or forbidden within Shi'a Sufi orders. Some orders (especially Shi'a ones) gave up dance and/or musical performance altogether. Sufi music flourished within the Ottoman empire. From the 15th to 17th centuries, the Mevlevi, Rifā'ī and Qādirī orders gained such strong recognition and political influence that they were able to develop their own music. This was strongly influenced by secular art music, which in turn influenced it (see [Ottoman music](#)). The South Asian Chishtī order is significant in its recognition of the use of musical instruments as valid in a devotional context (see §6 below).

Rituals are held at Sufi lodges or saints' shrines, on a weekly and occasional basis, with the aim of attaining union with God. They usually include *dhikr* ('recollection of God') (see §3 below). The various Sufi orders recognize spiritual 'chains' of transmission through male leaders; women have been largely excluded, although there are numerous 'sister' orders in Egypt. In Uighur Chinese Turkestan in 1989 a closed weekly ritual (*zehr*) for about a hundred women was documented as taking place without many of the husbands' approval.

Middle Eastern and Central Asian art music traditions are (to varying extents) imbued with Sufi concepts of spiritual audition, as reflected in the use of mystical song texts and reverential audience responses. The ethos and instrumentation of the *Sūfiāna kalām* of Kashmir also show these connections (see [Kashmir](#), §3(i)). The Tunisian *ma'lūf* repertory is linked to Arab-Andalusian traditions preserved within Sufi lodges (see [Tunisia](#), §1). The long Sufi poem in Persian, *Mathnawī-i ma'nawī* by Jalāl al-Dīn Rūmī, has been spread by specialist *mathnawī*-singers. Its melody is found within the main vocal part of several modern *dastgāhs* of Persian art music (in particular the *avāz-e Afshārī*).

Outside the organized orders, music has an important place in certain groups which split away from Islam. Avoiding orthodox restrictions, they were able to cultivate music-making as an expression of pious emotion,

developing and retaining musical forms no longer found elsewhere. The Bektaşî movement founded by Hajji Bektaş (d 1338) was accommodated within the Ottoman empire as a Sufi order, but its beliefs are heterodox, closely related to those of the Alevîs and also to the Ahl-e Haqq sect (see §III, 2 below). (For an account of Yezidi sacred music and musical instruments see [Kurdish music](#), §5.)

[Islamic religious music, §II: Sufism and popular Islam.](#)

2. Popular Islam.

Devotion to the Prophet Muhammad has popular expression at *mawlid*s (see §4 below). Saints' shrines have provided an informal focus for religious music with strong popular appeal, and in Algeria, Morocco, Egypt and elsewhere saints' festivals (*mousssem*, *mawlid*) with music attract thousands of pilgrims. In the Pakistani province of Sind, there are numerous musical shrines, those of Lāl Shahbāz Qalandar (d 1262) at Sehwan, and of Shāh Abdul Latīf (1690–1752) at Bhitshah being most notable (see [Pakistan](#), §7(i)). At shrines and outside mosques, religious mendicants (variously known as *faqīr*, *dervish*, *malang* and *qalandar*) have improvised and disseminated religious folk music.

In Egypt religious singers (*munshid*) occupy a prominent role in rituals at shrines and in other settings. A leading exponent is Sheikh Yāsīn al-Tuhamī (b 1949), who specializes in the poetry of Ibn al-Fārid (d 1235). A *munshid* may be privately sponsored to sing at a *layla* or *hafla dīniyya* ('religious night'), which includes *dhikr* and religious songs with melodic accompaniment (see Egypt, §II, 3).

Islamic and indigenous traditions mingle. In Liberia women sing 'There is no god but Allah' in Arabic while pounding rice for consumption at a funeral feast, combining the power of holy words with West African work-song. The use of religious invocations is notable in various traditional forms of therapy that employ music, divination and trance. Baluchistan is a desert area spanning south-eastern Iran and western Pakistan and influenced by African culture along its coast. There male musicians organize musical sessions (*leb*) to exorcise spirits (*guat*) believed to cause sickness. Instruments include the *sorud* (fiddle), with song texts drawn from well-known Persian Sufi poets and local material, including *qalandar* songs (see [Iran](#), §III, 2(v)). In North Africa, Gnawa male professional musicians descended from African slaves have created musical sessions (*lila*: 'night') designed to induce healing trance states (*hadra*). These and other examples include pre-Islamic and non-Islamic practices and beliefs incorporated within Islamic mysticism.

In Indonesia, Malaysia and Singapore, vocal genres known as *zikir* or *dikir* (derived from the Arabic term *dhikr*) have popular appeal. Various styles use group repetitive singing of religious phrases with accompaniment on small frame drums, performed in a seated position, with coordinated body movements. In Malaysia *dikir barat* has developed into a form of competitive entertainment. The West Sumatran form (*diki*) spread from Aceh in the late 16th century, influenced by the Rifā'ī sect whose Iraqi founder was Ahmad Rifā'ī (d 1178).

See [Indonesia, §VI](#); [Malaysia, §I, 1\(v\) and \(vi\)](#); and [Singapore](#).

West Sumatra has other Sufi-derived popular genres. *Indang* has a lead solo singer with 11–15 musicians sitting cross-legged in a row, providing interlocking drum patterns and swaying movements of the upper body. *Salawat dulang* uses two singers performing interlocking continuous melodies with accompaniment on brass trays. These enliven weddings, circumcisions, death ceremonies and national and religious holidays. In Indonesia *qasidah moderen* ('modern ode') designates a popular type of religious music typically performed by a lead singer (usually female) and modern instrumentation (see [Indonesia, §VIII, 1](#)).

As the language of the Qur'an, Arabic has a special elevated status, greatly appreciated even in areas where it is not understood. The Taussig people of the southern Philippines have a tradition of highly melismatic songs in Arabic known as *lugu*, performed mainly by women (see [Philippines, §II, 1\(ii\) \(d\)](#)). (See also [§III, 2\(i\)](#) below.)

[Islamic religious music, §II: Sufism and popular Islam](#).

3. Dhikr and sufi ritual.

The remarkable ecstatic rituals of the Sufis usually focus on the communal utterance (*dhikr/zikr*) of the sacred name of God (*Allāh*) and phrases such as *Allāh hū* ('God is he'). The declaration (*tawhīd*) in Arabic of 'There is no god but Allah' is also commonly used. The term *dhikr* (or *zikr*) literally means the 'remembrance' of God. It refers both to the act of naming God and to the actual words or phrases used. In many societies it also designates the entire ritual session, but in North Africa this is called *hadra* ('in the presence of [God]') or in Sudan *noba*.

The Sufi *dhikr* rituals include recitations from the Qur'an, prayers and, optionally, singing. Group performances, coordinated by a religious leader, usually last several hours. Depending on tradition, the devotees stand, sit or dance in a circle or lines. Rhythmic breathing accompanies the constant repetition of the *dhikrs*, usually with regular body movements. Performance usually entails several phases, sometimes accelerating in tempo and dynamism. Many orders use frame drums for additional rhythmic effect.

Dhikr can be performed silently (as within the Naqshbandī order) or aloud, spoken or sung to a simple series of notes. Soloists or several singers (in unison or heterophony) often accompany the *dhikr*, commonly using classical forms such as the *ghazal* or *qasīda*. Most Ottoman orders (except the Mevlevi) formerly sang *durak* songs as solos or in chorus, with free improvisation, in pauses within the ritual. Turkish Sufis sometimes sing a form of mystical poetry (*tevhit*), which evolved from the *tevhit* (Arab. *tawhīd*) declaration 'There is no god but Allah'. In some orders (e.g. Mevlevi and Rifā'ī), *dhikr* and dance are performed side by side, complementing each other. In others *dhikr*, musical performance and dance-like movement may alternate or occur simultaneously. Among the Dayfī and Shadhilī in Alexandria and 'Ammārī in Morocco, some participants dance while the rest perform the *dhikr*.

Outside the Sufi orders, *dhikr* has quite varied applications. Female *dhikr* performances have been documented in Transoxania (Central Asia) for many centuries. In the Ferghana valley, Uzbekistan, professional women religious practitioners (*otin-oi*) sing texts including classical poetry and *dhikrs* at life-cycle events and for problem-solving sessions (*mushgelkushā*). In western Afghanistan women use *dhikrs* as a form of lullaby. In Tajikistan female and male professional experts use them in shamanistic divinatory ceremonies (*kōch*) to call spirits for diagnostic and healing purposes. In Indonesia *dikir maulud* is used in contexts such as celebrations on passing a Qur'an-reading examination.

See also Afghanistan, §I, 4; Algeria, §2; Iran, §III, 2(i); Iraq, §II, 4; Morocco, §4(ii); Sudan, §1; Syria, §2(i); Tunisia, §§1(iv) and 2; Yemen, §I, 2(ii).

Islamic religious music, §II: Sufism and popular Islam.

4. 'Mawlid'.

The term *mawlid* ('birthday') refers to celebrations attending the Prophet Muhammad's birthday or other occasions. There are many linguistic variants, the most common being *mālid*, *mawlūd*, *mevlit*, *mevlut*, *milād*, *mōlid* and *mūlid*. *Mawlid* designates both the festival and the hymns of praise and epics about the Prophet's life performed there.

The Prophet's birthday has been celebrated since at least the 9th century, and by the end of the 12th century it had become a magnificent festival with various musical and other entertainments. According to region, the *mawlid* developed in very different ways, offering scope for popular musical expression in local vernacular styles. These observances are particularly important in the Arab world, Turkey and Muslim Africa, being more muted (or absent) in other areas. In South Asia the *milād* has developed as a women's event, held at home to mark auspicious occasions (see India, §VI, 2).

Performance of the *mawlid* is not restricted to the Prophet's birthday, but can mark anniversaries of local saints (held at their shrines) and official and private days of commemoration, both joyful and sad. Performances may be held in public or private spaces, including saints' shrines and mosque courtyards, but rarely in the prayer hall itself. At outdoor venues where huge crowds gather, there may be other entertainments, such as fireworks, as in Libya.

In Egypt *mawlids* resemble vast fairs, with *dhikr* performances by many different Sufi orders, funfairs and secular entertainments. The *mawlid* in Cairo honouring the death of Husayn (the Prophet's grandson) draws huge crowds and lasts for several weeks. The October *mawlid* of Abū Haggāg in Luxor features a procession of boats as in pre-Islamic ceremonies related to the annual flooding of the Nile.

As performed in the Middle East, the *mawlid* generally begins with an introductory recitation from the Qur'an. There are songs in the *qasīda* and

tawshih forms, and anecdotal sections describing the Prophet's life, performed solo in improvised free rhythm. Interspersed, there may be choral songs which invite audience participation. In Iraq the *mawlid* is divided into four sections, each comprising three to seven *maqāms*, marked off by metric songs in colloquial Arabic (see Iraq, §II, 3). In Turkey *mevli* compositions began using the *makams* of art music in the 18th century, developing 'improvised' settings with precise rules for the selection of *makam* to text, as transmitted within schools for professional *mevli* singers. In rural areas of Turkey, the *mevli* is performed as a recitative with a narrow range but with impressive climaxes. However, styles vary considerably. In Oman and other parts of the Gulf, *mālid* ceremonies are conducted by two groups of men facing one another under the leadership of a shaykh (fig.3; see also Oman, §3(iv)).

Certain texts are commonly used within the *mawlid*. A Turkish *mevli*, *Vasilet ün-nejāt* ('Way to salvation'), written by Sülyman Çelebi in 1409, spread throughout the Ottoman empire, known simply as 'the *mevli*'. The Arabic text by Ja'far al-Barzanjī (d 1765), composed of prose narratives and accompanying invocations and poems, is used in Iraq and elsewhere. In North Africa *al-burda* ('the Prophet's cloak') is the best-known epic about the Prophet, chanted in its entirety once a week at the tomb of Sharaf al-Dīn al-Būsīrī (d 1298) in the centre of Alexandria, and used in *mawlids*.

Essentially popular, ceremonies for the Prophet's birthday borrow extensively from local musical styles. In the Dagbon area of northern Ghana, the *damba* festival entails performance on the *damba* (hourglass drum). In the Atlas mountains of Morocco, women perform highly rhythmic group singing, accompanied by drumming (on *bendīrs*), hand-clapping and ululation. In Liberia the *mahodi* festival includes an innovative dramatic enactment by women of the birth; the audience participates with singing, dancing and hand-clapping led by a song-leader (*suku-ba*) performing in Arabic. There are also reciters in Arabic, and translators work phrase by phrase, directly explaining the Arabic narrative content. The educational aspect of the Prophet's birthday celebrations is evident elsewhere. In Pakistan, schools and colleges present impressive *milāds*, and in Egypt children participate in group singing of *mawlid* songs glorifying the Prophet's life and work.

Celebrations for the Prophet's birthday present considerable diversity. Types of music (which may include audience participation) allow the strong expression of emotions ranging from happiness and exhilaration, spiritual ecstasy, and even the pain of separation, as in Iraq, when songs of separation (*fragiyyāt*) are performed in dialect. Melodic instruments are rarely used, but Java has a sacred type of gamelan (gong/metallophone ensemble) termed *gamelan sekati*. This provides music for the week of Sekaten, for seven days leading up to the Prophet's birthday, performing throughout the day and most of the night.

Islamic religious music, §II: Sufism and popular Islam.

5. The Mevlevi ayin.

Founded by 'Mawlānā' Jalāl al-Dīn Rūmī (1207–1273), the Mevlevi (Arab. Mawlawī) order was the first to develop dance with set forms and strict rules for group performance. Its centre is at Rūmī's tomb in Konya, Turkey.

The ceremonial dance (*ayin-i şerif* or *mukabele*) has retained its sacred ethos but now also flourishes as a tourist attraction and concert phenomenon. Its standardized musical form probably originated in the 17th century, the current version being a 19th-century development. *Ayin* compositions can be traced back to the 16th century. Over 100 reputedly survive (some as fragments), most by well-known composers. From the 18th century some were notated and over 40 are published. With closure of the Sufi orders in Turkey in 1925, Mevlevi rituals continued clandestinely, but in 1946 the *ayin* became officially permitted at anniversary celebrations of Rūmī's death at Konya.

The *ayin* is preceded and followed by Qur'anic recitation and prayers and is accompanied by Turkish art music songs and musical instruments. The original instrumentation of end-blown flute (*ney*) and frame drum (*def*) or small kettledrums (*kudüm*) is retained in country districts, but in western Anatolia and Istanbul it was gradually enlarged to include several flutes, a long-necked lute (*tanbur*), a fiddle (*rebab*), several pairs of small kettledrums and a pair of cymbals (*halile*) (fig.4).

Three introductory passages precede the dance: the *na't* (addressing the Prophet) composed by Itri (in *makam rast* and *türkizarb* metre); a non-metric *taksim* on flute, establishing the underlying *makam*; and the instrumental *peşrev* in *devr-i kebir* metre, usually in four sections, each ending with a refrain (*teslim*). The dance is performed to four vocal compositions known as *selams* ('salutations'), usually to texts by Rūmī or his son Sultan Veled, chosen according to the *makam* of the day, which used to vary from week to week. The first *selam* has no set metre; the second is usually slow (*ağır evfer* metre); the third and longest has several vocal and instrumental sections in *devr-i kebir* metre, ending with an *aksak semai*, a *saz semaisi* and a *yürük semai*; the fourth *selam* may be a repetition of the second. The *ayin* closes with an instrumental postlude (*son peşrev*) and a piece named after its metre, *son yürük semai*.

The dancers move serenely in a continuous turning motion, the head characteristically tilted and arms raised sideways, right hand turned upwards and left downwards. They move in two rings around the sheikh who slowly gyrates in the centre, breaking the formation after each *selam* to move around once more.

Islamic religious music, §II: Sufism and popular Islam.

6. Chishtī Sufism.

The Chishtī order was founded by Mu'īnuddīn Chishtī (d 1236), from the village of Chisht in western Afghanistan. His shrine at Ajmer, North India, is highly venerated by Muslims and non-Muslims as a pilgrimage site. It is an important centre for *qawwālī*, an ecstatic style performed by hereditary male professional singers with harmoniums supported by drums (*dholak* or *tablā*), hand-clapping and other voices (solo and in chorus). Chishtī Sufism is widespread in Pakistan and North India, significant for its ideology supporting the use of instrumental music in spiritual concerts (*samā*). Its major form, *qawwālī*, employs texts in Persian, Urdu and other local languages such as Punjabi, often by notable poets. Performers such as the Sabri Brothers and Nusrat Fateh Ali Khān have achieved commercial success and brought this music to a globalized and non-Muslim audience.

Islamic religious music

III. Shi'a Islam

Shi'a communities are found in an area stretching from East Africa to India and beyond. Shi'ism originated in the political and religious faction following 'Alī, the Prophet Muhammad's son-in-law. Political failure and the death of 'Alī's son Husayn in the battle of Karbala in Iraq (680) led to fervent worship of saints and martyrs, and the development of specific genres of religious recitation, lamentation and drama.

1. Mourning ceremonies.

(i) Gatherings and processions.

The anniversary of Husayn's death on the 10th of Muharram (Arab. *'āshūrā*: 'tenth') is the focus of group lamentation observed over many days (10 or 40). Special religious gatherings are held in homes and religious meeting-places (*tekīe*; *imāmbāra* in South Asia). In Iraq, Iran and Afghanistan, male specialist *rowze* singers sermonize and chant recitations (*rowze*) about the martyrs' lives; these may be interspersed with dirges (*nowhe*). The most important *rowze* singers are esteemed as virtuosos, and their material may overlap in structure with local art music repertoires. *Rowze* has application at any time of the year and is used in commemorating the death of family members. Folksongs and children's songs with religious content are sung during Muharram and other occasions, including feast days such as *Omar-koshūn* ('The slaying of the Caliph Omar').

In South Asia, the Muharram assembly (*majlis*) opens with ornate and expressive invocations (*sōz* and *salām*) by specialist performers trained in *rāga* music. Accompanists support the solo melody with a vocal drone. *Marsiya* is a narrative style, and simple *nowhe* laments precede the final *mātām* hymns during which all the participants stand, beat their breasts and fervently call out. (For transcriptions see India, §VI, 2, [ex.19](#) and [ex.20](#).)

Shi'a women may attend public mourning ceremonies, sitting separately, but they also commemorate Muharram in closed all-female gatherings at home. In Iraq, ten days of consecutive sessions (*qirayyāt al-husayniyya*) are led by a specialist reciter (*mullāya*), declaiming from a book in a highly dramatic way. Her assistants clap in rhythm, and she evokes coordinated cries from members of the audience, who also beat their chests rhythmically. Two girls loosen their hair and perform a mourning dance to a rapid rhythm. In a most impressive style ('Indian women's style'), the women all stand, beating their chests and repeating the syllable 'Ha' or 'sayn' with accelerating speed and accented off-beats, sometimes attaining trance states.

Outdoor Muharram processions (*daste-gardānī*) originated in the streets of Baghdad from the 10th century. They became more elaborate after Shi'ism became the state religion of Iran in 1502. They are performed in Iraq (centring on Karbala), Iran, Afghanistan (prior to Taliban rule), Pakistan and India (especially in Lucknow). Individual processions are organized by district, rehearsed and directed by a leader. Male performers move in rhythm through the alleys of their quarter, singing antiphonal *nowhe* songs and beating their breasts (*sīnezanī*) or striking their bare backs with small bundles of chains (*zenjīrzanī*). The songs are heavily rhythmic; and the blows on the performer's breast and back fall on the downbeat (see [Iran, §III, 2\(ii\), ex.1](#)).

(ii) Ta'ziye.

Ta'ziye is remarkable as the only type of indigenous religious drama in the Islamic world. From at least the 18th century, theatrical plays (*ta'ziye* or *shabih*) depicting the martyrdom of Husayn were staged during Muharram and at other times, especially in Iran. They were first performed at crossroads, marketplaces and town squares, then in special buildings (*tekie, tekie husayniye*). The heyday of *ta'ziye* was the second half of the 19th century: plays performed in Tehran's impressive royal *Tekie Dawlat* (built in the 1870s next to the palace) involved numerous players, a chorus and military ensemble. In Iran royal patronage was withdrawn under Pahlavi rule, and *ta'ziye* was banned for a while. The corpus of *ta'ziye* plays is very large, and since the 1979 Revolution there is renewed interest in Iran in this popular art. A related tradition exists in the Shi'a village of Nabawiya in Lebanon, with an impressive presentation of the martyrdom story, an elegy singer and some choral passages by actors.

Ta'ziye means 'consolation', and, like the *rowze* and *qirayyāt al-husayniyya*, its purpose is to evoke remembrance and weeping. In Iran and Iraq certain conventions are used: the 'bad characters', Husayn's opponents, wear red and declaim in violent shrieking voices, whereas Husayn and his party wear green and sing their parts (see [Iran, §III, 2\(iii\), ex.2](#)). Drums and wind instruments may be used, with different instrumentation allotted to the opposing forces.

See also [Iran, §III, 2\(ii\) and \(iii\)](#); [Iraq, §III, 1\(ii\)](#); and [India, §VI, 2](#).

2. Heterodox sects.

(i) Alevi and Bektaşī.

The term Alevi refers to Anatolian heterodox communities worshipping 'Alī, Husayn and the Shi'a imams; they are closely related to the Bektaşī Sufi sect. Closed ceremonial gatherings (*cem*) involve poetry, music and dance. They take place on feast days (including the 10th of Muharram and the Persian New Year representing 'Alī's birthday), initiation ceremonies and private gatherings (*muhabbet*).

Highly respected within their own communities, Alevi musicians are among the most gifted singers in Turkey. They have considerably influenced *aşik*

singers such as [aşik Veysel](#). *Aşik* initiation dreams are modelled on Bektaşî and Alevi initiation rites, and the social criticism within *aşik* songs revives old Bektaşî musical traditions. The Alevi repertory includes *deyiş* and *nefes* ('breath') poems of mystical love. The latter are always metric (usually with six or nine beats), structurally resembling the main form of *aşik* poetry, *koşma* (see [Turkey](#), §II, 3). Texts are by religious poets of the 14th century to 20th. Other genres are *düyaz*, addressed to the 12 Shi'a imams, and *mersiye* laments for Husayn. Alevi musicians are skilled performers on the long-necked lute (*saz* or [Bağlama](#)) to which religious symbolism is attached. Its body represents 'Alī: the neck is his sword, and the 12 strings of the large *saz* symbolize the 12 imams.

In Istanbul, Bektaşî music is influenced by Turkish art music. Their early 20th-century *nefes* songs resemble *makam*-style *ilahi* songs of other Sufi orders in tonality and form, and they are accompanied by instrumental ensembles. Emigrant communities maintain their traditions in Germany (see fig.6; see also [Turkey](#), §VI).

(ii) **Ahl-e Haqq.**

This secret sect is principally Kurdish, with religious poetry performed to music as a prominent feature of its closed gatherings. The concept of music as the way to the Knowledge of God appears in many legends, and in their name, meaning 'Followers of divine truth'. As with the Alevi, their long-necked lute has religious symbolism (see [Iran](#), fig.14). It is used to play Kurdish folk tunes (*dastgāh*) analogous to the Alevi *makam*, but dissimilar to the *dastgāh* of Persian art music.

3. Zūrkhāne.

In Iran ritual athletic training within the *zurkhāne* ('house of strength') has a religious character. The gymnastic exercises were originally primarily intended to train the breath. Pre-Islamic tradition mingles with the influences of medieval Islamic men's leagues and guilds, military training and Shi'a piety. Music within the *zurkhāne* includes recitations of Sufi poems by the *morshed* (leader) to his own accompaniment on a large clay goblet drum (*zarb*).

Isle of Man.

Island located in the Irish Sea, off the north-west coast of England.

1. Cultural and musical origins.

Manx music has been shaped by the Isle of Man's unique political status and its position at the cultural crossroads of the British Isles. Manx Celts had been Christian for nearly 400 years before the arrival in about 800 ce of pagan Scandinavian settlers, who were converted to Christianity and founded the Tynwald (parliament). From the early 15th century onwards English rule was to have a profound effect on cultural life. Manx Gaelic, a

dialect of Irish and Scots Gaelic, was still the majority language in the early 1800s; the influx of English-speaking holidaymakers hastened its decline, although it was still spoken in the 20th century. Trading and commercial links with Britain and Ireland as well as further afield helped shape a distinctive musical life.

Little music has survived from before the 18th century, although documentary evidence indicates that there was an active musical life at all levels of Manx society. The English Lords of Man (the earls of Derby and their successors the dukes of Atholl, 1405–1765) employed musicians to sing services and provide domestic entertainment in their castles at Peel and Castletown, and there was music at the cathedral of Peel and the Cistercian abbey of Rushen as at comparable northern British foundations.

2. Church music after 1800.

By the 1800s three distinct styles of church music co-existed. Traditional Gaelic psalm-singing survived in remoter country areas as a reminder of the Byzantine origins of the Celtic church. In most parish churches, clerks raised the hymns, 'lining out' the metrical psalms, in the style widely practised throughout most of the British Isles and, on special occasions, West-Gallery musicians led hymn singing, amazing the congregations (but often dismaying the clergy) by providing splendid anthems with instrumental accompaniment in the style of Purcell or Handel. This music was sometimes locally composed, but more often painstakingly copied from published collections into manuscript books, over 20 of which survive to offer an insight into the social lives of West-Gallery musicians, mostly artisans who learnt their musical skills through playing in bands. The third style was provided by the introduction of surpliced choirs accompanied by organ music, a novelty which attracted churchgoers but was often detrimental to the standard of congregational singing, although generating printed collections of hymns specially designed for use in Manx churches. The first collection of hymns in Manx (1799) was printed in Douglas and reprinted in 1830 and 1846. *A Selection of Psalms and Hymns Chiefly Designed for the Use of Congregations in the Isle of Man* (1835) contained 58 tunes, none of Manx origin. In 1840, 108 tunes (only ten of which duplicated the 1835 collection) appeared in Isaac Dale's *Mona Melodist*, including the traditional Manx melody 'Molly Charane', and featuring island composers such as the Rev. R. Brown, I. Cretney and G.H. Wood.

The language of the old-style Gaelic psalms was predominantly Manx: metrical psalms had been translated from English in 1760, and parish clerks were more likely to use Manx until well into the 19th century, especially in country areas. West-Gallery music was probably bilingual; anthems were generally copied from English-language collections but hymns were likely to have been sung in Manx and were often composed locally. After the Anglicans had adopted the recommendations of the Tractarians, the music-loving Methodists clung to West-Gallery music, and remnants of the tradition survived until the 1950s in tiny country chapels. Other nonconformists continued to use instrumental music in worship, provided by 'Hallelujah', Teetotal and Salvation Army bands. In urban areas the use of organs and surpliced choirs became widespread, partly to attract holidaymakers, who filled the new churches and chapels in the

seaside towns. Open-air services attracted huge numbers to Braddan; chapel and Sunday school anniversaries were splendid occasions; Moody and Sankey evenings were popular in country districts; and the increasingly English-speaking congregations adopted the new hymnbooks. Some traditional Manx tunes were used in the *Methodist Hymn Book*, notably W.H. Gill's *Manx Fishermen's Evening Hymn* to the tune 'Peel Castle'. The decline of church music in the late 20th century led to few parish churches having regular choirs and many finding it difficult to appoint organists.

3. Social music after 1800.

Secular music was greatly affected by trading and immigration patterns during the 18th and early 19th centuries, and the influx of half-pay officers and debtors fleeing English prisons inevitably resulted in the importing of new styles and repertory. Professional and amateur musicians often seem to have worked together in bands, orchestras and choirs in concerts and festivals. Private teachers offered tuition in piano, singing, harp, guitar and cornet, as well as, anachronistically, figured bass. Many singers and instrumentalists learnt their skills by joining one of the many bands and choirs which flourished in villages and towns. These were often church-based or linked with the many friendly and benevolent societies, which had an important charitable function before the introduction of the welfare state. After playing anthems and psalms on Sundays, musicians provided quadrilles, quicksteps and polkas during the week at functions ranging from barn dances to formal balls at the Assembly Rooms in Douglas. Concerts of sacred and secular music were popular, and often featured singers from Ireland and the north of England, while string bands and formal orchestras began to be active in about the 1870s. A huge amount of sheet music was published, featuring songs, ballads and dance music, much of it aimed at the growing tourist industry. Visitors from northern England and Scotland were richly entertained with indoor concerts, outdoor band music and music hall. Some of the songs lived on, including *Ellan Vannin*, which many thought was the national anthem.

The tourist industry had a far-reaching effect on popular music in the 20th century, with dance bands led by Joe Loss, Ivy Benson and Ronnie Aldrich and others entertaining holidaymakers and residents alike. The growth of radio and recorded music hastened the decline of vernacular music, which began to be seen as old-fashioned. The 1960s and 70s saw a proliferation of subscription concerts, festivals such as the Mananan Festival, and international competitions for viola, harp and double bass. Amateur music-making is spurred on by the Manx Music Festival ('the Guild'), which celebrated its centenary in 1992 and is the highlight of the year, particularly for singers. There are several active choirs and the instrumental tradition has strengthened since the 1970s. Youth groups flourish outside the educational system, and the high standards of the Manx Youth Band have developed alongside the revival of town bands and a popular brass band festival.

4. Traditional music.

Increasing international awareness of nationhood was reflected in an interest in ethnic music, which began with *Mona Melodies* (1820), the first publication of Manx tunes arranged for voice and piano, and peaked in

1896 with W.H. Gill's *Manx National Song Book* and A.W. Moore's *Manx Ballads and Music*. The remarkable work of the late 19th-century collectors, such as Gill, Moore and John Clague, rescued over 300 popular songs, ballads, instrumental melodies, sacred pieces and dance tunes, which had been transmitted orally and became the basis of the folk revival. Music and dance had survived in the 17th and 18th centuries despite opposition from the established church, which often 'presented' musicians to the ecclesiastical courts for breaking the Sabbath.

An early form of non-liturgical sacred music was the carval, a form closely related to medieval and pre-Reformation carols. In the 17th and 18th centuries carvals were the province of educated composers and authors, but by the 19th they could be heard at Oiell Verrees, a form of entertainment which took place after the minister had left the church on Christmas Eve. They were sung to popular Manx tunes by male soloists, who composed their own verses based on biblical texts, including the Nativity; the most popular story was that of the prodigal son. The performance began at the west end of the church, the singer taking a step forwards at the beginning of each verse. The tradition became increasingly associated with rural areas; although the character of the melodies varied, most were exclusively Manx in origin and show little trace of the wider influences that appear in other parts of the repertory.

Musical styles reflecting the island's history – including Celtic laments and lullabies, tunes with Scandinavian features, early English dances and carols, pagan and Christian ritual music (notably the mummers' play *The White Boys*) and 18th-century ballads – were adapted by Manx musicians, often with some sophistication. Fiddle music dominated the instrumental tradition and old Christmas and wedding customs (many similar to those in Scotland and Scandinavia) were still being observed in Douglas in the mid-19th century, lingering longer in the countryside. By the time the 19th-century collectors were at work, performance styles were only hinted at, and the songtexts were often incomplete or heavily censored. Popular tunes were constantly adapted for contemporary use; new words to commemorate tragic events such as the wreck of the herring fleet in 1787 were fitted to earlier laments and Gill's arrangement of the major version of 'Mylecharaine' was to become the Manx national anthem.

Developments in popular music led to changes in the oral tradition. Most musicians in the first 70 years of the 20th century learnt their Manx tunes from *The Manx National Song Book*, but as Sophia Morrison, Mona Douglas and later collectors were to discover, not all traditional music had died. Local chruinnaghts and eisteddfods continued to be held, even after the demise in the 1930s of the Chruinnaght Ashoonagh Vannin (Manx National Gathering). Choral and orchestral arrangements by Elgar, Vaughan Williams, Arnold Foster and Haydn Wood, as well as Manx composers such as J.E. Quayle, gave opportunities to amateurs to perform traditional music in contemporary styles. Using 19th-century notebooks, traditional dance was recreated by Mona Douglas and Leighton Stowell in the 1930s, and continues strong, with new compositions actively encouraged and performed. Oiell Verrees and hymn-raising also continue to be popular, particularly in country areas. Led by Mona Douglas, the successful revival of Yn Chruinnaght in 1976 gave a new impetus to Manx

music, and the festival's links with other major Celtic festivals in Ireland, Scotland, Wales, Cornwall and Brittany fuelled the growth of traditional music and dance. The movement was further stimulated by Colin Jerry's publications of tunes from the notebooks of the early collectors, previously difficult of access, and the appearance of the second volume of the *Manx National Song Book* (1979), edited by Charles Guard. Tapes and CDs chart stylistic changes from the 1960s through the performances and compositions of groups and individuals including Phynodderree, the Mannin Folk, Charles Guard, Stuart Slack, Bernard Osborne and Peter Lumb, the Mollag Band, MacTullough Vannin, Caarjyn Coidjagh, Emma Christian and Paitchyn Vannin.

FENELLA BAZIN

Isler, Ernst

(*b* Zürich, 30 Sept 1879; *d* Zürich, 26 Sept 1944). Swiss organist and music critic. After studying at the Zürich Music School (1895–9) and with Rudorff at the Berlin Hochschule für Musik (1899–1901), he became organist at the Reformed church in Zürich-Enge and, from 1919 to 1942, at the Fraumünster in Zürich. At the same time he taught at the Zürich Conservatory, from 1919 as head of the organ department, and taught music history at the Volkshochschule. From 1910 to 1927 he was the editor of the *Schweizerische Musikzeitung* and from 1902 to 1944 music critic of the *Neue Zürcher Zeitung*.

In his many decades as music critic Isler established the paper's particular approach to music reviewing: considering the composition as paramount, he based his assessment of its interpretation on detailed analysis of the score. This type of criticism had a wide influence on German-speaking parts of Switzerland and was continued by Isler's successors, Willi Schuh and Andres Briner. Isler's championship of Swiss composers like Schoeck and Burkhard, as well as Max Reger and his organ music, was equally important. As an organ teacher he had a far-reaching importance in Protestant Switzerland.

JÜRIG STENZL

Isley Brothers.

Black American soul and funk group. The original members, lead singer Ronald Isley (*b* 21 May 1941), O'Kelly Isley (*b* 25 Dec 1937; *d* 31 March 1986) and Rudolph Isley (*b* 1 April 1939), began singing gospel in their native Cincinnati. In 1958 they moved to New York and recorded a series of singles for the Teenager, Mark X, Cindy and Gone labels before signing to RCA. They achieved success in 1959 and again in 1962 with their composition *Shout*. Their next hit was a cover of the Top Notes' *Twist and Shout* (Wand, 1962) using an arrangement which was subsequently copied by the Beatles for their version of the song. After a short-lived attempt at

starting their own label, T-Neck records, in the mid-1960s the Isley Brothers recorded for Motown. Here the production team of Holland, Dozier and Holland wrote four hits for the group, including *This old heart of mine (is weak for you)* (1966).

In 1969 the Isley Brothers reactivated their T-Neck label and added two younger brothers, Ernie on guitar and Marvin on bass, plus cousin Chris Jasper on keyboards. At this point, the group followed the recent development of funk by James Brown and Sly and the Family Stone and, with Ernie Isley's Hendrix-influenced guitar, recorded a series of hit singles that dominated the rhythm and blues charts until 1983, while hardly reaching a white audience. These included original songs such as *It's your thing*, *That Lady*, *Fight the power* and *The Pride* juxtaposed with covers of pop material such as Steve Stills's *Love the One You're With* and Seals and Crofts's *Summer Breeze*.

In 1984 Ernie and Marvin Isley and Jasper left the original trio to form Isley-Jasper-Isley and had a big hit in 1985 with *Caravan of Love*. Ronald and Rudolph continued as the Isley Brothers after O'Kelly's death in 1986, finally disbanding in 1990. A year later Ernie, Marvin and Ronald Isley reformed the group.

ROB BOWMAN

ISM.

See [Incorporated Society of Musicians](#).

Ismagilov, Zagir Garipovich

(*b* Verneye Sermenevo, Bashkiri Autonomous Republic, Russia, 26 Dec 1916/8 Jan 1917). Bashkiri composer. From childhood he was a superb exponent of folk songs and a celebrated kuray player. After completing his studies at the Forestry Technology School (1934 in Inzer, Bashkortostan) he decided to devote his life to the theatre and music. He completed his studies at the studio attached to the Bashkir Academic Theatre of Drama (1935, Ufa), and for two years he worked as a company member and kuray player in this theatre (1935–7). For the next seven years he worked in the Moscow Conservatory (in the studio, the Bashkir department and the department of theory and composition), where he also studied with Viktor Bely, Anatoly Aleksandrov and Vladimir Fere. For the next 24 years (1954–78) he headed the Bashkir Union of Composers; in 1968 he became rector

of the new Institute of Arts in Ufa, which he directed until 1988. Through his teaching he is said to have inspired a new generation of composers. He is the holder of the following orders: the Badge of Honour (1949), the Workers' Red Banner (1967), the Order of Lenin (1971), the Friendship of Nations (1977), the October Revolution (1988); he is a laureate of the Glinka Prize, the Salavat Yulayev Prize, and he is a People's Artist of the USSR, the RSFSR and of the Bashkir ASSR.

Although Ismagilov works in the most varied of genres, opera occupies the central place in his output. The heroic and dramatic opera *Salavat Yulayev* – his graduation piece – became the first classic of Bashkir opera. Then followed the tragic opera *Shaura* based on themes from a folk legend, the lyrical opera *Volni Agideli* ('The Waves of the Agidel') concerning contemporary life, and two operas devoted to heroic and patriotic themes. These latter works, *Posli Urala* ('Ambassadors from the Urals') and *Akmulla*, continued the style he established in *Salavat Yulayev*. He also composed the first Bashkiri comic opera *Kodasa* ('The Sister-in-Law').

Of his works for chorus and orchestra of particular note are the symphonic poem *Bessmertiyе* ('Immortality') and the oratorio *Mi pobediteli* ('We are the Victors') which commemorate respectively the 30th and 40th anniversaries of the defeat of fascism. Among his numerous choral works (which include folk song arrangements) the cycle *Slovo materi* ('The Word of a Mother') is of great significance.

WORKS

stage

Salavat Yulayev (op, 4, B. Bikbay, after M. Karim), 1954, rev. 1986, Bashkir State Theatre of Opera and Ballet, 15 April 1955

YEVGENIYA ROMANOVNA SKOURKO

Ismail, Aly

(*b* Cairo, 28 Dec 1924; *d* Cairo, 16 June 1974). Egyptian composer. He studied the clarinet, saxophone and bassoon at the Institute for Theatre Music in Cairo, graduating in 1949. After a period as an orchestral musician he began to compose songs for the radio, but from 1959 he became closely associated with the Reda Troupe, a folkdance ensemble, eventually serving as its conductor–composer. With them he initiated the movement for folklorism in dance and song, presenting Egyptian material in stylized form. He composed the music for all 26 of their shows, using an orchestra including Arab instruments, and with them he toured through most of the Arab countries, Asia, Europe, the USSR, the USA and Latin America. In

addition, he did much arranging for most of the song composers in Egypt, but his most important contribution was in his work for the cinema, in which he showed imagination, humour and skill in the use of local features. His film music won him four first prizes from the Egyptian Ministry of Culture; he also received awards in international festivals of popular song, and in 1973 he was given the Gamal Abdel Nasser Prize. In style, his music is essentially a mixture of folk and classical Arab elements (in melody, rhythm and instrumentation) with Western elements (in instrumentation, harmony and syntax). The result is a light and sometimes jazzy style with a strong oriental flavour; his orchestration tends towards a rather heavy use of the brass. He used folk tunes from various parts of the country, treating them with some melodic liberty, though his rhythm shows interesting features (irregular phrases, irregular groups of five and seven) derived from the patterns of classical Arab music. Many of the lyrics for his songs were written by his wife, including those for some popular patriotic pieces. He composed patriotic songs for Hāfez and other singers. In 1975 he was awarded a posthumous state prize.

SAMHA EL KHOLY

Ismailov, Abduhashim

(*b* Fergana Basin, 9 June 1952). Uzbek *ghidjak* player and composer. He came from a family of musicians and played the *ghidjak* and the *rubāb* from an early age. He also performed Uzbek traditional music on the violin; in the Fergana area, the *ghidjak* was sometimes replaced in ensembles by the violin. In 1967 he began to study at the Fergana College of Music, and in 1971 he became a student at the Tashkent State Conservatory. From 1975 to 1996 he performed in the Uzbek State Radio *makom* ensemble founded by Yunus Rajabi. In 1978 he took part in an international symposium for traditional music held in Samarkand, and two years later he was awarded the title of Honoured Artist of Uzbekistan. The Tashkent division of Melodiya released six recordings of his performances, and in 1987 he received the company's Golden Gramophone award. In 1990 he was named Artist of the People of Uzbekistan. His repertory includes pieces from the Tashkent-Fergana *makom*, the Khorezm *makom* and the Bukhara *shashmakom* as well as Indian *rāgas* and western art music.

His importance lies in his contribution to the *ghidjak* repertory in Uzbekistan. Ismailov introduced rapid and technically demanding solo passages for the *ghidjak* into well-known Uzbek traditional classical songs. He also developed a new combination of instruments; in 1984 he founded an ensemble including the *ghidjak*, the *nay* (played by Abdulahat Abdurashidov) and the *kanun* (Abdurahman Holtojiev). The ensemble subsequently toured extensively and was noted for its rapid and complex development of musical material within the Uzbek traditional classical style; it performed traditional melodies as well as pieces created specifically for

the combination of *ghidjak*, *nay* and *kanun*, including about 20 of Ismailov's compositions.

Isnard.

French family of organ builders. Jean-Esprit (bap. Bédarrides, Vaucluse, 22 Jan 1707; bur. Tarascon, 16 March 1781), a priest at the Dominican convent in Tarascon, except for a period spent with the Jacobin order in Toulouse, was one of the geniuses of French organ building. Among his instruments are those for: Ste Marie-Madeleine, Aix-en-Provence (1743); St Cannat, Marseilles (1747); St Trophime, Arles (1767); and the basilica at Saint Maximin-la-Sainte-Baume (1772–4). This last is Isnard's masterpiece and survives in its entirety. The 16' *Grand orgue* contains a Gross nazard 51/3', a Grosse tierce 31/5', three chorus mixtures and a second treble Trompette *en chamade*; the *Positif* contains three 8' flue stops, both the full separate mutations including a Quart de nazard and a Larigot and also a five-rank Cornet, and three reeds; a three-stop *Récit* of 32 notes constitutes the fourth manual while the third manual, called *La résonance*, consists of a 27-note *Echo* of Flûte à cheminée 8', Cornet V, another Trompette *en chamade*, and a full-compass manual Bombarde consisting of Flûtes 16', 8' and 4' and reeds 16', 8', 8' and 4', which serves both as a pedal division and as an extra manual with *grand jeu* effects. The organ is still tuned in an unequal temperament, and its pitch is still about two semitones below present pitch. It remains one of the most remarkable, beautiful-toned organs ever built in France.

Jean-Baptiste Isnard (b Bédarrides, 24 June 1726; d Orléans, 18 Aug 1800), nephew and pupil of Jean-Esprit, worked in Le Puy (1750), Lyons (1756) and Orléans (1756). He also worked in Blois, where he married Gabrielle Mollet. They had a daughter and a son. He built the organ at Pithiviers parish church (1784–9); the church was converted to a hospital after the Revolution, but the organ survives. Joseph (b Bédarrides, 5 April 1740; d Bordeaux, 9 April 1828), Jean-Baptiste's brother, was also a pupil of Jean-Esprit and assisted his uncle with the building of the organ for Saint Maximin-la-Sainte-Baume. He worked with F.-H. Clicquot (1767), then for Adrien L'Epine (1768, Nogent-sur-Seine). He built the organs at the convent of the Minims, Marseilles (1777), and Notre Dame, Lambesc (1788). He took refuge in Spain during the Revolution, then returned to Bordeaux where he restored the organs at Ste Croix and the cathedral.

GUY OLDHAM/PIERRE HARDOUIN

Isnardi, Paolo

(*b* Ferrara, 1536; *d* Ferrara, 7 May 1596). Italian composer. He was a pupil of the Ferrarese composer Francesco Manara. The title-pages of his works show that he was *maestro di cappella* at Ferrara Cathedral from 1573. Although they also claim that he was a 'ducal musician', he never appears in the salary rolls of the Ferrarese court; it seems that he was a ducal musician only in the sense that he oversaw the music at the duke's principal church. He is not to be confused with Paolo Ferrarese, a musician and Cassinensian monk active in Ferrara during the first and second thirds of the 16th century. Superbi maintained that Isnardi had many students, including several sons, who became honoured musicians: Paolo Isnardi, *maestro di cappella* at the Accademia della morte, Ferrara, from 1604 to 1609 was probably one of these sons; Vincenzo Isnardi, who wrote a madrigal printed in *Il giardino dei musici ferraresi* (RISM 1591⁹), is probably another. Isnardi was married to Lucrezia Pocaterra, the sister of the Ferrarese poet Annibale Pocaterra. A perusal of several of his madrigals from the 1580s indicates that Isnardi was a skilful, serious, conservative and rather unimaginative madrigal composer.

ANTHONY NEWCOMB

Iso [Yzo, Yso], Pierre

(fl c1715–c1794). French composer and teacher. In the sources his surname appears as 'Yzo' until 1759, after which it becomes 'Iso'. He was not related to the composer and bassoonist Etienne Ozi, or the bassoonist François Ozi, as has been suggested. He went to Moulins from Nevers and became, in 1736, *maître de musique* at the Académie de Musique and a director of a music school there: he was required to conduct rehearsals and concerts and teach singing and the violin. He left in 1742 and was probably in Paris by 1748. Between 1753 and 1754 he played a part in the Querelle des Bouffons by publishing under the name of Yzo an answer to Rousseau's *Lettre sur la musique française* (Paris, 1753) entitled *Lettre sur celle de Monsieur Jean-Jacques Rousseau ... sur la musique*. His op.1, a motet for full chorus and orchestra to words from Psalm xcvi, was published probably shortly before two one-act *ballets héroïques* of his appeared at the Paris Opéra: *Phaëteuse* and *Zémide*, which together with *Apollon berger d'Admète* (music by Grenet) formed part of the *Fragments héroïques* produced on 20 July 1759. *Zémide* was also performed in Lyons in 1764 at the academy there. Both were printed in full score and reveal a rather simplistic and perfunctory approach to the genre.

A court document, *Mémoire pour le sieur Iso, maître de musique ... contre le sieur Lagarde, aussi maître de musique, défendeur* (1759, US-Wc), reveals that Iso attempted to collect payment for composing and revising several works for his fellow composer, Pierre de La Garde. He claimed that La Garde had a reputation for making false promises of shared payment and commissions in exchange for work. The document cites five works which he worked on for La Garde. Iso's witnesses included La Garde's copyist and librettist, as well as other musicians who allegedly observed Iso working on these compositions in La Garde's house. However, Charles-François Clément and Joseph de Laporte reported that the judgment went against Iso at both the *Châtelet* and the *Parlement*.

Isochronic.

A term applied to [Text-setting](#) in which new syllables are enunciated at regular intervals, regardless of the number of notes per syllable.

Isoiar, Nicolò.

See [Isouard](#), Nicolò.

Isoir, André

(*b* Saint Dizier, 20 July 1935). French organist. He studied in Paris with Edouard Souberbielle at the Ecole César Franck, and then with Rolande Falcinelli at the Conservatoire, where in 1960 he won a *premier prix* for organ and improvisation. He won the St Albans International Organ Competition in 1965 and the Haarlem Competition in three consecutive years, 1966–8. Isoir was organist of the Paris churches of St Médard, 1962–7, and St Séverin, 1967–73, and in 1973 was appointed organist of St Germain-des-Prés. Although he won the composition prize of the Amis de l'Orgue with his *Variations sur un psaume huguenot* (1974), his career has been as a performer. He has specialized in French music of the 17th and early 18th centuries, and has explored little-known works by such composers as Titelouze, Lebègue, Boyvin, Dandrieu and Séjan. In his approach to the technique and registration of this repertory Isoir has been influenced by his interest in the construction and restoration of old organs. He has made many recordings, including the extensive compilation *Le livre d'or de l'orgue français* and works by Couperin, Grigny, Franck and Jehan

Alain. He has also recorded the complete organ works of Bach. In 1978 he was appointed professor of organ at the Orsay Conservatoire.

FRANÇOIS SABATIER

Isola, Gaetano

(*b* Genoa, 1754; *d* Genoa, 17 July 1813). Italian composer. It is known from a letter he wrote to Padre Martini (in *I-Bc*) that he spent about ten years at the Palermo Conservatory studying for a diploma as *maestro di cappella*. Returning to Genoa in 1775 he began a career as a composer and music director. From 1777 to 1796 he was *maestro di cappella* at various churches and from 1789 *maestro al cembalo* at the Teatro S Agostino, of which he also seems to have been director at least for the last years of his life. In 1800 he was a member of the music section of the Istituto Nazionale della Liguria.

Between 1785 and 1797 six operas and an oratorio by him were performed in Genoa, Turin, Florence and Lisbon to public acclaim. Two in particular were big spectacle pieces. For *La conquista del vello d'oro* Boggio chose a mythological subject on which to construct an opera in the French style. It incorporates a dance of the infernal spirits and some machine spectacle in the form of a fire-breathing dragon and a temple of the sun appearing in mid-air. The trio that closes Act 2 contains programmatic storm music, generously scored for percussion and wind including solo bassoon, clarinet and trumpet in addition to the usual oboe and horn. In *Le danaidi*, the innovatory librettist Sertor provided a formally more fluid work including many ensembles, choruses and pantomime. Two of the ensembles involve some action, and several include a chorus.

Besides operas Isola wrote songs and sacred and instrumental music; his works survive only in manuscript. His sacred music includes a Credo and four-voice mass for the coronation of the doge Raffade de Ferrari, dated 25 November 1787. Isola also composed a few cantatas for the Accademia biennale delle Scuole Pie in Genoa. Of his stage works, in most cases only the librettos and a few arias survive. His pupils included the English tenor and composer John Braham.

CARMELA BONGIOVANNI, MARITA P. McCLYMONDS

Ísólfsson, Páll

(*b* Stokkseyri, 12 Oct 1893; *d* Reykjavík, 23 Nov 1974). Icelandic composer, organist, teacher and conductor. The son of an organist-composer, he began his musical studies with Sigfús Einarsson in Reykjavík in 1908. In 1913, with the financial assistance of his uncle, he enrolled at the Leipzig Conservatory; his teachers there included Karl Straube (organ), Robert Teichmüller (piano), Hans Grisch (theory), and Max Reger (analysis). He became Straube's assistant at the Thomaskirche (1917–19), and completed his studies with Bonnet in Paris (1924–5). After his return to Iceland, he gradually assumed a central role in the reshaping of the country's musical life. He was principal of the Reykjavík College of Music from its foundation in 1930 to 1957, and head of the music department of the Icelandic State Radio from 1930 to 1959 (apart from the period 1937–8). He was organist first at the Reykjavík Free Church (1926–39), then at Reykjavík Cathedral (1939–68). He received the Knight's Cross of the

Order of the Falcon (1940) and the Grand Cross (1955), and was elected a member of the Royal Swedish Academy in 1956.

The first Icelandic instrumentalist of international renown, Ísólfsson's repertory was centered around the works of J.S. Bach and Reger. He toured Scandinavia, Germany, Great Britain, the United States, and the USSR, made solo recordings for HMV, and appeared with soloists such as Rostropovich and Telmányi. A pioneer in the performance of large-scale choral music in Reykjavík during the second quarter of the 20th century, he conducted works by Brahms (including the *Begräbnisgesang* and movements from the *German Requiem*) in 1926 and Haydn's *Creation* in 1939. His compositions are in a late-Romantic idiom influenced by Bach, Brahms and Reger. Many of his larger works were composed for specific occasions: his first major work, the *Althingishátíðarkantata*, won a competition for a work to be performed at the millenary of the Icelandic parliament in 1930. Among his other large-scale works are an organ Chaconne on a plainchant antiphon from the Office of St Thorlak, and a set of late-Brahmsian piano variations on a theme by his father, completed when he was in his 80s. A master of small forms, his most successful compositions include the hauntingly beautiful *Vögguljóð* ('Lullaby', op.2) and the ethereal *Máriuvers* ('Hymn to the Virgin Mary') for female voices, from his incidental music to *Gullna hliðið* ('The Golden Gate').

ÁRNI HEIMIR INGÓLFSSON

Isomelism

(from Gk. *isos*: 'identical' and *melos*: 'melody'; Ger. *Isomelie*).

A term coined by Heinrich Bessler for the melodic resemblances in the upper parts between different sections of certain isorhythmic motets of the first half of the 15th century. Isomelic recurrence may take place at the beginning of successive taleae and may involve transposition, as in the triplum of Du Fay's *Rite maiorem* (ex.1). Since color and talea do not normally overlap in 15th-century motets (by contrast with earlier practice), isomelic resemblance may also be found at the beginning of successive colores, as in the triplum of Du Fay's *Fulgens iubar* (ex.2). Isomelism of this kind, also found in music of the Old Hall Manuscript (see Bukofzer), is not related to the cantus firmus. (In this special meaning of coloration, the term was used by E. Reeser.)

Isomelism was once regarded as highly significant, but its importance has since been disputed. Scholars at first interpreted it as a product of conscious compositional procedure: either as a means of 'symbolizing' isorhythmic structures, and hence clarifying them (Bessler), or simply as a device which could be inserted in order to mark off isorhythmic sections (Bukofzer, Eggebrecht, Reichert). At the other extreme, Sanders regarded it as a mere by-product of motet composition. More recently, an intermediate view has gained acceptance (see Finscher and Laubenthal).

The majority of melodic connections within motets involve variation rather than strict repetition. It does not seem in such cases that a calculated decision has been made; however, the decision has been not for identity, but against it. In other words: the compositional procedure for the upper parts involves working out certain passages a number of times using variational techniques: the basic contrapuntal outline remains the same each time because of the construction of the tenor part. This is particularly clear in the case of panisorhythmic motets, because of their especially narrow pre-compositional constraints. The technique of variational changes at the openings of successive taleae and colores (which originated either in England or in the Ciconia circle) can therefore be seen as a means of avoiding similarity between sections. In this way it is comparable to certain techniques of cantus firmus coloration (in the sense of diminution).

In some exceptional cases (as in the motetus of *O proles Hispanie*, probably by Ciconia, and in certain works by Du Fay), upper parts do contain precise repetition of melodic material, and here a conscious compositional decision in favour of isomelism may indeed be inferred. Like so many other highly individual techniques used by motet composers between 1400 and 1450, however (including melodic and rhythmic imitation, duet construction etc.), these must be put down to the *subtilitas* of the composer; the intention is not to create a separate compositional genre.

(2) Although the term 'isomelic' normally refers exclusively to upper parts, it has also been used in connection with certain aspects of color construction and hence with the tenor part, notably by Reeser and Reese.

Isorhythm

(from Gk. *isos*: 'equal' and *rhythmos*: 'rhythm').

A modern term applied with varying degrees of strictness to the periodic repetition or recurrence of rhythmic configurations, often with changing melodic content, in tenors and other parts of 14th- and early 15th-century compositions, especially motets. Since its introduction, however, the term has been more widely applied than is warranted, often with conflicting meanings. It belongs to a family of descriptive terms including 'isomel(od)ic' (see [Isomelism](#)), 'isochronous', 'isosyllabic' and 'isometric'; for 'isoperiodic' and 'panisorhythm' (where all voice-parts of a composition participate in rhythmic repeats) see below.

1. Medieval theory.
2. Development of the term.
3. Isorhythmic motets.
4. England, Italy: isorhythm outside motets.
5. Generic status; limits of the term.

BIBLIOGRAPHY

MARGARET BENT

Isorhythm

1. Medieval theory.

No equivalent term was used or needed in medieval theory, which instead used the words 'color' and 'talea'; these now designate tenor melodic and rhythmic units respectively, and are more supple analytical instruments than any single concept of 'isorhythm', although then they were less clearly distinguished (see [Color](#), (1) and [Talea](#)). Johannes de Muris (*Libellus cantus mensurabilis*, ed. in *CoussemaekerS*, iii, 58, with corrections by U. Michels: *Die Musiktraktate des Johannes de Muris*, Wiesbaden, 1970, p.49), among others, applied the term 'color' to the repetition of a rhythmic pattern to different pitches, but added that musicians commonly distinguished 'color' as the repetition of the same pitches to different rhythms and 'talea' as the repetition of the same rhythms to different pitches. This accords both with modern usage and with instructions for tenor repetition in several musical sources, including 'color' for melody in Du Fay's *O gemma, lux* and Billart's *Salve virgo virginum*, and 'talea' for rhythm in *Alpha vibrans/Cetus* (ed. in *PMFC*, v, 1969, no.25 and *CMM*, xxxix, 1965), Ciconia's *Petrum Marcello* and Sarto's *Romanorum rex*. A similar distinction is made by the anonymous vernacular Florentine treatise (ed. in *CSM*, v, 1957, p.56) and the Berkeley treatise of 1375 (ed. and trans. O.B. Ellsworth, Lincoln, NE, 1984, pp.180–81). Most other Italian theorists follow de Muris's near equation of color and talea (Prosdocimus de Beldomandis: *Tractatus practice ... ad modum Ytalicorum*, ed. in

*Coussemaker*S, iii, pp.228–48; Ugolino of Orvieto: *Declaratio musicae disciplinae*, ii, ed. in CSM, vii, 1960).

Johannes Boen (*Ars*, c.1355; ed. in CSM, xix, 1972), perhaps followed by the late 14th-century author of the *Tractatus figurarum* (see [Egidius de Murino](#)), used ‘color’ (‘colorare’) for the division of the tenor melody chosen to be ordered (‘ordinare’, as in the 13th-century ‘ordo’, ‘ordines’) into the rhythmically identical groups now called ‘taleae’. Boen cited specific examples: in Vitry’s *Impudenter circuivi/Virtutibus*, to what we would call the second color (melody) statement ‘the composer applied the same color [rhythmic disposition, what would now be called talea] as before’. (This 30-note tenor is disposed in five six-note ‘parts’ – we should say ‘taleae’ – then the whole melody is repeated in halved values.) Boen also cited *Apta caro/Flos virginum*, likewise with a 30-note color, stated twice: ‘but then he split [the whole 60-note tenor] into three [rhythmic] parts, 20 notes each, and by an identical arrangement preserved beautiful color in the succeeding two parts’. A similar overlapping of color and talea is seen in Machaut’s motet *Fons tocius O livoris/Fera pessima* ([ex.1](#)); another is exemplified by the late 14th-century Anonymous V (*Ars cantus mensurabilis*, ed. C.M. Balensuela, Lincoln, NE, 1994, p.258), also from a surviving motet, *Rex Karole/Leticie pacis* (ed. in PMFC, v, 1986, no.26), whose tenor overlaps color and talea with five 24-note rhythmic statements imposed on two 60-note melodic statements. The same theorist gives *Ida capillorum/Portio nature* as an example of color: the same sounds are repeated but ‘under different figures’ (p.256); the beginnings of these four statements are shown in [ex.2](#). The same tenor is ‘isorhythmic’ in notation but not in result; it is read successively in perfect and imperfect time (i.e. mensural transformation), then again in diminution at the next note-level down, also with mensural transformation. While theorists discussed color and talea mainly with reference to the tenor, contemporary compositions cultivated isorhythmic repetitions (without diminution) in other voices, most clearly in hockets and where the taleae join, and in some cases consistently in all parts, for which Apel used the term ‘panisorhythm[ic]’ (1955, pp.139–40). None of the theorists’ examples, of which this is a virtually complete list, is panisorhythmic; their tenor plans differ, and there was no single isorhythmic paradigm. Theorists and musical repertory alike show more interest in cultivating variety than identity.

Isorhythm

2. Development of the term.

The German word *Isorhythmie* was coined by Friedrich Ludwig in 1904 (*SIMG*, v, p.223) to describe exact rhythmic repeats, to different melodies, in the 13th-century motetus part of *On parole/A Paris/Frese nouvelle* (F-MOf H196, no.302, 368v–369v; ed. Y. Rokseth: *Polyphonies du XIIIe siècle*, Paris, 1935–9, and in RRMMA, ii-viii, 1979). He next applied it in 1910 (pp.444–5), still for the 13th century, to successive phrases of equal length but not necessarily the same rhythm, a phenomenon whose 14th-century use Besseler (*AMw*, 1926, p.201, n.1) called ‘isoperiodic’ (the German noun is *Isoperiodik*), meaning that ‘the upper voices only follow the plan of the lower voices in a general way or have merely a few bars rhythmically identical in each Tenor period’ (Günther, *MD*, 1958). Isoperiodicity, unlike isorhythm, cannot survive diminution of the overall length of a phrase. Sanders developed the idea of modular numbers to represent the periodic construction of motet upper voices bounded by rests (*Grove6*; 1973), sometimes non-coincident, or offset (see also Harrison, *PMFC*, xv, 1980/R). Ludwig (*AdlerHM*) extended the term ‘isorhythm’ to 14th-century repertory on the basis of his work on Machaut and the manuscript *I-IVc*, and it was this sense that Besseler adopted, listing the isorhythmic motet repertory as then known (*AMw*, 1926, pp.222–4), though including many motets with a very weak claim on the definition. Sanders favours defining “isorhythm” in the sense of such rhythmic occurrences in all voices’ (*Grove6*).

The more closely panisorhythm was approached, the higher the generic status became: ‘the Tenor (color) is frequently repeated several times and usually made up of a number of rhythmically identical periods (taleae). If the upper voices also follow this scheme, the composition is an isorhythmic motet’ (Günther, *MD*, 1958, p.29). Thus the term ‘isorhythmic motet’ came to denote a distinct and more exalted genre cultivated from the 1310s to the 1440s, irrespective of scale, text or occasion.

Modern analytic formula notations have been devised to summarize isorhythmic motet structures. The systems of Besseler (1926), Reaney

(CMM, xi, 1955–76, xviii), de Van (CMM, i/1, 1947) and Günther (CMM, xxxix, 1965) do not indicate color, color-talea relationships or the extent and nature of diminution. Apel (1955) adopted a simpler system to indicate color-talea relationships in the tenor only, which is likewise incomplete (see Turner, *MAN*, 1991). Such systems can convey overall proportions but not, or not so readily, the mensural transformations that cause them or new rhythmicization of the second color, let alone the extent of isorhythm in the upper parts. Varying combinations of letters and numerals, sometimes illogical or inconsistent, are used by editors to mark these events in the scores. Principal parallel events can be aligned, as Ludwig did in his Machaut edition; and although such layout still cannot represent overlaps and displacements, it can help the modern reader more effectively than most formulae. The analyst must consult not only editions (with their pitfalls for the unwary) but often also manuscripts. The repertory's resistance to standard formulations belies the widespread modern notion of a strict and uniform 'isorhythmic' principle.

Isorhythm

3. Isorhythmic motets.

From the start, motets were shaped by tenor repetition. Short repeating rhythmic-modal units (*ordines*; see [Rhythmic modes](#)) in 13th-century pieces are occasionally superimposed on non-coincident melodic units. Despite such repetitions, the status of 'isorhythmic' is now usually reserved not for the 13th-century repertory that prompted it (see the exclusions by Sanders, *Grove6*) but for later motets where such repetition extends to parts other than the tenor (Günther, *MD*, 1958), or to more ambitious schemes of a kind of 'developing variation'. Besseler cited *Se je chante/Bien dois/Et sperabit* (*F-MOf* H196, no.294) as the earliest instance involving all voices in rhythmic recurrence in the hocket passages, but without regular tenor patterning (see Sanders, *Grove6*, esp. ex.2). Upper-voice correspondences were hardly present in the 13th century, but rapidly increased in the 14th, first in hocket sections and around talea joins (see [ex.1](#)). In the 14th century tenor units often became longer, and repetitions more systematic and more adventurous. The rhythmic innovations of the French *Ars Nova* enabled upper-voice micro-relationships to mirror the more sustained tenor durations that undergirded the structure, but no single new principle emerged that was neither anticipated in the 13th century nor extended in the 15th.

Of over 100 surviving 14th-century motets, only 15 are panisorhythmic. Many others (including some by Machaut and in *I-IVc*) have at least tenor isorhythm; many have extensive upper-part isoperiodicity and some exact isorhythmic repetition, especially in hockets, around talea-joins and in diminution sections (see [ex.1](#)). Before about 1350, panisorhythm occurs only in Machaut's *Amours qui ha le povoir Faus Samblant/Vidi Dominum* (no.15) and in four motets in *I-IVc*. Early datings in the 1310s have recently been suggested for some motets with upper-voice isorhythm and precocious features of notation (Leech-Wilkinson, 1995; Kügler, 1997, chap.3; see [Vitry, Philippe de](#)). Günther argued from statistics of survival and characteristics that 'the [isorhythmic] motet with its long tradition as an art-form of the first rank has had to give way [around 1400] before the more modern polyphonic song' (*MD*, 1958, p.47). This view of a declining genre

is superseded by Allsen's listing (1992) of 134 mostly panisorhythmic motets (including fragments) from the first half of the 15th century. Among the better-known composers of altogether nearly 250 'isorhythmic' motets are Vitry, Machaut, Ciconia, Dunstaple and Du Fay; many motets are anonymous, including 40 in *I-Tn* 9 (from Cyprus). Other principal manuscript repositories include the *Roman de Fauvel* (*F-Pn* fr.146; 34 motets), *I-IVc* (37), the Machaut manuscripts (23), *F-CH* 564, the Old Hall Manuscript (*GB-Lbl* Add.57950), *I-Bc* 15 and *I-MOe* X.1.11. (see [Sources, ms, §§V, VII and IX, 1–3](#)). These approximate figures for the repertory need adjustment to take into account different modern understandings of isorhythm; in addition, isorhythmic mass movements and many anomalous or non-isorhythmic motet forms should be considered. It was in the first half of the 15th century, and not in the 14th, as is generally believed, or in the 13th, for which Ludwig first coined the word, that the cultivation of rhythmic identity had its brief and major flowering.

Color and talea can be manipulated in many combinations. Usually there are several taleae within a color. Sometimes melodic and rhythmic units are overlapped (as in *Rex Karole* and several of Machaut's motets; see [ex.1](#)). Some motets present subsequent statements of the color in the same rhythm; others challenge an isorhythmic classification by presenting the repeats in mensural transformation and/or diminution. In [ex.2](#), taleas I and III are read in perfect modus; II and IV interpret the same notation in imperfect modus and therefore do not have the same rhythmic results; the first two statements in [ex.3](#) are likewise distinguished from the third; [ex.5](#) achieves the 'same' results but counted out in different, accelerating mensurations. In [ex.2](#) taleas III and IV are read in diminution; [ex.4](#) has a written-out diminution to which mensural transformation is also applied. In [ex.3](#), the first statement is in augmentation in relation to the last (notated). The second color is sometimes not even a diminution of the first but independently rhythmicized and with its own separate set of internal repeats (though such distinctions are now rarely made). Occasionally, tenors are presented in retrograde. Machaut's motets with irregularly repeating song tenors have not normally been counted as isorhythmic; nor have extreme cases of mensural transformation (such as *Inter densas/Imbribus*, see Bent, 1992), though slight deviations due to the same principle have often been overlooked in motets commonly classified as isorhythmic.

Isorhythm

4. England, Italy: isorhythm outside motets.

Although the isorhythmic motet has usually been considered mainly a French phenomenon, Sanders draws attention to numerous early English instances, unknown to Ludwig and Besseler, that form an important background to the wide variety of motet styles in 14th-century England (ed. in PMFC, xv, 1980/R); about 25 have some form of tenor isorhythm (Sanders, *Grove*6; 1973). The Old Hall Manuscript applies French techniques to diversely 'isorhythmic' works; its later motets settle to a panisorhythmic English tripartite design (Allsen, 1992, chap.4), best known from Dunstaple (Bent, 1981, chap.4; see [ex.3](#)).

The earliest Italian uses of rhythmic repetition are not in motets but in madrigals: Landini's *Si dolce non sonò* (in praise of Vitry) and Lorenzo da Firenze's *Povero zappator*, in which short units are immediately followed by their own diminutions and the resulting larger patterns are repeated. Only after 1400 did isorhythm enter the Italian tradition of ceremonial and occasional motets (Bent, 1992; Allsen, 1992, chap.3). In each half of Ciconia's motet *Petrum Marcello* the tenor follows the undiminished form immediately with its diminution, while in two other motets Ciconia makes the second half an undiminished rhythmic replication, in all voices, of the first. The tenor of his *Doctorum principem* is read in three different mensurations, and is therefore not isorhythmic in result. In both the Italian and English repertoires rhythmic repetition takes its place among a wide range of techniques less well served by the criteria developed largely for French repertory.

Various forms of isorhythm also appear in other French genres, including Machaut's ballade *S'Amours ne fait* (no.1, before 1350) and in three rondeaux in the late 14th-century Chantilly manuscript (*F-CH 564*) by Matteo de Sancto Johanne (*Je chante ung chan*), Haucourt (*Se doit il plus*) and Vaillant (*Pour ce que je ne say*), as well as in the 15th-century English

goliardic-texted drinking song *O potores* in *GB- Lbl* 3307. A few 14th-century mass movements (notably Machaut's) employ some form of isorhythm, and around 1400, especially in England, isorhythmic principles of various kinds and strictness are applied to mass movements, separately or in cyclic combination.

The formal expansion enabled by 14th-century notational advances is paralleled by the 15th-century extension of the principles and spirit of these structuring techniques to the related movements of mass cycles, and to extended motet or antiphon compositions, often in several proportioned sections, articulated by mensural change, vocal scoring and isorhythm. It is hard to establish boundaries for the concept of isorhythm within the evolution of these large forms; there is an ongoing body of music governed by mensurally, proportionally or rhythmically (but not necessarily isorhythmically) structured tenors or sections, representing the evolution rather than the cessation of a tradition (Dammann, *AMw*, 1953; Brothers, *JAMS*, 1991). Some of Du Fay's grandest motets of the 1430s have only a single talea per color, which precludes intra-sectional upper-part isorhythm, thus calling their isorhythmic credentials into question.

Indeed, the cyclic mass extends principles of rhythmic unification and proportioned sections defined by mensuration change to Ordinary cycles on a single cantus firmus. The movements of Dunstaple's *Jesu Christe Fili Dei* are related to each other by tenor isorhythm; in addition, each surviving movement is internally isorhythmic, with two cantus firmus statements, the second in diminution, each with its own proportioned (but not isorhythmic) perfect-imperfect time change. The anonymous 'Caput' Mass has tenor identity between all movements, but two differently rhythmicized statements of the cantus firmus in each, respectively in perfect and imperfect time. Dunstaple's Mass *Da gaudiorum premia* and Power's *Alma Redemptoris* Mass likewise have tenor identity between but not within movements, with change from perfect to imperfect time; the length of non-tenor duets varies among movements. *Rex seculorum* presents a differently rhythmicized version of the same chant in each movement, but retains the same chant divisions between perfect and imperfect time sections. The movements of Du Fay's *Missa 'Se la face ay pale'* are unified by single or multiple isorhythmic statements of the cantus-firmus, and by carefully controlled proportions. On the isorhythmic status of such cases, as on the cantus-firmus based sectional motets and antiphons of the later 15th century, opinion remains divided.

Isorhythm

5. Generic status; limits of the term.

The emphasis on identity has fostered a view of the isorhythmic motet as a rule-bound monolith, whence it became the prestigious and defining genre of the French Ars Nova, to the detriment of the varied range of motet strategies both covered by and excluded from it: 'the grandiose manifestation of the speculative medieval view' (Dammann, *AMw*, 1953, p.16). It was precisely during the period (1920s to 50s) when serialism was introduced and evolved to total serialization that medievalists rejoiced in uncovering a validating intellectual construct which, in its purest form, could account for every note of compositions. In the 20th century composers

including Birtwistle, Maxwell Davies, Wuorinen, Messiaen and Berg used isorhythm (see Kügle, *MGG2*).

Number and proportion have been stressed as guiding principles of motet construction and isorhythmic diminutions (Sanders, 1973; Trowell, *PRMA*, 1978–9; Bent, 1990; Bent and Howlett, 1990; Brothers, 1991; Turner, 1991; Bent, 1992; see also [Du fay](#)). Combinations of numbers, structural features and allusions remain the basis for identifying linked pairs or groups of motets (whether by the same or, as homage or competition, different composers) and numerous instances of allusion and play in which one motet acknowledges another (such as the series of ‘musician’ motets, mostly ed. in PMFC, v and xv, the Marigny motets, in *F-Pn* fr.146; see also Leech-Wilkinson, *PRMA*, 1983; Allsen, 1992, chap.6; Kügle, 1997, chap.3). The combination of mensural transformation and proportional diminution mentioned above in *Ida capillorum/Portio nature* (see [ex.2](#)) is also conspicuous in the Credo *Omni tempore* (Bent, 1990). But further examination shows that most such diminutions, and any irregularities of result, are due to a mensural strategy with proportional consequences, proportions that may indeed be deliberate and reflected in other quantifiable aspects of the motet, such as textual elements. In the 14th century diminution (see [Diminution, §2](#)) was defined not (as is now usual) by numerical proportion, but as the substitution of the next lower note value, which may produce an asymmetrical relationship; the resulting proportion, regular or irregular, is a consequence of this, not the cause. For example, *Humane lingue/Supplicum voces* (PMFC, xv no.36; see [ex.4](#)), presents the tenor color first in normal values (in imperfect modus, perfect tempus) then in written-out diminution (in perfect tempus, minor prolation) at the next level down. This produces different results: the perfect-time notes take a third of their former value, the imperfect (coloured) half.

Recent work challenges the continuing appropriateness of the term ‘isorhythmic motet’ in the face of increasingly refined analyses, new repertoires and anomalous forms marginalized as motets mainly because they are not ‘isorhythmic’ (Bent, 1992; Kügle, 1997, chap.3). A more neutral general term, or a repertory of specific terms, would suit a fuller range of structuring techniques. Several procedures commonly subsumed under ‘isorhythm’ do not, or do not necessarily, produce rhythmic identity; these include:

(i) newly rhythmicized second color statements (as in *Vos/Gratissima, Firmissime/Adesto, Douce/Garison*);

(ii) mensural transformation of a color repeat. Such transformation between perfect and imperfect relationships will not always result in the ‘different’ rhythms of [exx.2](#) and [3](#), depending on the permutations and note-values actually used. The same notation and the same process may produce either the same or different results; it is therefore wrong to classify all such cases as isorhythmic, and artificial to segregate differing outcomes generated by the same procedure. Some such transformations have been loosely classified as diminutions because the tenor notes become progressively shorter; but as in *Sub Arturo plebs* ([ex.5](#)), an imperfect long whose breves successively contain nine, six and four minims is still an undiminished but mensurally transformed long in each statement. The

resulting proportions are contrived by mensuration signs and named in the motetus text as 'twice by hemiola'. This tenor is strictly isorhythmic, not because of its transformative process, but only because it avoids shorter note values that would have been subject to alteration and imperfection thereby producing different rhythms.

(iii) diminution of a color repeat. This involves the substitution of a note of the next level down, a breve for a long, etc.; such diminution can be applied mentally, or it can be written out. When duple and triple relationships are reflected in the diminution process, the resulting rhythms are indeed the same (isorhythmic), and the result is, for example, 'by half', as indeed some theorists say. But if those duple and triple relationships shift, or if successive statements invoke different mensurations with different applications of alteration and imperfection, their relationship can no longer be properly described as isorhythmic.

Mensural transformations and diminution can each produce the same or slightly or extremely different internal rhythmic relationships; on the other hand, apparently slight differences may result from new rhythmicizations of the color, while some deceptively extreme mensural essays (such as *Inter densas/Imbribus*) derive from the same notation, as can retrograde forms and canons. To create an isorhythmic/non-isorhythmic distinction within the conflated categories of mensural and diminutional transformation obscures fundamental differences between these categories, as does modern notation. Only exact repetitions with no change of mensuration and no diminution can reliably, if trivially, meet isorhythmic criteria; other repetitions may only do so by virtue of constraints such as the avoidance of variable note values. In addition, an isorhythmic classification privileges one particular kind of periodic repetition at the expense of melodic and verbal craft, all of which are interrelated in complex and varied ways; it subordinates the artistic cultivation of variety, difference and displacement, such that these are noted negatively, as absence, irregularity or incompleteness of isorhythm. Composers and theorists throughout the period cultivated variety rather than uniformity: almost every motet of the period is a unique essay in difference not identity. As a descriptive term of limited application, isorhythm is unproblematic; but as an overall validating name for a genre, it is ripe for reconsideration.

Isouard, Nicolò

1. Life.

Isouard was baptized John-Joachim-Edward-Nicholas. As a composer he often used the names Nicolas or Nicolò de Malte. His father, Fortunato Isouard Xuereb, was a merchant and secretary to the government storehouses, married to Elena Maria Lombardo. Constant Campion, Commander of the Maltese Order of Knights, financed Nicolas's first stay in Paris and education at the Pensionnat Berthaud, a preparatory school for the Engineers and Artillery, where he learnt Latin, drawing and mathematics, and the piano with Pin. The Revolution forced him to leave France in 1790, and back in Malta his father placed him in a merchant's office. He played the piano in society with success and studied counterpoint with Michelangelo Vella and Francesco Azzopardi, who were both associated with the Neapolitan school. On 10 November 1791 Vincenzo Anfossi (brother of the composer) became organist at the church of St-Jean-de-Jerusalem in Malta, and Isouard became his assistant. But, soon after, he was sent by his father to Palermo as a merchant's assistant where he studied composition with Giuseppe Amendola; later, in Naples, he worked for the German bankers Cutler and Herzelin, completing his

composition studies with Sala and, thanks to Princess Belmonte's recommendation, with P.A. Guglielmi.

Early in 1794 Isouard's début as a composer took place in Florence with the opera *L'avviso ai maritati*, which was enthusiastically received and later given in Lisbon, Dresden and Madrid. From this time, he abandoned commerce and called himself Nicolò de Malte in order not to compromise his family. His next opera was *Artaserse*, commissioned by the singer Senesino; it was produced with success in Livorno. The Grand Master of the Maltese Order of Knights, Rohan, commissioned a mass from Isouard (dated January 1795), and in November or December of 1795 Isouard was received as Donatus of the order. On the death of Vincenzo Anfossi in January 1796 he was appointed organist of the church of St-Jean-de-Jerusalem. During this time he wrote his sacred works, but also composed Italian operas (some of them based on French plays) for the Maltese theatre. In July 1797, the impresario Rosario di Majo sent him to Naples, where he persuaded the singer Paolo Febraro to come and work in Malta. Following the French invasion in June 1798, Isouard and his father collaborated with the French; three months later General Vaubois appointed Isouard commissioner of the Théâtre Manoel, and when the surrender was signed in September 1800 he took Isouard with him back to Paris. *Le petit page*, Isouard's first Parisian *opéra comique*, was given in the Théâtre Feydeau on 14 February 1800, and was composed in collaboration with Rodolphe Kreutzer. Their second collaboration, the serious opera *Flaminius à Corinthe* (1801), was a failure, but Isouard had success in the same year with *Le tonnelier* and the French translation of *L'improvisata in campagna*. His collaboration with the librettist E.J.B. Delrieu and his friendship with F.B. Hoffman influenced his sense of lyric drama, and he secured his first great success in 1802 with *Michel-Ange*, to a libretto by Delrieu.

Isouard's easy sociability, together with his membership of the freemasons, probably helped him make his way in Parisian society, and his mercantile experience led to the formation of the publishing concern Le Magasin de Musique (5 August 1802) with Cherubini, Méhul, Rode, Kreutzer and Boieldieu. Intended to further the works of its co-founders, it survived until 1811, although Isouard retired from the association in 1807, and published some of his own works. After his death his widow (under the name Veuve Nicolo) assured the distribution of his compositions and arrangements before ceding the collection to Troupenas in 1825. His collaboration with the librettist C.J. Etienne, editor of the *Journal des deux mondes*, began with *Un jour à Paris* (1808). In 1810 they produced the biggest financial success of this period at the Opéra-Comique with the fairy-tale opera *Cendrillon*, which imitated Grétry's *Zémir et Azor* with its moral subject based on mistaken appearances, the transformation of Cendrillon (like Azor) and the rose as a symbol of beauty. This success reconciled Isouard with his father, who came from Malta for his son's wedding to Claudine Berthault (b 1785) on 11 January 1812.

Isouard's creativity was stimulated by the return in 1811 of his chief competitor, Boieldieu, from eight years in Russia. In his later works Isouard showed extraordinary power of expression, which the levity and rapid composition of earlier operas had not admitted. When Boieldieu was

elected to the Institut de France in 1817, however, Isouard broke off relations with his old friend, and they were still unreconciled when Isouard died the following year. His opera *Aladin* was completed by Benincori, who himself died before the première on 6 February 1822.

Isouard's daughter Ninette (1814–76), known as Ninette Nicolò, was a pianist and composer, mainly of songs. His brother Joseph-Alexandre-Victor-Antoine-Calcédoine-Jacques-Emmanuel Isoiar (1794–1863) was a tenor in *opéra comique* in France and elsewhere in Europe, afterwards (1825–33) becoming a director of theatrical companies in Lille, Ghent, Rouen, Nîmes and Toulouse.

[Isouard, Nicolò](#)

2. Works.

Isouard's style is defined by his sense of declamation, the predominance of dance forms, occasional harmonic boldness (always for expressive ends), essentially syllabic ensembles with rapid parlando and repetition of phrases; his finales are in general less well-organized than those of Dalayrac or Boieldieu. From *Cendrillon* onwards his writing combines vocal virtuosity with a search for greater expression. His most striking trait is the way in which he matches in music the sense and tone of the words, as, for example, in *Michel-Ange* where an instrumental chromatic descent accompanies Pasquino as he falls asleep (no.7), or in *Cimarosa* (entr'acte) where the orchestra paints the night calm, snoring and the beginning of a fire.

L'intrigue aux fenêtres, created from a *jeu de scène*, and *L'une pour l'autre*, called a 'comédie d'intrigue' in the score, recall the origins of *opéra comique* in spoken theatre and this is further suggested by Isouard's use of melodrama techniques in much of his work. He often draws on situations linked directly with music. For example, *Cimarosa* depicts the sound of a piano (no.1), the composer searching for a melody and imitating various instruments (no.3), a performance class (no.4) and the bravos of the public and the whims of performers (no.5). *Lully et Quinault* presents the composer imagining the staging of his work (no.4). In the interests of verisimilitude Isouard also used pre-existing material, for example, an air by Lully (*Lully et Quinault*, no.4), or Quinault's words (*Armide*, Act 5). To create a sense of mystery he called on the glass harmonica (*Magicien sans magie*, no.10) and the celestial playing of the piano (*Aladin*, no.11); offstage and onstage music were also used to great effect. The musical portrayal of characters or emotions and the adaptation of musical style to situation become crucial: in *Cendrillon* the coloratura of the coquettish sisters contrasts with the syllabic declamation of the true and simple feelings of Cendrillon and Alidor; Cendrillon's singing of a popular air ('Il était un p'tit homme') confirms her simple character. Isouard often used specific styles and instruments to connote the setting, as for example in *Joconde*, in which, 50 years before Gounod in *Mireille*, Isouard created a Provençale local colour: a musette, introduced in the overture, is taken up again as a ritornello (no.12) and developed in the finale; a drone effect is created (nos.4, 10, 17); jingles and tambourins are used; the oboe and horn suggest a pastoral setting in the *couplets* (no.4) where an 'oboi soli in guisa de Boscarescchia' is called upon in the minor section. The *fête* at the

end of Act II (no.9) of *Jeannot et Colin* seems to have been inspired by the onstage music with three orchestras in Mozart's *Don Giovanni*, and prefigures the vast polychoral constructions of the *grands opéras* of Rossini and Meyerbeer. The characters of the three quadrilles, les Bergères in 6/8 (A), les Basques in 2/4 (B) and les Troubadours in 2/4 (C), are defined musically and instrumentally as they succeed and combine with each other in the design *A B AB C ABC*.

Isouard's published scores provide remarkable glimpses of performance: he indicates with diagrams the precise position of the characters on stage and fixes tempos with Maelzel's metronome (see, for example, *Les deux maris, L'une pour l'autre*). Paradoxically, although criticized at first for his Italian style, his music represents ultimately one of the most important contributions to the determining of a final form for French *opéra comique*, balancing spoken comedy and opera, grace, spirit, emotion and will. This established him as the successor to Grétry, whose example he actively looked to follow in *Jeannot et Colin*, and Monsigny.

Isoz [d'Isoz], Kálmán

(*b* Budapest, 7 Dec 1878; *d* Budapest, 6 June 1956). Hungarian musicologist of French descent. After qualifying at the Budapest School of Commerce (1895) he became a bank clerk and started studying music

seriously, learning the piano and theory at the Budapest Conservatory (1895–9) and the flute privately. He joined the staff of the Hungarian National Museum (1897), of which he subsequently became general secretary (1920–24), and in 1908 began a course (interrupted by war service, 1914–18) at the arts faculty of Budapest University, where he took the doctorate in 1921 with a dissertation on the notation of the Pray Manuscript. Having served for ten years as principal librarian of the Széchényi Library (1924–34), where he organized the music department, he became secretary of the Hungarian Royal Academy of Music (1934–43) and co-editor, with Bartha, of *Musicologia Hungarica*. In 1928 he organized the Hungarian section of the International Music Exhibition at Frankfurt, and in 1936 lectured at the Bayreuth Liszt Festival.

Isoz was one of the leading Hungarian musicologists of the early 20th century, producing invaluable studies of early 19th-century Hungarian music and musicians, musical life in Hungarian cities, the history of Hungarian music publishing and instrument making, and of Liszt's associations with Hungary. As a librarian he established modern methods of music bibliography in Hungary; he also contributed extensively to periodicals and newspapers, and to the *Zenei lexikon*.

Israel.

Country in the Middle East. The history of the Jewish people was dominated by the traumatic destruction of the Second Temple (70 ce) and the dispersal of the majority of Jews in the Diaspora. Longing for a return to the Holy Land became a basic tenet in Jewish faith. Religious devotion, persecutions and the emergence of a Jewish national movement in the late 19th century triggered successive immigration waves of Jews to Palestine, beginning in 1880. The Jewish community of Palestine, referred to as the *Yishuv* ('Settlement'), was culturally autonomous both under Ottoman rule (until 1918) and under the British mandate until the foundation of the independent state of Israel in 1948.

Israeli society has always been dominated by the ideological call to return to the Eastern biblical roots of the nation and to act as a melting pot, contrasted with internal pressures to preserve the heritage of the diverse Jewish ethnic groups, including the performance and study of classical Western repertory. Music played a role in bringing people together, whether for active participation in choirs, bands and folk singing, or as concert audiences. The deliberate revival of Hebrew as a modern language of communication was their most powerful unifying tool, and vocal music was encouraged as a potent device for disseminating the use and the correct accent of the language among immigrants. Lacking a common tradition of folksong, amateur and professional composers turned to inventing a new tradition of Hebrew songs in the hope of their dissemination among the people. Jewish communities of ancient Sephardi, or Middle Eastern, descent comprised expanded families that settled together, leading a mutually supporting cultural and religious life around their synagogue, with daily services and family events providing ample opportunities for music-making. By contrast, most European, or Ashkenazi, Jews immigrated as individuals or in nuclear families, and socialized through the Western institutional model of public concerts. Processes of acculturation ranged from complete compartmentalization to syntheses of traditions.

1. Before 1948.

(i) 1880–1918.

The number of Jews in Palestine under the Ottomans grew from 8000 in 1839 to 80,000 on the eve of World War I. A small, strictly religious

community, known as the 'Old *Yishuv*', settled in the 'holy towns' of Safed, Tiberias, Jerusalem and Hebron. The first waves of religious immigration of Jews from the Yemen, and of nationally motivated immigration from Europe, mostly from Russia, arrived in the 1880s. Musical activity started with the first amateur communal orchestra in the settlement of Rishon Le-tsiyon (leZion; 1895), soon emulated in most other settlements as well as in Jerusalem and Jaffa under the auspices of Agudat Kinnor Tsiyon ('The Violin of Zion Society'). Their repertory consisted of light classics, marches and arrangements of Jewish folksongs. The Jews became the largest ethnic group in cosmopolitan Jerusalem, where limited musical activity was conducted within small cultural enclaves such as the private homes of diplomats or among such religious groups as the Templars.

In January 1907 the cantor and scholar A.Z. Idelsohn (1882–1938) settled in Jerusalem and conducted pioneering ethnomusicological research among the numerous local Jewish ethnic groups there, using a cylinder phonograph. His goal was to define the common elements of Jewish liturgy that might reveal the heritage of the Temple. His study of the Yemenites culminated in the first volume of his *Thesaurus* (1914). He was also active as a teacher and choral conductor.

Tel-Aviv was founded in 1910 as the Jewish suburb of Jaffa, and in the same year the singer Shulamit (Selma) Ruppin (1873–1912) founded the first music school in the country. Basing its curriculum on that of the traditional German conservatory, it served as a model for other music schools, with violin, piano and voice classes, a student orchestra and choir and ear training classes. World War I had disastrous consequences for the small Jewish community, and musical life was halted.

(ii) 1919–30.

With the establishment of British rule, Jewish immigration resumed, mostly from Russia and Poland. Tel-Aviv became a vibrant urban cultural centre, with fine professional musicians settling in the country. But many imaginative initiatives soon ran aground because of the unstable economy. The conductor Mark Golinkin (1875–1963) initiated in 1923 the Palestine Opera, which performed operas by Verdi, Rossini, Meyerbeer, Anton Rubinstein and others in Hebrew translation, strongly supported by the literary Jewish élite. With fine singers but a deficient orchestra, the Opera performed for capacity audiences in dreary cinemas; lack of funds forced its closure in 1927. In 1925 the conductor Max Lampel had started a short-lived monthly series of outdoor symphonic concerts.

In 1924 Joel Engel (1868–1927), who had founded a Society for Jewish Folk Music in St Petersburg in 1908, made Tel-Aviv the centre of his Niggun society, active mostly in the low-cost publication of hundreds of arrangements of Jewish folksongs from eastern Europe. Music societies in Tel-Aviv and Jerusalem cultivated small audiences for chamber music. The Jerusalem Musical Society, founded in 1921 by the British-born cellist Thelma Yellin and her violinist sister Margery, formed the first professional string quartet in the country and sponsored high-standard chamber concerts in Jerusalem for 15 years. Music critics, especially David Rosolio and Menashe Ravina, published detailed reviews in the daily press, insisting on high standards of performance. The European Classical-

Romantic canon soon came to dominate concert programmes, delegating the light classics to a secondary position.

Composition was concentrated on the invented folksong, with new art music limited to a handful of works, notably the first Hebrew folk opera, *The Pioneers* (1924) by Jacob Weinberg (1870–1958). The dominating spirit of socialism spearheaded by the idealistic kibbutz (communal village) movement and the idealization of agricultural pioneer work were the backdrop for the Institute for the Promotion of Music among the People, which sponsored lectures, workers' choruses and courses for choral conductors all over the country. The economic depression of the late 1920s and the deterioration of Arab-Jewish relations in 1929 dealt a heavy blow to these frail initiatives.

(iii) 1931–48.

The rise to power of Nazi and fascist regimes in Europe provoked a large wave of immigration from Europe. The Jewish population more than doubled, to 445,000, with well trained and musically committed immigrants from central Europe immediately taking the lead in musical life, both as professional musicians and as a highly discerning and demanding audience. In October 1933 the violinist Emil Hauser, former first violinist of the Budapest Quartet, settled in Palestine and founded the Palestine Conservatory, which again emulated the German model, with a staff of 33 teachers of most instruments, as well as classes in theory, music history, composition and music education. In March 1936 the British administration established the Palestine Broadcast Service (PBS), transmitting on one channel and shifting daily from Arabic to Hebrew and then to English programmes. The small and under-funded music department was run by British and Jewish musicians, with relatively large slots for live music from the studio. The studio ensemble soon expanded into the radio orchestra and stressed performances of Jewish and locally written new compositions.

The major event of the 1930s was the founding of the Palestine Orchestra. Conceived by the violinist Bronisław Huberman (1882–1947) as a visionary, multi-faceted musical centre situated in the fresh East in response to what he had regarded as the decline of the West, it soon turned into a salvage operation for the finest Jewish musicians who had lost their positions in some of the best orchestras of central Europe. Huberman supervised and financed most of the operation. Inaugurated in December 1936 as a powerful anti-Nazi protest under Toscanini, the Palestine Orchestra maintained high standards from its inception, performing with the finest international conductors and soloists for capacity subscription audiences. Members of the orchestra formed chamber ensembles, such as the Israeli Quartet, that preserved the central European chamber-music tradition with regular series in intimate halls, such as the old Tel-Aviv Museum. The founding of the orchestra completed the stratification of musical life in the Yishuv.

More than 40 well trained composers came to Palestine during this period. They had not known each other before immigration, and did not constitute any cohesive school. Foremost were Stefan Wolpe (1902–72), Paul Ben Haim (1897–1984), Erich Walter Sternberg (1891–1974), Josef Tal (b 1910) and Marc Lavry (1903–67), all trained in Germany, and A.U.

Boskovitch (1907–64) and Verdina Shlonsky (1905–90), who had received most of their training in Paris. Menahem Avidom (1908–95) and Mordecai Seter (1916–94) came to Palestine at a young age, but received their advanced training in Paris. Slightly younger composers, such as Haim (Heinz) Alexander (b 1915), halted their studies in Germany and completed them in Palestine. The Palestine Orchestra provided an incentive for symphonic works, such as Lavry's *Emek* (1936), eulogizing the pioneers through the insertion of the *horah* folkdance into a symphonic poem, or Sternberg's large-scale *Twelve Tribes of Israel* (1938), in which he transplanted the high pathos of the late Romantic German style to express his identification with Jewish history. Other important compositions were Ben Haim's *Variations on a Hebrew Tune* (1938), based on the Arab melody that had been turned into the folksong *My Motherland, the Land of Canaan*, and Wolpe's *Dance in a Form of a Chaconne* (1938), which boldly combines *horah* rhythms with a strict chaconne pattern and atonal harmony.

The bold and innovative Wolpe felt alienated in the traditionally inclined local musical community and emigrated to the USA in 1938, but all the other composer immigrants overcame the resettlement trauma and stayed. In 1938 Sally Levi, a dentist and amateur composer, initiated the World Centre for Jewish Music, which started a huge network of correspondence with Jewish musicians, published a single issue of *Musica hebraica*, and sponsored performances, most notably of Bloch's *Sacred Service*, until the outbreak of World War II stopped its activities. The intense compositional activity led to the creation of ACUM, the performing rights society, founded in 1936 and officially registered in 1940. The Academy of Music in Tel-Aviv opened in 1944.

During World War II the country was nearly cut off from the outside world, but concert life continued, with local musicians substituting for international conductors and soloists, and with the composition and performance of such key works as Ben Haim's *First Symphony* (1940), Mordecai Seter's cantata *Sabbath* (1940), Boskovitch's *Oboe Concerto* (1943) and *Semitic Suite* (1945), and Lavry's opera *Dan the Guard* (1945). Founded by the American singer Addis de Philip in 1948, Israeli opera survived for 30 years, marred by chronic economic and personal difficulties.

[Israel, §I: Art music](#)

2. East–West encounters.

An East–West dichotomy dominated many aspects of musical life. National ideology demanded rejection of the European Diaspora and called for the revival of the ancient roots of the Jews in the East. However, there were few who insisted on a total rejection of the Western musical heritage; the chief argument was between those searching for a West–East synthesis and those upholding the value of individual freedom of expression. Idelsohn's bold endeavour triggered respect and even a romanticization of ethnic traditions, especially that of the Yemenite Jews, among Western musicians. But the lack of training in ethnic interaction, and the economic pressures on the immigrant musicians to make ends meet, hindered most attempts to reach out to the East, and left the core of the problem – the lack of compatibility between the two musical worlds – unresolved. Eastern

elements in most early compositions were transplants of Russian orientalism or French exoticism.

Deliberate East–West contacts started in the 1930s almost simultaneously from both directions. A few fine musicians of Middle Eastern origins brought ethnic Jewish and Arab traditions to Western audiences through concerts and radio programmes. The Yemenite singer Brakha Tsefira (Bracha Zefira; 1910–90), raised as an orphan by foster families of different Eastern ethnic groups, from whom she absorbed diverse oral traditions, started an international career in 1930 with the improvising pianist Nahum Nardi, while collecting by memory further traditional songs. In 1939 she turned to most of the immigrant composers and commissioned arrangements, which she performed with members of the Palestine Orchestra on European instruments, as well as with piano, disregarding intonational clashes. The Iraqi-born 'ud player and composer Ezra Aharon (1903–95) was a member of the Iraqi Royal Band. In 1932 he participated in the Cairo conference of Arab music, where he met the ethnomusicologist Robert Lachmann (1892–1939); they continued to collaborate after their settlement in Palestine. Aharon was head of the Arab music ensemble of the PBS, and he also experimented in playing with members of the radio orchestra. The Yemenite Sarah Levi-Tanai was a singer, composer and choreographer who brought Yemenite traditions to the stage, culminating in her dance work *'Inbal* (1948).

The gap left by Idelsohn's emigration was filled by Lachmann, who conducted an intensive recording and research project, continued and much expanded after his early death by the ethnomusicologist Edith Gerson-Kiwi (1908–92).

The composer A.U. Boskovitch presented a well articulated ideology based on the dialectics of time and place. He regarded the Israeli composer as a representative of the collective, one who should strive for a new national style based on what he called 'static' and 'dynamic' landscapes, referring to the vocal rhetoric of Sephardi Hebrew and of Arabic. Stressing the regional culture rather than Jewish heritage, he expressed his ideology in the second movement of his Oboe Concerto (1943), in which the oboe emulates the sound of the *zurna* in improvisatory melismas over a three-note string ostinato, and in the *Semitic Suite* (1945), where he imitates the sound and melody of an Arab *takht*.

[Israel, §I: Art music](#)

3. Since 1948.

(i) Ensembles and venues.

The young state of Israel acknowledged the role of music as a powerful social, educational and promotional tool, and the Ministry of Education appointed a High Music Council (later the music wing of the Public Council for Culture and the Arts). The Palestine Orchestra, renamed the Israel PO, was sent on frequent concert tours of Europe and the USA, and fine recitalists were dispatched as cultural ambassadors. The first Israel Prize for composition was granted in 1954. The government sponsored large-scale international events, such as the International Harp Contest (from 1960) and the annual Israel Festival (from 1961). The newly built

Jerusalem Congress Centre (1953) and Frederic Mann Auditorium (1957) provided spacious concert venues.

Increased immigration to Israel in the 1950s further diversified its culture, with massive waves of Bulgarian Jewry and entire communities from Yemen and North Africa. Urban growth encouraged new performing groups, such as the Haifa and Be'er-Sheba' orchestras, the Rinat (Israel National Choir) and the Israel Chamber Orchestra. The immigration of musicians from the Soviet Union in the early 1970s led to the expansion of the small radio orchestra into the Jerusalem SO (1972), housed at the new performing arts centre of the Jerusalem Theatre.

The New Israeli Opera opened in Tel-Aviv in 1985, performing in the original language with Hebrew surtitles; the Tel-Aviv Opera House opened in 1994. Further huge immigration from the Soviet Union (1989–94) trebled the number of musicians in Israel and encouraged the founding of new orchestras, such as the chamber string orchestra Rehovot Camerata (in Jerusalem since 1996) and Rishon Le-tsiyon SO, which has functioned also as the opera orchestra. The Musica Nova and Caprisma ensembles have specialized in contemporary repertory, and the early music movement found fertile soil.

Chamber music has continued to attract audiences, with regular series held at the Israel Museum, Tel-Aviv Art Museum, Tel-Aviv Conservatory, etc. Ensembles such as the Israel and Tel-Aviv string quartets, Yuval Trio, Israel Wind Quintet and Be'er-Sheba' Piano Duo have survived for more than two decades.

(ii) Composition.

Tension between individualism and ideological collectivism increased when a new generation of composers (such as Yehezkiel Braun, Ben-Zion Orgad, Tzui Avni, Noam Sheriff, Ami Ma'yani), born in the 1920s and 30s joined the founders of Israeli music. Most of them composed with a personal commitment and under external pressure to find a new national style. At the same time they were exposed to and attracted by new developments in the West after 1950. No consensus nor a national Israeli school ever emerged, and the search only increased pluralism and polemics. Of special significance was the use of the sound and rhythm of the Hebrew language, whether biblical or modern, in vocal music. Contrasting techniques were at times juxtaposed within a single composition. For example, Josef Tal quoted a simple folk tune by Yehudah Sharett as an ostinato bass under atonal progressions in his Piano Sonata. Oedoen Partos quoted two Yemenite melodies, altering their structural 5ths into Bartókian tritones, in *Visions*. Tzui Avni integrated passages of declamatory heterophony into rich and dissonant orchestral harmony in *Meditations on a Drama*. Composers frequently alternated techniques according to context and genre: Haim Alexander, for example, used serialism in his *Patterns* but folk-like modality in his *Nature Songs*. New immigrant composers who came at the prime of their creative power went through profound artistic transformations. Mark Kopytman, who arrived in 1972 from the Soviet Union, integrated a traditional Yemenite song as sung on stage by the Yemenite folk singer Gila Bashari into dense heterophony in his *Memory*. In the 1970s the melting-pot ideology disintegrated and

postmodern pluralism gained the upper hand. Third- and fourth-generation composers entered the stage, further expanding the stylistic diversity of Israeli music from the iconoclasm of Aric Shapiro to Haim Permont's and Michael Wolpe's nostalgic mementoes of *Yishuv* times.

(iii) Instruction, research and publication.

The Hebrew University, founded in 1925, became involved in music in 1933. The University National Library is the main repository of manuscripts and prints of Jewish and Israeli music. The Sound Archives house numerous field recordings. The Jewish Music Research Centre has initiated projects such as the RISM catalogues and the periodical *Yuval*.

The first department of musicology was founded at the Hebrew University in 1965, followed by Tel-Aviv University (1966) and Bar-Ilan University (1969). Their varied research fields and curricula include the theory and history of European music, Jewish music, world music and ethnomusicology in its broadest sense. The laboratory of musicological research at the Hebrew University was among the pioneers in the development of the melograph.

Instruction in performance and composition has been provided by the Rubin Academies in Jerusalem and Tel-Aviv, the latter incorporated into Tel-Aviv University. The Jerusalem Music Centre, founded in 1971, sponsors master classes by distinguished international teachers, as well as specialized concerts and symposia. Until the 1980s institutional instrumental instruction involved European instruments only, with the exception of Erza Aharon's limited activity at the Jerusalem Conservatory. The Hebrew University initiated a workshop in the performing practice of Arab and Javanese music, having acquired a full gamelan. Instrumental instruction in Classical Arab music started in 1996 at the Rubin Academy in Jerusalem and at a school for Eastern music sponsored by Jerusalem City Council.

In 1951 Peter Gradenwitz founded Israeli Music Publications, and in 1961 the Culture and Arts Council founded the Israeli Music Institute as a publicly sponsored publishing house for Israeli music. The Israeli Composers League, founded in 1953, established in 1993 its own publishing house, the Israeli Music Centre.

II. Folk and popular music

1. Before 1948.

2. After 1948.

BIBLIOGRAPHY

Israel, §II: Folk and popular music

1. Before 1948.

An area of musical creativity originating in Erets-Israel ('land of Israel') was Erets-Israeli song, which consists of Hebrew texts set to music with a monophonic texture, usually by identifiable Erets-Israeli composers during the period 1882–1948. Erets-Israeli songs developed alongside other Hebrew songs sung in Erets-Israel up to 1948.

The origins of Hebrew songs coincide with the revival of Hebrew culture in Europe and the beginning of the Zionist movement in the latter half of the 19th century. The Hebrew cultural revival included literature and poetry, just as the Zionist movement brought with it waves of immigration to Erets-Israel.

(i) Era of the First Immigration (1882–1903).

The majority of songs in Erets-Israel during the era of the first immigration were brought by immigrants. Songs typically expressed a longing for Erets-Israel along with the hope for rebirth in the homeland. Many of the song lyrics were written in Hebrew by poets who were part of the *Hibat Zion* (love of Zion) and *Hathiyah* (revival) movements, but who, for the most part, had never visited Erets-Israel. The majority of song melodies were borrowed from Hasidic and Yiddish sources, and from Russian, Romanian and Polish folk and popular songs.

Most melodies were in minor keys and in duple metre, at times in slow march-like tempos, with typical Hebrew syllabic emphasis on the penultimate syllable. These songs are also referred to as *Hibat Zion*, among them *Hatiqvah*, a song that became the anthem for the Zionist movement, later becoming the Israeli national anthem.

(ii) Eras of the Second and Third Immigrations (1904–14, 1919–23).

Four distinct song types characterize these eras. First, *Hibat Zion* songs continued from the previous era, becoming part of the second immigration's repertory. The second category includes songs composed

within Erets-Israeli educational institutions. With the establishment of educational institutions in cities and villages and the inclusion of songs in school music curricula, the need for suitable materials became evident. Until this time appropriate pre-school and school songs were almost non-existent, resulting in new musical materials, primarily songs, composed by some of the music teachers. Teacher-composers such as Karchewsky (1873–1926) and Idelsohn (1882–1938) began their activities in the 1910s, and thus were the first Erets-Israeli composers. The third category includes songs with Arab melodies that were widespread in Erets-Israel to which Hebrew texts were fitted, e.g. *Hachmisimi*, *Bein Nehar Prat*, *Yad 'Anugah* and *Ani Re'itiha*. These were usually love songs characterized by use of the interval of a 2nd (often an augmented 2nd), slow tempos and rubato. The wide circulation of these songs indicates an integration with a widespread native Eastern culture. The fourth category includes songs with melodies originating in Eastern European Hasidic culture. Such texts include short verses from the Bible or from prayer books. These songs include melodic redundancy, repetition of lyrics, binary structures, ranges of one octave and duple metre. *El Yivneh Ha-miqdash*, *Vetaher Libeinu*, *El Yivneh Ha-galil* and *Zivhu Sedeq* are examples of songs that also made up the principal component of *horah* dances. The rise of communal singing and *horah* dancing became distinguishing characteristics of the Erets-Israeli settlement.

(iii) Eras of the Fourth and Fifth Immigrations (1924–48).

The 1920s was a period of dramatic change for Erets-Israeli song. Composers such as Hanina Karchewsky, Abraham Zvi Idelsohn and Yoel Engel (1868–1927) were ending their active periods, while others, such as Yedidiah Admon (1894–1985), Nahum Nardi (1901–77), Shalom Postolsky (1898–1949), Menashe Ravina (1888–1968), Mattityahu Shelem (1904–75), Mordecai Zeira (1905–68), among others, were beginning careers. Several composers lacked basic formal music education, while others did not know or use musical notation. Their songs were intrinsically different from those of their predecessors; for example, syllabic emphasis, moved to the last syllable of words, brought about changes in musical rhythm. In these and in subsequent years, subjects of songs composed and sung in Erets-Israel concerned work and the homeland, the landscapes of Galilee and the Izrael Valley, construction and creation. Song lyrics written by the best Erets-Israeli poets often used third-person plural verbs to express a national, collective 'I'.

Many songs later included in the Hebrew song repertory are by identifiable composers who considered their efforts as contributing to the building of a renewed Hebrew culture. As a nation of immigrants, Erets-Israel lacked a long-standing tradition of folksong. The goal of the national movement included a rapid realization of folksong in the revived Hebrew language, and composers wrote hoping to achieve a wide circulation. In their search for musical roots, many composers of Erets-Israeli song adopted the Dorian mode to evoke an older style. The Yemenite trill was also used, as was rhythmic syncopation.

Many country, shepherd, ceremonial, children's and holiday songs were composed in the 1930s and 40s. Eastern influences existed in songs from

Eastern composers such as Sarah Levi, Nissan Cohen Melamed and others, or by means of environmental influences on composers such as Yedidiah Admon, Nahum Nardi, Emanuel Amiran and others. Internal and external political events transformed Erets-Israeli song at that time; Arab-Jewish conflicts highlighted 'Watchmen's Songs' and 'Defenders' Songs'. Attempts to create a rural culture encouraged compositions from working settlements, particularly those composers from the Kibbutz movement such as David Zehavi, Mattityahu Shelem, Jehuda Sharet and others. The encouragement for young Israelis to enlist in the British army during World War II inspired Hebrew 'Army Songs' composed by Mordecai Zeira, Daniel Sambursky and others. The Holocaust brought the influence of Yiddish village songs, along with political and propagandist Russian tunes.

The War of Independence and the establishment of the State of Israel brought about the conclusion of the era of Erets-Israel. Approximately 4600 Hebrew songs were circulated and sung during this epoch and of these approximately 57% could be considered Eretz-Israeli.

[Israel, §II: Folk and popular music](#)

2. After 1948.

(i) Folk music.

Diverse Israeli songs were discernible immediately following statehood, a direct continuation of Eretz-Israeli song. Mourning and bereavement songs, memorials to the Independence War and victory songs were heard along with songs influenced by foreign dances (tango, rumba, paso doble and mamba), and songs, both new and translated, that were products of festivals of European and American popular songs.

Composers continued writing in the period after statehood, and in the 1950s a 'country song' or 'shepherd song' style emerged that was a continuation of the 'rural country' style of the 1940s. Texts drew on pastoral and rural settings, florid language and cries of 'hey' and 'ho'. Melodies were in minor scales and modes with relatively simple structures. Accompanying instruments included the acoustic guitar, which often dictated harmonic accompaniment, accordion and the Arab clay drum. Special dances developed at this time, known as 'folk dances'.

Representative composers of this period include Emanuel Zamir (1925–62), Gill Aldemah (*b* 1928), Amitai Ne'eman (*b* 1926) and Josef Hadar (*b* 1926), who formed the first generation born in Israel (most were accordion players). Lahaqat Ha-nahal, the first military performing troupe, was created in 1951 for the Israeli army to entertain soldiers with skits and songs portraying Israeli army life. The international recognition of *Tsahal* (Israeli army), raised the status of military performing troupes and thus of Israeli song. A large repertory of songs was created by military troupes, who were awarded top honours in song festivals. These troupes performed extensively, providing venues for many who would later become leading artists, composers, arrangers and directors.

Materials for the troupes were commissioned from the best Israeli composers, among them Alexander Argov (1914–96) and Moshe Velensky (1910–97), who were also prolific Erets-Israeli composers. Other Israeli

composers who wrote for the troupes include Nurit Hirsh (*b* 1942), Matti Kaspi (*b* 1949), Aryeh Lavnon (*b* 1932), Yair Rosenblum (1944–96), Naomi Shemer (*b* 1930), Yohanan Zarai (*b* 1930) and Dov Zeltzer (*b* 1932). A significant number of Israeli composers took advantage of writing for military troupes.

A transformation of Israeli song took place in the latter half of the 1960s. The accordion was replaced by the electric organ, the Arab clay drum was replaced by a drum set, and electric and bass guitars were added. This transformation stimulated the rise of 'beat' and rock groups in peripheral areas. The band, Hahalonot Hagvohim, heralded the introduction of rock-styled Israeli song. Many performers, among them duos (Ran and Nama, Ilka and Aviva, Ha-dudaim, Ha-parvarim), trios (Shloshet Ha-metarim, Gesher Ha-yarqon), and troupes (Batsal Yarok, Ha-tarnegolim) in addition to hundreds of singers, enriched the Israeli song repertory.

The Six-Day War represented a watershed for Israeli song, flooding the country with 'homeland' songs resembling Eretz-Israeli homeland songs. Together with 'countryside' songs, homeland songs were integrated into the nostalgia that inundated Israel in the 1960s. The blend of old and new homeland songs formed a current of Israeli music that is referred to as 'Songs of Erets-Israel'. Naomi Shemer (*b* 1930), composer of the song *Yerushalayim Shel Zahav* (Jerusalem of Gold), became symbolic of this era.

Television broadcasting began in 1967 in Israel, providing venues and wide exposure for performers. In this era, a number of songwriters also doubled as performers. Shalom Hanoch, Samuel Kraus, Matti Kaspi, Yehudith Ravitz, Schlomo Gronic are composer-singers who were active as independent soloists, while others worked in groups, duos or ensembles (Ha-lul, Ha-churchelim, Ha-keves Ha-shishaasar). The talents of Arik Einstein over the course of 30 years stimulated composers such as Shalom Hanoch (*b* 1946), Micky Gavrielov (*b* 1949), Yoni Rechter (*b* 1951) and others. The group, Kaveret, made its first appearance at the beginning of the 1970s, and despite their brief period of activity, introduced a new sound to Israeli song. A new Hasidic song style developed after the Six-Day War, influenced by annual festivals of Hasidic songs taking place as early as 1969. Hasidic songs employ biblical and prayer book texts, mostly repeated verses with tunes mostly in minor keys, intermediate ranges (an octave to a 10th), simple structure, regular rhythm and basic harmonic progressions (I–IV–V).

The influences of Eastern Jewish communities were felt before the establishment of the State of Israel, owing to the presence of Yemenite and Arab songs. After the Six-Day War, especially since the 1980s, ethnic consciousness grew, and Eastern styles became an important marker, known as the Eastern Mediterranean style. This style includes the use of melisma, the augmented 2nd and melodic ornamentation with the range of quarter- and half-tones. Instrumentation generally consists of electronic instruments, electric and bass guitars and drum sets, and is expanded at times to include, the *'ūd*, *qanūn*, and *darbouka*. Among composers associated with this style are Avihu Medina (*b* 1948), Boaz Sharabi, Shlomo Bar and others.

In the first half of the 1990s, singer-composers who performed their songs with their ensembles gained prominence, such as Yuval Banai with the group Meshina, Arkadi Dukhin with Ha-haverim Shel Natasha, Aviv Gefen (*b* 1971) with Ha-ta'uyot, Rami Kleinstein (*b* 1963) with Hmo'etza, Shlomo Arzi (*b* 1949), Yehuda Poliker and many others.

(ii) Popular music.

The first signs of a popular music industry are found in the mid-1930s with the setting up of a record company and a radio station. Professional immigrant musicians from Germany and Poland opened venues for music theatre and cabaret in the growing cities of Haifa and Tel Aviv, where contemporary European songs were sung with Hebrew texts. The diversity of styles can be heard on the 1933 recordings *Mi-shirei erets Yisra'el* ('Songs from the land of Israel').

Although these musics continued to be performed after the state of Israel had been established, up until the 1970s popular music was dominated by state-controlled cultural policies and mass media. The Israel Defence Forces (IDF) entertainment groups (*lehakot tsva'iyot*) were characteristic of this period. They performed songs which combined 'native' elements with international popular styles, were arranged as group songs with short solo sections and were initially accompanied by accordion and *derbuka* (drum). These songs attained wide popularity and were disseminated on LPs and by radio. By the 1970s the distinction between military and civilian artists had become blurred and IDF artists became major stars.

Other songs of this period included the *pizmonim* or *shirei meshorerim* ('songs of the poets') performed by duos or trios, such as Duda'im, Parvarim and Shlishiyat Gesher Ha-yarqon, and were accompanied by acoustic guitar. Unlike previous genres, these songs stressed individual, urban experiences rather than collective or national topics. During the 1950s popular musics emerged based on Iraqi and Egyptian urban styles. These were performed in bars and at parties by Jewish immigrants from Arab countries. Greek popular songs, performed in Hebrew, became popular during the 1960s, and these and songs derived from Arab styles were perceived as oppositional to musics sanctioned by the cultural establishment.

From the 1970s onwards Israeli popular musics have diversified and have been increasingly influenced by Anglo-American styles, particularly rock. Contemporary popular styles may be divided into four categories. Firstly, pop and rock of foreign origin, particularly from the UK and USA. Secondly, *shirei erets Yisra'el*, which includes 'folk' songs, IDF ensemble songs and popular songs in a folk spirit, particularly those composed by N. Shemer. Thirdly, Hebrew songs in Western popular styles such as disco, rap and middle-of-the-road. Israeli rock was started by a group of artists including Arik Einstein, Shalom Hanokh and Shmulik Kraus, who were influenced by the Beatles. The most influential Israeli rock band continues to be *Lahaqat Kaveret* ('The beehive band') who performed in 1971–3. Many Hebrew pop songs are influenced by Europop and Israel has twice won the Eurovision Song Contest. Fourthly, *musiqah mizrahit* ('eastern music') developed in the early 1970s which combines Greek, Turkish, Arab and Yemenite-Jewish styles and instruments with Western popular forms. Associated with

the working class it achieves huge sales and has had a lasting appeal to a wide audience.

Israel

III. Arab music

Before the creation of the state of Israel (1948), the region was mainly inhabited by Arabs, and various genres of Arab music played an important role in religious and secular ceremonies and everyday life. At the end of Ottoman rule (1517–1917), Muslim and Christian Arabs formed over 90% of the population. The vast majority of these Arabs were Sunni Muslim. From 1948 onwards Jewish interests became dominant.

1. Folk music.

The most authentic and pervasive kind of Arab music in Israel has been the rich folk music practised by Bedouins, farmers and (to a certain extent) town-dwellers. A characteristic repertory of songs and dances separately involving women and men enhance the various events of life in Bedouin encampments as well as in small or large agrarian villages inhabited by Muslims, Druzes, Christians or mixed populations. The literary, performative and musical components of the sequence of traditional and improvised songs marking any given event all depend on talented individuals who are able to combine the gifts of poet, musician and performer. Normally not all villages are fortunate enough to have a poet-musician within their midst, so they have to bring the best known of them from afar. A normal performance requires the participation of two poets who alternate in singing the verses of certain genres. These are mainly improvised, like the popular Middle Eastern four-line stanzas, the *'ataba*, or the argumentative dialogue in sung verses, the *huwar*. On special festive occasions, four poet-musicians participate.

Most ceremonies are held outdoors and an active audience takes part by uttering responses, hand-clapping and dancing the *debka* (chain dance). This is accompanied by a flute, *urghul* or *mujwiz* (two types of a double clarinet), the main instruments used in the villages.

2. Urban music.

From scattered information provided mainly by European travellers, we know that under Ottoman rule Arab art music was occasionally performed in coffee houses and at weddings in urban centres. In style it was essentially similar to that of Turkish, Lebanese, Syrian and Egyptian music of the period: singer, supported by instrumentalists of the *takht* ensemble (see [Arab music](#), §I, 6).

From 1920, when Palestine was under British Mandate, Christian churches in Jerusalem, Ramalla and Nazareth stimulated and sponsored musical activities through educational work and events outside the regular church services. The repertory consisted of a mixture of Arab and Western music.

In the city of Haifa, Ibrahim Bathish founded a music club which played an important role in the development of local art music. One of its graduates, Selim Hilou, became a prominent Lebanese composer and singer of the prestigious *muwashshah* vocal genre. Among his other writings he has devoted an important book to this subject. After the creation of the state of Israel, three Haifa club graduates became central promoters of Arab musical activity in the northern part of the country: Sudki Shukri, Michael Dermalkonian (who also studied Western music) and Hikmat Shaheen. Through music education a number of performing groups gradually emerged, sponsored largely by the establishment.

The traditional transmission of Arab art music is through assimilation, listening to the fundamental aspects of the art as performed by great masters, or through private lessons given by renowned musicians to interested individuals. Alongside this, an official and formal method of teaching came into being with the establishment in 1951 of a programme for training Arab music teachers at the Haifa Conservatory. In 1963 Suheil Radwan, one of the first trainees, became head of the department of Arab music at Haifa.

The Haifa Arab music department fostered a musical renaissance in schools, clubs and cultural and community centres throughout the country, including the establishment of orchestral ensembles and choirs. Most ensembles included Jewish musicians who had migrated to Israel from Iraq, Egypt and Syria. Muslims, Christians and Jewish musicians worked side by side in a musical community which created a bridge of fraternity between Arabs and Jews. The foundation in 1965 of an Arab-Jewish centre, Beit ha-Gefen, in Haifa, was crucial in this process, and musical activities took place there.

In 1957 the Radio Broadcasting Authority founded the first professional orchestral ensemble. Its first director was Ezra Aharon, a famous composer and *'ūd* player originally from Iraq. In the 1932 Cairo International Congress of Arabic Music, he had led the official Iraqi ensemble under the name 'Azzuri Efendi. Gifted Jewish instrumentalists from Iraq, Egypt and Syria

formed the radio ensemble, later joined by two Arab violinists. Arab singers were employed to sing on radio programmes, and by the 1970s Arab singers and composers were participating in annual festivals held by the radio stations of major cities. Folk, art and popular music programmes were regularly shown on the Arab section of Israeli television.

Most recently some small Arab-Jewish groups have been established containing fine bi-musical instrumentalists conversant with Arab, Jewish and Western art music styles. Their repertoires include interesting arrangements of traditional Arab and Israeli music. The most famous of these ensembles is the Bustan ensemble, using *qānūn*, guitar, banjo, *ūd*, violin, flute, bass and Arab percussion. The group combines an eclectic mixture of musical influences and has gained an international reputation.

See also [Palestinian music](#) and [Arab music](#), §II.

Israel Festival.

An annual festival of music, dance and theatre, founded in 1961 by Aharon Z. Propes, director of the Ministry of Tourism, with the intent of making the young state, already renowned for its high musical standards, into an international artistic centre catering to local audiences and attracting summer tourists. The first festival hosted Pablo Casals, the Budapest Quartet and Rudolf Serkin, thus establishing the predilection for Western classical music. In 1962 the festival commissioned Stravinsky's *Abraham and Isaac*, introduced by the Israel PO under Robert Craft, with Stravinsky himself attending and conducting his Symphony of Psalms. At that time festivals were held in July and August, with performances all over the country, including in the Roman theatre at Caesaria, refurbished for outdoor spectacles such as *Samson et Dalila*. Israeli premières included that of Schoenberg's *Moses und Aron*. In 1982 the Ministry of Tourism handed the organization of the festival to a publicly controlled society, Hagigat Israel (Israel Festival), which has frequently cooperated with private entrepreneurs. Since then the festival has been situated in Jerusalem and held over a period of three weeks in May–June, with some events repeated in other locations. Most performances are given in the four-auditorium complex of the Jerusalem Theatre; other venues include the Ein Karem Music Centre, Dormition Abbey and the Scottish Church (St Andrew's), and there are also firework displays over the walls of the old city and other free outdoor events. The festival has had no clear artistic policy. Nearly every year a large-scale opera production, such as the Arena di Verona's *Aida*, is imported as an outdoor spectacle. The festival has regularly responded to salient changes in taste, demonstrated in its sponsorship of performances of Japanese and Indian music (1991), Moroccan trance-art (1994) and concerts given by the Consort of Musicke and Academy of Ancient Music (also 1994). Jazz features on programmes as well. While most events involve international artists, leading Israeli ensembles and soloists regularly take part.

Israeli Music Publications.

Israeli firm of music publishers. It was founded in Tel-Aviv in 1949 by Peter Gradenwitz in association with the Israeli Association of Composers. From 1952 Gradenwitz managed the firm independently as a limited company. It was the first Israeli music publishing house of an international standard, and publishes works by Israeli composers of all schools and styles, as well as works by composers of any nationality that are based on biblical subjects or texts or that have a particular association with Israel or the Near East. The firm has published works written specially for Israel by Schoenberg, Milhaud, Villa-Lobos, Martinů, Martinon, Staempfli, Hovhaness, Castelnuovo-Tedesco, Rathaus and many others. The series *Early Hebrew Art Music* comprises practical scholarly editions of synagogue music from the 12th to the 19th centuries; other first publications include an *Allegro barbaro* for piano by Alkan, *Beatus vir* for soprano and alto soloists, chorus and orchestra by Galuppi, the completion of Schubert's fragmentary setting of Psalm xiii d663, and music by Joseph Achron. By 1982, when the firm was taken over by a British company and transferred to Jerusalem, the catalogue contained about 600 titles in printed editions and an orchestral lending library. Books published by the firm include biographies of composers under its aegis and theoretical works. It has outlets in most countries in Europe and elsewhere, and played a vital role in establishing the Israeli Music Publishers' Union, a member of the International Union of Publishers. Under the imprint of Illan Melody Press, the firm issued light music from 1949 to 1982.

PETER GRADENWITZ

Israel Piano Trio.

Israeli ensemble. It was founded in 1972 by the pianist Alexander Volkov, the violinist Menahem Breuer and the cellist Zvi Harell, who was later replaced by Marcel Bergman. Breuer is the leader of the Israel PO and Bergman is its principal cellist; they and Volkov are also active as soloists. The trio's recordings of the complete piano trios of Brahms, Mendelssohn, Schubert and Schumann have been highly praised. The group's repertory also embraces 20th-century works, some by Israeli composers including Oedoen Partos, Yardena Alotin, Yehezkiel Braun and Ebel Erlich, who dedicated his Piano Trio to the ensemble. The trio performs regularly in international festivals, including Edinburgh and Schleswig-Holstein, and has given many recitals for the BBC. Its members give masterclasses at the RAM, London, the Musikhochschule in Munich and elsewhere.

MICHAL BEN-ZUR

Israel Quartet.

Israeli string quartet. It was founded in 1957 as the New Israel Quartet, to distinguish it from an earlier group known as the Israel Quartet. Its original members were Alexander Tal, Mordecai Yuval, Daniel Benyamini and Yaakov Menze, all of whom played in the Israel PO. During the quartet's subsequent history, the membership changed several times. Zeev Steinberg joined as viola in 1959; during the 1970s Tal was replaced by Ilan Gronich and Gronich by Raphael Markus; and in 1978 the word 'New' was dropped from its title. In 1999 the ensemble included Yigal Tuneh, Elikum Salzman, Robert Moses and Alexander Kaganowsky. The Israel Quartet has concentrated mainly on 20th-century music, especially by Israeli composers. It has performed more than 50 Israeli works, most of them in premières, by such composers as Oedoen Partos, Mordecai Seter, Artur Gelbrun, Josef Tal, Zeev Steinberg, Abel Ehrlich, Joachim Stutschewsky and others. It has given many concerts abroad, thereby promoting its particular repertory.

MICHAL BEN-ZUR

Israelyan, Martun

(*b* Leninakan, [now Kumayri, 25 March 1938). Armenian composer. He began his studies at the Leninakon (now Gyumri) Music College, where he learnt to play the *kyamancha*, an Armenian folk instrument. In 1964, he moved to Yerevan where he studied composition with Eghiazarian (1964–9) at the Yerevan Conservatory. He then taught harmony at the Babadjanian Music College (1969–81) before returning to teach orchestration and composition at the conservatory, of which he has been a professor since 1997. He joined the Armenian Composers' Union in 1969, the year in which he received a prize in the All-Union Young Composers' Competition for the orchestral work *Music*.

His early works – such as *Contrasts* (1967), *Ensemble* (1968) and the *Septet* (1973) – combine the contemplative and expressive qualities of post-Webernian pointillism and often display stereophonic spatial structures. The expressive sonority employed in these works intensified during the mid-1970s and resulted in the unique timbral qualities of the two books of *Taghs* for voice (1972, 1974) and the *First Cello Sonata* (1975). These sonic qualities acquire conceptual significance in the *Symphony* (1981), the final sections of which are characterized by the prolonged *diminuendo* in the chord sustained by the strings and soloists, leading to a cathartic coda in which a solo soprano line is underpinned by an orchestral pedal. This work signals the end of his first period after which his language becomes more universal; aspects of neo-Baroque, folkloristic, impressionist and academic styles appear in works in the 1980s and 90s.

Highly systemized organization is a constant feature in his language; the serial technique of early works is superseded by one in which diatonic modality is built up from the melodic transformation of a sequence of fifths. Intervallic cells are embodied in material ranging from the smallest motif to highly developed pentatonic and whole-tone systems which frequently share similarities with the modal formulae of medieval Armenian music. Armenian musical traditions have also influenced the dynamism of his rhythmic and formal structures which are largely flexible, aperiodic and

asymmetrical. The structural properties of the monodic *taghs* of the 10th-century poet-musician Grigor Narekatsi are echoed in Israelyan's freely developed single-movement forms. His works have been heard in Argentina, France, Germany, Russia, Scotland and Switzerland and are frequently performed in Armenia.

SVETLANA SARKISYAN

Issandon, Jean.

See Yssandon, Jean.

Isserlis, Steven (John)

(b London, 19 Dec 1958). English cellist. Grandson of the Russian pianist and composer, Julius Isserlis, he studied with Jane Cowan at the International Cello Centre (1969–76) and Richard Kapuscinski at Oberlin College (1976–8). He made his London début in 1977, and has subsequently performed as a soloist with most of the world's leading orchestras and many period-instrument groups. He is also a noted player of chamber music: he gives regular recitals with Melvyn Tan, and in 1991

formed a trio with Joshua Bell and Olli Mustonen. In 1996 he succeeded Sándor Végh as artistic director of the International Musicians Seminar in Cornwall, where he teaches and gives masterclasses. He has given first performances of works by Robert Saxton, Elizabeth Maconchy, Howard Blake and John Tavener, including *The Protecting Veil* (1989, London), of which his recording won a Gramophone Award. Among his many other recordings are the concertos by Elgar and Barber, Britten's Cello Symphony and much chamber music. He was presented with the Piatigorsky Artist Award (1992) and the Royal Philharmonic Society's Instrumentalist of the Year Award (1993). Isserlis' sensitive, stylish and passionate playing reflects his highly individual personality.

Istel, Edgar

(*b* Mainz, 23 Feb 1880; *d* Miami, 17 Dec 1948). German musicologist and composer. He studied the violin at Mainz but soon turned to composition and became a pupil of Volbach. In 1898 he went to Munich, where he completed his studies under Thuille and Sandberger. He took the doctorate in 1900 with a dissertation on Rousseau's music to *Pygmalion* and worked as a lecturer, music critic and essayist until 1913. He was then appointed lecturer in aesthetics at the Humboldt Academy, a post he held until 1919, when he took a position at the Lessing-Hochschule; he also worked as music critic for several newspapers. In 1920 he moved to Madrid, where he represented the Verband deutscher Bühnenschriftsteller und Bühnenkomponisten and the Vienna Gesellschaft der Autoren, Komponisten und Musikverleger. In 1936 he emigrated to England and in 1938 to the USA. He established his reputation with his work on the history of opera, especially opera librettos; his book on the libretto is one of the best accounts of the outlines and characteristics of opera texts. His major compositions include five operas, incidental music for Goethe's *Satyros* and a *Hymn to Zeus* for chorus and orchestra; he also wrote several choral works and songs.

ALFRED GRANT GOODMAN

Istesso tempo, l'

(It.: ‘the same pace’).

A direction to maintain the tempo in spite of apparent disturbances, particularly changes of time signature or note value. Thus in a change from 2/4 to 6/8 time the beat would remain constant: the crotchet of the former would equal the dotted crotchet of the latter. *Medesimo tempo* was also used. By the later 19th century these directions were increasingly replaced by equivalence equations.

DAVID FALLOWS

Istituto di Studi Verdiani.

Institute established in 1963 in [Parma](#).

Istomin, Eugene (George)

(b New York, 26 Nov 1925). American pianist. He first studied with Kiriena Siloti, and then at the Mannes College. When he was 12 he entered the Curtis Institute, where he studied with Rudolf Serkin and Mieczyslaw Horszowski. In 1943 he won the youth competition sponsored by the Philadelphia Orchestra, with which he made his orchestral debut playing Chopin's F minor Concerto the same year. That year he also won the Leventritt Award, which led to an appearance with the New York PO, playing Brahms's Second Concerto (1943). Around this time he also played with the Busch Chamber Players; his first recording, which brought him considerable attention, was of Bach's D minor Concerto with that ensemble. He then appeared regularly as a soloist with leading American orchestras, embarking on major tours abroad from 1956; he has been associated primarily with 19th-century works. In 1961 he formed a trio with Isaac Stern and Leonard Rose; his performances of chamber music represent the delicate end of the expressive spectrum. In 1975 he married Marta Casals, the widow of Pablo Casals; she became artistic director of the Kennedy Center in 1980.

MICHAEL STEINBERG/DENNIS K. McINTIRE

Istrate, Mircea

(b Cluj, 27 Sept 1929). Romanian composer. He began his studies at the Cluj Academy with Elisa Ciolan (piano, 1945–9) and Toduța (composition, 1950–53), but was expelled on political grounds; he was able to transfer to the Bucharest Academy, where he studied composition with Andricu and the piano with Florica Musicescu (1954–7). He taught the piano in Music School no.3 in Bucharest from 1959 until his retirement. A non-conformist composer, Istrate respects tradition while remaining open to techniques ranging from modalism to serialism. The limited number of his works reveal a meticulous and rigorous approach to composition. *Pe o plajă japoneză* ('On a Japanese Beach', 1961) employs variation and phasing techniques within its integrated serial structure; *Evenimente* ('Incidents', 1966) displays his subtle use of timbre and sonic textures.

OCTAVIAN COSMA

Ištvan, Miloslav

(b Olomouc, 2 Sept 1928; d Brno, 26 Jan 1990). Czech composer. He studied composition with Kvapil at the Brno Academy of Music (1948–52) and remained there as a postgraduate student (1953–6), assistant lecturer (1956–66) and lecturer (from 1966). He was also active in the Brno branch of the Czech Composers' Union (1951–60), a member of the Tvůrčí Skupina A (Composer's Group A) from 1963, and an associate of the Brno electronic music studio from 1966.

The years of Ištvan's studies and first works were marked by an ideological prohibition of much important 20th-century music in Czechoslovakia. However, he quickly found his own direction, gaining stimulus from Moravian folksong and from the music and theory of Janáček. Robust, dramatic and unsentimental qualities, together with a persistent search for new forms of expression, are typical of his early years. The Piano Trio (1958) is the finest work of this period, which culminated in the three symphonic frescoes *Balada o Jihu* ('Ballad of the South', 1960), a protest against racialism and national injustice. Three other works of these years, the Second Piano Sonata, the Violin Concertino and the Rhapsody for cello and piano, show him taking up a Bartókian modal technique; in all of them the themes are elaborated very strictly and consistently. The String Quartet (1962–3) again shows Bartók's influence in the palindromic relation of its five movements, but Ištvan also continued to write works with a topical message: the piano piece *Odyssea lidického dítěte* ('Odyssey of a Child of Lidice', 1963) describes the fate of a child, dragged from his home by the Nazis and returning after years of hardship.

Ištvan's subsequent adoption of serialism is documented in *Dodekameron* (1964), a composition for 12 instruments in 12 movements, some modal, some 12-note. Derived from his incidental music for Büchner's *Woyzeck*, the score catches the main phases of the dramatic action in its brief sections. Ištvan then began to show an increased interest in rhythm, notably in *Ritmi ed antiritmi* for two pianos and percussion (1966), where African patterns in the percussion are confronted by vague, aleatory material in the pianos. The final development of his collage technique came in the first vocal works, *Zaklínání času* ('The Exorcism of Time', 1967) and *Já, Jákob* ('I, Jacob', 1968). The first is a meditation on the meaning of human existence scored for two speakers and orchestra, the montage of three texts being allied with a musical juxtaposition of archaic and contemporary materials. All this is achieved with Baroque tightness, but *Já Jákob* is much more free-ranging and colourful in its multiplicity of levels. Ištvan had now established his pluralist technique, and his creative potency increased greatly despite the fact that his works were receiving few performances as he was no longer a member of the Composers' Union. The compositions that followed include the electronic *Ostrov hraček* ('Island of Toys', 1967–8), based on the sounds of toys, *Ommagio a J.S. Bach* for wind quintet (1971), in which Bach motifs are transformed in a pseudo-electronic manner and through serial progressions, and *Psalmus niger* for percussion ensemble (1972), an extreme product of his preoccupation with elemental rhythm.

During the second half of the 1970s Ištvan approached the peak of his compositional designs. Not hiding his disagreement with the social and political developments in Czechoslovakia, he withdrew from public life and concentrated exclusively on composition and on teaching at the Academy. In *Shakespearovské variace* ('Shakespeare Variations', 1975) for wind and percussion and in the orchestral *Hry* ('Games', 1977) he was inspired by medieval and Renaissance approaches, the forms of the madrigal and the partita determined the shape of his choruses *Horlivá toužení* ('Ardent Longings', 1974), *Cor mio* (1979) and Partita (1980) for 16 strings. At the same time, however, he rethought his use of the jazz, pop and minimal music, which he realized in an original way in the diptych *Mikrosvěty* ('Microworlds', 1977), in the chamber cantata *Hard Blues* (1980) and in the Concertino for Baroque Jazz Quintet (1982). His discontent and anger at social events are encrypted in his string quartet *Zatemněná krajina* ('The Darkened Landscape', 1975) and in the single-movement symphonic piece *Tempus irae* (1983), the provocative titles of which had to compensate for the missing textual hints (a dedication to the victims of war in the first piece, a reference to John Steinbeck's novel in the second) so that the works could be publicly performed. With its simplified expression and large-scale conception the extensive *Vokální symfonie* ('Vocal Symphony', 1986) bore witness to the composer's love of heterophony.

The last two years of Ištvan's life were marked by the death of his wife Věra (1988). An elegiac tone is heard in the *Variace na renesanční téma* ('Variations on a Renaissance Theme', 1988), in the chamber trio *Rotace a návraty* ('Rotations and Returns', 1988) and especially in *Solitudo* (1989) for 11 string instruments, which he completed in the disturbed atmosphere of November 1989. The resulting political changes brought him to the fore in the revival of activities by Brno artists; involvement cut short by his sudden death soon after completing *Makrosvěty* ('Macroworlds', 1990).

ALENA NĚMCOVÁ

Istvánffy, Benedek

(*b* Szentmárton [now Pannonhalma], 1733; *d* Győr, 25 Oct 1778).

Hungarian composer. Born into a noble family, he probably received his first musical instruction from his father, an organist, and came into contact with G.J. Werner, Kapellmeister at the Esterházy court. He was employed by various members of the Széchényi family from 1757 onwards. In 1766 he became succentor at the cathedral in Győr, and from 1773 to 1775 he was also responsible for leading the choir of the Jesuit church there.

Istvánffy's works, of which only ten survive, cannot have been known outside his immediate surroundings in his own time. Nevertheless, he may be considered the most talented Hungarian composer of the second half of the 18th century in Hungary: his works are almost faultless in technique and up to date in style, and each one shows some individuality in structure.

ÁGNES SAS

Isum, John.

See [Isham, John](#).

Italian overture.

A type of [Overture](#) to an opera, oratorio or other vocal work, common from the late 17th century to the late 18th. It is usually in three movements, fast–slow–fast. The texture is generally homophonic, and the outer movements

are normally in major keys, most often D major. Initially, the first movements tended to be in duple metre; the slow movements were often quite short; and the finales were dance-like, often resembling fast minuets or giges. As the form developed, the first movements tended to incorporate fanfare elements and came increasingly to follow the pattern of sonata form without a development section; the slow movements became longer and more lyrical.

The Italian overture became established in the works of Alessandro Scarlatti in the 1690s (his earliest use of the form is in the 1687 revision of his opera *Tutto il mal non vien per nuocere*) and spread throughout Europe until it became the standard operatic overture in the middle decades of the 18th century. Alternatives to the three-movement pattern among multi-sectional Italianate overtures include the 'reprise' overture and a two-movement design, fast–slow, in which the first number after the curtain serves as the finale of the overture (Mozart, *La finta giardiniera*, 1775). After 1760 these types gradually gave way to other patterns, particularly the familiar one-movement design, which represents the first movement of the earlier Italian overture.

Italian overtures detached from operas were often used as independent concert pieces and were important in the early history of the symphony (see *Sinfonia*, §2, and [Symphony](#)).

Italy, §I: Art music

1. Plainchant.

The length and mountainous nature of the Italian peninsula, and its historical vicissitudes, have given its regional segments significantly different ethnic and linguistic profiles. Similar differences existed in the local 'dialects' of Western plainchant that developed during the early Middle Ages and continued in use until the imposition of Gregorian chant throughout most of Italy by the 11th century. In some areas of the peninsula, the Greek liturgies were followed, notably in the south where the Byzantine rite was celebrated in the old Basilian monasteries; Eastern practices are also known to have existed during the early medieval period in the Greek monasteries in Rome and in cities, such as Ravenna, that were once governed by Byzantium.

Traditionally, the origins of Roman chant were ascribed to Pope Gregory the Great (590–604), who, according to legends dating from the Carolingian era, composed the basic melodic repertory and established the Schola Cantorum as the model for the correct performance of liturgical music in the Western Church. However, there is no contemporary evidence to suggest that Gregory was particularly concerned with chant and it is now thought that the Schola Cantorum was founded in Rome during the second half of the 7th century. The repertory that bears his name – Gregorian chant – probably derives from the late 8th century, when the Carolingian kings attempted to introduce Roman chant into the Frankish lands. Whether Gregorian chant was actually sung in Rome at this time, however, is unclear and it has been suggested that it represents a 'reworking' of the genuine Roman repertory by Frankish cantors (see [Plainchant](#), §2(ii)). The earliest extant notated manuscripts from Rome, dating from between the 11th and 13th centuries, present a body of melodies that is clearly related to Gregorian chant but which consistently differs in certain details. The performance of this repertory, known as [Old Roman chant](#), was brought to an end in Rome when Pope Nicholas III (1277–80) officially suppressed it in favour of Gregorian chant.

During the Carolingian era many of the local Italian repertories were replaced by Gregorian chant as part of an attempt to establish liturgical uniformity; by the 11th century only Rome and Milan maintained their indigenous musical traditions. The Aquileian Church, which had formerly followed its own rite, adopted the Gregorian use during the reign of Charlemagne (*d* 814); almost nothing of its melodic repertory survives. Beneventan chant, however, which developed in southern Italy during the

7th and 8th centuries, was not fully suppressed until 1052 and a significant amount of its music survives in notated sources. The only tradition that successfully resisted the imposition of Gregorian chant was that of Milan. Its survival was undoubtedly helped by the prestige of St Ambrose, Bishop of Milan (374–97), who was traditionally credited with the creation of the chant repertory. Ambrose is known to have introduced the singing of psalms and hymns to strengthen the resolve of his flock when they were besieged in the Basilica Porziana by Aryan persecutors, and at least four of the many hymn texts attributed to him are genuine. However, there is no evidence to associate him with the composition of ‘Ambrosian’ melodies. The melodies of the Milanese rite were first written down in the 12th century in pitch-specific notation and are still performed today in Milan and in some churches in the diocese of Lugano (see [Ambrosian chant](#) and [Ambrose](#)).

From the 10th century, several different kinds of neumatic notation were used in Italy, and the diversity began to decrease only when the various scriptoria adjusted their neumes to the staff perfected by Guido of Arezzo (*d* after 1033) and adopted shapes which became those of square notation (see [Notation, §III, 1](#)). Guido is also credited with the invention of solmization, a teaching method for reading neumes and producing the corresponding pitches. Less easily assessed are other Italian contributions to the further development of liturgical and paraliturgical singing. Although sequences, either belonging to an international repertory or of local origin, were sung at an early date, only a few, which survived the rigours of the Council of Trent, are well known: *Dies irae*, *Lauda Sion* and *Stabat mater*, the melodies of which are respectively attributed to Thomas of Celano (*d* c1250), St Thomas Aquinas (*d* 1274) and Jacopone da Todi (*d* c1306); the only other surviving sequences are *Victimae paschalis laudae* and *Veni sancte spiritus*. The production of tropes seems to have been modest, but liturgical dramas were performed in various places, and the music of four at Cividale and six at Padua survives. The latter group (dating from the late 13th century, with 15th-century additions) includes pieces for two equal voices, a type of polyphony (*cantus planus binatim*) of which other examples have recently been found, suggesting a widespread practice of polyphonic elaboration of plainchant. Two-part organum had already been described in Guido’s *Micrologus* as a current practice; and many melodies were prescribed to be sung *cum organo* (i.e. in polyphony) in 13th-century *ordines* of the churches of Siena and Lucca. Simple, essentially *punctus contra punctum* polyphony appears to have lasted until the Renaissance and even later, with more cultivated types. Some of these two-part compositions were internationally known, others used only locally. In any case, performances of this type of polyphony in the 18th, 19th and early 20th centuries are attested by several recently discovered sources.

[Italy, §I: Art music](#)

2. Early secular music.

Information concerning secular music is scant until the 12th century, and even then it consists of descriptions of performances and texts of songs, but no music; the few exceptions (some historical complaints, a vigil song of Modenese sentries and the well-known pilgrim song *O Roma nobilis*, to the simple tune of which the more profane *O admirabile Veneris ydolum*

was also sung) all belong to the 9th century and to ecclesiastical circles, to which they owe their survival. Among the earliest documents of poetry in the vulgar tongue, some jongleur songs addressed to bishops show that the traditional condemnation of jongleurs and mimes had subsided by the 12th century. Dance-songs in a popular vein and in ballata form (often entitled *danze*) survive in notarial acts of the 13th century and early 14th century; the way in which they were sung in alternation between a leader and the chorus of dancers is described in a Latin epistle by the grammarian Giovanni del Virgilio. Ballata form was also used for solo songs unconnected with dancing.

Troubadour lyrics were performed and composed during the 13th century at the courts of feudal lords in northern Italy, in bourgeois circles in Bologna and Tuscany and at the court of the Emperor Frederic II (1197–1250; King of Sicily, often engaged in wars throughout the peninsula) both by visiting troubadours and by local poets also using the Provençal language; among the latter were Sordello da Goito (c1200–c1270) and the Genoese Lanfranco Cigala (d c1274) and Bonifacio Calvo (d after 1274). In this regard it is worth noting that most extant sources of troubadour poetry are of Italian origin; they seldom contain any music, however, and it is hard to say whether this is due to the compilers' exclusive interest in the texts or to the fact that the melodies were usually transmitted orally. The same applies to the vernacular poetry of the so-called Sicilian and Tuscan schools, the former centred on Frederic II and his sons, the latter with Guittone of Arezzo (c1225–c1294) as its main representative. For the later *dolce stil nuovo* it can only be surmised that the increasing length and the philosophical bent of its poems conflicted with an increasing floridity of the settings. Dante (1265–1325) had some of his canzoni and ballatas set by musician friends (e.g. Casella); yet he asserted (*De vulgari eloquentia*, ii, 8) the self-contained verbal musicality of the canzone and argued that music would better suit the 'mediocre' style of the ballata. After him there was a split: because of the feeling that profound poetic thoughts had little to gain from the ornament of music, canzoni and the most sophisticated ballatas were no longer set to music, while shorter ballatas, madrigals and cacce began to be written specifically as *poesia per musica*.

Frequent references to the singing of ballatas persist during the 14th century, indicating a widespread use of this most versatile form as a dance-song, aristocratic or popular, and as a vehicle for lyrical expression. Music survives, however, only for the religious counterpart of the ballata, the *lauda*; and even then, only two lavishly decorated *laudari* contain music, while many simpler ones are without it, suggesting that notation (which did not, anyway, show the rhythm of the songs) was more an ornament than the answer to a real need. The penitential singing of *laude* spread from Franciscan Umbria around 1260 and became a devotional custom practised by lay fraternities all over Italy, a practice which survived well into the 18th century, often through the adaptation of secular melodies and folk tunes to texts of devotional character, thus continuing the medieval practice of *contrafactum*. The alternation of soloist and chorus, involving all those present in the singing of the choral refrain, had been borrowed from the dance-song. An early 14th-century manuscript of Umbrian origin (*I-CT 91*) contains simple melodies of touching directness, while a slightly later

Florentine repertory (*I-Fn* Magl.I.I.122) already shows a pronounced tendency towards florid vocalization.

Notation is a natural need of a polyphonic art and explains the impressive array of manuscripts containing music of the Italian Ars Nova, which, however, was the expression of only a small minority and had a much more limited diffusion than monophonic music. It is thus deceptive to see it as representative of Trecento music. Polyphonic singing, probably taken over from the private entertainment of ecclesiastics, began to be fashionable at the courts of the Scaligeri and Visconti, in Padua, Verona and Milan during the early 14th century; later it also gained favour in literary circles in Florence. Accordingly, its composers, most of them ecclesiastics or lawyers, divide into a northern group, whose main figures are Jacopo da Bologna and, later, Bartolino da Padova (both significantly from places with famous universities), and a larger Florentine group, including Francesco Landini (*d* 1397). The role of lesser places, such as Perugia, Rimini, Caserta, Teramo and Lucca, is unclear. Over 600 extant works, datable from about 1335 to about 1420, include madrigals, ballatas, a small number of *cacce* and a scattering of motets. The madrigal and *caccia* were the oldest forms, apparently created by polyphonists from both the musical and the literary point of view. The madrigal's short, descriptive, epigrammatic or celebratory texts (some of them by Petrarch, Boccaccio and Franco Sacchetti) were set for two, seldom three, texted parts, with effusive figuration in the upper one, often to mark the beginning or end of a poetic line or verse. Madrigals set in canon were called '*cacce*', but that musical term (a musical synonym of the later *fuga*) soon suggested longer, metrically irregular descriptions of open-air scenes (hunting, fishing, marketing etc.), whose onomatopoeic animation, rendered by the voices in canon, often required the support of a third, non-canonic instrumental part. Ballatas were at first set monophonically even by polyphonists (two manuscripts contain a small number of such settings), but began to be set for two or three parts after 1360; as the lyricism of their upper voice-parts (often supported by lower, instrumental parts) appealed to somewhat larger audiences, they gradually supplanted madrigals and *cacce*. This explains the particular renown enjoyed by Landini, whose works are mainly ballatas.

With its special forms and special system of notation, codified in the 1320s by Marchetto da Padova (himself a composer), Italian secular polyphony was related to, yet independent from, the contemporary French Ars Nova. Its learned supporters, however, began gradually to indulge in *subtilitas*, mostly identifying it with the imitation of French contemporary models; in time, and particularly during the great schism following the return of the popes from Avignon to Rome, various artists were induced to embrace a French style. As a counterpart, some foreign composers who were active in Italy, among them Johannes Ciconia (*d* 1412) and later Du Fay, set Italian texts and showed their appreciation of the original flavour of the Italian polyphonic style. A distinguishing feature of 14th-century Italian polyphony was the motet celebrating a state or religious occasion, whose text (always in Latin) mentions not only the event itself but also the personalities involved and, in some cases, the composer.

[Italy, §I: Art music](#)

3. Renaissance.

Historians have been puzzled by the sharp contrast between the apparent brilliance of 14th-century polyphony and the emptiness of that of the 15th century. Actually, the Ars Nova is magnified by its splendid manuscript tradition; when its thin support was all too easily washed away by a wave of humanistic distrust for all that smacked of scholasticism, secular society simply reverted entirely to kinds of music that were mainly committed to oral tradition. Such a humanistic attitude is epitomized by Leonardo Giustiniani (*d* 1446), a Venetian nobleman, who set out to recapture the spell of ancient music by singing dialect songs in a popular style. A whole class of songs came to be called *giustiniane* after him; his music is completely lost, however, as is that of many singers *a liuto* or *alla viola*, some professional, like Pietrobono of Ferrara (c1417–1497) and Serafino Aquilano (1466–1500), others amateur, like Lorenzo de' Medici and many members of his retinue. Their techniques may also have included some kind of simple polyphonic accompaniment to the voice. Virtuoso playing on the lute or keyboard was also increasingly admired.

Many churches had organs and organists, but only a few had singers, most often foreigners, who sang and taught polyphonic music; S Pietro in Rome seldom had more than four. Sacred polyphony fared better in the *cappella papale* (papal chapel), particularly under Martin V (1417–31) and in the first years of the reign of his successor, Eugene IV; it then declined, mainly because of the latter's drive for ecclesiastical reforms and austerity, which, however, may have inspired Du Fay to compose his remarkable cycle of hymns. Du Fay, who had previously been connected with the Malatesta family, was a papal singer, with some interruptions, from 1428 to 1437; in 1436, while in Florence with the *cappella* he composed the motet *Nuper rosarum flores* for the dedication of Florence Cathedral during the visit of the Pope. But after Du Fay no composer of stature entered the *cappella* until late in the century, when a renewal of interest (which was to culminate under Leo X) brought Weerbeke (1479), Orto (1484) and Josquin (1489). The *cappella* established in Naples in 1442–3 by King Alfonso I of Aragon, the most famous member of which was Johannes Tinctoris, a Netherlander, served as a model for a few other courtly *cappelle*; the most important among them were those of Ferrara and Milan, the former created by Leonello d'Este (*d* 1450), who employed English musicians, and later strengthened by Ercole I (1471–1505), and the latter founded in 1473 by Galeazzo Maria Sforza (Josquin was associated with Cardinal Ascanio Sforza and the ducal court in 1484–9). In nominally republican Florence, the Medici did not have a *cappella* but encouraged and exploited for their private use the presence of polyphonists in various Florentine churches, including Heinrich Isaac.

Numerous manuscript collections of the late 15th century indicate a more widely spread and intensified interest in polyphony, the extent of which is even more eloquently stressed by the appearance in 1501 of music printing, started by Ottaviano Petrucci in Venice and soon imitated elsewhere in Italy and abroad. Petrucci's output, evidently addressed to a rapidly growing public of lesser nobility and upper bourgeoisie, mainly consists of secular music. His *Odhecaton* and two other collections of Franco-Flemish pieces, seemingly intended for instrumental performance, were soon followed by a series of 11 books of typically Italian pieces, whose markedly chordal (and possibly instrumental) accompaniment to a

main vocal line apparently continued and developed previously unrecorded practices (two more of his prints contain similar pieces in arrangements for voice and lute). In addition to frottoles and *strambotti*, a more literary class of text – sonnets, *ode*, *capitoli*, Petrarchan canzoni and madrigals, as well as Latin poems – were also set in this style. These compositions, printed by Petrucci – and others preserved in contemporary manuscripts – clearly reflect and, in some cases, actually preserve in written form the oral practice of music-making from previous centuries in Italy. Bartolomeo Tromboncino and Marchetto Cara are the best known among the composers, many of whom served the courts of Ferrara, Mantua, Urbino and Rome. Also included in the prints are settings of mascheratas, certainly intended for courtly entertainment and requiring choral rather than solo singing; their Florentine equivalents, *canti carnascialeschi*, survive in manuscript form.

Early in this outburst of a new vitality two trends began to appear, both of which arose from a humanistic concern for the text but led to different conclusions. On one hand, the demand for higher literary standards and the revival of Petrarchism typical of the first decades of the century led to settings that concentrated on the effective delivery of the text by the upper voice, unobstructed by the subdued, basically chordal support of the other parts, often one or more instruments. On the other hand, the general interest in all artistic activities, also spurred by humanistic ideals, suggested that the literary refinement of the texts be matched by the musicians, summoning up all the resources of contrapuntal polyphony. The latter attitude gradually prevailed, leading to the madrigal (an old name for a new coalescence of poetic forms) becoming the main vehicle through which the composers set out to interpret musically the poetic content of their chosen or given texts; hence the recourse to so-called madrigalisms, a repertory of partly spontaneous, partly contrived associations of poetic and musical images, which, however, had its roots in the international motet style of the turn of the century. Madrigals were often intended to be performed in connection with the meetings of the academies, as musical interludes or to conclude learned speeches or discussions.

Early madrigals by Verdelot, Costanzo Festa and Arcadelt generally achieve a balance between recitative-like clarity and contrapuntal activity. Later a sharper alternation of contrapuntal writing and chordal passages developed, while a keen spirit of experimentation led to the faster rhythms of the madrigals *a note nere*, or (fostered by Vicentino's speculations on the genres of ancient music) to Rore's exploitation of dissonance and chromaticism for the expression of deep poetic feelings. The whole gamut of expressive resource, ranging from dramatic moods to sunny enthusiasm or to pastoral levity, was displayed at its best towards the end of the century by Marenzio, while extreme emotional tensions dictated Gesualdo's sudden shifts from exaggerated chromaticism to melodious diatonicism. None of this ever completely erased the predominance of the upper part, as is also shown by performing practices; for although polyphony was now issued in partbooks – all provided with text – contemporary sources indicate that all-vocal performance could often be replaced by combinations of voice and instruments (even title-pages speak of 'madrigali da cantare e da suonare'). Furthermore, frottoles and *strambotti*, dropped by the printers about 1530 (although they continued to

be sung), were soon replaced by new popular genres, such as the villotta, the three-voice *villanesca alla napoletana* and later the canzonetta. Midway between the madrigal and the lighter genres are Striggio's witty madrigalian narratives (e.g. *Il cicalamento delle donne al bucato*), to which Vecchi's and Banchieri's so-called madrigal comedies and other musical entertainments are related.

Less venturesome, and yet the main field of activity for many famous composers of madrigals, sacred music continued to be international in style and repertory. So too were many of the performers, including Verdelot, Arcadelt, Jacquet of Mantua, Jacquet of Ferrara, Nasco and Werrecore, whose church positions made them specially apt to influence new generations of musicians; in the 1530s, when the devastations of war were over, newly formed *cappelle* based on the model of the Cappella Giulia at S Pietro, designed in 1513 by Julius II, began to teach boys. Often, however, foreign musicians were so much involved in the Italian way of life as to become deeply italianate. The most relevant example is Willaert, who, after sojourns in Rome, Ferrara and Milan, succeeded Petrus de Fossis, also a Fleming, as *maestro di cappella* of S Marco, Venice, in 1527; during his 35-year tenure Parabosco, Vicentino, Rore, Zarlino, Andrea Gabrieli and Costanzo Porta were among his colleagues and pupils. With the pupils succeeding their masters, it became exceptional for foreign musicians (such as Rore, Wert or Victoria) to occupy leading positions in the second half of the century. From the combination of Willaert's powerful personality and the standards of magnificence set by the Venetian government for its official church, the main features for which the Venetian school became one of the principal models of Italian (and foreign) church music were established: richness of sound, polychoral writing, colourful use of the organ (S Marco constantly used at least two) and later of other instruments and finally a relative lack of concern for all debates on the future of church music. Following a century-old tradition, motets were composed to celebrate important state festivities, as in the works of the great Venetian composers such as the Gabrielis. Contrasting with the open attitude in Venice, the leading Roman institution, the *cappella papale*, was slowly evolving a guarded attitude, partly protecting old privileges under the shield of tradition, partly reacting to mounting criticism of church polyphony from both outside and inside the Catholic church. Without being a conservative, Palestrina continued and brought to consummate refinement stylistic trends that he had come to know from his French teachers in the *cappella* of S Maria Maggiore. It is significant, too, that he usually based 'parody' masses either on his own motets and madrigals or on French models of the 1530s. Mounting concern that the Council of Trent might banish the use of polyphony from the liturgy led Palestrina and his Roman colleagues to write masses paraphrasing plainchant (or even treating it in chorale-like fashion); above all, however, they were careful to avoid polyphonic complexity that might obscure the liturgical text. Finally, while the organ accompanied the singing in most Roman churches, the model of the *cappella papale*, where purely vocal performance was traditional, suggested moderation in the use of instruments. Thus, while the Venetian school followed a course that was to lead to the concertato style of the next century, the stage was set in Rome for the concept of *stile antico*. However, the church music of Palestrina's successors at S Pietro also

reveals clarity of declamation and the use of vertical sonorities found in the works of their Venetian colleagues.

Music printing, of which Venice was the main centre, soon reflected a demand for instrumental music. In 1507 a series of prints containing vocal pieces (mostly secular, but also sacred), dances and ricercares in lute tablature was started by Petrucci. A privilege granted to him to publish keyboard music was assumed instead by Antico for his *Frottole intabulate da sonare organi* (Rome, 1517; see [fig.3](#); printers always referred to all keyboard instruments as *organi*). The most famous performers and composers of lute music were Francesco da Milano and, later, Vincenzo Galilei; lute transcriptions of polyphonic works were performed by university students during the Renaissance. Organists were much more numerous, because of their church employment. Their music was sometimes printed in score to make performance by a group of instruments possible, but instrumental music was practised to an even greater extent simply by use of the vocal repertory; favoured instruments were recorders and viols (for which tutors were published) and the whole family of cornetts. A great variety of instruments, combining or alternating with voices, was also displayed in the spectacular *intermedi* performed between the acts of comedies or pastoral plays, the most famous of which were those given at the Florentine court in 1589 to celebrate a ducal wedding (see [fig.5](#)). A remarkable 16th-century collection of instruments is still housed in the Accademia Filarmonica in Verona.

An intense theoretical activity often led to debate. The most heated controversy was between supporters of a tuning similar to just (or harmonic) intonation, which was first taught at Bologna by the Spaniard Ramos de Pareia (*b* c1440), and defenders (including Gaffurius) of the traditional Pythagorean system, better suited to the needs of monophony. The former were later joined by Zarlino (1517–90), whose works cover a much wider range of philosophical, historical, aesthetic and compositional problems. Ancient theory was often summoned in support of tradition and as a justification for daring harmonic experiments in the direction of the ancient genera; further, it also helped critics of the current polyphonic style to foster the ideal of a new, essentially melodic, expressive immediacy. Vincenzo Galilei (*d* 1591) was the most outspoken critic, and yet it is an over-simplification to see his theoretical and musical works, as well as the discussions held from about 1575 in the Camerata of Count Bardi in Florence, as prime factors of a stylistic change to which many other elements contributed. Many of Galilei's arguments – that polyphony obscured the perception of the text and that its imagery singled out individual words but lost sight of the real poetic message, so that its artistry reached no deeper than the ear – had been anticipated in the discussion on the fate of church music; his suggestion that music should emulate the intensity of reciting actors had precedents in such madrigals (often called *ariosi*) as aimed to recapture the pathos of popular singers of epic verse. In any event, emotional intensity was not the only issue. More difficult to explain was the ideal of a melodic spontaneity, which was not (as in successful *villanesche* and canzonettas) attained simply by playing on instruments all parts but one of a polyphonic piece, for the resulting vocal line did not have the poise and balance of a real melody. The latter

depended, paradoxically, on deep-seated harmonic feelings and on the fulfilment of expectations aroused by its harmonic implications.

Italy, §I: Art music

4. 17th century.

The new style 'invented' about the turn of the century by Giulio Caccini consisted of vocal melodies unconditioned by any contrapuntal interplay and supported by a bass line that was subservient to them – the continuo – to be sparingly realized as full chords by the accompanying instrumentalist (possibly the singer himself). This combined the advantages of harmonic function and flexible adjustment to the expressive needs (*sprezzatura*) of the singer's rendition. Caccini correctly claimed that what is called accompanied monody was the same as the *stile rappresentativo* or *recitativo* used by Peri, his colleague and rival at the Florentine court, in the first operas (*pastorali tutte in musica*), *Dafne* (1598) and *Euridice* (1600; fig.6). In both cases the composer set out to 'represent' the emotions of characters reacting to dramatic situations, although those of Caccini's madrigals and arias were merely hinted at by the texts. In fact this kind of dramatic projection through a chamber recital, which had had many precedents in the polyphonic madrigal, now became typical and often adopted the striking, emotional harmonies of Peri's and Monteverdi's operas. In time this extremely popular genre, fostered by many composers, evolved into an even larger production of cantatas.

Operas, on the other hand (of which the recitative aspects are now given too much emphasis over the melodious singing, choruses and instrumental colour), were connected with infrequent court events. In Florence, where they began, there was often a reversion to spoken plays with *intermedi*, or to spectacles, 'tutti in musica', of a choreographic rather than dramatic nature, after the model set in the 1590s by Cavalieri. After the Mantuan performances that included Monteverdi's *Orfeo* and *Arianna* (1607–8), both court events, the lead was taken by Rome, especially with the custom instituted by the Barberini family, relatives of Pope Urban VIII (1623–44), of holding operatic performances in their palaces during Carnival. The opening of the first public opera house in Venice in 1637 was a turning-point; within a few years operas were offered from December to Lent, and again in the spring, by four or five theatres in Venice, while the custom quickly spread to Bologna, Milan, Genoa, Lucca and Naples, and even in Rome opera was given in semi-private theatres (against the will of various popes). Although the tradition of performance at court was never completely broken, opera in the 17th century was practised either as an entertainment in the academies (thus continuing the Renaissance tradition of music at such events) or in smaller centres, performed by touring companies in connection with local celebrations. Already in the Barberini operas the plots, drawn from Tasso's epic poetry or from saints' lives, had begun to expand and sharpen the distinction between recitative sections (in the modern sense) and self-contained arias and choruses. Later librettos, starting with Busenello's *L'incoronazione di Poppea* (1643) for Monteverdi, drew freely from the whole range of history, juxtaposing in a cavalier fashion highly dramatic moments, arbitrarily inventing amorous effusions and scenes of ludicrous comedy. The music, however, often succeeded in making all incongruities plausible with a flexible, far from

formalized, handling of recitative and aria, the former attaining on occasion highly dramatic effects, the latter avoiding stagnation in the compelling drive of the plot. The most effective and widely performed operas were those of Cavalli (1602–76). Towards the end of the century a new ornamental style of singing led to the appearance of virtuosos who practised what became known as *bel canto*. At the same time the comic element disappeared from operatic plots, leading to the appearance of the intermezzo, performed by actors who were also singers, at the beginning of the 18th century.

Lesser genres, such as extended cantatas or serenatas, expressed their dramatic content through purely auditory means, as also did opera's sacred counterpart (usually given in Lent), the oratorio, born from the spiritual exercises of Philippine oratories, from which the genre acquired its name. Cavalieri's allegorical *Rappresentazione di Anima, et di Corpo*, fully staged in Rome at the Oratorio del Crocifisso in 1600, was an exception; more typical were G.F. Anerio's *dialoghi*, published in his *Teatro armonico spirituale* (1619), in which a choral narrative introduced the words of the main characters sung by soloists. This type, using vernacular texts, had a wide diffusion through the Philippine congregation, showing, however, a tendency to assimilate dramatic techniques from opera, with more emphasis on solo recitatives and arias and developing more complex plots. Giacomo Carissimi (1605–74), who wrote his works (*historiae*) on Latin texts with a greater display of choruses and instruments, represents a somewhat different trend established by the Jesuits. As a teacher at the Jesuit Collegio Germanico in Rome, Carissimi had considerable influence on German composers.

In the oratorio, to a greater extent than in the opera, accompanied monody was often incorporated in the new *stile concertato* which had developed from earlier polyphony, giving much greater differentiation to the various elements and a pointed expressive and sonic distinction to each, be it a voice, an instrument or a choral or instrumental group. The *stile concertato* had had its first important representative in Venice with Giovanni Gabrieli (c1554–7–1612), followed by Monteverdi, who used it at first in sacred pieces (beginning with the Vespers of 1610) and later in a number of madrigalian works. Instruments tended to be more sparingly used in the Roman school, where the *stile concertato* often took the shape of large-scale polychoral pieces supported by organs, the most representative being those by Orazio Benevoli (1605–72). These stylistic trends also characterize much of the sacred music composed at this period.

The free play of harmonic feeling to which both accompanied monody and concertato music instinctively tended did not open the way to an immediate assertion of the so-called tonal system. In the first place, the new vogue for harmonic surprise based on chromaticism, used (and abused) for emotional purposes, had to take its full course. Composers still relied on elementary harmonic functions, or on such traditional bases as the *romanesca* and *passamezzo*, or on new ones, such as the descending Dorian tetrachord and its many variants. Whole compositions, sometimes the most dramatic arias, could be based on a ground bass of some sort. Only gradually did the precise feeling of how each chord related to the tonal centre of its key begin to take shape. It had become clearly outlined in

the operas and oratorios of Alessandro Stradella (1639–82) and even more so in those of Alessandro Scarlatti (1660–1725) and in the instrumental works of Arcangelo Corelli (1653–1713), although theoretical treatises still continued to expound the system of the church modes.

Instrumental practice, increasingly flourishing and autonomous, may have played a greater part than vocal music in the development of modern harmony with a language richer in figurations outlining full chords. Furthermore, at least part of it had inherited the elementary but powerful tonal drive of dance music. The warm, brilliant sound of the new violins built by famous makers in Brescia and Cremona lent itself to accompanied monody in the form of solo sonatas with continuo, such as those of Biagio Marini (c1587–1663). Most instrumental music, however, belonged to the concertato type. Here, too, the variety of instrumental colours in Giovanni Gabrieli's canzonas in eight to 15 parts (published in 1597 and 1615) gradually gave way to an almost absolute prevalence of strings. A most successful combination proved to be that of two violins with continuo (the latter doubled by a violone or cello), the *sonata a tre* of which Corelli's opp. 1–4 were to become the best-known and most influential examples. Corelli was the first significant composer to devote himself entirely to instrumental music. His works became the model for string compositions in the first half of the 18th century. In larger ensembles recourse was first made during the second half of the century to an interplay of a group of soloists and a larger tutti; from it developed the concerto grosso, best represented, once more, by Corelli, in his op. 6, most of which had been composed for performance during Roman festivities at least 25 years before its publication in 1714. The *canzona per sonar* was a composition of some length, alternating contrapuntal sections and chordal or melodic ones, generally played during Mass; in time (by about 1650) such pieces were called sonatas and were more sharply divided into various movements, so called from their changing time signatures and tempos. Canzonas and sonatas were also used for secular entertainment, and many were given titles referring to the noble dedicatees for whom they had been played. Only late in the century was a distinction made (though seldom stated) between sonatas *da chiesa* and *da camera*, which was probably meant to indicate the inclusion in the latter of dance movements rather than works specifically destined for either church or chamber.

The distinction is hardly clearer in keyboard music, although the transfer of organ pieces to the harpsichord was much more likely than the performance on a church organ of partitas (variations) or dance suites intended for harpsichord. Composers of organ music reacted to the general trends of the time in peculiar ways. Expressive goals, analogous to those that had led to accompanied monody, were achieved in pieces of the toccata type, with their abrupt changes of texture, unexpected harmonic turns and, above all, the agogic flexibility of performance as emphatically recommended by Frescobaldi in his prefaces, especially that to his second book of toccatas. The organ had only limited potential as a concertato instrument; but contrapuntal pieces like the *ricercare*, elaborating on themes of more pointed individuality and secular flavour than those of the preceding period, slowly evolved towards the tonal fugue.

Theoretical writing was on the whole less intensive and polemical during the 17th century than in the Renaissance. It was essentially concerned with the practical consideration of problems of composition or performing practice; the works of Banchieri (1568–1634) and Cazzati (1616–78) are particularly valuable as a source of information about the views and criteria adopted by musicians in a time of rapid change.

Italy, §I, 5: 18th century art music

(i) General observations.

18th-century Italian music appears to have well-defined chronological limits: at one extremity stand Corelli and Zeno's operatic reforms, at the other the late works of Boccherini. This historical construct contains a measure of truth but is also misleading. The idea that the revolutions at the end of the 18th century released a spirit of artistic renewal was ideologically motivated: during the period of the Risorgimento critics condemned 18th-century music because of its hedonistic functions and as the expression of an élite class, and De Sanctis and Carducci judged Metastasian opera in the same light. Nevertheless, as early as the 19th century the music of Sammartini and 18th-century Venetian composers caught the attention of such theorists as Carpani, Gervasoni, Lichtenthal, Picchianti and Ruta. Ascoli (1832) identified the counterpoint of Corelli and Marcello as instructive models of a style that was scholarly but not dry, but in doing so undervalued its purely aesthetic value. This view, a symptom of inadequate historic awareness, was repeated by Verdi's pupil, Emanuele Muzio, when he described Corelli's music as 'tough food to digest', but as a useful subject for study because it was 'full of science'.

The re-evaluation of 18th-century instrumental music was the work of the 20th-century musicologists Torchi, Chilesotti, Vatielli and Torrefranca, followed by the composers Casella and Malipiero. In contrast, the genres of oratorio and cantata, more concerned with a specific function, aroused no interest in an intellectual environment so heavily influenced by Benedetto Croce. In recent decades, however, research into 18th-century Italian opera has afforded greater insight into its codes of communication and its system of production. The definition of 18th-century Italian music as an abstract, stylized art, a hedonistic diversion for a society which the Treaty of Aix-la-Chapelle (1748) consigned to the margins of history, has thus declined.

Three broad categories of places where music was performed in 18th-century Italy can be identified: the public, private and ecclesiastical, which correspond in general terms to the three genres of opera, instrumental and chamber music (including cantatas) and liturgical music. There was an uninterrupted growth in the number of opera houses, which took on the character of civic institutions and became points of reference in the layout

of a city. The old system of court theatres was progressively replaced by one of theatres run by impresarios for profit. Instrumental concerts ('academies') were mostly given in private homes; since it did not involve the commercial mechanisms of the theatre, instrumental music was the exclusive province of the upper classes. Cathedrals and their chapels were affected by the opera house: performers often worked both in church and the theatre, and the idiom of liturgical music grew increasingly similar to that of opera.

The three genres have in common a diffused habit of inattentive listening: it was only with considerable effort that the idea of listening to music as a work of art became established in Italy, and for this reason many musical compositions go no higher than the level of ornamental, extemporary and occasional work. The ephemeral nature of musical expression entailed a high degree of improvisation in all three genres: from the opera house (where the singer improvised in the *da capo* sections of arias, and, as Gardini and Galeazzi document, orchestral players sometimes did likewise) to the church, where the organist had *carte blanche* to improvise, and private entertainments (in 1787 Hadrava describes an improvisation on 'composed' music, such as that by Mozart).

As the century progressed, music, without distinctions between genres, became the prevailing artistic expression in the daily life of the upper middle class: 'the Italians may, perhaps, be accused of cultivating music to excess' (Burney). The high rate of consumption led to greater conventionalism and periodic changes in taste: 'musical taste in Italy changes at least every ten years' (De Brosses, 256). With the spread of 'profit-making' opera houses, and the increased tendency to celebrate public occasions with music, the social range of consumers widened. This broadening of the social base of the 'leaders of taste' guided the choice of musical genres: the only really classless genre was opera, particularly comic opera after 1750. Although Stendhal, writing in 1817, still saw Italy as the land of music *par excellence*, this supremacy had diminished in the last decades of the 18th century, as can be seen in the exodus of players abroad and opera composers' search for success in the great capitals outside Italy.

In the middle of the century music started to be reconsidered aesthetically, no longer viewed as something ephemeral and occasional, but an art form with its own expressive worth. Algarotti, Tartini and Muratori, and later Baretto, Galeazzi and Carpani document the passage from a scientific concept of musical composition to an aesthetic one; from music as one of the liberal arts to music as one of the fine arts; no longer a craft (as Saverio Mattei was still maintaining in 1785), but an expression of character and *affetti*, a direct imitation of nature (Tartini/Algarotti).

Italy, §I, 5: 18th century art music

(ii) Musicians' lives.

Musicians were educated within the family circle, in the case of the professional musical families, or in the few institutional schools in Italy: these were the conservatories in Naples and Palermo (the famous *ospedali* for girls in Venice did not, with a few exceptions, prepare their pupils for a profession), the chapels of the great cathedrals like S Petronio in Bologna

or, for 16th-century counterpoint, the Roman chapels and the Santuario della Santa Casa in Loreto. Lastly there was private teaching, the greatest example of which is provided by Tartini, 'teacher to all the nations', as well as the instances of Hasse with Scarlatti and Galuppi with Lotti. According to De Brosses (p.598), 'the best seminaries of *maestri di cappella* are in Naples. ... For voices, the best school is in Bologna; Lombardy excels in instrumental music', and this is confirmed by Josse de Villeneuve (1756). Naples, where the majority of Italian composers were educated, had four conservatories: the Poveri di Gesù Cristo (closed in 1743), S Maria di Loreto and S Onofrio (which merged in 1797), and S Maria della Pietà dei Turchini. It is estimated that each conservatory had an average of about 100 pupils in a city of about 250,000 inhabitants. The subjects taught were counterpoint and figured bass (*partimenti*), while operatic and instrumental composition were learned orally and by imitation, a distinction between the educational and the professional (theory and practice) that remained unchanged until Verdi's day.

After completing his education, the young composer could make his début with short comic operas, liturgical pieces, or by writing arias for insertion into operas by others. After he made himself known, he could aspire to *opera seria* and the great theatres: the determining factors at this stage were the family ties and contacts of his own teacher. However, it was difficult to guarantee an income and regular work in writing for the theatre. Instrumental composition offered the composer two lucrative possibilities: a dedication to a member of the nobility, rewarded with a one-off gift, or in private sales of an independently printed work. Another possible employment was as *maestro al cembalo* (harpsichordist) in a theatre, as was probably the case with the young Galuppi at the Teatro S Angelo in Venice. As well as these personal sources of income a composer usually also held a permanent post in service to the nobility, in the church, or as a teacher. In these cases, too, the remuneration was modest. A composer in the mid-18th century being thus active in all genres meant that there was a continual stylistic cross-fertilization between them, a situation criticized by Tartini.

There are various examples of singers being born into professional musical families, such as the Mingotti, Ristorini, Baglioni and Laschi families. The greatest number of singing teachers is recorded in Bologna, although no institutional school of singing with a local stylistic identity was ever established there. In Rome the Collegio Germanico and the Seminario Romano, both Jesuit foundations, exported their pupils all over Europe. Because of the papal ban on women performing either in church or in the opera house, many castratos, often from humble backgrounds, began their careers in Rome.

Singers who did not succeed in entering the extensive operatic scene, which had its centre in Bologna, contented themselves with posts in the cathedrals. The first performers to reap the benefits of the nascent star system were singers, on whom every category of musical performance depended; they were thus the first element operatic administrators had to consider, and they were the highest paid, commanding up to ten times the fee of the composer. Later on, the composer also entered the open market: for example, Piccinni in 1770 could choose where to work according to the

pay on offer. This was the point at which the composer became a cornerstone in the mechanism of opera production, and began his social ascent.

Italy, §I, 5: 18th century art music

(iii) Opera.

Opera was the most widespread artistic form; no other cultural expression had the same capacity to reflect social life, the same cultural prestige or comparable turnover. Opera as a whole had a double social and cultural function: its social function was as an instrument of moral and civil education (Zeno), the vehicle of the dominant ideology (Metastasio), and as social critique (comic opera); its cultural function was to disseminate 'high' culture and language and to convey classical subjects or, later on, otherwise unknown ones from fiction. Hence Strohm's assertion (1991, p.19) that 'Italian opera, good and bad, was a school for the nation, precisely as cinema and television are today'. At the beginning of the century opera divided into two genres: *opera seria* (*dramma per musica*) and comic opera (*intermezzo*, *commedia per musica*, *dramma giocoso per musica*, *opera buffa*). This division made it possible for opera to be widely disseminated and carry out multiple functions. The two genres constituted two alternative systems with mechanisms of production, performance and reception that rarely intersected, but which influenced each other to a great extent in dramaturgy, versification, musical language and structure.

Max Fehr and Hermann Abert were the first to recognize that the men of letters rather than the composers played the leading role in the 'reform' of 17th-century Venetian opera into the rational *dramma per musica*. The first reformers, besides Zeno, were Silvio Stampiglia, Girolamo Frigimelica Roberti, Antonio Salvi and Pietro Pariati, who all shared the same Arcadian ideals. Another member of the Accademia dell'Arcadia was the poet Metastasio, the most pervasive figure in the history of 18th-century opera.

The first Arcadian operas were created in Venice: *La forza della virtù* by Domenico David to a libretto by Zeno (1693), and *Gli inganni felici* (1695) and *Lucio Vero* (1700) by C.F. Pollarolo, also to librettos by Zeno. At first literary reform had little influence on the music: Alessandro Scarlatti, Giovanni and Antonio Bononcini and Gasparini continued the 17th-century legacy of contrapuntal writing, concertante instrumental parts, and arias accompanied only by basso continuo. The spread of Arcadian and rationalist opera coincided with Metastasio's first libretto (*Didone abbandonata*, 1724, Naples) and the first operas by the composers of his generation: the Neapolitans Porpora, Feo, Pergolesi, Leo, Hasse and Vinci (the first 'classical' composer, according to De Brosses, Algarotti, Burney and Grétry), and the Venetians Albinoni, Orlandini, Caldara and Vivaldi. The anti-Baroque reforms of Zeno and Metastasio covered a number of elements: the revival of the Aristotelian unities, the elimination of comic elements, marginal episodes and spectacular stage effects, and a reduction of the number of scenes from 60 or 70 to between 20 and 30. The composition followed the dramatic form, divided into repeated sequences of recitative (or multiple recitatives) and da capo aria. The recitatives, generally dialogues for up to five characters, set up the motivation for the subsequent aria, in which the character stepped outside

the real time of the action for a personal, reflective reaction. At the end of the aria, the character left the stage. This recitative and aria structure remained dominant until 1770 and suited the 'tyranny of the text' over the music. Such a word-centred concept was in line with the classical idea of tragedy in which events did not take place on stage but were referred to by characters who brought their personal reactions on stage instead. The 19th century's charges against Metastasian opera derived in large part from an inability to understand these assumptions, which have their roots in the Enlightenment.

During the Metastasian period (by extension, from 1700 to 1770) only the drama was a work of art, the music having a simple auxiliary value. The 'author' was thus the dramatist, while it was the responsibility of the singer to create the performance; the composer had a subordinate role, vaguely comparable to that of the modern-day director. This is the reason why in 18th-century Italy it was the libretto, not the score, that was printed, and on the title-page, as on the theatre poster, the name of the composer was not given (in 1842 the title-page of the libretto of *Nabucco* still gave only Solera's name, not Verdi's). This also explains the practice of continual resetting of the same Metastasio librettos: *Didone abbandonata* was set to music about 60 times; *Olimpiade* about 50, *Achille in Sciro* about 30. *Opera seria*, at least until the last quarter of the century, was an established genre and the tendency was for each musical and dramatic realization to be a one-off, a costly undertaking incompatible with the emerging commercial nature of opera.

During the 1750s even faithful supporters of Metastasio such as Hasse and Jommelli reacted against the 'tyranny of the text'. At this time the text had a conservative function and a high prestige stemming from tradition, while the music had a contrasting evolutive function: arias broke free from the da capo form, the overture acquired greater interest (as in Piccinni's *Catone in Utica*), and accompanied recitative became predominant (Traetta, *Ifigenia in Tauride*). Sacchini, Traetta (*Antigona*) and Salieri (*L'Europa riconosciuta*) show in different ways the influence of French *tragédie lyrique* in the increasingly spectacular nature of opera and the greater use of chorus and orchestra. Another evolutionary impulse came from *opera buffa*, especially in the use of ensembles: in *Artaserse* (1749) Galuppi brings together in a final quartet what the Metastasio original had as a sequence of five separate arias. Dance became a source of new subjects: with Noverre and Angiolini in Milan from the 1770s onwards, the 'ballo pantomimo' proved more popular than opera, prompting lamentations from Metastasio. Of all the 18th-century trends in opera, only the reform of Gluck and Calzabigi had no great effect in Italy, except in those states with Habsburg connections.

In the last third of the century many new librettists (no longer autonomous playwrights like Metastasio) came to the fore, including Calzabigi, Da Ponte, Coltellini, De Gamerra, Sografi and Verazi. During this phase it was the composers who made operatic history: Anfossi, Sacchini, Paisiello, Cimarosa, Tritto, Zingarelli (the 'late Neapolitans'), Sarti, Salieri, Paer and Mayr. Metastasian opera was based on a range of conventions which were utterly clear to his contemporaries: the post-Metastasian phase (1770–1800) was multiform, sometimes experimental, but the tendency was

towards an acceleration of the dramatic rhythm. New subjects and a new vocabulary implied new metres, with frequent breaks and a preference for lines with an even number of syllables. New types of scene were introduced (dungeons, oracles, executions, cemeteries, eerie forests, ghosts and skeletons), and there was greater dependence on spectacular effects and the use of the chorus even during arias (Traetta's *Ifigenia in Tauride*, Paisiello's *Elfrida* and Cimarosa's *Gli Orazi ed i Curiazi*). The orchestra acquired greater importance: in his *Nitteti* (1756) Metastasio had already imagined the 'din of tumultuous symphonies' in the battle scene. The number of arias was reduced and the scenes were extended: sequences of solo scenes were transformed into ensembles (like the final sextet of Cimarosa's *L'olimpiade*): this brought about a reduction of exit arias, and Paisiello, for example, wrote only four exit arias in *Elfrida* and none at all in *Elvira*. The same composer reached a new level in *Pirro* in 1787; contemporary periodicals (*Gazzetta Universale* and *Gazzetta Toscana*) and direct documentation (G.G. Ferrari, Hadrava) reveal how much the dramatization of the solo scenes and the elaborate ensemble finales were admired. Singers were asked to interpret with greater realism and fidelity, as Burney documented when he praised the Florentine Guarducci for his expressivity and because he 'adds but few notes' to the melody.

Comedy, which had been banished from opera by Zeno's reform, began a history of its own. The first comic operatic forms were the *commedia per musica* and the intermezzo, neither of them popular art forms – indeed, in some cases, they were quite erudite – and they shared in the same anti-Baroque reaction as Zeno's reforms. The intermezzo, which grew out of the comic scenes in 17th-century opera, sprang from collaborations between the librettist Pariati and Gasparini and Albinoni and the *buffo* bass G.B. Cavana in Venice (the first printed librettos date from 1707). Cavana is responsible for the intermezzo being exported from Venice to Naples, where it was taken up by Scarlatti, Leo, Sarro, Vinci, Hasse and Pergolesi. The most frequently performed intermezzo of the century was *Bacocco e Serpilla* by G.M. Orlandini (1715, Verona). But posterity remembers the intermezzo (suppressed in Naples by royal decree in 1736) only by Pergolesi's *La serva padrona* (1733, Naples), which sparked the [Querelle des Bouffons](#) when it was performed at the Académie Royale de Musique in Paris in 1752. There were some forward-looking elements in the style of a typical intermezzo: music which stays close to the text, short, unadorned vocal phrases, a simple plot with two or three characters, a recognition scene set as a duet, and middle-class, popular subject matter.

The *commedia per musica* had a more complex genesis: in Naples, after the private experiment of *La Cilla* (1706), the Teatro dei Fiorentini organized the first public season of *commedeje pe' museca*, all in Neapolitan dialect, in 1709. There were companies active in Rome performing Neapolitan *commedie*, and in 1717 Florence saw a scholarly attempt to revive the 17th-century 'civili e rusticali' operas of Moniglia and Villifranchi, while the librettist, impresario and composer G.M. Buini had a company working in Bologna and Venice. Only Neapolitan comedy, translated into Italian, went on to long-lasting success; the *buffo* bass Francesco Baglioni was responsible for the genre's decisive step forward in popularity, in Rome. Here in 1729 there were performances of *La costanza*

(from Vinci's *Li zite 'ngalera*) and *La somiglianza* (from Leo's *Lo simmele*) at the Teatro Capranica; in 1738 *La finta cameriera* (Latilla) and *La commedia in commedia* (Rinaldo di Capua) were given at the Teatro Valle. *La finta cameriera* had been performed more than 20 times in northern Italy by 1750. Neapolitan *opera buffa* continued on its way in Florence, where it was performed by the singers Pertici, Laschi, Brogi and Querzoli. Goldoni was living in Florence until 1748; when he returned to Venice his collaboration with Galuppi produced the two examples of *dramma giocoso per musica*, *L'Arcadia in Brenta* (1749; see fig.11) and *Il filosofo di campagna* (1754), the first pan-Italian comic operas.

The golden age of *opera buffa* lasted from 1770 until about 1820, significantly, from Piccinni to Rossini. Although more ambitious in scope, the genre has similarities with the intermezzo: the various characters are stylized in music that has a new, imitative quality; each text was set only once, and operas were frequently revived, but the text was not printed, as yet; ensembles are used and secco recitative retained in response to the need to present the action as succinctly as possible; multiple musical forms and linguistic registers are employed, from dialect to Latinate Italian for parody purposes, and a range of vocal writing from parlando to the decorative melismas of *opera seria*; many more voice types are used, and the leading role is always taken by a *buffo* bass (the famous performers were G.B. Cavana, Gioacchino Corrado, Filippo Laschi, Pietro Pertici, Francesco Baglioni and Antonio Lottini) while the higher voices are expected to be more actors than virtuoso singers. In 1760 *La buona figliuola* by Piccinni, to a libretto by Goldoni, marked the change to a pathetic, sentimental genre; the success of this work can be measured both in the influence it had on *opera seria* and in the dissemination of some of its techniques, such as the rondo finale.

Venice was the centre of the operatic market both for its high rate of consumption and because it provided the link to posts in northern Europe; Bologna was where the agencies that looked after the engagements of singers, composers and designers were concentrated, and Naples was the centre for the training of operatic composers. This division, already clear to De Brosses (1799) and Archenholz (1787), reflects the system of Italian opera production, based not on permanent service, as in the courts of northern Europe, but on itinerant singers, composers, designers and choreographers. The mobile work force was coordinated by the impresarios, who belonged to the urban middle class, and who directed the theatres with public and private money. The great cities had many theatres: usually the political authority controlled and financed the leading theatre, devoted to *opera seria* for celebrations and during the Carnival seasons (averaging two new operas a year), and occasionally a minor theatre, giving *commedie* or *opera buffa*; these two organizations had the characteristics of civic institutions. For example, in Naples the leading theatre of S Bartolomeo (S Carlo from 1737) was linked to the Fondo; in Milan the Ducale (La Scala from 1778) was associated with the Cannobiana; in Turin the connected theatres were the Regio and the Carignano, and other financed theatres were found in Rome, Genoa, Bologna, Florence, Parma and Reggio nell'Emilia. Many smaller theatres were not subsidized and were in competition with one another: the Fiorentini and Nuovo theatres in Naples, for example, and many others in

Venice, Rome, Bologna and Florence; smaller cities, finally, were connected to the dominant centres by the impresario network (in 1785 about 80 cities had a theatre). The private minor theatres favoured comic opera, which meant that impresarios could economize on the production and choose operas with a wider audience appeal. In these cases it was more economical to revive tried and tested scores. The smaller business corresponded to more moderate payment to the singers; *opera buffa* was performed by more or less stable companies when the market in *opera seria* was already operating on an individual basis (this could be a practical reason why there are more ensembles in comic opera). The business of the leading *opera seria* theatres involved greater outlay, but survival was guaranteed by government support: the business of the minor theatres was subject to the risks of the free market: this contrast reveals another aspect of the bourgeois nature of *opera buffa*.

In *opera seria* the long survival of castratos (Guadagni, Farinelli, Senesino, Caffariello and Gizziello) and the stardom of the great virtuosos (Bordoni, Gabrielli, Cuzzoni, Raaf and Carlini) meant that the profession never became one transmitted from generation to generation (in fact, singing was considered extremely specialized); in comic opera, in contrast, skills were passed down through entire family trees (descendants of the Laschi and Baglioni families appeared in the first performances of Mozart's *Le nozze di Figaro* and *Don Giovanni*). The abstract, idealized tone of *opera seria* allowed unnatural voice types to survive for quite some time; the realistic, middle-class tone of *opera buffa* required only natural voices and the entire range of voice types to differentiate between the characters.

When it first appeared, comic opera was musically and dramatically progressive, but the financial basis on which the opera house was organized meant that within 30 years the situation was reversed. Being less exposed to market forces, *opera seria* had greater freedom to experiment and develop, while *opera buffa*, subject to public approval, maintained its original features up to the 19th century; for this reason, the eclecticism of *opera seria* from the 1780s onwards (in the work of Paisiello, Sarti, Paer and Mayr) enabled it to develop continually, while the growing success of *opera buffa* meant that it became a conservative genre.

[Italy, §I, 5: 18th century art music](#)

(iv) Sacred music.

Foreign travellers such as De Brosses, Burney, Coyer, Lalande and Hadrava were struck by the amount of music performed in Italian churches. Burney, in particular, paints a picture of much sacred music, often of poor quality, being composed and performed for a non-class-specific audience. The principal causes for its weakness were the quasi-operatic character of the music, and the demands of composing quickly to order. Besides this 'consumer' output, the visitors also noted a rigorous 'Palestrina' style of strict counterpoint with or without instrumental accompaniment, unconnected with consumption or changing taste. Burney in 1770 indicates its use not only in Rome in the famous Cappella Sistina and Cappella Giulia and at the Chiesa Nuova, but also in Florence and Venice.

The stylistic colonization of sacred music, in particular of oratorio, by opera reflects the latter's economic dominance. The connection between the two

is suggested by the title of Arcangelo Spagna's essay *Oratorii ovvero melodrammi sacri* (1706), in which he proposes that the lessons of contemporary opera should be taken on board to alleviate the monotony of oratorios. The oratorio of the early 18th century was divided into two sections with a total of 400 lines, split into recitatives and da capo arias. The most active librettists in Italian oratorio, apart from those who were also patrons, Benedetto Pamphili and Pietro Ottoboni, were Stampiglia, Zeno (from 1718) and Metastasio (from 1730).

Rome was the centre of oratorio: the Oratorio del Crocifisso, where Alessandro Scarlatti worked and Corelli was leader of the violins, was the home of oratorio in Latin until 1710; other locations were S Girolamo della Carità, S Maria in Vallicella, Chiesa Nuova, Seminario Romano Gesuita, Collegio Clementino, the Confraternita della Morte and the Confraternita della Pietà dei Fiorentini, and the many noble homes which hosted performances of oratorios and cantatas in Italian by Alessandro Scarlatti, Handel and Caldara. From 1720 Durante, Leo, Porpora, Jommelli, Piccinni, Cimarosa, Paisiello, Anfossi and Zingarelli worked at the Oratorio dei Girolamini, Naples; here a debate on sacred music saw the supporters of Durante ('durantisti'), who wanted to distinguish between modern composition and the style of Palestrina, line up against Leo's supporters ('leisti') who looked instead for a fusion between the two. In Venice oratorio continued to be in Latin, cultivated first by Lotti, Gasparini and Vivaldi, then by Bertoni, Sacchini and Galuppi. In Bologna, the second papal city, Vitali, the Predieri family, Perti and his pupil Giovanni Battista Martini provided works for the cathedral of S Petronio and the academies: degli Unanimi, degli Anziani and delle Belle Lettere. Sammartini and Marchi worked for Milan Cathedral, where in 1724 there was a performance of the composite oratorio *La calunnia delusa* by ten local composers, in the manner of the operatic pasticcio. There is documentation of the fashion for such composite oratorios in Florence as well.

In the mid-century the papacy also made concessions to the prevailing operatic style: Pope Benedict XIV's encyclical *Occasione imminente Anni Sacri* (1749) hopes for a middle way 'inter cantum ecclesiasticum et scaenicas modulationes'. Teachers like Durante and scholars like Padre Martini safeguarded the strict Palestrina style. In his polemic with Eximeno, Martini takes Pergolesi's *Stabat mater* to task for paying little attention to sacred style, and in so doing Martini demonstrates an abstract idea of strict counterpoint that is at a remove from the actual music, and thus anachronistic.

[Italy, §I, 5: 18th century art music](#)

(v) Instrumental music.

For a long time instrumental music was also held to be a functional adornment which could be altered according to the occasion. The composer did not yet consider his own work to be an absolute 'text'. The evidence for this lies in the details of for whom, and for what occasions, sonatas or concertos were composed: Corelli for private celebrations of Roman patrons, Vivaldi to provide music for teaching, Tartini for the solemn functions at the basilica of S Antonio in Padua, Sammartini 'for the entertainment of those citizens who for amusement come to the ramparts

[of the Castello Sforzesco in Milan] on summer evenings' (Carpani). In the middle of the century there was a reaction against the predominantly lightweight nature of instrumental music in the period: Algarotti heard 'motives' and 'subjects' derived from Petrarch in Tartini's works; Tartini himself attributed to instrumental musical expression the natural imitation of 'characters' and 'affects', often clarified in short Metastasian verses placed at the head of the piece of music. Despite their differences, the two attitudes indicate the movement from a scientific concept of music (applied science) to the aesthetic idea (expressive fine art).

At the beginning of the century Rome and Venice were the leading centres: Burney saw in the Venetian school around Vivaldi (Albinoni, Alberti and Tessarini) 'a light and irregular troop'; on the other hand, the Roman school formed by Corelli (Locatelli, Geminiani and Valentini) provided 'the greatest performers and composers for the violin which Italy could boast during the first 50 years of the present century'. Historical distance, however, shows a proximity between the two, encouraged by the Borghese and Ottoboni families. In 1905 Schering established Corelli's thematic influence on Vivaldi; he saw Vivaldi's op.3, *L'estro armonico*, as an eclectic collection embracing both conventional Venetian elements and contemporary Roman elements taken from Corelli's pupil Valentini. There were two responses to Corelli's position as the archetype: for some his work was a model from which to develop according to the composer's own sensibilities: these include Vivaldi, Veracini and Tartini. Others took a more conservative approach and followed the Corellian forms of sonata and concerto to the letter; examples of this are his pupil Geminiani, Locatelli and Handel.

The basic compositional element for Corelli is variety, the juxtaposition of contrasting elements. The op.6 collection of concerti grossi brings together paratactic elements written at different times and on different occasions, assembled as constructional building-blocks according to the basic criterion of contrast (counterpoint–harmony, tutti–concertino, cantabile–virtuosity, slow–fast, *sonata da chiesa–sonata da camera*).

While the form of the Corelli sonata with a prelude and two or three movements spread quickly to the Venetian school (Caldara, op.2, 1699; Albinoni, op.3, 1701), there are some differences between the two schools when it comes to concerto writing: the make up of the ensembles is different and Vivaldi tended to establish a uniform style of writing in five parts (principal violin, first and second violin, viola and cello/basso continuo). The concerto for one or more soloists was developed much more in Venice, and the Venetians reduced the formal variety of the Roman concerto to the form Allegro–Adagio–Allegro.

The Corelli model was disseminated not only through his influence in Venice but also by his pupils: Locatelli and Geminiani brought the Italian concerto grosso to the Netherlands and England, Somis (in Rome from 1703) began the Turin school of violin playing which led to Gardini, Pugnani and Viotti, and lastly, for Tartini the starting-point was a Roman source in a Venetian manner.

It was Tartini, with his work after 1735, who exceeded the bounds of the Corelli tradition. In his concertos for violin and strings the three movements are planned tonally and have four tutti sections alternating with three solo

interventions. Tartini's sonatas, on the other hand, follow a scheme of increasingly fast tempos (Lento, Allegro, Vivace), and are in a two-part form – tonic-dominant–retransition. The slow movements demonstrate the 'instrumental cantabile which constitutes the real achievement of Tartini's art' (Petrobelli).

De Brosses (1799), while recognizing Tartini's eminence, had a high opinion of the Lombard instrumental school, which benefited from the region's political links with Vienna. There were many composers active in Milan, with G.B. Sammartini at their head, who wrote 'sinfonie' (works for four-part strings, also known as 'ouverture' or 'sonate'): Brioschi, Scaccia, Giuliani and Lampugnani (who also composed operas). Sammartini's sinfonie, from the 1740s, constitute a model which J.C. Bach, Boccherini, Haydn and Mozart must have looked to. The key to Sammartini's mature symphonic style is rhythmic organization and his ability to maintain an intense musical flow giving rise to continuity of structure: this gives his style an eminently logical and dynamic structure which is also to be found in Tartini, distinct from the static-architectural conception of the late-Baroque concerto. In his *Dictionnaire de musique* (1768) Rousseau signals Tartini as an exemplary composer of Adagios, Sammartini of Andantes and Locatelli of Allegros.

With Boccherini the diaspora of Italian instrumentalists became evident. Boccherini sums up the history of Italian instrumental music: from the neo-classical composure of Corelli assimilated during his student year in Rome (1757), to the Tartini style which he came to know through his teacher G.B. Costanzi and his collaborators Nardini and Manfredi, all pupils of Tartini, and the symphonic style of Sammartini, with whom he collaborated in person in 1765. Boccherini unites this Italian legacy with an eclectic international experience that ranges from Gluck to Gossec to the Mannheim school. But his assimilation of such elements was consciously directed towards a 'stylistic originality' (Degrada) that would support his authoritative role and individual creativity ('I would not be Boccherini if I had written as you advised').

Keyboard composition shows less vitality. The harpsichord was used principally to realize basso continuo, as can be read in the treatise *L'armonico pratico al cimbalo* by Gasparini (1708) and in Burney's documentation (1771). While Zipoli, organist of the church of the Gesù in Rome in 1716, and Durante introduced a distinction of timbre and idiom between organ and harpsichord, this came to fruition only in Domenico Scarlatti's sonatas, a personal development which has few connections with the Italian experience.

In 1711 in the *Giornale de' Letterati d'Italia* Scipione Maffei announced the construction of the first pianoforte by Bartolomeo Cristofori, harpsichord builder to the grand ducal court of Tuscany; but the new instrument was slow to become established. Sonata composers in the Venice area, Pescetti, Platti, Alberti, Galuppi, Paganelli, remained tied to harpsichord thinking. Some melodic ideas, however, and a broad use of functional dynamic accompaniments to suit the new melodic manner (the 'Alberti bass') show some evidence of interest in the new instrument. Here we can see a model for that 'singing Allegro' which became widespread in Europe

for several decades. The Neapolitan school shows individual features in keyboard music too: Rutini, Paradies and Vento became famous abroad in particular (in England especially) more as harpsichordists than as opera composers. One of the flood of Italian composers who travelled to London was Clementi, and it was due to him that the piano became completely independent from earlier instruments. His sonatas op.2 (1773) display a modern, independent thematic style while introducing a whole range of pianistic techniques which remained in use up until the time of Schubert.

Italy, §I, 6: 19th century art music

(i) Opera.

The multifarious activities of the previous century slackened at the beginning of the 19th and concentrated on musical theatre, where a code of communication between the composer and the Italian audience was firmly established. Whereas in the rest of Europe Romantic aspirations were expressed through instrumental music, in Italy this spirit was entirely manifested in opera; in fact the *melodramma* mirrored the behaviour of Italian society, in the manner of the novel in France, England and Russia. The middle classes began to rule the country even at the level of musical life, and publishers (such as Ricordi in Milan) and impresarios (such as Barbaia, Jacovacci, Lanari and Merelli) were the arbiters of operatic life. There was no place in the new century for a learned scholar like Padre Martini; his heirs, Padre Mattei at Bologna, Bonifazio Asioli at Milan and G.B. Baini at Rome, were restricted to a narrower sphere of activity. Men of culture were less important, while the clever impresario (often of humble origins) and the efficient publishers grew in power as they began to employ the medium of newspapers or new industrial techniques. Revolutionary opera, with its contemporary social implications, had little following in Italy. In his preface to the libretto of *La congiura pisoniana* (1797, Milan), F.S. Salfi presented an opera that aimed at 'instruction', at 'the heart' as well as 'the ear'; but such purposes would have required a freer form like the *opéra comique* or the Singspiel, foreign to taste in Italy where opera sung from beginning to end was a deep-rooted tradition. The revolutionary storm shipwrecked many composers of the old school. Cimarosa and Paisiello led turbulent lives under revolutionary and Bourbon governments, and the peaceful life of the second half of the 18th century ended in a period of great confusion. Significantly, after starting conventional careers in Italy, the two greatest Italian composers of the age, Cherubini and Spontini, worked abroad and wrote operas in foreign languages. At the same time, at least in northern Italy, the scene was dominated by a foreigner, Simon Mayr, who introduced a type of serious, carefully orchestrated opera influenced by Gluck.

The Restoration period was brightly illuminated by Rossini, whose star rose in 1813 just as that of Napoleon was about to set. Rossini's comic operas perfectly mirror the 'average Italian', with his disillusioned view of existence and his refusal to accept extreme solutions; similarly, the distinction between the Neapolitan and Venetian schools, between south and north, ended after 1815, when Barbaia summoned Rossini to Naples for *Elisabetta, regina d'Inghilterra*. As his operas were produced throughout Italy, many composers such as Mayr, Pietro Generali and Nicola Vaccai, who a few decades earlier would have scored a deserved success in their respective centres, were eclipsed by Rossini; those who, like Pacini and Mercadante, competed with Rossini, Bellini and Donizetti on the one hand, and Verdi on the other, suffered even more from the comparison.

The musical unification of the country achieved by Rossini soon bore fruit; Bellini, a Sicilian, triumphed in Milan, while Donizetti, a Lombard, conquered Naples and Rome. Italy seemed smaller and more united, its boundaries increasingly connected by modern means of transport, its roads travelled by political exiles from one end of the country to the other. The number of major theatres was smaller than in the 18th century, but their prestige grew in inverse proportion, and La Fenice at Venice, La Scala at Milan, the Pergola at Florence, the Apollo and Argentina at Rome and the S Carlo at Naples were renowned throughout Italy. The export of Italian music, checked by the flourishing Romantic movement at the beginning of the century, was revived by Rossini; connections with Paris were renewed, and Bellini, Donizetti and Verdi followed in Rossini's footsteps, while for nearly the whole of the century France acted as the channel through which English and German literature reached Italy.

Italian opera, though still based on the supremacy of the voice, was no longer a self-sufficient and united world. It had to adapt itself to Romantic ideals. One of the first results was the waning popularity of comic opera after the peak reached by Rossini. Works in the style continued to be written (for instance by Valentino and Vincenzo Fioravanti at Rome and Naples), but after Donizetti's *L'elisir d'amore* (1832) the next comic masterpiece in Italy was Verdi's *Falstaff* (1893). Meanwhile new sources were discovered in European fiction and literature and particularly in English history (after the downfall of Napoleon such subjects became very popular); they were treated with a modified form of Romanticism, as for instance in the librettos of Felice Romani, who remained faithful to classical rules of plot construction. However, a new feeling for specific environment and a new interest in the development of the emotions produced new forces in opera, directed essentially towards the creation of dramatic tensions by musical means. Principally in pursuance of this aim, the plots drawn from novels were reduced to stock situations, allowing the music to come into its own. Significantly, no major composer set Manzoni's *I promessi sposi*, the greatest Italian novel, whose complexity of events and non-tragic dénouement found no echo in operatic forms.

Though intrinsically less perfect than his comic works, Rossini's serious operas contained greater potential for development. A fine thread connects Piccinni's *Cecchina* and Paisiello's *Nina* to the Desdemona of Rossini's *Otello* and through her to the heroines of Bellini and Donizetti, in whose operas love – a love thwarted by outside circumstances – forms the

nucleus of the plot. Rossini also pointed the way to action through music, by the regular transference of the ensemble from comic into tragic opera. All these composers aimed, in different ways, at dramatic consistency. Bellini's dramatic sense, particularly strong in *Norma*, was not allowed to prejudice the supremacy of bel canto but permeated and combined with the great voices of the epoch, Pasta, Malibran and above all Rubini, for whom Bellini wrote the first typical Romantic tenor roles (e.g. Gualtiero in *Il pirata*, 1827). Donizetti and Mercadante, from 1835 onwards, reflected their concern for action and consistency in trenchant and pithy thematic material and in a melodic line immediately responsive to expressive demands; they, rather than Bellini, were the direct precursors of early Verdi.

The literary polemics between classical and romantic conceptions were also applied to music, dissolving into a series of artificial antitheses long current in Italian musical circles: melody (exclusively the heritage of Italy) and harmony (an *oltremontana*, i.e. German, quality), voice and orchestra, bel canto and *canto declamato*, idealized history and everyday reality. The debate between the traditionalists (who included men of letters such as Carlo Botta, Giuseppe Carpani and Felice Romani) and the innovators was still going on in 1836, when Giuseppe Mazzini published his *Filosofia della musica*, which proclaimed the 'emancipation from Rossini', the birth of a music-drama based on stronger moral principles, with greater chorus participation, and the decline of the typical situation drama with its soprano and tenor lovers separated by the baritone. The debate was echoed in 1847 by the poet Giuseppe Giusti, who advised Verdi, after the production of *Macbeth* at Florence (where the first Italian performances of *Robert le diable* and *Der Freischütz* had been given in 1840 and 1843 respectively) to leave such fantastic plots to northern artists.

The renewal of musical theatre advocated by Mazzini was achieved in the art of Verdi, who perfectly expressed the ideals of the second half of the century. Verdi triumphed in Milan at a time when La Scala was dominated by Bartolomeo Merelli and the power of Ricordi was increasing through the absorption of smaller firms and the foundation (in 1842, the year of *Nabucco*) of the *Gazzetta musicale di Milano*. Verdi learnt from Rossini, in particular from the choral grandeur of *Mosè*, which in hastier style and with more pressing rhythms he transferred to the Risorgimento operas *Nabucco*, *I lombardi alla prima crociata* and *La battaglia di Legnano* (the last named was performed in 1849 at Rome, which had been abandoned by the pope and was governed by the republicans Mazzini, Armellini and Saffi).

The years 1848–9 were a watershed in 19th-century Italian music, and not only because of the death of Donizetti. The war against Austria produced a crisis in theatrical life; fewer people attended, the number of performances decreased, and celebrated singers like Erminia Frezzolini and Eugenia Tadolini either worked abroad or lost confidence in the managements. The failure of the national revolution led to a neglect of heroic themes in favour of individual dramas in which conflict raged in the soul and not on the battlefield. This tendency achieved perfection in Verdi's operas *Rigoletto*, *Il trovatore* and *La traviata*, produced at Venice and Rome between 1851 and 1853. The primacy of the individual seemed to herald a revival of the stories about individual characters such as had been treated by Bellini and

Donizetti, but the ordering of events was no longer in the hands of a librettist such as Romani. The learned Salvatore Cammarano, librettist of *Lucia di Lammermoor*, could not understand the characterization of Azucena conceived by Verdi in *Il trovatore*; a librettist like F.M. Piave, willing to follow the composer's wishes in supplanting the aria with the scena, was more useful. This broadened conception is realized in all three operas, but the subject of *La traviata*, with its contemporary setting, best illustrates the spirit of the 1850s, although it was considered a bad influence by the leaders of the Risorgimento, who preferred high-minded subjects and saw a dangerously complacent sentimentality in the choice of a fashionably consumptive courtesan as heroine.

Verdi's ascendancy over Italy throughout the second half of the century is significantly based entirely on public acclaim; intellectual and cultural circles were not won over until much later (through the influence of Toscanini around 1920). The 'classicists' considered Verdi's early operas 'noisy' because of their abuse of the chorus and of martial rhythms. In the middle years of his career, the writers Giuseppe Rovani and Carlo Dossi, from the Milanese milieu that formed the cradle of Verdi's art, continued to prefer the operas of Rossini. The critic Basevi, who found Rigoletto's physical deformity unacceptable, showed that strong classicist prejudice remained even in 1859. After about 1860 Verdi aroused opposition less in the traditionalists than in the younger generation, interested in the novelties of European music and attracted to the cultural and technical ambitions of Meyerbeer, the elegant precision of Gounod and the dramatic ideals of Wagner (whose music was still little known in Italy, apart from the overtures to *Der fliegende Holländer* and *Tannhäuser*).

During its early years (1861–70), the newly formed kingdom of Italy had naturally to stand comparison with other European countries and to discover by how much it lagged behind in the cultural and artistic fields. In spite of Verdi, there was much talk of decadence in opera and of the reforms needed in the management of theatres and schools. Musical education became a national responsibility, developing from seeds planted in northern Italy by the short-lived Napoleonic governments at the beginning of the century. The Milan Conservatory, which maintained high standards, was instituted in 1807 and set the pattern for conservatories founded in mid-century in Florence, Turin, Rome, Palermo, Venice and Bologna. It was a difficult time financially; in 1867 theatrical subventions were curtailed and taxes imposed on contracts and profits; the following year Broglio, the minister for education, drew up a scheme for an association to administer and direct the conservatories, with Rossini, then in the last year of his life, in Paris, as president. A similar commission, with Verdi as president, was set up in 1871 to reform the musical institutions. Even so, many young people felt that Italy could not satisfy their thirst for knowledge, and in 1861 Arrigo Boito and Franco Faccio went abroad with scholarships – a significant reversal of the trend that since the Renaissance had led students and scholars towards Italy.

As the music schools multiplied, there was a growing interest in chamber and symphonic music, mostly German; Germany, the country of technical excellence, was much admired by Italy in the 1870s, while political events caused a growing coldness towards France. In 1870 the critic Filippo Filippi

published six reports in *La perseveranza* on the Wagner operas he had seen at Weimar; the following year at Bologna Angelo Mariani conducted *Lohengrin*, the first Wagner opera heard in Italy, which immediately aroused enthusiastic and polemical reactions throughout the country. A long-standing rivalry between Verdi and Wagner ensued. Essentially it was an extension of the traditional rivalry between opera and music drama, between voice and orchestra, between Italian and German music; unlike the otherwise similar dispute between Piccinni and Gluck, it was not carried on with 18th-century chivalry but, especially in the case of the rivalry between the two publishing houses Ricordi (Verdi's publisher) and Lucca, with the insensitive hostility of modern business methods. The firm of Francesco Lucca, established in 1825, benefited greatly from the energies of Giovannina Strazza, wife of the founder. In opposition to Ricordi she too started (in 1847) a newspaper, *L'Italia musicale*; in an attempt to find an alternative to Verdi, she supported Mercadante, Pacini and other minor figures, including Salvi, Ricci and Petrella, and also zealously introduced into Italy the works of foreign composers, from Gounod, Halévy and Meyerbeer to Wagner.

Meanwhile, the more progressive of the generation of composers that followed Verdi and considered him outdated (though without specifically saying so), began to appear. The manifesto of this new movement, outlined by Boito in two articles that appeared in *La perseveranza* (1863–4), was summarized in four points: 'the complete elimination of formula; the creation of form; the realization of the largest possible tonal and rhythmic development; the total embodiment of drama'. The practical realization of these aims was more tame, as was exemplified by Faccio's *Amleto* (1865) and Boito's *Mefistofele* (1868). Boito was a man of wide culture, the first Italian composer who was also an intellectual, and an adherent of the 'Scapigliatura', a forward-looking literary movement active in Milan. But in musical matters the 'Scapigliati' were Rossinians, while Boito's modernism was largely intellectual; his covert antagonism to Verdi, therefore, changed quite naturally to sympathy and from 1881 to collaboration. Verdi, faced after 1860 with a transformation in Italian musical life, adopted two different attitudes – one a public resistance to innovation, the other a secret absorption of new ideas into his own operas, written at increasingly long intervals. After *La traviata* his choice of subjects, no longer confined to love, became much wider. *Don Carlos*, composed for Paris in 1867, is a more progressive work than either *Amleto* or *Mefistofele*, and its protagonist reflects more clearly than either of theirs the hectic excitement of the 'Scapigliati'. Later the *Messa da Requiem* won over the Wagnerians, through Bülow. In his final operas, *Otello* and *Falstaff*, both on texts by Boito, Verdi banished all traces of closed form; in them he again confronted the basic myth of Romanticism, Shakespeare.

Verdi had no pupils and no real imitators. The opera composers who attempted, during the first years of Italian unity, to establish themselves in the small area left free by Verdi, all achieved one dazzling success that had no sequel. Filippo Marchetti's *Ruy Blas* (1869) was produced at 60 theatres within two years; *Il Guarany* (1870), by the Brazilian composer Carlos Gomes, was admired by Verdi himself; after *I goti* (1873), Stefano Gobatti was for a short time hailed as 'the new Verdi'; and Ponchielli's *La Gioconda* (1876) was received, more justifiably, with exceptional enthusiasm that

lasted longer. But none of these inaugurated a successful career for its composer, and all of them, despite a superficial similarity of dramatic content, differed from Verdi's works in their ostentatious, neo-Romantic style or in their insistently picturesque detail. Even further from Verdi's realism were those operas based on a different kind of plot: Antonio Bazzini's *Turanda* (1867), coloured by the fairy-tale surrealism of Carlo Gozzi; Luigi Mancinelli's *Isora di Provenza* (1884), produced at Bologna, the Wagnerian stronghold; and *Loreley* (1890) and *La Wally* (1892) by Alfredo Catalani, Bazzini's pupil at Milan. In all these, and particularly Catalani's, the spirit of northern fantasy crossed the Alps, and under the auspices of Wagnerian harmony it at last established a precarious foothold in Italian opera.

Wagner himself came to be better known; in 1883 the touring company managed by Angelo Neumann brought the *Ring* to Venice, Florence, Rome, Turin, Milan and Trieste. In 1888 the publishing house of Ricordi took over that of Lucca, and little by little the taste for novelty diminished. During the 1876–7 season Italian theatres still put on about 40 new operas, but public interest increasingly centred on successful works of the recent past, which were now the basis of the repertory. Innovation was regarded with scepticism, a sign of the decline of opera, at least in the sense of a common language uniting the musician and society, such as had prevailed at the beginning of the century. In the years immediately before the appearance of Puccini, the true face of the Italy of the time can be seen not in large-scale operas on historical subjects (which continued to appear, however) but in the salon song, a genre cultivated by refined singing teachers like Gaetano Palloni and Filippo Marchetti at Rome, Gaetano Braga at Milan, and the greatest of them all, Paolo Tosti, the darling of Roman aristocratic society until he settled in London in 1880. In his songs Tosti caught the flexible intimacy, the sentimental sheen characteristic of the age of King Umberto I behind its façade of pomp and grandeur (which inspired, for instance, the building of the Teatro Costanzi at Rome in 1880).

[Italy, §I, 6: 19th century art music](#)

(ii) Church music.

Church music was the least popular genre for the 19th-century Italian composer. Certainly a large quantity was written, not only by minor composers, for use in worship, but also, less prolifically, by most of the major figures; but its prestige in Italian society reached a low level during the century, and began to rise again only with Perosi. The explanation lies partly in the 'religiosity' of Romanticism, hostile to codified systems and more sympathetic to secular forms such as opera, where monasteries, convents and religious choruses are frequent elements; and partly in the particular circumstances of Italy, where political and cultural progress, inspired by the laity, found an obstacle in the Church of Rome, no longer the symbol of a universal religion but a state within a state. This accentuated the growth of two different styles, both already apparent in the previous century: the academic and the theatrical. The stronghold of the academic style was still the Cappella Sistina, where first Bainsi and then Alfieri maintained the tradition. It continued in current practice for even longer, although increasingly as a means of learning composition, or as a student's exercise useful for winning a scholarship (as Catalani and Puccini

did) to Milan, the capital of opera. Above this didactic level, the adoption of operatic language and vocal style was customary. The most prolific writers of church music were often opera composers who had withdrawn from the theatrical battlefield, like Generali, Vaccai or Carlo Coccia, who produced mainly masses with orchestral or organ accompaniment; while the sacred masterpieces of the century, including Cherubini's masses (in particular the two Requiem masses written in Paris), Rossini's *Stabat mater* and *Petite messe solennelle* and Verdi's Requiem, were all written by the leading opera composers.

It is symptomatic that in 1838 Pope Gregory XVI invited Spontini, rather than Bainsi or any other member of the Cappella Sistina, to compile a report on the decline of sacred music in Italy. The pervasive influence of the operatic style even penetrated the field most firmly closed to outside interference, organ music, as the works of Giacomo Davide of Bergamo and V.A. Petrali show. No consciousness of a need for reform or for the preservation of early church music was apparent until the last decades of the century, when in 1877 G. Amelli, inspired by the [Cecilian movement](#), founded the periodical *Musica sacra* and the Associazione Italiana di S Cecilia.

[Italy, §I, 6: 19th century art music](#)

(iii) Instrumental music.

Instrumental music, although to a lesser degree, also served primarily as a training ground for those composers aspiring to operatic success, while the instrument typifying 19th-century Romanticism, the piano, was the chief medium through which opera reached a large section of the public, in transcriptions, fantasias, variations and arrangements of the most popular numbers. The influence of operatic style was paramount here as well. Until 1850 aspects of the 18th-century situation persisted to some extent, with the greatest composers working outside Italy. Milan was still a centre for instrumental music, but the only figure of international repute based in Italy was Paganini, who was self-taught and was a native of the north, where the traditions of violin-playing were strongest. While Paganini's activity led him all over Europe between 1828 and 1834, other violinists returned to work in Italy after the Napoleonic era; they were second-rate composers, who had benefited from an exposure to European culture during long periods abroad, and it was due also to F.A. Radicati (in Bologna), Ferdinando Giorgetti (in Florence) and G.B. Polledro (in Turin) that the taste for chamber music did not die out altogether.

The decade from 1850 was the emptiest as regards instrumental music, the revival of which from about 1860 thus seemed to start from nothing. The various Italian court *cappelle*, whose activity was already much reduced, were swept away soon after the proclamation of the Kingdom of Italy (1861). They were succeeded by the philharmonic societies and other private associations founded by members of the aristocracy or the middle class, which became the centres of an instrumental culture. As if aware that a great deal of lost territory needed recovering, this culture began with the works of Beethoven, which did not become generally known throughout the country until the 1860s, a delay of 50 years that had far-reaching consequences. To meet the new demand, Ricordi published several major

collections, including *La biblioteca del pianista* and *L'arte antica e moderna*. Meanwhile a network of quartet societies rapidly spread over Italy, reaching Florence in 1861 (after the Beethoven concerts promoted by Basevi), Milan and Turin in the 1860s, Palermo in 1871 and Bologna in 1879. The growing interest in symphonic music (at Florence the publisher Guidi printed early pocket scores) led to the foundation of the Società Filarmonica at Naples in 1867, the Concerti Popolari at Turin in 1872 and the Società Orchestrale Romana in 1874. It was a natural, although oversimplified, consequence to ally this ferment of activity to the Wagnerian and progressive schools and to see it as an alternative to the Italian operatic tradition; so another rigid barrier, supported by the authoritative voice of Verdi, for whom Italian music was naturally 'vocal', was erected between operatic music, favoured by the vast majority, and instrumental (or 'classical') music, preferred only by a minority but associated with the qualities of culture and progress.

Celebrated soloists, including the violinist Camillo Sivori, the cellist Alfredo Piatti and the double bass player Giovanni Bottesini wrote chamber music or concertos for their own instruments in the intervals between concert tours abroad. Bazzini, after many years in Leipzig and Paris, settled in Milan; although he too chiefly composed music for the violin, or chamber music, he also attempted the symphonic style in the overtures *Saul* and *Re Lear*. Stefano Golinelli (at Bologna, from 1840), whose *Studi* op.15 were praised by Schumann, and the brothers Disma and Adolfo Fumagalli (at Milan), composers of many small pieces, studies and operatic fantasies, all concentrated on the piano; the two leading instrumental composers of the period, Giovanni Sgambati (in Rome) and Giuseppe Martucci (at Bologna and Naples), were also trained as pianists. Probably the first 19th-century Italians to eschew opera without exhibiting an inferiority complex, they attempted all forms of chamber and symphonic music, as well as songs; their works for solo piano in particular include, especially in the case of Martucci, pieces that surpass the dimensions of 'album leaves' and attempt extended forms. In spite of frequent references to the early Romantics (more than to Wagner and Brahms, whom they knew personally and intended to imitate), Sgambati and Martucci undoubtedly mark an important stage in the renaissance of Italian instrumental music.

[Italy, §I, 6: 19th century art music](#)

(iv) Musicology.

The attempts to re-establish ties with European musical culture were also fruitful in historical studies. Basevi's critical activities at Florence; Angelo Catelani's research into Renaissance and Baroque music in the archives at Modena; the historical compilations by Francesco Florimo on the Neapolitan and by Francesco Caffi on the Venetian schools; the foundation, in 1894, of the *Rivista musicale italiana*; Oscar Chilesotti's editions of lute and guitar tablatures; Amintore Galli's *Estetica della musica*, an ambitious attempt to realize an Italian history of music through analyses of works; and the output of Gaetano Cesari, whose research on the origin of the madrigal was the first of a series of basic studies on Italian music and who was the leading figure behind Ricordi's publication of *Istituzioni e Monumenti dell'Arte Musicale Italiana*: all are signs that Italian culture had

begun to observe its musical past in a new, historically conscious perspective.

Italy, §I, 6: 19th century art music

(v) Cultural systems and aesthetics.

In the age of Rossini the dominant musical aesthetic was neo-classicism, informing the writings of Gervasoni, Majer, Carpani, Asioli and Leopardi, and encapsulated by Rossini himself in 1868. At the root of this lay the concept of the *bello ideale*, the 'beautiful ideal', which embraced a number of ideas: the predominance of melody ('cantilena'); aesthetic pleasure, with the composer's goal being to 'please in music' (Carpani); music as a 'moral atmosphere' in which the characters represented the action (Rossini) or as a generic expression of emotions, but not as a concrete expression of the drama; and 'symmetries' of forms (Asioli): the melodic line did not have the power to adapt to 'characteristics', 'moods', 'action' or 'concepts', but had an architectural value, serving as the principle that justified formal conventions.

The Romanticism of the Risorgimento and the era of Mazzini shattered this aesthetic edifice: from the 1830s onwards Victor Hugo's *Cromwell*, *Hernani* and *Le roi s'amuse* were interpreted as spurs to political redemption. In his *La filosofia della musica* (1836) Mazzini put forward a series of statements which summed up the historical moment: the 'committed' composer cannot restrict himself to writing 'notes and chords', but must 'understand the vast influence which [opera] could exercise on society ... not renounce the idea in favour of the form'; 'progressive' operatic music must abandon the rigid rules of the classicists, to take on characteristic *tinte* and 'historical reality'; the idea of opera as entertainment must change to one of opera as a mission; the chorus, which portrays the people, must be used more. Mazzini's *Filosofia* reflected the state of Italian opera in the 1830s: new subjects taken from Schiller, Hugo, Shakespeare, Byron and Dumas père; the expansion of formal conventions, replacing 'ideal singing' with 'declaimed singing'; and the contrast between the individual and the chorus.

According to Mazzini, Donizetti's *Maria Stuarda*, *Marin Faliero* and *Lucrezia Borgia* were the greatest examples of 'social opera'. In his preface to *Lucrezia Borgia*, the librettist Felice Romani provided a snapshot of the cultural conditions of the years before the appearance of Verdi: extremes ('physical [and] moral deformity ... dark subject matter'), violation of the Artistotelian unities, mixed genres, characteristic verbal (but not yet musical) language ('the Poet must conceal himself and let the characters speak their own language'), distortions of form and of versification in accordance with the musico-dramatic 'metre and outline'.

In the revised edition of his *Filosofia* (1861) Mazzini substituted Meyerbeer for Donizetti as the representative of 'social opera'. During the same period Basevi recognized in Meyerbeer 'the living expression of the new requirements'. In his *Studio sulle opere di Giuseppe Verdi* (1859) Basevi defined the new trend in Italian musical aesthetics as 'eclecticism': the fusion of foreign influences and national tradition, of which Verdi was the greatest exponent, despite his proclamations of self-sufficiency. In the years around 1860 musical criticism received a boost, with the trenchant

writings of Boito, Basevi, Filippi, Biaggi, Mazzucato, D'Arcais and Depanis actively influencing composers in their search for a 'new ideal'.

After the 1860s this eclecticism was linked to the desire for a greater knowledge of musical history and of music from abroad: the effect was a multiplication of styles and techniques in opera, from the comic to the tragic, great public scenes to the intimate display of private passions, from Meyerbeer's technique of recurring themes to Berlioz's *réunion des thèmes* and techniques derived from Wagner and Massenet. Linked to this diversity of styles were plots with an all-embracing, epic sweep: the greatest example is *La forza del destino*, but the same tendencies can be seen in *Mefistofele*, *La Gioconda* and Carlos Gomes's *Il Guarany*. The inclusion of scenes incidental to the main plot has suggested a parallel with the discursiveness characteristic of the 19th-century novel.

A contemporary of Italian grand opera in the 1860s and 70s was the Scapigliatura movement in Milan, to which Boito, Faccio, Ghislanzoni and Giulio Ricordi were all linked. To Boito goes the credit for having established an openness to European culture and a new historical awareness, but one can also see in him the reaction of a cultivated man to the popularizing trends typical of the new Italy. In this phase new artistic and intellectual currents did not always run in parallel with the tastes of the broader public, dedicated to the consumption of repertory opera. Cultural exclusivity, the distance from an audience to which the artist no longer feels instinctively bound, gave rise to the idea of the 'avant garde'; this is the source of Boito's denial of traditional 'formulas'.

In the last three decades of the century musical taste seems to have been led by the increasingly affluent middle class. But those who really set new trends belonged to a small professional élite, in particular the 'Milanese monopoly' of the publisher Ricordi who in 1888 took over his rival publisher Lucca. Newspapers of the day contrasted the 'mass success' of Meyerbeer against the 'élite success' of Wagner; Verdi's operas from *Ernani* to *Aida* were popular successes, while *Otello* did not escape the charge of intellectualism (which in part reflects Verdi's own desire). Works of value were not directly subject to public judgment, as Verdi, with false ingenuousness, wished, but were now selected by a new professional class made up of intellectuals (Boito, Filippi and others) and businessmen (Ricordi, Sonzogno).

Popularization and specialization: this aesthetic duality was seen, on the one hand, in the growth of bands, of amateur choirs, the advent of operetta (after 1870) and grandiose stage productions; and, on the other, in the increase in concert-giving and the aestheticism of cultural fashions. The difficulty of bridging this dichotomy has condemned many works created in the last 30 years of the century to oblivion: it is not surprising that between *Aida* and *Otello* the only two operas to have remained in the repertory are *Mefistofele* and *La Gioconda*, representing the outer limits of the symbiosis between the two; the first tending towards intellectualism, the second towards popular appeal. The Giovane Scuola and so-called *verismo* opera were a success because of this aesthetic eclecticism and not as a popular reaction against it: while its components can still be identified as symbols of an Italian musical nature, their success rests on an intensive assimilation of

foreign influences. The 'international' Puccini is the interpreter of the profound weakness of the Italian educated classes, who unconsciously found themselves dependent on foreign cultures. The reconstruction of an Italian cultural and musical identity, never before really questioned, was the principal goal of the earliest musicologists (Torchii, Chilesotti, Torre Franca) and the composers of the *Generazione dell'Ottanta* – the generation of the 1880s.

Italy, §I: Art music

7. 20th century.

The development of Italian opera around the turn of the century was affected by continued rivalries between influential publishers. After the absorption of Lucca in 1888, Sonzogno quickly became the new rival of Ricordi, especially after Mascagni's spectacular success with *Cavalleria rusticana* (1890). Other young Italian composers taken up by Sonzogno included Leoncavallo, Giordano and Cilea, and the firm also brought important new foreign operas to Italy, starting with the Italian première of *Carmen* (1879). Ricordi responded not only by competing for the works of Sonzogno's 'discoveries' (publishing, for example, Mascagni's *Iris*) but above all by launching and supporting Puccini. All these composers were influenced by their publishers' rivalries, and there were others less fortunate who, by failing to win adequate support from either firm, were deprived of the opportunity for operatic success in Italy: victims of such ostracism included Smareglia (a gifted Wagnerian) and Wolf-Ferrari, whose vivacious comic operas became far better known in Germany.

The opera composers supported at this time by Ricordi and Sonzogno are often referred to as the *veristi*. But relatively few of their works in fact followed the fashion for *verismo* subjects set by *Cavalleria rusticana*: even Mascagni's own subsequent output, in its search for variety of subject matter at all costs, typifies, instead, that 'poetica del diverso' reflected also in the strong contrasts between successive Puccini operas. In Luigi Baldacci's words, 'for Donizetti and the young Verdi the idea of opera corresponded to a precise and direct demand from society. In Mascagni's time, however, the demand no longer came directly from society but from the publicity business, which had to astound the public with a continuous series of theatrical 'sensations' – thus combating audiences' tendency to rest content with successful operas from the recent past. Puccini, alone among the Italian opera composers who became prominent in the 1890s, had enough imagination and personality to turn the situation to his advantage: the others did not adequately follow up their early successes, but he continued to develop creatively and receptively until his death.

There were no unifying features in Italian opera in the decade before World War I. While naturalism and *verismo* were in decline, there emerged a spirit of pluralism that embraced the later works of Puccini (*La fanciulla del West*, 1910; *Il trittico*, 1918), Giordano's *Mese Mariano* (1910) and *Madame Sans-Gêne* (1915), the restless eclecticism of Mascagni (*Le maschere*, 1901; *Lodoletta*, 1917) and the Goldoni-based regionalism of Wolf-Ferrari (*Le donne curiose*, 1903; *I quattro rusteghi*, 1906). Through the pervasive influence of Gabriele D'Annunzio, elements of French decadence (sensualism, aestheticism, exoticism and archaism) gained broad currency

in Italian opera of the period. The D'Annunzian taste for archaism influenced the revival of pre-19th-century Italian instrumental music and stimulated the growth of Italian musicology. The first Italian chair in the history of music was created at Rome University in 1913. The nationalist ideology underpinning the view of Italy's musical past was also revealed in Torre Franca's anti-Puccini pamphlet *Giacomo Puccini e l'opera internazionale* (1912) and in the series *Classica della musica italiana* (1917), established with the participation of G.F. Malipiero and D'Annunzio.

Meanwhile Italian instrumental music was still gaining in importance after being marginalized in the 19th century, and was relatively free from the commercialization that affected opera, since it addressed mainly the select audiences of the orchestral and chamber music societies. By 1900 the composing careers of Sgambati and Martucci were almost over, culminating in Martucci's Second Symphony (1904), which G.F. Malipiero called 'the starting point of the renaissance of non-operatic Italian music'. Before the composers of the 'generazione dell'ottanta' (the generation born around 1880) became established, various other instrumental composers were active. Marco Enrico Bossi drew on both the contrapuntal traditions of his native Bologna and the 19th-century German symphonic tradition, while Leone Sinigaglia wrote the earliest significant Italian works systematically based on folk music. Notable, too, are the orchestral and chamber works of Giacomo Orefice, Amilcare Zanella, Francesco Paolo Neglia and Alessandro Longo. The most widely successful non-operatic compositions during these years were, however, Perosi's naive and eclectic oratorios. More progressive trends usually met with apathy or open hostility in Italy, and few Italian musicians born before 1875 shared Puccini's receptivity to new ideas. Symptomatic of the situation was the predicament of Busoni, by far the most adventurous Italian composer of the time: in 1913, after many years abroad, he became director of the Bologna Liceo Musicale, hoping to lead a revolution in Italian music; but he found himself surrounded by indifference and obstructive bureaucracy and soon gave up the struggle, resigning himself to permanent exile.

By then, however, a new generation of Italian artists was already groping towards new ideals, some of which were foreshadowed in the many-sided activities and interests of D'Annunzio. The most aggressive and notorious of these newcomers were the futurists, who achieved more in literature and (especially) the visual arts than in music, though Luigi Russolo's 'noise machines' have a notable place in the prehistory of *musique concrète*. The innovatory trends centring on the Florentine cultural periodical *La voce* (1908–16), with which Pizzetti and Giannotto Bastianelli were associated, were less barren where music is concerned. But the main sparking-point for new musical developments came in 1915, with the return to Italy from France of Alfredo Casella, who then for over two decades remained the leading figure (though not the most important composer) in the modernization of Italian music. Casella's Società Italiana di Musica Moderna (1917–19) provided a platform for young composers of widely varying aims, including most of the main members of the 'generazione dell'ottanta': Pizzetti, Respighi, G.F. Malipiero, Castelnuovo-Tedesco, Gui and even the seemingly traditional Zandonai (regarded by Ricordi as Puccini's heir-apparent), were all members of the society, although they never in the full sense formed a 'school'. Later, indeed, they tended to drift

apart until, on 17 December 1932, Pizzetti, Respighi and Zandonai joined with various lesser composers in signing the notorious 'Manifesto dei dieci' attacking the progressive trends of the time. Meanwhile, undeterred by the break-up of his first circle of collaborators, Casella (together with Malipiero and Labroca, with enthusiastic encouragement from D'Annunzio) founded the *Corporazione delle Nuove Musiche* (1923–8), which aimed to bring to Italy 'the latest expressions and the most recent researches of contemporary musical art' – promoting performances of, for example, *Pierrot lunaire* (conducted by Schoenberg) and Stravinsky's *The Wedding* in many Italian cities. It was appropriate that the organization soon became closely bound up with the ISCM.

The creative results of this ferment of new developments range from the archaic nobility of Pizzetti's choral pieces and the picturesque orchestration of Respighi's tone poems to Casella's aggressively dissonant 'second manner' and Malipiero's hauntingly idiosyncratic theatrical experiments. It becomes increasingly clear, with historical perspective, that Malipiero was the most original of these composers, for all his unevenness (Dallapiccola even called him 'the most important personality that Italy has had since the death of Verdi'). Moreover, his close involvement with early Italian music, which bore musicological fruit in his complete edition of Monteverdi (1926–42) as well as influencing his style, is the most conspicuous example of that preoccupation with the remoter past which also affected other composers of the time. This growing awareness, thanks to the recent research of musicologists, that Italian music had once been far more versatile, and less dominated by a frankly popular opera tradition, than it had become by the 19th century, was an important stimulus to the 'generazione dell'ottanta' in reacting against their immediate predecessors.

Under fascism the modernization of Italian music was to some extent held back by political pressures. But there was never a systematic censorship of the arts on Nazi lines (apart from the banning of works by Jews when Mussolini adopted Hitler's race policies in 1938); and the press was as likely to attack music for being insufficiently Italian as for being radical in idiom. More new organizations were created to promote new works and to revive early music; notable among these were the Teatro di Torino (1925–31; established by G.M. Gatti), the Venice Festival Internazionale di Musica Contemporanea (1930), the Maggio Musicale Fiorentino (1933) and the Teatro delle Novità in Bergamo (1937). Italy's relative cultural freedom, even in the very year of the Pact of Steel, is well illustrated by the fact that Casella, though a naively convinced fascist himself, could prominently feature Schoenberg's music at the 1937 Venice Festival. Moreover, an exceptionally open-minded and informative periodical, founded in 1920 by Gatti as *Il pianoforte* and renamed *La rassegna musicale* in 1928, provided a crucially important antidote to narrow-minded provincialism. Nevertheless, a recognizably *mussoliniano* spirit of assertive, rather bombastic optimism, which represents a retrograde step after the promising developments of a few years earlier, undeniably found expression in certain works of the time, including Casella's *Concerto romano* (1926) and Malipiero's *Inni* (1932). In the 1920s a strain of *petit-bourgeois* sentimentality contributed to the popularity of operettas by such composers as Mario Costa, Giuseppe Petri and Virgilio Ranzato.

Public responses to this rapidly changing scene were variable: as in most countries, the mass of the musical population turned its back on modern developments and continued to support established favourites. In the 1930s opera declined in popularity as audiences turned to the cinema for entertainment. The progressive musical idiom and dramaturgy of works such as Malipiero's *Torneo notturno* (1929) and Casella's *La donna serpente* (1932) had no lasting influence, and the majority of operas, including Respighi's *La fiamma* (1934) and works by Franco Alfano, Giuseppe Mulé, Adriano Lualdi, Luigi Ferrari Trecate, Felice Lattuada, Licinio Refice and Ludovico Rocca, adhered to traditional styles and techniques. But a new, more cultivated and receptive audience was growing up, and the extreme hostility which had surrounded the activities of the Società Italiana di Musica Moderna gradually subsided, though the audience for modern music, and for serious music of any kind other than opera, remains smaller in Italy than in some other countries. (Here a persistent reluctance, by the devisers of school and even university curricula, to give music an adequate place in a normal education outside the conservatories has much to answer for.) Among music publishers, Ricordi has retained a dominating position in Italian musical life; but the firm's former overwhelming preoccupation with popular operatic success had by the 1930s given place to a more open-minded policy. Meanwhile relatively new publishing houses like Carisch and (especially) Suvini Zerboni became increasingly associated with contemporary music; and the growing importance of the radio as an outlet for music of all kinds helped to put Italian composers into a situation very different from that of their predecessors at the turn of the century. However, a great disadvantage, impeding their progress on the international scene, has been the limited resources and extreme caution of Italian record companies: the exceptional paucity of Italian commercial recordings of modern music, and a seemingly incurable dilatoriness in their distribution (even at home, let alone abroad), has been one of the most important reasons why so many recent Italian composers have failed to win world reputations commensurate with their stature.

The generation of composers who appeared in the 1930s reaped many benefits from the achievements (both creative and practical) of the 'generazione dell'ottanta'. Composers who made their mark at this period included Vittorio Rieti, Antonio Veretti, Virgilio Mortari, Mario Pilati and Sandro Fuga. Much the most important of these newcomers were Dallapiccola and Petrassi, though Salviucci might have risen to comparable eminence but for his early death, and the rather older Ghedini reached a belated, highly individual maturity in his best music of the 1940s. Dallapiccola has won greater international renown than Petrassi, thanks partly to the powerful human appeal of 'protest' works like the *Canti di prigionia* (1941) and *Il prigioniero* (1948) and partly to his outstandingly sensitive adaptation of 12-note technique in terms of Italian sensibility. Petrassi, however, has in the long run proved the more adventurous composer: after 1955 drastic stylistic developments brought him unexpectedly close to the post-war avant garde.

As the 1940s progressed, several slightly younger composers, including Riccardo Nielsen, Riccardo Malipiero, Roman Vlad, Gino Contilli and the former disciple of Zandonai, Mario Peragallo, turned with varying strictness

to 12-note technique, as did other, still younger men (Togni, Nono, Maderna) who were to become prominent post-war radicals. In turning to dodecaphony, these composers were inspired partly by Dallapiccola's example and partly by a need to reject the more parochial aspects of the music of the fascist period. An important milestone in Italy's reception of 12-note technique was the first Congresso Internazionale per la Musica Dodecafonica, held in Milan in 1949. From this time thoroughgoing post-Webern and other avant-garde trends attracted growing followings among Italian musicians. Encouraged by an exhilarating sense of release, after the constrictions of the fascist and war years, many young composers visited, or drew inspiration from, such centres of new musical enterprise as Cologne and Darmstadt, and before long comparable ventures were launched in Italy. In 1955 Berio and Maderna founded the Studio di Fonologia Musicale attached to the Milan branch of RAI, and Maderna in particular played a major part (as teacher and conductor as well as composer) in making new methods and creative attitudes known south of the Alps. The development of electronic music in Italy began with the work of the RAI Studio di Fonologia Musicale in Milan. In 1960 the composer Pietro Grossi founded the S2FN sound studio in Florence; and computer music centres, generally within universities, subsequently appeared in Pisa (CNUCE, 1969), Milan (IJM, 1975), Padua (Centro di Sonologia Computazionale, 1979), where the composer Alvisi Vidolin, among others, has worked, and Naples (ACEL, 1979), where the physicist Giuseppe di Giugno, who has worked at IRCAM in Paris, and the composer Fausto Razzi have been active. Berio founded the Tempo Reale centre in Florence in 1987, while the AGON laboratory was established by Luca Francesconi in Milan in 1990. A new festival (the Settimana Internazionale di Nuova Musica), which specialized more specifically in avant-garde music than Venice did, was held at irregular intervals at Palermo from 1960 to 1968; and the Nuova Consonanza performances at Rome, presided over by Evangelisti from 1961, were another important platform for adventurous composers, both Italian and foreign.

Only a very small number of works of the new Italian avant garde of the 1950s and 60s has entered the repertory of the concert-giving institutions, which remain rooted in the music of the past. Those that have done so include Berio's *Folksongs* (1964), *Sinfonia* (1969) and some of his *Sequenzas* (from 1958). Scores like Nono's *Il canto sospeso* (1956), Maderna's *Serenata no.2* (1957), Clementi's *Informels* (1961–3), Donatoni's *Puppenspiel* (1961) and theatrical works such as Berio's *Passaggio* (1962), Nono's *Intolleranza 1960*, Manzoni's *Atontod* (1965), Bussotti's *La passion selon Sade* (1965–6), Evangelisti's *Die Schachtel* (1966) and Guaccero's *Rappresentazione et esercizio* (1968) remain important examples of a phase in Italian music that has been largely neglected by the country's musical institutions.

Like their predecessors, the leading members of this new generation are individualists, who have never in any full sense formed a 'school', despite certain shared techniques and attitudes. Their total achievement ranges wide, from the colourful, very Italian lyricism of Maderna and the restless, dynamic textures of Franco Donatoni to the kaleidoscopic capriciousness of Niccolò Castiglioni, the provocative, idiosyncratic extravaganzas of

Bussotti and the outwardly static yet subtly shifting 'continuum' techniques of Aldo Clementi.

The new musical avant garde has required new performers. From this point of view Italian composers have benefited from the work done by performers interested in and sensitive to new music such as Pietro Scarpini, Sergio Panazzi, Cathy Berberian, Severino Gazzelloni, Bruno Canino, Antonio Ballista, Maurizio Pollini and Giancarlo Cardini. After the student revolts and social protests of 1968, the 1970s saw the encouragement of the new avant garde, linked to the growth of the PCI (Italian Communist Party), which supported its development.

New ventures and festivals dedicated to contemporary music were founded in the 1970s and 80s, among them Musica nel Nostro Tempo in Milan (1975), the Settembre Musica and Festival Antidogma in Turin, the Festival Pontino in Latina (1977), the Festival Nuovi Spazi Musicali in Rome (1978), the Festival G.A.M.O. in Florence (1980) and the Festival Spaziomusica in Cagliari (1982). The RAI supported the output of new music through its four symphony orchestras (Turin, Milan, Rome, Naples) and the Third Programme on the radio. Composers who emerged at this period include Francesco Pennisi (*La lune offensée*, 1971–2; *Carteggio*, 1976), Armando Gentilucci (*Canti di Majakovskij*, 1970; *Trama*, 1977), Salvatore Sciarrino (... *da un divertimento*, 1970; *Amore e Psiche*, 1973) and Adriano Guarnieri (*Mystère*, 1978; *Poesia in forma di rosa*, 1979).

The 1980s saw a renewed interest in opera and the creation of theatrical works by leading figures such as Aldo Clementi (*Es*, 1981), Berio (*Un re in ascolto*, 1984) and Nono (*Prometeo*, 1984), in addition to operas by composers born in the 1950s such as Lorenzo Ferrero (*Mare nostro*, 1985) and Marco Tutino (*Cirano*, 1987). The latter represented a postmodern neo-Romantic outlook, violently opposed to the values of the avant garde and committed to re-establishing communication between composer and audience and to the fertilization of art music by popular music.

In the 1980s and 90s the public sector in Italy progressively retreated from involvement in contemporary music, with the closure of the RAI choirs and orchestras in Naples, Rome and Milan, a reduced amount of new music in RAI programming and the closure of many local ventures. After Casa Ricordi was taken over by BMG (1994) and reorganized, the company's commitment to contemporary music was much diminished. Despite this negative picture, however, Italian music at the start of the 21st century is represented by a lively group of composers with an international reputation, foremost among them Giorgio Battistelli, Mauro Cardi, Marco Di Bari, Stefano Gervasoni, Ivan Fedele, Luca Francesconi, Giuseppe Soccio, Alessandro Solbiati and Marco Stroppa.

BIBLIOGRAPHY

Italy, §II: Traditional music

1. General features.

Oral musical traditions were first studied in Italy in the 19th century. The earliest scholars to approach this repertory were folklorists (including Costantino Nigra, Alessandro D'Ancona, Antonio Casetti, Vittorio Imbriani and Giuseppe Ferraro) who made extensive collections of song-texts, suggested the first classifications of genres and prevalent metrical forms and occasionally provided some musical examples. The first half of the 20th century saw the appearance of some noteworthy studies of specific musical repertoires by Alberto Favara, Giulio Fara, Luigi Colacicchi, Giorgio Nataletti and Alfredo Bonaccorsi, among others, but it was only after World War II that comprehensive documentation of the oral musical tradition got under way. Fieldwork initiated in 1954 by Alan Lomax and Diego Carpitella and carried out throughout the entire country by several scholars during the following decades has led to the production of about 200 LPs and CDs since 1954. In the 1950s Ernesto De Martino undertook important research into the rituals of funeral mourning in Lucania and tarantism in Puglia, which marked the establishment of musical anthropology in Italy. But it was only from the 1970s that a body of scientific literature developed in Italy exploring various aspects of the traditional repertory and musical life.

It goes without saying that while the research was being undertaken, profound changes in musical life were taking place in tandem with fundamental changes in the country's social and economic conditions. Growing industrialization led to the abandoning of many traditional farming and pastoral activities and an increase in urbanization; more recently immigration from other European countries, North Africa and Asia has occurred. Many traditional music practices became obsolete, entire repertoires fell into disuse, and where music was preserved, it was often associated with the shoring up of cultural identity in individual communities and the need to hold on to alternatives to mass-produced music. Unlike

other European countries, Italy saw the appearance of no broad initiatives, either in the mass media or under state auspices, to promote oral musical traditions, nor is there any folk music genre or idiom that is felt to express national identity. The musical picture is one of great diversity and creative independence; there is a rich variety of types of expression, which generally highlight specific regional quality. In summarizing these conditions it is worth examining the main elements of the various musical practices, keeping in mind that under discussion here are the principal repertoires for which there is documentation, regardless of their current state of survival.

First of all, vocal repertoires are differentiated in linguistic terms by their texts. Three different linguistic levels are used in songs: Italian (a highly literary, courtly version, far removed from the current spoken language, as evidenced in printed publications from the end of the 15th century), and generally reserved for public repertoires, such as *canto in ottava rima* or the *Maggio drammatico*; dialect (generally not the local dialect, but an artificial language which draws elements of the regional dialect into the local version), and mainly used for private pieces such as lullabies and dirges; and a mixed Italian-dialect language, used in many repertoires. Still on a textual level, many types of metre are in use, with lines of 11 syllables prevalent in central-southern Italy, and the epic-lyric metre (with a variable number of syllables organized in two hemistiches, one plain, and the other truncated) in the northern ballad repertory. Poetic forms are generally strophic, and display a wide variety of different ways of elaborating the text, many of them highly sophisticated, with the occasional inclusion of added elements (refrains, nonsense syllables).

As to the relationship between the verbal and musical text and the processes of production and performance, two different systems can be observed. The first is based on the composition, transmission and performance of poetic-musical entities which can be defined as 'songs' in the strictest sense, possessing an identity and completeness that is both verbal and melodic. These 'songs' are not tied to a place and a distinct group of performers, but can be found in different areas and among different communities; performers who absorb them into their own repertory can elaborate them and create variant forms. In contrast, the second system does not recognize identifiable poetic-musical entities that can be circulated as such; instead it is based on creative actions that make an impromptu union of text and music, using a 'way of singing' specific to a social group or geographical zone, or both, whose realization is based on principles shared by the whole community. A wide variety of texts can be performed according to such 'ways of singing', which are improvisatory in character. Neither system is specific to a single song genre, and each can be employed alternately by the same performers, but in general the first is prevalent in the north, the second in the south. As to instrumental music, a further division can be observed between a musical idiom based on closed forms and organized into more or less regular harmonic and melodic phrases (typical of northern Italian violin music, for example), and one based on open, improvisatory forms, where the musical discourse uses a series of processes including repetition, variation and the connection of elements which may have no phrase-like character (as can often be found

in southern instrumental music and, in particular, in the repertory of the *launeddas*).

Several scholars have attempted to classify Italian folk music by area, from the point of view of vocal style and musical idiom (Lomax 1955–6; Leydi 1973, 1980, 1990), but as knowledge has increased of the many vocal styles, instrumental traditions, musical idioms and vocal polyphonic practices to be found in the country, it has become more and more difficult to define areas of substantially similar characteristics. For this reason material is treated here according to genre, stressing the content, use and function of musical practices, with some indications of musical characteristics and geographical location. The distinctive music of [Sardinia](#), however, is treated separately.

[Italy, §II: Traditional music](#)

2. Narrative singing.

Several principal narrative repertoires can be identified: the *ballad* in the oral tradition, traditionally a major presence in the north, becoming increasingly rare towards the south; the *broadside ballad* (found in the north and centre); the narrative song in *ottava rima* (in central Italy); and the southern *storia*. Some types of religious songs, like the *orazioni* and Sicilian *orbi* songs, are also narrative pieces.

The repertory which has received the most attention, starting with Nigra's classic *Canti popolari del Piemonte* (1888) is that of the ballad, whose links to the great European repertory extend even to the inclusion of some examples in variant forms. The Italian ballad is cast in epic-lyric metre (unusually, in central to southern Italy, in lines of 11 syllables), it is strophic (using many different forms), specific texts and melodies are closely linked, and there are variant versions. Ballad narratives have the following main features: the action is stripped to its essentials, concentrating only on the most salient episodes with details omitted, the approach is emotionally detached, there is a non-linear presentation of time, action is dramatized (sometimes giving rise to theatrical presentation, in the Pavia Apennines, Canavese and Lorzane), much use is made of dialogue and the focus is on a number of principal themes, dealing with relationships between men and women.

In Italy ballads have been documented as an essentially female repertory, and the very circulation of ballads and creation of variants can be linked to the mobility of women under the virilocal system found in the north, the fact that women lived together within multiple family households in the old peasant society, and the practice of singing during women's collective work. Ballads can thus be considered the product of a totally female way of representing and interpreting reality, expressing women's perceptions of themselves and how they relate to the world. In peasant society in the past, ballads both had a strong educational role in transmitting models of values and behaviour, and helped to develop imaginative activity. Italian ballads essentially present women's stories, and through these symbolic tales they represent the woman's world view in past peasant society, which stresses female weakness in the face of strength, violence and authority of men, honour as the main socially recognized value of women, death as the likely consequence of legal and moral transgressions. The narratives

concentrate on a small number of principal themes: 1. Violence done by a man to a woman (e.g. *Gli anelli*, Nigra 6); 2. Women betrayed by men (e.g. *Cecilia*, Nigra 3); 3. Forbidden love (e.g. *Fior di tomba*, Nigra 19); 4. Virtuous girls (e.g. *La prova*, Nigra 54); 5. Women who break the law (e.g. *Donna lombarda*, Nigra 1, the most famous of all Italian ballads).

Musical analysis suggests that in the past the ballad repertory was dominated by the practice of two-voice singing; the music examples given by Nigra in 1888 suggest that this was already commonplace in the 19th century. Not only have ballads sung by two voices in parallel 3rds been documented (ex.1), but a large repertory exists of melodies that derive from singing in 3rds where only the lower part, ending on the tonic, or the upper part, ending on the third degree of a major scale, has been retained. As well as this repertory, linked to collective performing practice, there are also ballads that are clearly monodic, often based on a minor scale, or, in rare cases, on a different mode (ex.2). Monodic and polyphonic ballads also differ in vocal style. Monodic ballads use a contained delivery in the central register and a declamatory style of singing that focusses on communicating the text; in polyphonic ballads the voice is louder, the melody often moves in a higher register, and the performers are clearly more interested in singing in itself. In both cases, however, the ballad retains its character as an identifiable poetic and musical entity, belonging to the first system of music production and transmission outlined above.

From the 1950s, women's ballads saw a progressive decline in the wake of massive migration from the countryside into cities and the disintegration of multiple families into scattered families; this marked the end of collective occasions for singing and exchanges among women. Moreover, from the end of the 19th century, peasant women in the north became increasingly involved in the new form of seasonal work as rice-weeders. This brought profound changes as much to their lives and the imagery they commanded – they were living apart from their families for the first time, had freer relations with men and could earn an income of their own – as to their repertory of songs and style of singing (linked to choral performance, tense and high-pitched). A repertory of rice-weeders' songs came into existence, preserving only a few of the old ballads (sometimes in altered versions), but giving rise to new songs that bore directly on the women's work experience.

A male song practice, which shares points of contact and exchange with the female practice of ballad singing, has also been documented. Men's songs are predominantly choral and associated with musical entertainment in the classic male gathering-places, chiefly the inn. The male choral repertory is mixed, and may include social, Alpine, comic and risqué songs, as well as some ballads. The unifying element of this repertory is the style of singing, a two-voice, parallel third structure, enriched by octave doublings, drones or additional harmony notes. Generally there is a solo opening before the entry of the chorus, which is loud, emphatic and slow (ex.3). Since this style is very taxing, men often tend to shorten ballad texts, preferring to focus on the cohesion of the group and the musical activity itself rather than the narrative. This may be related to the different function that singing has for a male chorus: as an event it has a looser connection with the textual content of the songs and is more directed

towards emphasizing the social and cohesive value of the simple act of singing together. There are interesting examples of this type of male choral singing in the Po valley and the Ligurian hinterland.

Broadside ballads are quite different from the ballads of the oral tradition, both in terms of the way they are produced and their content. They are the creation of folk-music professionals, *cantastorie* (street singers), active in northern and central Italy, and form part of the performances they give in town piazzas, where instrumental pieces and other types of songs are also heard. The songs are a part of the show which is sold to the audience and paid for by the acquisition of various objects, including broadsheets with the song texts (in the past) or pre-recorded cassettes (today). The narrative songs that ballad singers produce are quite different in character from ballads belonging to the oral tradition: they use a variety of poetic metres, different from epic-lyric verse, employ recurrent musical motifs (as in ex.4) and often have an instrumental accompaniment. With topics drawn mainly from recent crime stories, dealt with in a sensationalist manner, their highly detailed narrative style is directed towards the emotional involvement of the spectators. These songs have also entered the repertory of the oral tradition, but they are easy to distinguish from traditional ballads. The exchange has not been one way: ballad singers have also taken over traditional ballads, re-elaborated in the style of broadside ballads, like *Donna lombarda* or *Cecilia*.

As well as the broadside ballads, the *storie* of southern *cantastorie* are worthy of note. Traditionally, the *storia* is quite a long piece, with a particularly elaborate narrative and a wealth of detail, employing a strict strophic form, with a preference for 11-syllable lines. Lengthy *storie*, concerned with matters of honour and blood, have been documented by folklorists in the past, the most famous being *La baronessa di Carini*, but there are also *storie* concerned with political events, such as *La storia di Muratti* (ex.5), which recounts the historical tale of Gioacchino Murat, the former King of Naples who was shot dead in 1815. In the 20th century Sicilian ballad singers have often collaborated with poets (including Ignazio Buttitta) for their texts. Their performances in town piazzas, accompanied by guitar, use the traditional visual aid of the *cartellone*, a placard depicting the key events of the tale.

The long *storie* in *ottava rima* found in central Italy are also narrative in content, and are traditionally sung at *veglie*, social gatherings with music; a famous example is the *storia* of *Pia de' Tolomei*, which exists in different popular printed versions. More typical of the work of poets in *ottava rima*, who, in contrast to the *cantastorie*, are not professionals, but specialist interpreters of a song tradition, are re-elaborations of narratives mainly drawn from published classical and Renaissance epic literature. These are heard at competitions in which two performers confront one another, improvising verses according to a specific musical practice, which allows for subjective elaboration of the melodies (as happens in lyrical singing).

Lastly, mention should be made of religious narrative compositions, the *orazioni* that recount Christ's Passion or the lives of saints. Often performed in the past by mendicants, the religious narrative song in Sicily has been the prerogative of the *orbi*, a congregation of blind musicians in

existence since 1600 in Palermo, who are the trustees of a wealth of *novene* and *triumfi*, songs commissioned by a believer in honour of a saint who has bestowed a grace.

Italy, §II: Traditional music

3. Lyrical singing.

This term refers to a system of improvised music-making prevalent in southern and central Italy, but also to be found in the north. The basis of lyrical singing is a creative act, whereby words and music are combined extemporarily. A variety of musical practices are used, by men and women, individually or together. They form an essential part of local culture, often being taken as a potent symbol of local identity. The texts do not recount stories, but express feelings (in most cases addressed to an imaginary female figure), and are subjective in character. They are widely circulated and have given rise to innumerable variants, but are not tied to specific melodies. The principal metre is the 11-syllable line, organized into different poetic forms, and variously elaborated in the course of the song, even with fragmentations and the insertion of verses in contrasting metres. The singing practices are normally local in character and adopt a 'way of singing' peculiar to the community which each interpreter is free to elaborate on individually. There are also specific ways of elaborating the text and organizing a group of performers to participate in the singing and the various forms of accompaniment. Since these singing practices are highly diversified, this overview is limited to the observation of some of the elements that differentiate them.

In some traditions the performance is based on a single, consistent text, a 'continuous discourse' performed as a solo (such as Sicilian carters' songs) or by a group of performers who follow strict rules of alternation. For example, the first performer may sing a couplet, repeated by the others in turn, and elaborated in a particular manner, as in songs *alla verbiarese* or *alla lonnuvucchisa*, or else the singers will alternate, taking single verses and using a technique of fragmentation and repetition which has echoes in 14th-century Italian music. An example of this type is provided by songs 'alla mageraiota' (ex.6). In other traditions, the performance will use several song texts (either complete or in part) in sequence, possibly adding verses of contrasting character or nonsense. Such pieces are generally performed by several singers in turn, and the performance is characterized by the notion of 'interrupted discourse', in that texts on different themes follow on from each other. Lastly, the performance can be organized as a dialogue between two singers alternately using a precise musico-poetic form for each entry (*contrasti*, *stornelli*, *dispetti*, etc.).

The types of lyrical singing discussed so far are all monodic and are performed employing either purely vocal melodies or dance tunes. In the former case, the rhythm is free, the vocal style is often very tense, the singer uses a high register, and the melody is organized in descending segments, frequently moving by step; there is a great deal of melismatic decoration, the melody is often modal, sometimes characterized by modal mobility, and there may be instrumental accompaniment. When a song is performed to an instrumental dance-tune, the singers can still use the same 'gestural' style, or they may adopt less articulated melodies, with a

fixed rhythm and a less emphatic vocal style more concerned with communicating the often very dense text. They may even mix the two singing styles as in ex.7. At any rate, making music within the system of lyrical singing provides ways for participants to test their own creative skill and degree of competence in giving a musical performance, within shared guidelines that determine the possibility of reciprocal communication, interaction and exchange between performers.

Lyrical singing serves many functions. One practice of great interest which has now disappeared is the *serenata* which a man addresses to his beloved; this fulfilled the social function of monitoring pre-marital relations, and in some parts of southern Italy could take the forms of a 'song of love' and 'song of contempt'. The performance of 'songs of love' publicly announced the relationship, while 'songs of contempt' either informed the community that an engagement had been broken off, or else provoked the break by directing highly offensive comments to the woman. The same repertory can be sung today as a form of entertainment within a male group; the function here is to socialize certain subject-matter of an emotional nature, and realize particular models of interpersonal interaction. In some traditions, the performance of lyrical songs may be part of devotional behaviour during religious festivals. In the past there was also frequent recourse to lyrical singing during agricultural work, at social occasions or competitions, where verbal communication and competitive improvisation predominated.

Agricultural work and entertainment are also associated with polyphonic renditions of lyrical songs, and while these are to be found in many regions of Italy, different regional traditions generally display no connections. In the north, the *villotta* (a type of lyrical song in verses of 8 or 11 syllables, now rare in either monodic or polyphonic performance) can be sung in parallel 3rds, while in the Italian communities of Istria it gives way to various types of two-voice, non-parallel discant known as *canto a pera* or *a la longa* in Gallesano, *basso* in Dignano, *mantignada* in Sissano and *butunada* in Rovigno. In central Italy the most significant form is the *vatoccu*, found in Umbria, the Marches and the Abruzzi. This type of discant performed by two voices (either both male or mixed), used to perform lyrical satirical songs with verses of 11-syllable lines, whose chief point of interest lies in the non-parallel movement of the lines(ex.8). Other forms of two-part singing in central Italy, in many respects similar to the *vatoccu*, are known locally by names such as *canto a coppia*, *a recchia*, *alla metitora*, *alla pennese*.

There are also traditions of polyphonic singing in the extreme south accompanied by a drone (ex.9). In [Sardinia](#) forms of lyrical singing show individual aspects when compared to those on mainland Italy, including the monodic 'song with guitar', and the polyphonic *tenore* singing. Mention should lastly be made of the *vjersh* of the Albanian communities in Calabria, a form of great contrapuntal interest, where a brief sequence of verses is interpreted by two and three voices according to a variety of polyphonic models.

[Italy, §II: Traditional music](#)

4. Other vocal repertories.

(i) Children's songs.

The best-known songs for children are lullabies, an enormous repertory with great variations throughout Italy. This repertory is identified not by form or poetic metre nor by a given musical idiom, but uniquely by the occasion for the song – an important moment in the relationship between mother and child. Different functions can be expressed inside this relationship, beyond the mere inducement to sleep through repeated, rocking melodies.

Lullabies display a wide range of imagery, with references to everyday life or religion, and as some of them derive from lyrical songs, they make up a repertory in which women create a world of fantasy that goes beyond the dimension of the relationship with the baby. The very melodic articulation of the song and the loud nature of the vocal style are evidence that the lullaby has often been the instrument for women to express themselves musically, and that has developed beyond the traits generally associated with the occasion of its use.

There is also a rich repertory of rhymes and counting songs for children, often using simple melodies and linked to games which, together with tongue-twisters and riddles, traditionally constitute instruments of the child's physical and mental training. Less well known are the songs that children use for their own games, and which may include pieces from adult repertories, like ballads, or, as in Brianza, the medieval *Visitatio Sepulchri*, reworked as children's games.

(ii) Work songs.

It has already been observed that there are multiple song traditions, many of them lyrical, that performers relate to agricultural work. They take on a variety of names in different locations: *canti alla mietitoria* (harvesting songs), *boare*, *canti alla falciatora* (scything songs), carters' or waggoners' songs, *canto alla monnarella*, *vatoccu*, *canto a pennese*, etc. In most cases the singing style is quite taxing, both in terms of vocal production and, for polyphony, in the coordination of voices, a style traditionally sung not while working but during breaks or after the work was done. Other repertories more closely related to work have now generally disappeared, like that of tuna fishers in Sicily, who used sound to coordinate various points in the work of fishing. For salt-workers the principal element lay in counting the boxes of salt transported, while pedlars sang to attract clients and advertise their wares(ex.10). The piledrivers of the Venetian lagoon had work songs, and work was also the context of the repertory of rice-weeders (songs recounting moments of life in the rice-fields or expressing social protest), spinners (working in silk mills) and with other songs of social protest associated, among other things, with labouring and emigration.

(iii) Other polyphonic practices.

Besides the polyphonic practices described above, which are associated with specific occasions (such as work or ritual) or repertories (ballads, lyrical singing), the main function of some other singing practices is collective entertainment. Such practices are characterized more by style than by repertory. Among these are several styles of male polyphony in the north of Italy (including that of the Alpine chorus, which is partly connected to folk repertories), which vary in their particular musical choices. In urban

Genoa a complex type of five-voice polyphony has developed, known as *trallalero*: its characteristics are the use of a falsetto voice (*cuntrètu*), and a voice that imitates a guitar and takes that name (*chitarra*), with the addition of a tenor voice (the soloist who begins the song), a baritone and a bass, the last part being taken by at least three singers (ex.11). *Trallalero* was already documented in the 19th century, but it started to develop from the 1920s particularly. Its musical structure is solidly tonal, most of the texts are very short, it offers no particular message and often resembles nonsense. A singing practice that is similar in many respects is the *bei-bei* of Monte Amiata in Tuscany. This is characterized by a solo voice (tenor), who sings the song text to the accompaniment of the *bei* (a voice that performs a kind of yodel moving in intervals of a 3rd or 6th) and the *corda* (a bass who sings the fundamental notes of the harmony), and sometimes an intermediate voice which fills out the harmonic texture or provides a rhythmic support (ex.12).

A further form of polyphonic song in which voices imitate an instrumental accompaniment (like the *trallalero* and the *bei*) is found in Rovigno in Istria. This is the *bitinada*, a singing style for three male voices: the upper voice takes the melody and sings the text, while the two lower voices perform an accompaniment of nonsense syllables (*lulu, tin tin*, etc.), based respectively on an arpeggio and a rhythmic motif on a repeated pitch. Another category of polyphonic song in Rovigno is the *aria da nuoto*, night song. This is for three voices in choral style (ex.13); as in the other examples, the texts are of varied provenance and are no more than a pretext for collective singing. A further style is the *tirr* of Premana in the province of Como, which aims for maximum socialization during the singing, with no distinction between singers and audience. Men and women together create a complex musical texture where there are no predetermined roles and great harmonic richness is achieved spontaneously.

Italy, §II: Traditional music

5. Music in ritual.

Of the principal life-cycle events, birth is not connected in Italy to any specific musical repertory, but marriage was often accompanied by songs and music for the bridal pair. Among the different traditions is the *sonata per la sposa* performed in the pastoral communities of Alta Sabina. This includes three pieces played on the *ciaramella* (here a bagpipe with two chanters and no drone): the *piagnereccia*, played while waiting for the bride outside her father's house, and expressing in music the bride's grief at leaving her family (ex.14), the *camminareccia*, which accompanies the bride's journey to the church, and the *crellareccia*, a dance performed by the newly-weds as they leave the church. Death has traditionally been an occasion of ritual mourning (ex.15) in the south and in Sardinia. Ernesto De Martino devoted one of his greatest works to this practice (D1958), examining the rites connected with death in Lucania and, for comparison, in other Mediterranean areas of Europe. He describes ritual mourning as 'protected speech' (D1958, pp.89–103), that is, a cultural model that offers the protection of organized behaviour for the expression of grief. He thus interprets the lament as a technique for weeping (including particular verbal, musical and gestural behaviour) established in order to control and

overcome the psychological risks connected to the experience of death, undergone by individuals and the community as a whole.

De Martino devoted his most famous work (D1961) to another rite, therapeutic in character, which is found in Puglia. His analysis again concerns a situation of physical and psychological crisis, called tarantism. Traditional culture in Puglia considered tarantism to be poisoning caused by a tarantula bite, which could be cured only through a symbolic rite, featuring music, dance and colour. According to De Martino's interpretation, tarantism aims at symbolically representing and acting out a critical situation (a psychological struggle that cannot be remembered, thus leading to neurosis) that affects all women during the age of sexual development. His study (including an article by the ethnomusicologist Diego Carpitella) reveals the large part played by music during the therapy of tarantism, since music represents the only instrument that can provoke a reaction to the state of complete apathy of those affected, inviting them to dance and thus to represent and overcome the conflict. Towards the end of his life De Martino began studying a phenomenon parallel to tarantism, the Sardinian *argia*.

Music plays an important role in a large number of rites that may be either religious or seasonal, or both, varying by region. The cycle of festivals of the winter solstice is the occasion for instrumental performances (the *pastorale* performed on the bagpipe is common in the south), narrative songs relating to Christmas, lullabies for the baby Jesus, songs for Epiphany (such as the *Pasquella* in Romagna and the *Stella* in the eastern Alps) and Christmas novenas. Strictly speaking, the term novena signifies a narrative song in nine sections, corresponding to the nine days preceding the feast day: a widely known piece in Sicily is the *Viaggiu dulurusu*, a narration in nine parts traditionally performed by the *orbi*, that begins at the point where Joseph learns of the imperial decree ordering the census and ends with the Nativity. Carnival was traditionally the period for *veglie* (when songs would be sung and stories told), dances (Bagolino in the province of Brescia has a particularly famous repertory) and rites which are widely found in many parts of Italy. Often the subject is the death and resurrection of a symbolic figure (the Carnevale, the Vecchia) or the representation of 'the world turned upside-down', and there may be an element of dressing-up (a famous example being the masked *mamutones* of Mamoiada in Sardinia, who form a procession, playing cow-bells and rattles). Sometimes the rites take on an explicitly theatrical dimension (for example, the *Zeza* and the representation of the months in Campania, and the *Befanate* in Tuscany).

In many parts of the country Easter is the occasion for ritual and representational events which culminate in the rites of Good Friday, and many important song traditions are connected to these. In addition to the numerous songs narrating the Passion found in many regions, mention should also be made of polyphonic songs, often liturgical in character and sung in Latin, traditionally sung by groups of men (although recently women's voices have been introduced in some cases) who belong to lay confraternities. There are particularly interesting examples in Emilia, Liguria, Umbria, Campania (ex.16), Sicily and [Sardinia](#). Particularly in the south, spring and summer see numerous festivals dedicated to the Virgin

Mary or to saints, each of which calls for ritual behaviour and involves much singing and dancing. Roberto De Simone's recordings of religious festivals in Campania, issued in 1977, are an important piece of documentation.

In many central and northern regions the arrival of summer is celebrated in the May (*Maggio*) festival, which, in Emilia and Tuscany takes the form of a proper music-theatre performance, whose origins seem to be traceable to the late 18th century. The *Maggio drammatico* is one of the most important expressions of folk music-theatre in Europe, and while it retains an explicit connection with a seasonal theme (the triumph of summer over winter), it has developed into a complex piece of work, all of it sung. The subject matter is freely drawn from medieval and Renaissance literature, the Bible and other sources, and elaborated by local writers who adapt the material to a recurring dramatic scheme: through a series of adventures a group of heroes (generally Christians) is formed, and they fight an enemy group (generally pagans), until the eventual triumph of the heroes. The dramatic composition is framed by the procession of the *maggerini* (or *maggianti*) followed by a prologue (a series of opening verses often referring to the seasonal theme and introducing the subject-matter), and the final chorus (ex.17), the only polyphonic piece in the presentation, which signals the return to the stage of all the characters who have appeared in the action, representing a communal concluding rite. The drama presented between the prologue and final chorus often has a cyclical structure and is frequently characterized by a number of synchronized actions. The acting style is 'alienated' and in some traditions gestures are used to explain particular words of the text. The musical and poetic structures are closely linked: four lines (or sometimes five in Tuscany) of eight syllables – the dominant metre, related to the flowing action – are intoned on a fluid melodic pattern, articulated in four sections, similar to local forms of lyrical singing. An eight-line stanza (*ottava*) of 11 syllables, intoned on a melody repeated with variations at every couplet, is reserved for the key moments in the drama (death, imprisonment, separation); the *sonetto* (four lines of seven syllables) is used mainly for lyrical scenes and for the final chorus. As well as the singing there are short instrumental episodes (fragments of *liscio* dance tunes performed by violin, guitar and accordion) whose principal role is to divide the scenes and underline dramatic moments. The *Maggio drammatico* is still found in local variants in the Emilian Apennines and in Tuscany.

[Italy, §II: Traditional music](#)

6. Dances and instruments.

The principal instrumental music traditions found in Italy are mostly of dance music. Both in terms of dance and of music, the repertoires are often profoundly different in the northern and central-southern regions. In northern Italy, the most important dance repertoires, prominent in Emilia, Bagolino and Resia, are played by a small instrumental group, based around the violin (whose playing technique retains many elements from Baroque practice). In Emilia these *concertini* have often changed in composition depending on the availability of players, but the classic formation in the early 20th century was two violins (the first having a solo function while the second provided a rhythmic-harmonic accompaniment),

guitar (accompanying), a bowed bass instrument (such as a violone, three-string bassett, cello or bass) and whatever other instruments might be available to double the melody and in some cases perform a counter-melody (such as another violin or a viola). The repertory consisted of skipping dances (*ruggero, saltarello, ballo di Mantova, roncastalda, monferrina*, etc.), dances with ritual aspects (*ballo di baraben*) and waltzes, polkas and mazurkas, known as *liscio* ('smooth') to differentiate them from skipping dances.

In contrast, the repertory of instrumental groups in Bagolino is tied exclusively to Carnival. These groups consist of two violins, playing the main melody and a doubling or a counter-melody, two guitars (for accompaniment), a bass and a mandolin. The dances (*ariosa, bal frances, bas de tach, muleta, pas in amur, rose e fiori*, etc.), reserved for the last Monday and Tuesday of Carnival, are complex and sophisticated, and are performed by specially trained dancers from the village. Instrumental groups of the Val di Resia in Istria are made up of a violin (*citira*) which performs the melody alternately in two keys a fifth apart, an optional second violin doubling the melody in 3rds, a cello (*bunkula*) which holds the alternating tonics as a drone, and the stamping of the players, providing rhythmic support (ex.18). The dance repertory (such as the *ta palacowa, ta matianowa, ta panawa, rezianka zagatina*) is performed for the departure of conscripts (young conscripted soldiers), at Carnival or for festivals, and sometimes has vocal accompaniment.

Although the violin is predominant in the north, it is also used in Puglia in the context of tarantism rites: accompanied by a tambourine (taking the rhythmic function essential to the rite), guitar and sometimes accordion, the violin plays an essential role in the music and dance therapy of tarantism. Still in the north, in the Oltrepò pavese region around Pavia a further repertory of skipping dances can be found; examples are *alessandrina, monferrina, piana, giga, perigurdino, sposina* (dance for a bride), and *povera donna*, a Carnival dance that represents a rite of death and resurrection. The latter repertory is played by a *piffero*, a double-reed instrument belonging to the oboe family, and formerly accompanied by the *mùsa* (a bagpipe with a single chanter for the melody and a one single-reed drone), now replaced by the accordion. Today besides the traditional dances many such groups perform a more recent repertory of *liscio* dances, also used by band groups (the Concerto Cantoni band in Emilia is famous for its repertory).

Many instruments are used in folk traditions, often deriving from art music. Idiophones include castanets, bells and cow-bells, crotales, cymbals, rattles, Jew's harps, setaccio, traccola and triangle. Of the membranophones, tambourines of different sizes are played (which may incorporate various types of idiophones, like small cymbals or bells), as well as double-sided drums and friction drums. Aerophones include end-blown, transverse or vessel flutes, panpipes, clarinets, oboes with or without pirouettes, shells, mouth organs, accordions and band instruments. Apart from the chordophones already mentioned, guitar and mandolin are common, and in the past the harp was found in Viggiano, Basilicata, and the zither in the Tyrol.

Formerly one of the most widely found instruments in various forms throughout Italy was the *zampogna* or [Bagpipe](#). In the north, where apart from the *müsa* mentioned above, types such as the Alpine and Apennine *piva* were formerly played, today it has completely died out except for the Istrian *piva*, which has two single-reed chanters and no drone. The *piva* was once used to accompany singing as well as to play dance tunes (*furlana*, *balùn*, *liscio* dances) to the accompaniment of a tambourine, *simbalo*. The *zampogna* is now most widely found in central-southern Italy and Sicily. The instruments found in this area share a common structural characteristic: they have two chanters played with separate hands, and the drone pipes are mounted together with the chanters in a single block of wood, placed in a goatskin bag. In other respects, the central-southern bagpipes display profound differences. Some have chanters of equal length (the *surdulina* of Basilicata and northern Calabria, the Calabrian and Sicilian *zampogna a paro*, which generally has single reeds and two or three drone pipes), some have chanters of unequal length (*zampogna zoppa* with one, two or no drone pipes, mainly with double reeds, found in central Italy). Some have a key mechanism for the longest pipe to facilitate access to the complete system, presumably taken from the Renaissance [Shawm](#), such as the *zampogna a chiave* found from Lazio down to Sicily, generally with two drone pipes and double reeds. There is also the Calabrian 'a' *moderna* bagpipe, with chanters of unequal length, three drone pipes and single reeds.

Given the widespread presence of the bagpipe in Italy, its repertoires are naturally diverse, using different musical idioms which have yet to be examined in depth. The instrument is used in ritual performance (processions, music for a saint, novenas), for dance (in southern Italy and Sicily the *tarantella* predominates, displaying a variety of choreographic and musical aspects) and to accompany singing. In many cases the bagpipe is accompanied by other instruments, especially the tambourine, different forms of which are found wherever the bagpipe appears in central-southern Italy, and the *ciaramella* (shawm; fig.22). The bagpipe is absent from Sardinia, but a triple clarinet of reed pipes called *launeddas* (played using circular breathing) is found throughout the southern area of the island.

The music played by the *launeddas* is the most refined example of the open, improvisatory forms mentioned earlier and is widespread in the instrumental music of southern Italy. The general structure of the dances (*ballo tondo*) played by professional musicians is completely dominated by the aesthetic notion of thematic continuity (*sonai a iskala*). In practice, the dance is made up of a series of *nodas* or *pikkiades* (short elements endowed with a characteristic tripartite form), each of which is developed in a series of variants that together form a group. The passage from a group based on one *noda* to a new *noda* has to be effected without a perceptible modification in the musical discourse, something that is achieved through a sophisticated variation technique. Similarly, techniques of improvisation based on the connection and variation of short musical elements may be found, for instance in the repertory of the southern bagpipes and diatonic accordion.

The instruments mentioned above are the most important to be found in the panorama of Italian music, both in terms of diffusion and size of repertory. But the country also has many other instrumental traditions, often limited but nevertheless of great interest, such as that of the *chitarra battente* (in Puglia, Campania and Calabria), the *lyra* (found almost uniquely among the Greek-descended communities of southern Calabria), the double flute (in Campania, Calabria and Sicily: ex.19), and simple, double and triple clarinets (such as the Sardinian *benas*).

Ite missa est.

The formal dismissal of the Mass consisting of the words 'Ite missa est' ('Go, you are dismissed') answered by 'Deo gratias' ('Thanks be to God'). The use of 'missa' in the sense of dismissal is quite ancient: by the early Middle Ages this meaning had been lost. Jungmann was thus of the opinion that 'this formula is as old as the Latin Mass itself'; it certainly dates

from at least the 4th century. In fact the very term 'Mass' (*missa*), which replaced the earlier 'eucharistia', is taken from this phrase. The *Ite missa est* is an element of the Ordinary and was originally sung or chanted at the end of every Mass. In the 11th century, however, a change took place that resulted in the inclusion of the *Ite* only in masses with a Gloria; on other occasions the [Benedicamus Domino](#) replaced it.

A number of melodies have survived (see Robertson for those in the service books of the abbey of St Denis), and there are 28 troped forms of the *Ite* in manuscripts from St Gallen and St Martial. The first source in which the *Ite missa est* is grouped with the other Ordinary chants is the 14th-century manuscript *F-TLm* 94, containing a collection of cyclic mass Ordinaries as well as a polyphonic mass, the so-called Mass of Toulouse; of the nine cycles, seven include the *Ite missa est* and two the *Benedicamus Domino*. With regard to the cycles of the *Edition vaticana*, Apel remarked that most of the *Ite* chants are identical to the Kyries in each cycle 'thus bestowing upon the cycle a noteworthy trait of musical unity'. Apparently, there was a tradition of adopting Kyrie melodies for the *Ite*, although other chants were also used, both for the *Ite missa est* and for the *Benedicamus Domino* (see Hiley). There is, however, no evidence of an older tradition of such unified cycles; only two of the *Ite* chants in *TLm* 94 are like their associated Kyries. An interesting observation concerning *Ite* melodies was offered by Fischer who showed that the 'Ite missa est V. toni' is in fact a contrafactum of the *Abgesang* of the Minnesang *Meie hât wünnechlîche entsprozen* formerly ascribed to Neidhart von Reuenthal.

There are very few polyphonic settings, possibly because composers considered the *Ite missa est* a postlude and not really part of the Ordinary. The extant settings are all 14th-century, the most famous being that of Machaut's *Messe de Notre Dame*. Two other settings, in the Mass of Tournai and the Mass of Toulouse, are in fact motets with an 'Ite missa est' as tenor.

RICHARD SHERR

Iten [Itten], Wolfgang [Vital]

(*b* Unter-Ägeri, nr Zug, 18 Dec 1712; *d* Auw, Aargau, 2 Jan 1769). Swiss composer. He entered the school of the Benedictine monastery at Engelberg in 1725 and took his monastic vows on 20 February 1729. He was probably taught music by Ildephons Straumeyer, *phonascus* and choir director at Engelberg, and by the composer Benedikt Deuring between 1733 and 1736. Deuring's sacred works were almost entirely lost in a fire at the monastery on 29 August 1729, together with works by Italian and south German composers (including Corelli, Steffani and J.V. Rathgeber), and after the fire Itten composed a new repertory. His first dated works are from December 1735. In 1737 he was made principal Kapellmeister at the monastery; he also played the trumpet.

The majority of Itten's 149 extant works (most in *CH-EN*; some in *E*) are motets, offertories and Marian antiphons for soloists and choir, usually with two violins and organ; two works include parts for the [Trumpet marine](#): *Pastorella*, 1738, and *Aria de S.P.N. Benedicto*, 1751. A *Missa brevis solemn* (*CH-E* Eis.Mb.Th.199,36), dated 2 February 1739, has also been ascribed to him; it is for four voices and instruments (including two trumpets and timpani). Itten's music exemplifies the prevailing, Neapolitan-influenced concertante style, including recitatives and arias. It is not without a certain elegance, though marred by the occasional clumsiness. He also provided Latin contrafacta for the 40 Italian arias op.1 by his friend Franz Joseph Leonti Meyer von Schauensee (1720–89) and wrote two German Passion plays. For one of these, intended for use on Good Friday 1757 by his congregation in Auw, where he had become parish priest in 1754, he also supplied songs (*CH-EN* Cod.294).

For a full account of Itten's life and activities see J. Willmann: 'Pater Wolfgang Itten (1712–1769), Mönch und Komponist des Klosters Engelberg', *Zuger Neujahrsblatt* 1987, 83–111.

JOSEPH WILLIMANN

Itiberê, Brasília (da Cunha Luz)

(*b* Curitiba, 17 May 1896; *d* Rio de Janeiro, 10 Dec 1967). Brazilian composer. Although he had had music lessons with Leo Kessler in his native city, he studied engineering in Rio de Janeiro and was self-taught in composition. In 1934 he settled in Rio, where he became intimately acquainted with popular music, studying the samba schools and using popular material in such works as *O cravo tropical* for two pianos (1944), some of whose rhythmic figures recall Nazareth's tangos. His investigations of folk music were stimulated by his friendship with Villa-Lobos, who appointed him to teach folk music at the Conservatorio Nacional de Canto Orfeônico in 1942 (he had occupied a similar position at

the Universidade do Distrito Federal from 1938). Itiberê's small output was produced between 1934 and 1954. In the early works the characteristics of folk and popular music are clearly evident, but later they were transformed. His best music is in the choral works and the piano pieces, of which the *Estudos* have a high place in the Brazilian keyboard literature. The first is a study in syncopation, the fifth has the typical accompaniment figures of the popular *chôro*, and the sixth is in *embolada* style, with its repeated notes and octaves. Another major piano work is the *Suite litúrgica negra*, based on the ritual *macumba* music.

GERARD BÉHAGUE

Itier, Bernardus

(*b* 1163; *d* 27 Jan 1225). French chronicler of St Martial of Limoges and monk. Received as a boy scholar at St Martial in 1177, Itier held a succession of important offices, culminating in appointments as librarian (1204) and precentor (by 1211), posts he evidently held concurrently. Annotations in Itier's hand, scattered through surviving remnants of the St Martial library, testify to his interest in preserving the monastery books. One manuscript that he had bound includes a collection of early polyphonic music. Other musical manuscripts from the St Martial collection very probably owe their survival to his care.

Although not himself a professional scribe, Itier had charge of the monastery scriptorium and knew how to notate music. One composition in his hand, a Parisian motet based on the duplum of Perotinus's four-voice organum *Sederunt* (*F-Pn* lat.2208 f.1), shows a musical connection between Paris and St Martial in Itier's lifetime. The chronicle written by Itier is a central source of information on the monastery.

SARAH FULLER

Iturbi, José

(*b* Valencia, 28 Nov 1895; *d* Hollywood, CA, 28 June 1980). Spanish pianist and conductor. He studied at the Valencia Conservatory and then with Victor Staub at the Paris Conservatoire, where he gained a *premier prix* in piano in 1913. During World War I he played in Swiss cafés, then taught at the Geneva Conservatoire, 1919–23. Extensive tours followed. He first played in the USA (where he settled) in 1928; in 1930 he gave 77 concerts on one American tour. In 1936 he was appointed conductor of the Rochester PO, a post he held for several seasons. His connection with films began when his fingers impersonated Chopin's in *A Song to Remember*; he then appeared in several more films. He was the most famous Spanish pianist of his day, with a large popular following; in 1950 he became the first classical musician whose sales of a single record exceeded a million copies. Some critics held reservations about his Beethoven and Chopin, but his playing of the music of his native land was idiomatic, ebullient and vital. Iturbi composed a number of pieces in a Spanish idiom, including the *Pequeña danza española* for piano and a *Seguidillas* for orchestra. His sister Amparo (1898–1969), with whom he often performed, was also a pianist.

FRANK DAWES

Iturriaga, Enrique

(*b* Lima, 3 April 1918). Peruvian composer and teacher. He studied the piano with Lily Rosa and harmony with Sas (1934–9), and then composition with Holzmann at the National Conservatory of Music (1946–50); his studies were completed in Paris (1950–51) with Simone Plé-Caussade and Honegger. He was awarded the Duncker-Lavalle prize twice, the first time in 1947 for *Canción y muerte de Rolando*, the second for *Homenaje a Stravinsky*, and, in 1957, the Landaeta prize in Caracas for his Suite no.1 for orchestra. Appointed professor of composition and harmony at the National Conservatory in 1957, he also taught at the San Marcos University (1964–82), later becoming emeritus professor there, and at the Catholic University (1970–82). In addition, he has collaborated with UNESCO on many regional projects to train music teachers.

Each work in Iturriaga's relatively small output addresses anew the problem of finding a personal style which at the same time expresses the multi-culturalism of Peru. In the early *Pequeña suite*, *Preludio y danza* and *Obertura para una comedia*, he stylizes popular genres, occasionally resorting to irony. In the Suite (1957) the references are more fragmented and dramatic, the rhythm more pronounced and the orchestration

characterized by sudden shifts and contrasts. The *Homenaje a Stravinsky* for orchestra without upper strings and *cajón* (1971) is an example of Iturriaga's interest in building textures out of multiple instrumental planes; while the later *Llamada y fuga para un santiago* (1990) shows him still employing popular materials in an individual fashion, using an objective and analytical fugal form to arrive at a traditional three-part melody. Iturriaga's musical language has remained, for the most part, one of extended tonality – displaying the use of 'Arequipa 3rds', major and minor 3rds superimposed or juxtaposed to produce bimodal passages – or polytonality. The sober Webern-like serialism of *Vivencias I–IV* (1965), notable for its invention and expressivity, is an isolated example. Throughout his career his vocal writing has remained an important element, in particular in the *Ejercicios poéticos* (1951) and the *Cuatro poemas de Javier Heraud* (1977).

J. CARLOS ESTENSSORO

Ivanoff [Ivanov], Nicola [Nikolay] (Kuz'mich)

(*b* Poltava, 10/22 Oct 1810; *d* Bologna, 7 July 1880). Russian tenor. A singer in the imperial chapel, St Petersburg, he was given leave of absence to accompany Glinka to Italy in 1830, and never returned to Russia. He studied with Eliodoro Bianchi, Andrea Nozzari and Panofka, making his début at the S Carlo on 6 July 1832 as Percy in *Anna Bolena*. He first sang in Paris at the Théâtre Italien in 1833 as Gianetto in *La gazza ladra* and made his London début on 15 April 1834 as Percy at the King's Theatre.

Ivanoff passed the remaining years of his career mainly in Italy. In 1840 he sang in *Guillaume Tell* (given as *Rodolfo di Sterlinga*) at Bologna, where on 19 March 1841 he took part in a performance of Rossini's *Stabat mater* conducted by Donizetti. Engaged at Palermo, he sang Riccardo in the première of Pacini's *Maria, regina d'Inghilterra* (11 February 1843), and made his début at La Scala in the same opera (26 December). In the summer of 1844 he appeared at the Kärntnertortheater, Vienna, in two Donizetti operas, *Maria di Rohan* and *Roberto Devereux*. At Parma the same year he sang the title role of *Ernani*, with an extra aria, commissioned from Verdi and paid for by Rossini, who had adopted the tenor as his protégé. He repeated *Ernani* at the Teatro Apollo, Rome, in 1845. In 1846 at Trieste he sang Foresto in *Attila*, again with an extra aria commissioned from Verdi by Rossini. He returned to Rome (1847–8), Paris (1850) and to Palermo (1852), but by then his voice had nearly gone, and he had to be replaced after two performances.

At the beginning of his career Ivanoff had, to quote Chorley, 'the sweetest voice, as a gentle tenor, that ever sang in Italian or Muscovite throat. Nothing could be more delicious as to tone – more neat as to execution: nothing, assuredly, ever so closely approached an automaton not wound up, as did he, on the stage, by his insignificance of aspect, and his nullity of demeanour'. When later he attempted heavier roles, his voice lost its bloom, but he gained in stage experience and dramatic conviction.

ELIZABETH FORBES

Ivanov, Georgi.

See [Tutev, Georgi](#).

Ivanov, Lev Ivanovich

(*b* St Petersburg, 18 Feb/2 March 1834; *d* St Petersburg, 11/24 Dec 1901). Russian choreographer. See [Ballet](#), §2(iv).

Ivanov, Mikhail Mikhaylovich (i)

(b Moscow, 23 Sept 1849; d Rome, 20 Oct 1927). Russian critic and composer. He graduated from the Institute of Technology in St Petersburg in 1869 and then studied for a year at the Moscow Conservatory, where he attended Tchaikovsky's composition classes and took piano lessons from Dubuque. From 1870 to 1875 he studied with Sgambati in Rome; during these years he associated with Liszt and his circle of pupils and admirers. On his return to St Petersburg, he began to submit articles on musical topics to the St Petersburg press. In 1879 he edited the musical journal *Voskresniy listok muziki i ob'yavleniy*, but the following year he was engaged as permanent music critic on the *Novoye vremya*. His lively and informed articles appeared regularly in that paper until 1918. Conservative in his outlook on music, he adopted a hostile attitude towards the so-called National School. His often ironic and scathing reviews of new music earned him the dislike of many composers.

Ivanov wrote four operas (three of which were performed with some success), several competent if uninspired orchestral works, some choral pieces and some songs. His compositional style has been described as a pale imitation of that of Tchaikovsky. He wrote a history of music in Russia, *Istoriya muzikal'novo razvitiya v Rossii* (St Petersburg, 1910–12), and articles on Italian literature, and translated into Russian Hanslick's *Vom Musikallsch-Schönen* (a work which had a profound influence on him as a critic) and Nohl's *Die geschichtliche Entwicklung der Kammermusik*. After the Revolution he emigrated to Italy, where he lived quietly until his death.

JENNIFER SPENCER

Ivanov, Mikhail Mikbaylovich (ii).

See Ippolitov–ivanov, mikhail mikhaylovich.

Ivanov-Boretsky, Mikhail Vladimirovich

(*b* Moscow, 4/16 June 1874; *d* Moscow, 1 April 1936). Russian music historian and composer. He studied law at St Petersburg University, graduating in 1896, and music at the St Petersburg Conservatory, where his teachers included Rimsky-Korsakov. In 1901 he went to Italy to study at the Florence Conservatory; this fired in him an interest in Italian music and inspired him to write his first book, a short monograph on Palestrina. In 1905 he returned to Russia, where he undertook teaching commitments in Moscow and was a council member of the music theory department at the Institute for the History of the Arts in Petrograd. At about the same time he produced a number of compositions; almost all have remained in manuscript, and include a Symphonic Suite (1893), the operas *Adol'fina* (1908) and *Koldun'ya* ('The Sorceress', 1913; performed St Petersburg, 1918), chamber music, piano pieces, choral works and songs. In 1922 he was appointed dean of the faculty of theory and composition at the Moscow Conservatory, and under his supervision the research department was founded (1923).

Ivanov-Boretsky is considered to be the founder of the Moscow school of music historians; he taught many well-known Russian musicologists, including Livanova and Tumanina, who later became professors at the conservatory. He was the first Russian musicologist to write extensively on Western music, and early in his career produced a number of popular pamphlets on Mendelssohn, Schumann, Josquin and others. He followed these with more generalized studies of music history, which formed the foundation of the teaching courses he established at the conservatory.

IGOR BÉLZA

Ivanovich, Cristoforo

(*b* Budva, Dalmatia, 1628; *d* Venice, before 6 Jan 1689). Italian librettist and theatre chronicler of Dalmatian birth. He went to Italy in the mid-1650s to escape the war over Crete. He settled first at Verona, where he was a member of the Accademia Filarmonica and the Accademia dei Temperati, which organized opera and theatre performances there. From 1657 he

lived in Venice, where he became a member of the influential Accademia Delfica. Soon after moving there he became secretary to Leonardo Pesaro, one of the procurators of S Marco, where in 1676 he obtained the position of *sottocanonico* and in 1681 that of *canonico*. He wrote librettos for Venice, Vienna and Piacenza; he also adapted Moniglia's Florentine extravaganza *Ipermestra* to Venetian taste as *La costanza trionfante*. His exchange of letters with Pagliardi (*Poesie*, Venice, 1675) contains an interesting and rare description of that taste: 'The character of this city likes the heroic to be serious but lively, the pathetic not excessively languid, and the comic full of vigour but easy-going'. His principal contribution to musical theatre is a catalogue of Venetian opera performances from 1637 to 1681 (continued, in a second edition, to 1687), 'Le memorie teatrali di Venezia', published as an appendix to his *Minerva al tavolino* (Venice, 1681, 2/1688). Although it contains many inaccuracies (see Walker), it is a valuable source of information about 17th-century operatic repertory and is the basis for all subsequent catalogues; it also contains an extensive discussion of contemporary theatre practice. Ivanovich's will was proved on 6 January 1689.

WORKS

L'amor guerriero (dramma per musica), P.A. Ziani, 1663; *La Circe* (dramma per musica), Ziani, 1665 (D. Freschi, 1679); *Coriolano* (dramma), F. Cavalli, 1669; *La costanza trionfante* (dramma per musica), G.D. Partenio, 1673 (B. Pasquini, 1679, as *Dov'è amore è pietà*); *Lisimaco* (dramma per musica), G.M. Pagliardi, 1673; *L'africano trionfo di Pompeo* (dramma per musica), 1678 [unperf.]; *La felicità regnante* (serenata), 4 Sept 1681

THOMAS WALKER/NORBERT DUBOWY

Ivanovici, Iosif

(*b* ?1845; *d* Bucharest, 28 Sept 1902). Romanian composer and conductor. He studied in Galați with Alois Riedl and in Iași with Emil Lehr, and became director of the military bands of Galați and Bucharest. He composed fanfares, marches, waltzes and potpourris of folk melodies, and in 1889 was awarded a composition prize at the International Exhibition in Paris. His piano and vocal pieces became popular at the soirées of the day, and

his fanfare *Valurile Dunării* ('The Danube waves'), also arranged for piano, has become widely known.

WORKS

Military band: *Valurile Dunării* [The Danube waves] (Bucharest, 1880); *Zîna munților* [The mountain fairy] (Bucharest, 1886); *Porumbeii albi* [The white pigeons], op.132 (Hamburg, 1894); *La fille du marin* (Hamburg, 1894)

Pf: *La vie de Bucarest* (Bucharest, n.d.); *Un rêve sur le Volga* (Paris, n.d.); *Nathalia* (Leipzig, n.d.); *Abendträume* (Leipzig, n.d.); *Der Liebesbote* (Vienna, n.d.); *Im Mondenglanz* (Leipzig, n.d.); *Sur le bord de la Neva* (Paris, n.d.); *Wanda* (Paris, n.d.); *Parade militaire* (Bucharest, n.d.)

Many other marches, pf pieces and songs

ROMEO GHIRCOIAȘIU

Ivanov-Kramskoy, Aleksandr (Mikhaylovich)

(*b* Moscow, 26 Aug 1912; *d* Minsk, 11 April 1973). Russian guitarist and composer. He studied the guitar with Agafoshin, a student of Segovia, composition with Rechmensky and conducting with Saradzhev. His concert career began in 1933, but he toured very little outside the USSR. He made several recordings and composed over 500 works, including two concertos and other works for the guitar, which reveal him as an excellent musician and an accomplished technician. He was a leading figure in the establishment of the classical guitar in Russia, and his self-study method (1948) is still used there. His daughter, Nataliya Ivanova-Kramskaya, described his life in *Zhizn' posvyatil gitare: Vospominaniya ob otse* [A life dedicated to the guitar: memories of my father] (Moscow, 1995).

JOHN W. DUARTE

Ivanovs, Jānis

(*b* Preiļi, nr Daugavpils, 9 Oct 1906; *d* Riga, 27 March 1983). Latvian composer. He graduated in 1931 from Vītols's composition class and Schnéevoigt's orchestral conducting class at the Latvian State Conservatory, where he remained until 1933 in Vītols's practical composition class. From 1931 he worked for Latvian radio, and from 1945 to 1963 he was artistic director of the Latvian radio committee. He was appointed to teach composition at the conservatory in 1944, was made professor in 1955 and continued to teach there until 1983. He was president of the committee of the Soviet Latvian Composers' Union, 1950–51.

Ivanovs worked primarily in symphonic genres, the 21 symphonies standing at the core of his oeuvre. Deeply humanistic thought is evident in his orchestral works, where the language is characterized by broad melodies frequently rooted in the old scales of Latvian folk music, a lyrically dramatic expressiveness and rich textures. In his early works, those of the 1930s, he was to a certain extent subject to Impressionist influences and wrote programme works on the natural features and people of his native province of Latgale, occasionally using folksong melodies. His first three symphonies are also from this period, though the first two were lost in the war years. With his Fourth Symphony 'Atlantīda' (1941), he arrived at an innovatory monumental concept of symphonism which marked a new stage in the development of Latvian symphonic music. His Fifth Symphony (1945) reflects the experiences of the war years. As a result of the communist party's decree against formalistic music in 1948, performances of Ivanovs's fourth and fifth symphonies were for many years prohibited. The Sixth, 'Latgales' (1949), illustrates scenes of the sufferings and final freedom of his native land; for this he was awarded the USSR State Prize in 1950. Power, energy and lyricism characterize the Seventh (1953) and Eighth (1956). In the Ninth, Tenth and Eleventh, Ivanovs became more deeply involved with psychological and philosophical concepts, and his musical language evolved towards a more complex harmony, making use of polytonality and linear polyphony. His next symphonies deal with wider social themes, the Thirteenth, *Symphonia humana* (1969), being dedicated to Lenin. Nos. 14–16, however, reveal a tendency towards simpler forms and are in more of a chamber style. The music of the final symphonies synthesizes dramatic style with sophisticated, lyrical scenes and reminiscences transformed from his early works. Ivanovs's chamber music is characterized by weighty musical ideas, a vivid dramatic quality and laconic form.

JĒKABS VĪTOLIŅŠ

Ivanschiz [Ivanschitz, Ivanschütz, Ivanscics, Ivančić, Ivančić], Amandus

(*fl* mid-18th century). Austrian composer of south Slav extraction. Only fragmentary information about his life is available. A Pauline monk, he was a member of the Maria Trost monastery near Graz by 1755. He was evidently a prolific and popular composer: there survive about 100 works by him in manuscripts, dating mostly from 1762 to 1772 and scattered throughout the Habsburg Empire and in south Germany. His music is characteristic of the transition from late Baroque to early Classical style, and his best works are his masses and symphonies. The masses are mostly scored for four soloists, four-part choir, two violins and bass and a pair of trumpets; some are of considerable dimensions, and they show distinct Neapolitan traits. The symphonies, many of which have four movements, are scored for strings, sometimes with a pair of trumpets or horns. The trios, entitled variously 'Divertimento', 'Nocturno', 'Sinfonia', 'Sonata' and 'Parthia', are mostly in three movements in the same key; Ivanschiz's frequent use of the viola as the second solo instrument is a forward-looking trait.

Ives, Charles (Edward)

(*b* Danbury, CT, 20 Oct 1874; *d* New York, 19 May 1954). American composer. His music is marked by an integration of American and European musical traditions, innovations in rhythm, harmony and form, and an unparalleled ability to evoke the sounds and feelings of American life. He is regarded as the leading American composer of art music of the 20th century.

[Ives, Charles](#)

1. [Unusual aspects of Ives's career.](#)

Ives had an extraordinary working life. After professional training as an organist and composer, he worked in insurance for 30 years, composing in his free time. He used a wide variety of styles, from tonal Romanticism to radical experimentation, even in pieces written during the same period. His major works often took years from first sketch to final revisions, and most pieces lay unperformed for decades. His self-publications in the early 1920s brought a small group of admirers who worked to promote his music. He soon ceased to compose new works, focussing instead on revising and preparing for performance the works he had already drafted. By his death he had received many performances and honours, and much of his music had been published. His reputation continued to grow posthumously, and by his centenary in 1974 he was recognized worldwide as the first composer to create a distinctively American art music. Since then his music has been frequently performed and recorded and his reputation has broadened further, resting less on his innovations and nationality and more on the intrinsic merits of his music.

The unique circumstances of Ives's career have bred misunderstandings. His work in insurance, combined with the diversity of his output and the small number of performances during his composing years, led to an image of Ives as an amateur. Yet he had a 14-year career as a professional organist and thorough formal training in composition. Since he developed as a composer out of the public eye, his mature works seemed radical and unconnected to the past when they were first published and performed. However, as his earlier music has become known, his deep roots in 19th-century European Romanticism and his gradual development of a highly personal modern idiom have become clear. The first of Ives's major works to appear in performance and publication, such as *Orchestral Set no. 1: Three Places in New England*, the *Concord Sonata*, and movements of the *Symphony no. 4* and *A Symphony: New England Holidays*, were highly complex, incorporated diverse musical styles and made frequent use of musical borrowing. These characteristics led some to conclude that Ives's music could be understood only through the programmatic explanations he offered and was not organized on specifically musical principles. Yet by tracing the evolution of his techniques through his earlier works, scholars have demonstrated the craft that underlies even seemingly chaotic scores and have shown the close relationship of his procedures to those of his European predecessors and contemporaries.

One result of Ives's unusual path is that the chronology of his music is difficult to establish beyond general outlines. His practice of composing and reworking pieces over many years often makes it impossible to assign a piece a single date. That he worked on many compositions and in many idioms simultaneously makes the chronological relationships between works still more complex. There is often no independent verification of the dates Ives assigned to his works, which can be years or decades before the first performance or publication. It has been suggested, too, that he dated many pieces too early and concealed significant revisions in order to claim priority over European composers who used similar techniques (Solomon, C1987) or to hide from his business associates how much time he was spending on music in the 1920s (Swafford, C1996). Recent scholarship, however, has established firmer dates for the types of music paper Ives used and refined estimated dates for various forms of his handwriting, allowing most manuscripts to be placed within a brief span of years (Sherwood, C1994 and E1995, building on Kirkpatrick, A1960, and Baron, C1990). These methods have often come to support Ives's dates, confirming that he did indeed develop numerous innovative techniques before his European counterparts, including polytonality, tone-clusters, chords based on 4ths or 5ths, atonality and polyrhythm. Where a discrepancy exists – in the case of several longer works for example – this may well result from his practice of dating pieces by their initial conception, the first ideas worked out at the keyboard or in sketches now lost. The dates provided here are, then, estimates based on the manuscripts when extant, supplemented by contemporary documents and Ives's testimony.

2. Youth, 1874–94.

The Iveses were one of Danbury's leading families, prominent in business and civic improvement and active in social causes, such as the abolition of

slavery. Ives's father George E. Ives (1845–94) was exceptional in making music a career. He took lessons in the flute, violin, piano and cornet, following which, during 1860–62, he studied harmony, counterpoint and orchestration with the German-born musician Carl Foeppel in New York. After Civil War service as the youngest bandmaster in the Union Army and two more years in New York, he returned to Danbury and pursued a variety of musical activities, performing, teaching and leading bands, orchestras and choirs in and near Danbury, and sometimes touring with travelling shows. He also worked in businesses connected to the Ives family. He married Mary ('Mollie') Elizabeth Parmalee (1849–1929) on 1 January 1874, and Charles was born late the same year, followed by J. Moss (1876–1939), who became a lawyer and judge in Danbury.

Through his father, Ives was exposed to the entire range of music-making in Danbury. He studied the piano and organ from a young age with a series of teachers and was playing in recitals by his early teens. He became an accomplished performer and composer in two musical traditions, American vernacular music and Protestant church music, and gained his first exposure to a third, European classical music. Additionally, he was an avid athlete and was captain of several baseball and football teams. Ives played the drums with his father's band, and the spirit of band performance echoes in many works of his maturity. He wrote marches for piano, band and theatre orchestra, several of which adopt the then common practice of setting a popular song in one section of the march. His first publicly performed piece may have been the march *Holiday Quickstep*, written when he was 13; the review in the *Danbury Evening News* of the January 1888 première called him 'certainly a musical genius' and declared 'we shall expect more from this talented youngster in the future'.

At the age of 14 he became the youngest salaried church organist in the state, and he worked regularly as one until 1902. He wrote anthems and sacred songs for church services, at first using hymn texts and a hymn-like style (as in *Psalms* 42), and then from about 1893 (in works such as *Crossing the Bar*) adopting the more elaborate and chromatic style of Dudley Buck, with whom he briefly studied the organ around 1895. The hymns he knew from church and from camp-meeting revivals, where his father sometimes led the singing with his cornet, he later regularly borrowed or reworked as themes in sonatas, quartets and symphonies. He heard some classical music in concert performances in both Danbury and New York and learnt rather more through his own study and performance of works by Bach, Handel, Beethoven, Rossini, Schubert, Mendelssohn, Wagner, John Knowles Paine and others on the piano or organ, including many transcriptions. His virtuoso *Variations on 'America'* (1891–2) shows just how skilled an organist Ives was while still in his late teens.

Although he had many teachers for performance, his father taught him harmony and counterpoint and guided his first compositions. Several of these take existing works as models, following the traditional practice of learning through imitation, such as the *Polonaise* for two cornets and piano (c1887–9), modelled on the sextet from Donizetti's *Lucia di Lammermoor*. At the same time, Ives's father had an open mind about musical theory and practice and encouraged his son's experimentation. Bitonal harmonizations of *London Bridge*, polytonal canons and fugues, and experiments with

whole-tone pieces, triads in parallel motion and chromatic lines moving in contrary motion to create expanding or contracting wedges, all dating from the early 1890s, show Ives's interest in testing the rules of traditional music by trying out alternative systems. At the time, however, Ives apparently conceived of this merely as playing with music theory, a private activity shared primarily with his father, rather than regarding these new systems as a serious basis for composing concert music. On still another musical plane, it was his father whom he credited with teaching him the songs of Stephen Foster, whose tunes he would later borrow and whose simple diatonic lyricism informs many of Ives's own melodies.

Ives moved to New Haven in early 1893 to attend Hopkins Grammar School and prepare for entrance examinations at Yale (fig.1). He was the organist at St Thomas's Episcopal Church for a year, and then moved to Center Church on the Green in September 1894, the same month he matriculated at Yale. Just six weeks later, on 4 November, his father died suddenly of a stroke. Leaving home, starting university, and especially the death of his principal teacher and supporter marked a sharp break from the past and the end of his youth.

Ives, Charles

3. Apprenticeship, 1894–1902.

Ives began his time at Yale as a virtuoso organist and an experienced composer of popular and church music but with limited exposure to classical music. He continued to compose vernacular works including songs, marches, and glee club and fraternity-show numbers. Several works were published, including an 1896 campaign song for William McKinley. His church music also grew in maturity, as he gradually adopted the elevated choral style of his teacher at Yale, Horatio Parker, in works such as *All-Forgiving, look on me*. The choirmaster at Center Church, John Cornelius Griggs, became a supportive colleague and lifelong friend. But it was in classical music that he learnt the most. For the first time, he had regular access to chamber and orchestral concerts. He apparently audited Parker's courses in harmony and music history during his first two years, and then studied counterpoint, strict composition and instrumentation, sometimes as the only registered student. Comparison of his earlier exercises with the works of his last term shows how much he learnt from Parker. Like Ives's father, Parker encouraged mastering styles and genres through imitation. Ives assimilated the German lied by resetting texts from well-known examples, typically incorporating some aspects of the model's structure or contour while seeking a different figuration and mood. He later recalled that his *Feldeinsamkeit* (c1897–8) earned the praise of Parker's teacher George Chadwick for taking 'a more difficult and almost opposite approach' that was 'in its way almost as good as Brahms' and 'as good a song as [Parker] could write'.

Ives began his Symphony no.1 under Parker, and later recalled that the second and fourth movements were accepted as his final thesis. In this work there are strong echoes of the symphonic masterpieces he used as models, especially Schubert's 'Unfinished' in the first movement, Dvořák's 'New World' in the slow movement and the work as a whole, Beethoven's Ninth Symphony in the scherzo, and Tchaikovsky's 'Pathétique' in the

finale, yet even the most direct references are reworked in fresh and interesting ways. Ives owed to Parker his new-found skills in counterpoint, thematic development, orchestration and composing large forms, along with the concept, foreign to the utilitarian music of Danbury, of music as an experience to be savoured for its own sake. The simultaneous citation of the familiar and assertion of an individual personality is a distinguishing Ives trait, evident even in the music he wrote in a late-Romantic style. This work also set the pattern for Ives's later symphonies and for many of his sonatas in linking movements through the cyclic repetition of themes.

Although he studied music diligently, Ives may not have intended to make music his career. He took the usual round of Greek, Latin, German, French, mathematics, history and political science, and remembered especially fondly his English and American literature courses with William Lyon Phelps, who helped to form Ives's taste in poetry. A Yale education was seen as a preparation for success in business, and much of the social life on the all-male campus was organized around groups through which one could develop friendships and potentially useful connections. Ives was no great scholar outside his music courses, but he was well-regarded and socially successful, chosen as a member of the Delta Kappa Epsilon fraternity and of Wolf's Head, one of the most prestigious of Yale's secret senior societies. Songs of both groups figure in later works recalling his college days, such as in *Calcium Light Night* and the middle movement of the Trio for Violin, Violoncello and Piano. One of his best friends was David Twichell, who invited him to Keene Valley in the Adirondacks for a family vacation in August 1896; there Ives met his future wife, David's sister Harmony (1876–1969). After graduation in 1898, he moved to New York, living for the next decade in a series of apartments, all wryly dubbed Poverty Flat, with other bachelors with Yale connections. Through his father's cousin, Ives gained a position in the actuarial department of the Mutual Insurance Company. In early 1899 he moved to Charles H. Raymond and Co., agents for Mutual, where he worked with sales agents and developed ways to present the idea of insurance. There he met Julian Myrick (1880–1969), who would later become his partner.

While working in insurance, Ives did not give up all hope of a musical career. He continued to serve as an organist, first in Bloomfield, New Jersey (where for the first time he was also choirmaster), and then from 1900 at the Central Presbyterian Church in New York, a prestigious post. After university, he ceased writing vernacular music and sought to consolidate his training as a composer of art music in the Parker mould. He continued to write lieder to established texts and composed a seven-movement cantata, *The Celestial Country*, modelled on Parker's oratorio *Hora novissima*, whose 1893 première had established Parker's reputation.

He also pursued some new avenues. Parker had focussed on German music; now Ives wrote French chansons, modelled on those of composers such as Massenet. He reworked some of the German songs with new English texts; it would become characteristic of him to reshape older pieces into newer ones, often in different media. In similar fashion, he developed what may have been church service music from his Yale years into a string quartet that used paraphrased hymn tunes as themes. The opening theme of the First Symphony had used elements of two hymns, but the String

Quartet no.1 established the pattern for many later works in that it grew completely out of music he had written for the church, and derived virtually every one of its themes from a hymn tune source. Unaltered hymn tunes were too predictable and repetitive in rhythm, melody and harmony to serve well as themes for movements in classical forms, so Ives ingeniously reshaped them into irregular, Brahmsian themes ripe for development, while preserving a hymn-like, American character. Ex.1 shows the derivation of the opening theme of the third movement from its source, the hymn-tune *Nettleton* ('Come, Thou Fount of Ev'ry Blessing'). With this work Ives began to integrate the different traditions he had learnt, bringing the spirit and sound of Protestant hymnody into the realm of art music.

Most remarkably, Ives's experimentation took on a new seriousness. Armed with techniques learnt from Parker and perhaps inspired by the compositional systems of the Middle Ages and the Renaissance that Parker described in his music history lectures, such as organum, counterpoint and rhythmic stratification (Scott, 1994), Ives began to produce, not mere sketches or improvised 'stunts', but finished pieces that explore new procedures. Most significant is a series of sacred choral works, mainly psalm-settings, that Ives may have tried out with singers where he was organist, although no performances are registered. *Psalm 67* uses transformations of a five-note chord (arranged to create the impression of bitonality) to harmonize a simple melody in a style resembling Anglican chant. *Psalm 150* features parallel triads that are dissonant against sustained triads. *Psalm 25* deploys angular, dissonant two-voice canons over pedal points and includes a whole-tone passage that expands from a unison to a whole-tone cluster spanning almost three octaves. In *Psalm 24* the outer voices move in contrary motion, expanding from a unison in each successive phrase and moving first by semitones (often displaced by octaves), then by whole tones, 3rds, 4ths, 4ths and tritones, and finally 5ths; after the golden section of the work, there is a contraction, phrase by phrase, using the same intervals in reverse order, to make an approximate palindrome.

Each piece finds new ways to establish a tonal centre, create harmonic motion and resolution, and regulate counterpoint. The technique chosen often responds to the text; for example, the central image of *Processional: Let There Be Light* is perfectly conveyed by the procession of chords formed of 2nds, 3rds, 4ths and 5ths, through increasingly dissonant chords of 6ths and 7ths, to pure octaves. In these systematic experiments in compositional method, Ives established what was to become a 20th-century tradition of experimental composition, one that included the work of Cowell, Charles Seeger, Ruth Crawford Seeger, Cage, and many later composers. These experimental works remained distinct from his concert music, which continued to use the language of European Romanticism.

The climax of Ives's apprenticeship was the première of *The Celestial Country* at the Central Presbyterian Church in April 1902, his most ambitious piece to be performed up to that point. It received pleasant, if mild, reviews from the *New York Times* and *Musical Courier*. Yet soon after, Ives resigned as organist, the last professional position in music he was to hold. He left behind much of his church music, later discarded by the church, so that what survives of his anthems, songs and organ music

for services is only part of what may have been a much larger body of work. Ives apparently concluded that he did not want or would not achieve a career like that of Parker, who survived as a composer by serving as a church organist and teaching at Yale. He would later ironically describe this as the time he 'resigned as a nice organist and gave up music'.

Ives, Charles

4. Innovation and synthesis, 1902–8.

Leaving his church position freed evenings and weekends for composition, and forgoing regular performance allowed Ives freedom to explore without having to please anyone but himself. No longer a Parker apprentice, nor a composer of popular or sacred music, Ives entered a period of innovation and synthesis.

He continued experimenting, especially now in chamber music, whose greater range of sonorities allowed him to extend traditional counterpoint and increase the independence between the parts to create an effect of separate layers. Works such as the *Fugue in Four Keys on 'The Shining Shore'*, *From the Steeples and the Mountains, Largo risoluto* nos.1 and 2, and *The Unanswered Question* display polytonal and atonal canons, multiple layers distinguished by rhythm, pitch content and sonority, and the combination of atonal and tonal planes, often with a programme to explain the unusual musical procedures. For example, *Scherzo: All the Way Around and Back* gradually builds up six distinct layers, subdividing each bar into 1, 2, 3, 5, 7, and 11 equal divisions respectively, over which a bugle plays fanfares in common time (ex.2); the piece is palindromic, swelling to a climax and returning in an exact retrograde, a musical analogue to 'a foul ball [in baseball] – and the base runner on 3rd has to go all the way back to 1st'.

Ives now sought increasingly to integrate vernacular and church style into his concert music. In his Second Symphony, the major work of this period, he introduced for the first time both hymn tunes and American popular songs into a piece in the classical tradition. The framework is still European, a cyclic five-movement symphony in late Romantic style with direct borrowings from Bach, Brahms, Wagner, Dvořák and Tchaikovsky; the final two movements are modelled on the finale of Brahms's First Symphony. But the themes are all paraphrased from American melodies, including hymns, fiddle tunes and Stephen Foster songs, reshaped to suit sonata and ternary forms. Like many symphonies which employ national material, the work celebrates the nation's music while conforming to an international style. In other pieces, such as the improvisations and sketches that became the *Ragtime Dances*, Ives began to evolve a more modern and individual idiom that drew on American melodic and rhythmic characteristics, including ragtime, the currently popular style. The many guises the *Ragtime Dances* would eventually assume – from a set of dances for theatre orchestra to movements in his Piano Sonata no.1, *Set for Theatre Orchestra* and *Orchestral Set no.2*, and passages in his second Quarter-Tone Piece for two pianos – illustrate again his penchant for reworking his own music into new forms.

Having abandoned music as a career, Ives cast his lot with insurance. However, in 1905 the New York state legislature launched an investigation

of scandals in the insurance business, with Mutual and the Raymond agency as particular targets. Although Ives was not implicated, higher executives were, and the agency was ultimately dissolved. The investigation coincided with two bouts of illness or exhaustion for Ives, in the summer of 1905 and late 1906, possibly the first signs of the diabetes that would later afflict him. While recuperating over Christmas 1906 at Old Point Comfort, Virginia, he finalized plans with Myrick to launch an agency affiliated with Washington Life, which had begun as a Mutual subsidiary; it appears that Mutual's management helped with the arrangements. The ideals Ives stated and pursued as a businessman were, ironically, those articulated at the hearings by the president of Mutual: that life insurance was not a scheme for profit, but a way for each policyholder to provide for his family while 'participating in a great movement for the benefit of humanity at large' through mutual assistance. Ives & Co. opened on 1 January 1907, with Myrick as Ives's assistant.

The year 1905 also began changes in Ives's personal life, as he renewed his acquaintance with Harmony Twichell, now a registered nurse. Their courtship was slow, hindered by long absences, infrequent times together, and Ives's shyness. She wrote poems, some of which he set to music in a tonal, Romantic style meant to please her and her family, and they planned an opera that never materialized. Their friendship grew in intensity until they professed their love for each other on 22 October 1907. They were married on 9 June 1908 by Harmony's father, the Rev. Joseph Twichell, at his Congregational church in Hartford, and settled in New York.

[Ives, Charles](#)

5. Maturity, 1908–18.

Harmony played a crucial role in Ives's development. As he noted in his *Memos*, her unwavering faith in him gave him confidence to be himself, although she did not claim to understand all of his music. Moreover, she helped him to find the purpose and the subject matter for his mature work. She wrote to him in early 1908 stating that

inspiration ought to come fullest at one's happiest moments – I think it would be so satisfying to crystallize one of those moments at the time in some beautiful expression – but I don't believe it's often done – I think inspiration – in art – seems to be almost a consolation in hours of sadness or loneliness & that most happy moments are put into expression after they have been memories & made doubly precious because they are gone.

This upholds the Romantic idea of music as an embodiment of individual emotional experience, but adds two elements that were to become characteristic of Ives's mature music: capturing specific moments that are individual and irreplaceable, and doing so through memory. Her interest in Ives's father and family revived his own, and several pieces over the next decade recall the town band (*Decoration Day*, *The Fourth of July*, *Putnam's Camp*), the American Civil War (*The 'St Gaudens' in Boston Common*), camp meetings (Symphony no.3, Violin Sonata no.4, *The Rockstrewn Hills Join in the People's Outdoor Meeting*), and other memories Ives connected to his father. Harmony's interest in literature rekindled his, which had

apparently lain dormant since college, and he produced a series of works on Emerson, Browning, Hawthorne, Thoreau and others. Her sense of idealism about America echoed in him, stimulating a rush of pieces on American subjects. The socially committed Christianity of the Twichells reinforced that of the Ives family, as Ives took up subjects from Matthew Arnold's *West London* to the movement to abolish slavery (*Study no.9: the Anti-Abolitionist Riots in the 1830s and 40s*).

Ives's successes in insurance must also have bolstered his self-confidence. After Washington Life was sold in 1908, he took Myrick into full partnership in an agency with Mutual, launched on 1 January 1909. Within a few years, they were selling more insurance than any agency in the country, during a time of dramatic expansion in the industry. Their secret lay in recruiting a wide network of agents to sell policies for them and in preparing detailed guidelines for selling insurance, summarizing the best arguments to be made. Ives established the first classes for insurance agents at Mutual and helped to devise and promote 'estate planning', a method still used to calculate the amount of life insurance one should carry based on expected income and expenses. His pamphlet *The Amount to Carry* became a classic of its kind. He composed in the evenings, at weekends and on vacations, finding particular inspiration at a weekend cabin on Pine Mountain in Connecticut and during family vacations in the Adirondacks.

Ives continued to use American melodies as themes, but turned from the traditional ternary and sonata forms of the First Quartet and Second Symphony to a new pattern that may be called cumulative form. In the outer movements of the Symphony no.3, most movements of the four violin sonatas and the Piano Sonata no.1, and several other works from c1908–17, the borrowed hymn tune used as a theme appears complete only near the end, usually accompanied by a countermelody (often paraphrased from another hymn). This is preceded by development of both melodies, including a statement of the countermelody alone. The harmony may be dissonant, and the key is often ambiguous until the theme appears, but the music remains essentially tonal. Cumulative form drew on traditional sources, including thematic development and recapitulation; the 19th-century conventions of a large work culminating with a hymn-like theme and of combining themes in counterpoint; and the church organist practice of preceding a hymn with an improvised prelude on motives from the hymn. Indeed, Ives commented that many of these movements developed from organ preludes he had played or improvised in church, all now lost. However, Ives's synthesis was new. The avoidance of large-scale repetitions, inherent in older forms, allowed him to use hymns essentially unaltered as themes, for the rhythmic and melodic plainness and lack of harmonic contrast that made them unsuitable for the opening theme of a sonata form were perfect for the end of a movement. The process of developing motives and gradually bringing them together in a hymn paralleled, on a purely musical level, the experience Ives remembered of hymn-singing at the camp-meetings of his youth, as individuals joined in a common expression of feeling.

In other works, Ives sought to capture American life, especially American experiences with music, in a more directly programmatic way. *The*

Housatonic at Stockbridge (ex.3) evokes a walk by the river Ives and his wife shared soon after their marriage. The main melody (given to second violas, horn and English horn), harmonized with simple tonal triads (in the lower strings and brass, notated enharmonically), suggests a hymn wafting from the church across the river, while repeating figures in distant tonal and rhythmic regions (upper strings), subtly changing over time, convey a sense of the mists and rippling water. Like this work, most of Ives's music about life experiences is composed in layers, distinguished by timbre, register, rhythm, pitch content and dynamic level, to create a sense of three-dimensional space and multiple planes of activity; here the earlier experiments in layering bear rich fruit. *Central Park in the Dark* pictures the noises and music of the city against the background sounds of nature, rendered as a soft series of atonal chords in parallel motion. In *From Hanover Square North*, background ostinatos represent city noises in New York, over which commuters on a train platform gradually come together to sing a hymn for those lost in the sinking of the *Lusitania* that morning. When suggesting a memory of his youth, as in *Putnam's Camp*, *The Fourth of July* and *Washington's Birthday*, Ives often infused the background with a collage of tunes related by motif or genre to his main theme, evoking the way one memory will summon up others in a stream of consciousness. Songs such as *The Last Reader* and *The Things Our Fathers Loved* suggest a similar fount of memory through a patchwork of fragments from songs of the past.

These programmatic pieces and songs mix tonality with atonality, traditional with experimental procedures, direct quotation with paraphrases and original melodies. Having developed an impressive range of tools, Ives used them all in his mature works, choosing whatever was appropriate to fit the image, event or feeling he was attempting to convey. Ives wrote in 1925, 'why tonality as such should be thrown out for good, I can't see. Why it should be always present, I can't see. It depends, it seems to me, a good deal – as clothes depend on the thermometer – on what one is trying to do'. Ives's willingness to break rules, even his own, for expressive ends places him with the likes of Monteverdi, Mahler, Beethoven, Strauss and Berg as an essentially dramatic and rhetorical composer. Like them he often coordinated diverse styles within a single movement, using the contrasts to delineate sections and create form as well as for emotional effect. Though this eclecticism has been criticized by those who value systems, refinement, and homogeneity more than rhetorical power, many others have found the mix of elements in Ives's music an apt expression of the heterogeneity of modern, especially American, life.

In 1912 Ives and his wife bought farmland in West Redding, near Danbury, and built a house, soon settling into a pattern of spending May to November in West Redding and the rest of the year in New York. Unable to have children after Harmony miscarried in April 1909 and underwent an emergency hysterectomy, they found a partial outlet for their parental energies in Moss's six children, often hosting one or two of them for extended periods. They opened a cottage on their property to poor families from the city through the Fresh Air Fund; the second family to visit had a sickly infant daughter, whom they cared for and eventually adopted as Edith Osborne Ives (1914–56).

From time to time Ives sought out performances or at least readings of his music, and this encouraged him to have clean scores and parts copied by a series of professional copyists. Walter Damrosch conducted an informal reading of movements from the First Symphony in March 1910; attempts to interest him in the Second and Third had no result. Periodically, Ives invited professional musicians to his home to try out some of his music; the reactions he recorded in his *Memos* ranged from incomprehension to apoplectic criticism of its dissonance and complexity. The USA's entrance into World War I in April 1917 inspired him to write the song *In Flanders Fields* to a text by a Mutual medical examiner, and Myrick arranged for a performance at a meeting of insurance executives. Later the same month David Talmadge (violin teacher to Ives's nephew Moss White Ives) and Stuart Ross performed the Third Violin Sonata for an invited audience at Carnegie Chamber Music Hall.

Ives, Charles

6. Last works, 1918–1927.

The war pulled Ives away from composition into work for the Red Cross and Liberty Loan appeals. He even tried to enlist as an ambulance driver in 1918 but he was turned down for health reasons. At a meeting on 1 October 1918, he argued for Liberty bonds in small denominations to allow the public at large to participate; he won his point, but the same night suffered a heart attack, which kept him from work for a year.

Mindful of his mortality, Ives set about finishing and making available the music he had been composing. Two months in early 1919 were spent at Asheville, North Carolina, where he worked on his second piano sonata, subtitled *Concord, Mass., 1840–60*, with musical impressions of Emerson, Hawthorne, the Alcotts, and Thoreau, and an accompanying book of *Essays before a Sonata*, his most detailed statement of his aesthetics. The importance of transcendentalism in the sonata and essays has obscured other influences, including that of Beethoven, Debussy, Liszt and perhaps Skryabin on the sonata (and on much of Ives's other music) and that of Romantic aesthetics and liberal Christianity on his philosophy. The famous distinction Ives makes in the essays between 'substance' (more-or-less, the spiritual content of a work) and 'manner' (the means of its expression) derives largely from a 1912 essay on Debussy by Ives's friend John C. Griggs. The sonata and the essays were privately printed in 1920–21 and sent free to musicians and critics whom he hoped to interest in his music. Most reviews were mocking, but a perceptive notice by Henry Bellamann praised the sonata's 'loftiness of purpose' and its 'elevating and greatly beautiful' moments. Bellamann became Ives's first advocate, lecturing and writing on his music, and Ives later set two of Bellamann's poems.

Between 1919 and 1921 Ives gathered most of his songs, including 20 new ones, 20 adapted to new texts, and 36 newly arranged from works for chorus or instruments, into a book of *114 Songs*, privately printed in 1922. Many of the songs use words by Ives or by Harmony, while others set a wide range of texts, from the great English and American poets Ives studied with Phelps at Yale to hymns and poems he found in newspapers, or other such sources. The volume encompasses the diversity of Ives's output, from the vast clusters that open *Majority* and the quartal chords and

whole-tone melody of *The Cage* to his German lieder and parlour songs from the 1890s. The late songs include a new style for Ives: more restrained, simpler, and with less overt quotation, although still often dissonant and full of contrasts used to delineate phrases and highlight the text. This is illustrated in the song *Resolution* (ex.4), which features four distinctive figurations in its brief eight measures, each using a different collection of pitches and each subtly linked to images in the text: in *a*, a pentatonic melody with dotted rhythms recalls American folksong style, associated with rugged strength and the outdoors, while the wide spacing in voice and piano evokes the spaciousness of 'distant skies'; in *b*, tonal harmonies and secondary dominants suggest hymnody, representing faith; *c* mimics the style Ives associated with sentimental parlour songs, with an undulating melody in dotted rhythm over harmonies tinged with chromaticism, while the reiterated chords and emphasis on G create a sense of marking place; *d* is again diatonic, suggesting Romantic song through a leap and descent; and *a* returns at the close, as 'journey' harks back to 'walking'.

Once again Ives distributed his publication to musicians and critics, hoping to attract some interest, with little initial success; Sousa found some songs 'most startling to a man educated by the harmonic methods of our forefathers', and the *Musical Courier* called Ives 'the American Satie, joker *par excellence*'. Nevertheless, several of the songs were given their premières in recitals in Danbury, New York and New Orleans, between 1922 and 1924. Ives also completed or revised many other works between 1919 and the early 1920s, including the First Piano Sonata, the second violin sonata, and most movements of *A Symphony: New England Holidays*, *Orchestral Set no.1: Three Places in New England*, *Orchestral Set no.2* and the Symphony no.4 (fig.2). Many of these multi-movement cycles brought together movements first conceived separately, sometimes at different times. The Second Violin Sonata was first performed in 1924 to respectful reviews, but the others had to wait.

In 1923 Ives met E. Robert Schmitz, pianist and head of the Franco-American Musical Society, later renamed Pro-Musica. Schmitz arranged performances of the *Three Quarter-Tone Pieces* for two pianos in 1925 and of the first two movements of the Fourth Symphony in 1927. The symphony was a summation of all Ives had done, drawing on more than a dozen earlier works and encompassing the range of his techniques from pure tonality to the most rhythmically complex textures any conductor had ever seen. It traces a mystical inner journey: the brief opening movement poses 'the searching questions of What? and Why? which the spirit of man asks of life' (in the words of Bellamann's programme note) by means of a choral setting of the hymn tune 'Watchman, Tell Us of the Night'; the second movement is a dream-like collage based on Hawthorne's tale *The Celestial Railroad*, a satire of the search for an easy way to heaven; the third movement, based on the first movement of the First Quartet, depicts religious 'formalism and ritualism' through a tonal fugue on hymn tunes; and after these two false answers to the questioning prelude the finale suggests the truer path through a meditation on *Bethany* ('Nearer, My God, to Thee') in cumulative form. Despite the work's novelty and complexity, it won encouraging reviews from Olin Downes of the *New York Times* and

Lawrence Gilman of the *Herald Tribune*, two of the leading critics of the day.

Ives stopped composing by early 1927; as Harmony later told John Kirkpatrick, 'he came downstairs one day with tears in his eyes and said he couldn't seem to compose any more – nothing went well – nothing sounded right'. Theories abound for his cessation, from the psychological effects of his double life in business and music to the physical illnesses he continued to endure. He may have exhausted himself from the push to complete the Fourth Symphony and other major works. He had started no new large compositions since an attempt at a third orchestral set in 1919, which remained unfinished. The early 1920s had produced a few songs and his choral masterpiece *Psalm 90*, essentially rewritten from scratch around 1923. Around the same time he returned to his ambitious *Universe Symphony* (begun c1915), the capstone of his exploration of systematic methods of composition, which features over 20 wholly independent musical strands, each moving in its own subdivision of a metric unit eight seconds in length. This too would remain unfinished, finally appearing in three separate realizations in the 1990s. His last new work was the song *Sunrise* in August 1926. He had still received very few performances, and no professional publications since the 1890s. Ives may have followed the same steps as most composers – first conceiving a piece, then drafting, revising, completing and copying it, and seeing it through to performance and publication – but instead of doing this for each piece in a short span of time, he did it for dozens of pieces at once, stretched over decades.

[Ives, Charles](#)

7. Revisions and premières, 1927–54.

After years of health problems, eventually diagnosed as diabetes, Ives retired from business on 1 January 1930. His music was written, but its public career was just beginning. After Bellamann and Schmitz, Ives found an ever-increasing series of advocates who promoted and performed his music. Most important was Cowell, whose quarterly *New Music* printed several Ives works, starting with the second movement of the Fourth Symphony in 1929, and who wrote a series of appreciations of Ives's music emphasizing its pioneering use of innovative techniques. Cowell's New Music Society sponsored the première of the First Violin Sonata in San Francisco in 1928. Also at Cowell's urging, Nicolas Slonimsky approached Ives for a piece for his Boston Chamber Orchestra, and Ives responded by rescoring *Three Places in New England*, which Slonimsky performed in New York, Boston, Havana and Paris in 1931 to generally favourable reviews. In September, Slonimsky conducted the première of *Washington's Birthday* at a New Music Society concert in San Francisco, and the following year he conducted *The Fourth of July* in Paris, Berlin and Budapest. In May 1932 Hubert Linscott and Aaron Copland presented seven of Ives's songs at the first Yaddo Festival of Contemporary American Music, and Ives began to be seen as a forerunner of the current generation of American modernists. These seven songs, *The Fourth of July*, and the *Set for Theatre Orchestra* were published in 1932, followed by more songs in 1933 and 1935, *Three Places in New England* in 1935, *Washington's Birthday* in 1936 and *Psalm 67* in 1939. Numerous songs were given premières in recitals during the 1930s in New York, San Francisco, Boston,

Dresden, Vienna, Paris (with Messiaen at the piano) and elsewhere. The January 1939 New York première of the *Concord Sonata* by John Kirkpatrick (who had played the world première the previous November in Cos Cob, Connecticut) drew high praise from Gilman in the *Herald Tribune*, who called it 'exceptionally great music ... the greatest music composed by an American, and the most deeply and essentially American in impulse and implication'. More premières followed, including the Fourth Violin Sonata in 1940, the Symphony no.3 and the String Quartet no.2 in 1946, and the Piano Sonata no.1 in 1949, each more than a quarter of a century after its completion. Ives was elected to the National Institute of Arts and Letters in 1945, and the Symphony no.3 won the Pulitzer Prize in 1947. Bernstein conducted the New York PO in the première of the Symphony no.2 in 1951, over 40 years after its completion, and the Symphony no.1 was finally performed for the first time in 1953, half a century after it was finished.

Throughout this time, Ives continued to work on his music, copying the full score for *Thanksgiving* during a year in Europe with Harmony in 1932–3, recording his own piano performances and improvisations in London and New York, adding a new ending to the Second Symphony, and pulling old pieces out of his piles of manuscripts. He had photocopies made of his manuscripts and sent them to those who expressed interest in a work. In the early 1930s he dictated reminiscences about his life and his music, intended only to provide information for those writing about him, but published four decades later as *Memos*. Although in *Essays before a Sonata* he had seemed a follower of Beethoven, in *Memos* he emphasized his experimental works and his invention of novel techniques, presenting himself as the pioneer Cowell and others seemed to want him to be, and credited so much influence to his father that he obscured for decades his deep debts to Parker, to the 19th-century Romantic tradition, and to older contemporaries such as Debussy. He worked for years on a revised edition of the *Concord Sonata*, finally published in 1947. His health gradually weakened, and in May 1954 he died of a stroke while recovering from an operation.

Music continued to appear after his death, and his reputation continued to grow. Harmony Ives gave his manuscripts to the Library of the Yale School of Music in 1955, and John Kirkpatrick published a meticulous catalogue in 1960. The first biography, by Henry and Sidney Cowell in 1955, was followed by a steady stream of theses and articles. The Fourth Symphony was finally played in its entirety in 1965. *Memos* and other writings appeared in 1972. The Charles Ives Society, which became active in 1973, has sponsored a series of critical editions of individual works with Kirkpatrick and James B. Sinclair the most prominent editors. The 1974 centennial brought the first festivals devoted to Ives's music, and there have been several since. Extensive interviews with those who knew Ives were published in an abridged form (Perlis, C1974), an extremely valuable resource. A second biography appeared during the centennial (Wooldridge, C1974), and a third (Rossiter, C1975) began a current of reconsidering the legends that had grown up around the composer. The first survey of his music (Hitchcock, D1977) provided a succinct overview of his entire output. Since the mid-1980s, studies have appeared that clarify our picture of Ives's life, family, career, and psychology (Burkholder, C1985; Moore,

C1985; Feder, C1992; Swafford, C1996); demonstrate his strong links to European composers (Gibbens, C1985; Hertz, D1993; Block and Burkholder, B1996); reveal his use of interval cycles, pitch class sets, and other organizing principles (Winters, D1986; Baron, D1987; Lambert, D1987 and D1997; Roller, E1995); trace the American experimental tradition that began with Ives (Nicholls, D1990); treat major works in depth (Meyer, E1991; Rathert, D1991; Block, E1996); describe Ives's use of stylistic heterogeneity as a formal device (Starr, D1992); and examine his methods of musical borrowing (Burkholder, D1995). He is now regarded more highly for the beauty and power of his music than for his pioneering innovations, which is as it should be, and the meaning and structure of his music are more deeply and widely understood than ever before. His appeal to audiences worldwide continues to broaden, and his place among the leading composers of his time is secure.

See Borrowing, §12

Ives, Charles

WORKS

A chronological listing of Ives's works is neither possible nor appropriate as dates for many works are uncertain, and Ives tended to work on a number of pieces simultaneously, often taking years from first sketch to final revision.

This work-list follows the ordering, numbering and title style in James B. Sinclair, *A Descriptive Catalogue of the Music of Charles Ives* (New Haven, 1999), grouping works by genre and numerically or alphabetically within each genre. Most incomplete works, exercises, arrangements of works by others, unidentified fragments, and lost or projected works are omitted. Dates are of manuscripts when extant; these are based on Gayle Sherwood's datings of the manuscripts by paper type and handwriting, and they may not reflect the entire period of composition if the earliest sketches or final revisions do not survive. Dates in square brackets are from Ives's own hand but represent pieces or stages of composition for which no manuscripts are extant. Printed works are published in New York unless otherwise stated (reprints are not listed). For full details of publication and first performances, see Sinclair.

MSS in *US-NH*, photocopies in *US-NYp*, *Wcg*

Ives [Ive, Ivy], Simon

(bap. Ware, Herts., 20 July 1600; *d* London, 1 July 1662). English string player, singer and composer. He was probably the 'Simon a musician boy' who was taught by Innocent Lanier in the Cecil household (Hatfield House) in 1609. He may also have been associated with Sir Henry Fanshawe's household at Ware Park, where John Ward worked between about 1607 and 1616; there are several connections between the music of the two composers. He had relatives in Earl's Colne, Essex, was living there in 1625, and may be the 'Simon Ive' who became a supernumerary Groom of the Chamber at court in April 1630. Shirley's masque *The Triumph of Peace*, to which he contributed music, was given by the Inns of Court (1634), and some of the dedications of his lyra viol pieces suggest he moved in London's legal circles. He also wrote songs for Henrietta Maria's visit to Thomas Bushell's estate at Enstone on 23 August 1636; their texts were published that year in Oxford. About that time he contributed a story to Sir Nicholas Le Strange's *Merry Passages and Jests*; another story in the collection concerns his friendship with the poet Francis Quarles.

He became a London wait for 'song and music' in 1637 and was still serving in 1645. According to Anthony Wood, he was 'a singing man in the Cath[edral] Ch[urch] of St Paul in London and a teacher of musick before the Rebellion broke out, after it did break out [he] left his singing mans place, and stuck to his instruction in musick w[hi]ch kept him in a comfortable condition'. He may have taught Anne Cromwell, the protector's first cousin, whose virginal book contains at least 12 pieces by him, and he is listed as one of Susanna Perwich's teachers in John Batchiler's *The Virgin's Pattern* (London, 1661). In 1661 he became a minor prebendary of St Paul's. In his will he left his colleagues a chest of nine viols (five trebles, three tenors and a bass) by Thomas Aldred, a bass viol made by his servant Muskett, and a 'set of Fancies and Innomines of my owne Composition of foure five and six partes'.

Ive's vocal music mostly consists of convivial catches or simple dance songs, though the dialogue *Shepherd, well met, I prithee tell* shows that he was capable of deeper things. He also wrote fine three-part elegies on the death of William Lawes and the barrister and writer William Austin (*d* 1634). Anthony Wood wrote that he was 'excellent at the Lyra-Viol and improved it by excellent inventions'; about 90 pieces for one, two and three lyra viols survive, though some of the solos and duets probably have missing parts, and some of the constituent parts of the duets and trios actually circulated as solos. His bass viol duets are in the tuneful, dance-like idiom established by Ward. The 25 four-part dances, which appear as a set in the British Library, may have been put together for musicians at the Blackfriars Theatre. They include arrangements of pieces by Ward, 'J.L.' (? Innocent Lanier) and 'H.B.' (? Hieronymus or Jerome Bassano), as well as a version of the famous coranto that Bulstrode Whitelocke composed with Ives's help; Whitelocke wrote in his memoirs that it was first played by the Blackfriars musicians, and that they struck it up every time he came to the theatre. Ives has been overshadowed by Lawes and Jenkins as a consort composer, though his dances and fantasias are consistently graceful, tuneful and attractive.

His son, also called Simon (bap. Earle's Colne, Essex, 17 June 1625; *d* ? before 1 July 1662), was a viol player and composer. He was at school in Islington in the 1630s, and took the BA degree at Trinity College, Cambridge, in 1648. He was not a beneficiary of his father's will, so he probably died before him. Three lyra viol pieces by him are known (*Musick's Recreation: on the Lyra Viol*, RISM 1652⁷; *GB-Mp*).

WORKS

vocal

Almighty and everlasting God (anthem), music lost, text in J. Clifford: *The Divine Services and Anthems* (London, 1663)

Lift up your hearts, canon, 3vv, 1652¹⁰

Sad clouds of grief, elegy for W. Austin, 3vv, *GB-Och*

Lament and mourn, elegy for W. Lawes, 3vv, 1648⁴

Shepherd, well met, I prithee tell, dialogue, 2vv, *F-Pn*, ed. in MB, xxxiii (1971)

5 songs, 1659⁵, *Select Ayres and Dialogues* (London, 1669), *GB-Eu*, *Lbl*, *US-NYp*, 2 ed. in MB, xxxiii (1971)

7 catches, 3–6vv, 1652¹⁰, 1667⁶, 1673⁴, 1685⁴

Songs for The Triumph of Peace (masque, J. Shirley), 1634, lost
Songs for entertainment at Enstone (1636), lost

instrumental

c90 pieces, 1, 2, 3 lra viols, 1651⁶, 1652⁷, 1661⁴, 1669⁶, 1682⁹, incl. arrs. of pieces by J. Ward and B. Whitelocke, 5 ed. A.J. Sabol, *Four Hundred Songs and Dances from the Stuart Masque* (Providence, RI, 1978, enlarged 2/1982)

10 airs, 2 b viols, *GB-Lbl, US-NH*, 9 ed. G. Sandford (Albany, CA, 1991, 2/1994)

3 airs, a 2, *GB-Lbl*, 1 ed. M. Lefkowitz, *Trois masques à la cour de Charles 1er d'Angleterre* (Paris, 1970)

5 airs, a 3, *Lbl, Ob, Och*, 2 ed. in Lefkowitz

Pavan, a 4, *Lcm* (frag.)

25 dances, a 4, *D-Kl, EIRE-Dm, GB-Lbl, Lcm, Ob, Och, US-NYp*, incl. arrs. of pieces by J. Ward, ? I. Lanier, ? J. Bassano, B. Whitelocke, 9 ed. in Lefkowitz, 3 ed. in Sabol

4 fantasias, a 4, *EIRE-Dm, GB-Lbl, Ob, Och, US-NYp*, ed. S. Beck (New York, 1947)

In Nomine, a 5, *EIRE-Dm, GB-Lbl, Ob, Och*, also attrib. W. Cranford

3 fantasias, a 6, *EIRE-Dm, GB-Ob*, 1 ed. G. Dodd (London, 1969)

12 or more pieces, arr. kbd, in A. Cromwell's virginal book (MS, 1638, Museum of London; ed. H. Ferguson, London 1974)

4 pieces, kbd, *F-Pn, GB-Lbl*, arrs. by ? B. Cosyn of consort pieces or songs by Ives, ed. O. Memed, *Seventeenth-Century English Keyboard Music: Benjamin Cosyn* (New York, 1993)

2 pieces, arr. cittern, 1666⁴

PETER HOLMAN

Ivey, Jean Eichelberger

(b Washington, DC, 3 July 1923). American composer and pianist. She studied at Trinity College (BA 1944), the Peabody Conservatory (MM in piano, 1946), the Eastman School (MM in composition, 1956) and the University of Toronto (DMus in composition, 1972). In 1967 she founded the electronic music studio at Peabody, and from 1982 until her retirement in 1997 she coordinated its composition department. Ivey summarized her compositional ideals at the 30th anniversary of computer music at Peabody: 'I consider all the musical resources of the past and present as being at the composer's disposal, but always in the service of the effective communication of humanistic ideas and intuitive emotion'. Her early music was tonal and neo-classical, drawing particularly on the styles of Bartók and Ravel; in the 1960s she began to incorporate serial and electronic elements, which gave her music greater fluidity. She has been especially fond of writing for the voice in combination with orchestra, ensemble, piano or tape. Some of her works, including the monodrama *Testament of Eve* (1976), are to her own texts; in general she has preferred poems with a philosophical content, as in *Night Voyage* (1975), after Matthew Arnold's *Self-Dependence*. As a pianist she has toured Europe, Mexico and the USA. She was a director of the League of Composers of the ISCM (1972–5, 1979). Her awards include an Artists' Fellowship from the New York Foundation for the Arts (1992) and grants from the NEA to compose *Sea-Change* (1979) and the Cello Concerto (1983–5). She has written many articles on music and is herself the main subject of the WRC-TV documentary *A Woman is ... a Composer*.

SAM DI BONAVENTURA/GEOFFREY WRIGHT

Ivo [Yvo] Barry

(fl 1525–50). French singer and composer, active in Italy. Some sources (including RISM) have confused him with Ivo de Vento. He was one of a group of singers recruited by Jean Conseil for Clement VII's papal court in 1528, and he remained in papal service until at least 1550. During that time he may also have had some connection with the French national church of S Luigi dei Francesi. In 1540 or 1541 he visited France, and on 22 April 1545 he was granted right of succession to some French benefices. Ivo was one of six papal singers chosen to go to the Council of Trent, and during the years 1546–9 he travelled between Trent, Bologna and Rome. Two manuscripts in Perugia (*I-PEc* 431, 322) contain, respectively, a canon and a set of *Regole del contraponto* ascribed to the 'ecc.mo Ivo'. Whether these rules are by Ivo Barry or Ivo de Vento is unclear; whoever wrote them knew only eight modes and appears not to have read Zarlino. Five motets (in RISM 1539⁷, 1541⁴, 1549⁹) and eight madrigals (c1538²⁰, 1539²⁴, 1541¹⁵, 1542¹⁷) have survived. They are in the style of the Roman school associated with Arcadelt, the aging Costanzo Festa and Morales. One of Ivo's madrigals, *Pace non trovo* (in 1539²⁴), was exceptionally popular; it was reprinted several times, quoted and paraphrased by Lupacchino and Gero, and made the subject of a remarkable parody composition, Palestrina's *Da fuoco così bel*.

Ivogün, Maria [Kempner, Ilse]

(*b* Budapest, 18 Nov 1891; *d* Beatenberg, Switzerland, 2 Oct 1987). Hungarian soprano. She was the daughter of the singer Ida von Günther, from whom she derived her own stage name. Heard by Bruno Walter at an unsuccessful audition for the Vienna Hofoper, she was instantly engaged for Munich, where she appeared in 1913, first as Mimì and then as the Queen of Night. She remained at Munich until 1925, singing such roles as Konstanze, Zerbinetta (in which Strauss described her as 'simply unique and without rival'), Zerlina, Marzelline, Norina, Gilda, Oscar (*Un ballo in maschera*) and Nannetta, often performing opposite her first husband, the tenor Karl Erb, with whom she also recorded duets at that period. In 1917 she sang the part of Ighino at the première of Pfitzner's *Palestrina* (with Erb in the title role), and two years later she created the title part in the same composer's *Das Christelflein*. In 1924 she created a sensation when she sang Zerbinetta at Covent Garden under Walter; a memento of the occasion exists in her exhilarating account of Zerbinetta's aria. The same season she also performed Gilda, and returned for Konstanze in 1927. She made her début at the Salzburg Festival as Zerlina in 1925, the year she moved to Berlin, where she appeared at both the Städtische Oper and the Staatsoper. There she added to her repertory heavier roles such as Manon, Mignon and Tatyana. She never sang at the Metropolitan but appeared as Rosina in Chicago (1921–2). Ivogün's operatic career faded somewhat prematurely in the early 1930s but she continued to give frequent recitals with the pianist Michael Raucheisen, whom she married in 1933. All who saw and heard her remarked on her personal charm, light and airy to match her vocal qualities. Her numerous recordings bear out the evidence of her contemporaries. After retirement she taught in Berlin, where her pupils included Elisabeth Schwarzkopf and Rita Streich.

Iwaki, Hiroyuki

(*b* Tokyo, 6 Sept 1932). Japanese conductor. He studied percussion at the Tokyo National University of Fine Arts and Music while studying conducting with Akeo Watanabe and Hideo Saito. He became an assistant conductor at the NHK SO in 1954, principal conductor in 1963 and subsequently conductor for life. He led the NHK SO on several world tours between 1960 and 1983, and conducted the Bamberg SO on a Japanese tour in 1968. He served as music director of the Fujiwara Opera Company, 1965–7, and has conducted many other orchestras, including the Tokyo Metropolitan SO, the Japan PO, the Residentie-Orkest in The Hague, the Berlin PO and the Vienna PO. In 1988 he organized the Orchestra Ensemble Kanazawa and became its director. Iwaki is a renowned interpreter of contemporary music and has often performed works by Japanese composers abroad. He has given many premières, including those of several orchestral works by Takemitsu. He has also recorded frequently, and won a *grand prix du disque* in 1976 for his recording of orchestral works by Messiaen.

MASAKATA KANAZAWA

Izarra, Adina

(*b* Caracas, 27 Aug 1959). Venezuelan composer. She studied in Caracas with Alfredo del Mónaco, then at the University of York (doctorate, 1988), where her teachers included Hoyland (composition) and Orton (electro-acoustic music). She was appointed a lecturer in music at the Simón Bolívar University in Caracas.

Izarra is one of the emerging Latin American composers of the post-1950 generation, and her work has earned international recognition in festivals worldwide. Her early works show the influence of post-war European experimentalism, but since 1982 she has used the rhythmical and instrumental resources of traditional Venezuelan music with varying degrees of abstraction and manipulation. Her harmonic language is dissonant, with tonal resolutions on unisons, while her melodic material often imitates the calls of Venezuelan birds, notably in works for the flute, for which she employs a variety of extended techniques (e.g. *Pitangus sulphuratus*). After 1990 Izarra has experimented with minimalism, medieval techniques and Baroque forms, such as isorhythm, canon and the Spanish folía. She pays special attention to the guitar, composing prolifically for her husband, Rubén Riera. Izarra's approach stems from a playful exploration of contemporary compositional tools, but her style always manifests assured technique and refined expression.

CARMEN HELENA TÉLLEZ

Iznaola, Ricardo

(b Havana, 21 Feb 1949). American guitarist of Cuban birth. After the Cuban revolution his family moved to Colombia and then to Venezuela. He studied at the Escuela Superior de Música in Caracas with Manuel Perez Días, and subsequently with Regino Sainz de la Maza in Madrid and with Alirio Diaz at the summer school in Caracas. He won many international prizes, including first prize at the Francisco Tárrega Competition in 1968 and 1971. In 1969 he began his international career, touring Asia, Europe and North and South America, and the next year made the first of many recordings, concentrating particularly on Spanish and South American music. He gave his London début in 1976. In 1983 he was appointed professor of guitar at the University of Denver. He has published many articles, compositions and arrangements, and two books on the guitar, *Kitharologus: the Path to Virtuosity* (Heidelberg, 1993) and *On Practising* (Aurora, CO, 1992). Iznaola is a virtuoso recitalist of immense technical resources and powerful intellect, with a deep awareness of Hispanic culture.
