Iannaccone, Anthony (Joseph)

(*b* Brooklyn, NY, 14 Oct 1943). American composer. He studied composition with Ludmila Ulehla, Vittorio Giannini and David Diamond at the Manhattan School of Music (1961–8, MM) and with Samuel Adler at the Eastman School (1968–71, PhD); he also studied privately with Copland between 1959 and 1964. He taught briefly at the Manhattan School (1967–8) and in 1971 was appointed professor of composition at Eastern Michigan University, where he founded the school's electronic music studio; in 1973 he became director of the Collegium Musicum. He has received awards from the NEA, the Phi Mu Alpha Sinfonia Foundation, and other organizations.

After an early phase of nearly orthodox serialism from 1967 to 1975, his music diverged into what the composer described as 'small-audience' music – abstract and intense works such as *Mobiles* for brass and percussion – and 'large audience' music, wherein melody and cohesiveness are paramount and characterize works such as the *Divertimento* (1983) and much of his vocal and wind-ensemble writing. His craft reaches its zenith in his synthesis of the two styles in the *Two-Piano Inventions*, which won the SAT/C.F. Peters competition in 1990, and the Third Symphony; in both these works, organic growth inspires music of great strength and formal clarity, as opening bars generate the textural and thematic contours that forge contrasting sections of reflection and cross-rhythmic dynamism. In addition to the impact of Stravinsky, Bartók and Debussy, the poetry of Walt Whitman has proved a frequent source of inspiration, culminating in his Third Symphony with its effective imagery of Whitman's metaphors of night and rivers.

WORKS

(selective list)

Orch: Suite, 1962; Sym. no.1, 1965; Sym. no.2, 1966; Concertino, vn, orch, 1967; Lysistrata, concert ov., 1968; Variations, vn, orch, 1969; Interlude, wind band, 1970; Antiphonies, wind band, 1972; Scherzo, sym. band, 1976; Of Fire and Ice, sym. band, 1977; Images of Song and Dance: I Orpheus, wind band, 1979–82, 2 Terpsichore, wind band, 1981; After a Gentle Rain, sym. band, 1980; Plymouth Trilogy, wind band, 1981; Divertimento, 1983; Apparitions, wind band, 1986; Sym. no.3 'Night Rivers', 1990–92; Sea Drift, sym. band/wind band, 1993; Concertante, cl, orch, 1994; Crossings, 1996; West End Express, 1997

Iași

(Ger. Jassy).

Town in north-eastern Romania. Founded in 1387, it was the capital of the medieval province of Moldavia and is one of the most ancient musical centres in the country. In the 19th century it was ceded by the Turks to Russia; from 1854 it came under Austrian rule until independence in 1918. Traditional fiddle music was an important part of musical life from the 14th century. The Academia Vasiliană, opened in 1640, was a school for artistic and cultural education taught in Greek and Slavonic languages. The scholar and composer Dimitrie Cantemir studied at the Academia Domnească (open 1714–1821). An early documented art music performance was that of a *Te Deum* by Giuseppe Sarti in 1788. French and Italian opera was given by visiting troupes in the early 19th century; in 1838 Bellini's *Norma* was given in Romanian by conservatory students. The National Theatre in Copou, Iași, was inaugurated in 1846; the present Romanian Opera House was built in 1896. By 1851 there was a resident company that performed Italian opera, often with soloists from La Scala. The Societatea Lirică opera company was founded in 1878. The Conservatorul Filarmonic-Dramatic was established in 1836 and the Conservatorul de Muzică și Declamațiune in 1860, the same year in which the university was founded. A Romanian Philharmonic Society was organized in 1868; similar initiatives followed (1877, 1905, 1916, 1918), leading to the establishment of the George Enescu Symphonic Society in 1918, its conductors including Enescu, Antonin Ciolan (1883–1970) and Mircea Bârsan (1897–1977). In the late 19th century and the early 20th concerts were given by, among others, Liszt, B.H. Romberg, Auer, Henryk Wieniawski, Alexandre Artôt, Nedbal and Weingartner.

The Filarmonica de Stat Moldova orchestra, established in 1942, was the first state orchestra in Romania. Attempts were made to organize a Romanian music theatre company in 1916 and 1930; the Opera de Stat was founded in 1956 and has given premières of works by Doru Popovici, Mansi Barberis, Teodor Bratu, Vasile Spătărelu, Viorel Doboș and others. In the latter part of the 20th century concerts were given by Anatole Fistoulari, Rudolf Kerer, Václav Neumann, Carlo Zecchi, Roberto Benzi, K.H. Adler, Adolf Busch, Sviatoslav Richter, Dmitry Bashkirov, Aldo Ciccolini, D.B. Shafran and Igor Oistrakh. Under conductors including Achim Stoia, Ion Baciú (1931–95), Gheorghe Vintilă (*b* 1924), Corneliu Calistru (*b* 1941) and Gheorghe Costin (*b* 1955), the Filarmonica Moldova rose to international acclaim, touring in Greece, Italy, France, Spain, Poland, Sweden, Denmark, Norway, Bulgaria and elsewhere. The Gavriil Musicescu choir was founded in 1953; its conductors included George Pascu (1912–96) and Ion Pavalache (*b* 1927). The Voces string quartet was based in Iași for more than 25 years before moving to Bucharest in 1996. Other ensembles are the Concentum Musicum trio, the Musica Serena ensemble, the Musica Viva orchestra and the Cantores Amicitiae chamber choir. The journals *Arta* and *Byzantion* are published in Iași. The town is the site of the Festivalul Muzicii Românești (Romanian Music Festival) and the international Festum Musicae.

Ibach.

German firm of piano and organ makers. In 1794 Johannes Adolph Ibach (*b* Klausen bei Lüttringhausen, nr Barmen, 1766; *d* 1848) founded the firm in Beyenburg and built his first square piano. At about the same time he restored the organ of the monastery at Beyenburg.

In the *Westphälischen Anzeiger* of 14 October 1800 Ibach advertised 'all kinds of fortepianos, including grand pianos of the highest quality and in the finest taste, as well as large and small pipe-organs'. The firm grew and by 1816 he had a workshop in the Alleestrasse, Unterbarmen, producing 40 to 50 instruments annually. Ibach's sons, Carl Rudolph Ibach (1804–63) and Richard Ibach (1813–89), joined the firm in 1834 and 1839 respectively; it subsequently became known as 'Adolph Ibach Söhne, Orgelbauanstalt und Pianofortefabrik'. Richard took over the organ building part of the firm in 1869, and Carl's son P.A. Rudolf Ibach (1843–92) was left to run the piano department as 'Rud. Ibach Sohn', the title under which the firm has continued. In 1885, after ten years of study abroad, the founder's grandson, Walter Ibach, opened a factory solely for the production of modern uprights. Output was rapidly increased, averaging about 2000 instruments a year by 1900.

The firm developed a reputation for building both high-quality and good medium-class instruments. Tributes to the Ibach piano have come from such composers as Bartók, Schoenberg, Webern and Richard Strauss; the grand played by Wagner right up to the evening before his death is in the Richard-Wagner-Museum, Bayreuth. More than 120,000 pianos had been made by 1972. The firm has worked with more than 65 architects on the design of its instruments; Peter Behrens and Bruno Paul designed upright pianos for their bicentenary, and the American Richard Meier designed a new grand piano which was introduced in 1996–7. That year Christian Ibach (*b* 1938) left the company and Thomas Henke, a technician who had been instrumental in introducing an improved soundboard construction in

both upright and grand pianos, joined the management. The firm claims to be the oldest surviving independent piano manufacturer in the world.

MARGARET CRANMER

Ibarra (Groth), Federico

(*b* Mexico City, 25 July 1946). Mexican composer. He began his career as a pianist and later studied at the Escuela Nacional de Música, graduating in composition in 1978. He also took classes with Marie (1968), Stockhausen (1971), Schaeffer (1971) and Halffter (1975). As a pianist, Ibarra has given the Mexican premières of a number of works (Cage, Cowell, De Castro, Crumb). His own music has been performed internationally, as well as in Mexico, where his prizes include the Medalla Mozart (1991). He has also worked as a choir conductor and répétiteur.

Ibarra's sizeable output is characterized by the use of powerful, dramatic contrasts within carefully balanced forms. Many of his earlier works (notably the *Cinco estudios premonitorios* and the *Cinco manuscritos pnakótikos*) incorporate highly varied textures, colours and contemporary effects, including clusters, microintervals, and percussive taps on non-percussion instruments. His Concerto for prepared piano and orchestra (1970, rev. 1980) – in which the soloist unfolds a series of non-melodic textures juxtaposed with dense, sonorous masses in the orchestra – is typical. A number of compositions – the piano sonatas, symphonies and the Cello Concerto – do retain the principal thematic and developmental elements of Classical form; but traditional schemata are supplanted by diverse, dramatic structures. Ibarra has written more operas than any other 20th-century Mexican composer. In these, the musical language employed reflects the libretto; in *Leoncio y Lena* the music closely follows the tragicomic narration of the characters, whilst in *Orestes parte* the discourse becomes so dense that the character of Clitemnestra is shared between four sopranos.

RICARDO MIRANDA-PÉREZ

Ibert, Jacques (François Antoine Marie)

(b Paris, 15 Aug 1890; d Paris, 5 Feb 1962). French composer. His father was in the export trade, and his mother was a gifted pianist who had studied with Marmontel and Le Couppey, both teachers at the Paris Conservatoire. She used to play Chopin, Bach and Mozart, musicians for whom her son retained a particular liking. Ibert began learning the violin at the age of four, and then took piano lessons from Marie Dhéré (1867–

1950), who came to occupy a special position in his life. It was through her that he was introduced to the Veber family, into which he later married. After obtaining his baccalaureat, Ibert decided to devote himself to composition, but he also had to earn a living by giving lessons, accompanying singers and writing programme notes. He became a cinema pianist and also began composing songs, some of which were published under the pseudonym William Berty. He joined Emile Pessard's harmony class at the Paris Conservatoire in 1910, went on to Gédalge's counterpoint class in 1912, and then studied composition with Paul Vidal in 1913. Gédalge was the most significant influence in his three years of training; Ibert described him as 'an adviser, a confidant and a very good friend'. While Gédalge's teaching activities at the Conservatoire were confined to counterpoint, he also advised his pupils on orchestration and organized a private class for the best of them. It was in that class that Ibert met Honegger and Milhaud.

Ibert was not a member of Les Six, a group in any case united more by the random remarks of critics than by any real aesthetic affinity. Even had he wished to join them, his circumstances would have made it difficult, since first the war and then the award of the Prix de Rome kept him away from Paris. During World War I he was first a nurse and stretcher-bearer at the front, then a naval officer stationed at Dunkirk. That he won first prize in the Prix de Rome at his first attempt in 1919 was therefore a remarkable achievement after the four years of enforced interruption to his musical activities. Ibert now launched his career as a composer with the support of his wife Rosette, a sculptor, who was the daughter of the painter Jean Veber and the sister of Michel Veber, active as a writer and librettist under the pseudonym Nino.

The first public concert of works by Ibert was given at the Concerts Colonne on 22 October 1922, with Pierné conducting *La Ballade de la géôle de Reading*. Ibert's success was reinforced on 6 January 1924 when Paray conducted his *Escales* with the Lamoureux Orchestra. These two works quickly made Ibert known to a large public both in France and abroad. On the advice of his publisher Alphonse Leduc, he wrote two collections for piano, *Histoires* and *Les Rencontres*, and they too helped to establish him. The first work of Ibert's to be given at the Opéra, in 1925, was the ballet from the second of these piano works, *Les Rencontres*. The success in 1927 of his *opéra-bouffe Angélique* finally confirmed his status as one of the best-known composers of his generation.

Ibert also contributed to musical life by sitting on professional committees and conducting his own works both in France and abroad. In 1937 the government made him director of the Académie de France at the Villa Medici, an appointment that caused controversy in the press, since traditionally candidates were chosen from members of the Institut de France. Appointed to this eminent position, however, Ibert threw himself wholeheartedly into his administrative role and proved an excellent ambassador of French culture in Italy, supported admirably by his wife. Although travelling between Paris and Rome often caused him inconvenience and fatigue, Ibert loved the Villa Medici and felt happy in its atmosphere of calm. He held the post of director until the end of 1960, apart from an interruption during World War II. The war was an especially

difficult period for Ibert. In 1940 the Vichy government banned his music and he was forced to take refuge in Antibes, southern France, where he continued to compose, producing works such as the String Quartet and *Le songe d'une nuit d'été*. After several months in Switzerland (1942–3) he returned to France, and lived in the Haute-Savoie until August 1944, when General de Gaulle recalled him to Paris. In 1955 Ibert accepted an appointment as administrator of the Réunion des Théâtres Lyriques Nationaux, which put him in charge of both the Opéra and the Opéra-Comique. After less than a year, however, serious health problems forced him to resign. Two months later he was elected to the Académie des Beaux-Arts to fill the vacancy left by the death of Ropartz.

Ibert's music embraces a remarkable variety of genres as well as a considerable diversity of mood. His music can be festive and gay (as in the well-known *Divertissement* from his music for *Un chapeau de paille d'Italie*), lyrical and inspired, or descriptive and evocative (as in the orchestral *Escales*), often tinged with gentle humour. Neither atonal nor serial, and very rarely polytonal, all the elements of his musical language bar that of harmony relate closely to the Classical tradition. He makes regular use of chords of the 9th, 11th and 13th, altered and added-note chords; his modernity is also apparent in the contrapuntal writing that is the motor element in many of his works, though the sense of a tonal centre is preserved through the use of traditional cadential formulae. Evidence of the influence of other composers, even quotations, are found right across his output: the Debussian imprint in *Persée et Andromède*, the homage to Dukas in *La Ballade de la geôle de Reading*, his admiration for Roussel in the *Ouverture de fête* and the Bartók quotation in the *Symphonie concertante*. But the blend of tenderness and irony, lyricism and the burlesque are characteristics distinctly his own.

Dramatic works form a significant part of Ibert's output. He contributed enthusiastically to film music in its early years and to the development of broadcast music. Attracted by the theatre, he wrote seven ballets, two of which, *Diane de Poitiers* and *Le chevalier errant*, were collaborations with Ida Rubinstein; five of his symphonic works were also adapted for dance. He composed six operas, two of them in collaboration with his friend Honegger. In *Angélique*, the second of two works for which Ibert's brother-in-law Nino provided the libretto, he sought to renew the genre of *opéra-bouffe*; like others of his contemporaries, such as Poulenc, Milhaud and Sauguet, Ibert looked to the example of Chabrier in an attempt to revive the French virtues of clean-cut melody, clear tonality, transparent textures and freshness of inspiration. With *L'aiglon*, his first Honegger collaboration, Ibert demonstrated his ability to judge the spirit of the time. Composed when France was governed by the Popular Front, the opera's style proved both accessible enough not to deter a broad public, and at the same time sophisticated enough not to disappoint the admirers of the two composers, both of whom drew on the full resources of their technique.

Ibert was drawn to the *mélodie* early in his career. Most of his essays in the genre were composed in the decade between 1920 and 1930; thereafter he tended to compose songs only as part of operatic, theatrical, cinematic or radio works. He was equally adept at writing for solo instruments. He composed over 30 pieces for piano, as well as works for flute, harp, guitar,

violin, cello, bassoon, trumpet and saxophone. His String Quartet has had several recordings, and is often performed alongside the quartets of Debussy and Ravel. It was for the orchestra, however, in works such as the three concertos, two symphonies (one unfinished) and eight symphonic movements, that he reserved the best of his creative inspiration. Here his writing is always brilliant and assured, his concise and sharply-etched style marked by clarity of form and sureness of balance. His orchestration is always transparent and avoids undue complexity, showing a good understanding of instrumental possibilities.

Ibert's articles and interviews provided an outlet for his views on the present and future state of music in France. In particular, he defended film music, criticizing the difficult working conditions suffered by composers. He stated his position on the uncertain future of opera both as a genre and as an institution. His ideas, like his music, display the same libertarian tendency that kept him from subscribing to aesthetic movements of any kind. The honesty and courage of his views allowed him, at one and the same time, to admire the works of Wagner, appreciate the creative force of Schoenberg and take an interest in the innovations of *musique concrète*, which the sound effects in his incidental music for *Don Quichotte* (suggesting the creaking of windmill sails and the noise of battle) might be held to anticipate.

Ibn 'Abd al-Rabbīh [Abū 'Umar Ahmad ibn Muhammad]

(*b* Córdoba, 860; *d* 940). Andalusian Arab writer. Little is known of his life. His most important work is a large-scale compendium entitled *al-'Iqd al-farīd* ('The unique necklace'). Drawn mainly from Eastern Arab sources, it covers a wide range of subject matter and includes a substantial section on music which exemplifies the approach of the literary scholar. Proclaiming first the beneficial effects of music, Ibn 'Abd al-Rabbīh then reflects, but without systematically exploring, the juridical debate on its permissibility. His main concern, however, is to provide a selection of informative, but primarily entertaining or unusual anecdotes, including a copious selection of song texts. For the most part these concern prominent figures of the first two centuries of Islam and the musicians and singing slave-girls (see [Qayna](#)) who entertained them. The events described almost all take place in the Eastern Arab world, and there is an unfortunate absence of parallel materials to illustrate musical life at the court of the Umayyads in Córdoba.

OWEN WRIGHT

Ibn al-Nadīm [Abū l-Faraj Muhammad ibn Ishāq al-Warrāq al- Baghdādī]

(*b* c930; *d* c995). Arab bibliographer. He lived in Baghdad, and in 987–8 wrote *Kitāb al-fihrist* ('Index of books'), a classified bibliography of Arab literature known to him in his capacity as a copyist and bookseller (*warrāq*), from libraries and from earlier bibliographies. He listed almost 100 titles from Arab musical literature, giving short biographical notes on the authors and sometimes indications as to the origin and content of the books. Most of these are lost, though some later compilations, such as the *Kitāb al-aghānī al-kabīr* ('Great book of songs') by al-Isfahānī, contain fragments of older biographical works on musicians and singers, and collections of song texts. Of particular value is his information about Arabic translations of Greek treatises on music; quotations from these treatises, which are now mostly lost, are also found in Arab musical literature from the early 10th century.

WRITINGS

Kitāb al-fihrist [Index of books]; ed. G. Flügel (Leipzig, 1871–2); ed. R. Tajaddud (Tehran, 1971; Eng. trans. as *The Fihrist of al-Nadīm: a Tenth-Century Survey of Muslim Culture*, B. Dodge, New York and London, 1970)

ECKHARD NEUBAUER

Ibn al-Tahhān

(*fl* first half of the 11th century). Arab musician and writer. The son of an eminent musician, he became a prominent singer at the Cairo court of the Fatimid caliph al-Zāhir (1021–36), and was still active as a teacher in 1057. His music treatise, completed after 1036 and entitled *Hāwī al-funūn wa-salwat al-mahzūn* ('Compendium of the arts to comfort sad hearts'), is of particular interest in that it deals with various topics of little concern to other authorities. Written from the perspective of a cultured musician rather than that of a philosopher-theorist, it calls upon a literary tradition of writing

about music, and its historical content is frankly derivative, even if of interest for the implication of continuity with the court music of 9th-century Baghdad. But it is wide-ranging in its treatment of contemporary practice, dealing not only with such basics as mode and rhythm, but also with such matters as the normal sequence of events in performance, deportment and etiquette, the materials and construction of the *‘ūd*, and vocal quality and technique. Emphasizing the experience of the teacher, the latter discussion includes voice training and pedagogical method.

OWEN WRIGHT

Ibn Bājja [Avenpace]

(*b* Zaragoza, north Spain; *d* Fez, Morocco, c1139). Philosopher, administrator and composer. He spent much of his life, first in Zaragoza and then in Játiva, south Spain, as vizier to various Almoravid governors, and later moved to Fez.

His *Kitāb fī al-nafs* (‘Book on the soul’) deals with acoustics. He is also reported to have written a substantial treatise on music that could stand comparison with that of [al-Fārābī](#), but this, unfortunately, has not survived. However, his reputation as a composer stayed alive for some considerable time, and his songs are still mentioned by Ibn Khaldūn (1332–1406). He was also a dexterous *‘ūd* player. The fullest, if still succinct, account of his achievements is provided by al-Tifāshī (*d* 1253), according to whom he studied for several years with female professional musicians (*qiyān*) and subsequently introduced two important innovations. One resulted in improvements to two of the important song forms, while the other, more general, is intriguingly characterized as a fusion of ‘Christian’ and ‘Eastern’ song. The resulting synthesis was to establish itself as the dominant style in Muslim Spain, effacing that of the earlier school of Ziryāb.

Ibn Rushd [Abū I-Walīd Muhammad; Averroes]

(*b* Córdoba, 1126; *d* Marrakech, 10 Dec 1198). Arab philosopher, lawyer and judge. He studied law and medicine, although philosophy and mathematics interested him more. From 1153 onwards he held important positions as judge and vizier at the courts of Muslim Spain (Seville and Córdoba) and Morocco (Marrakech). As a philosopher he had great influence on Christian Europe; his commentaries on Aristotle's writings were studied by European scholars for nearly 400 years. His influence on European musical theory was mainly through his *Sharh* (or *Talkhīs*) *fī l-nafs li-Aristūtālis* ('Commentary on Aristotle's *De anima*'), of which the section on the theory of sound was particularly important. The commentary was soon afterwards translated into Latin and Hebrew. The first printed Latin text appeared in Padua in 1472; by 1600 there were approximately 100 editions.

H.G. FARMER/R

Ibn Sīnā [Abū 'Alī al-Husayn; Avicenna]

(*b* nr Bukhara, 980; *d* Hamadan, 1037). Persian philosopher, administrator and physician. Educated in Bukhara, he was a student of such precocity that he had mastered the whole range of traditional sciences by the age of 18. He led an eventful life of fluctuating fortunes as a minister and adviser to various rulers, but enjoyed in his later years a period of relative peace at Isfahan. One of the great intellectual figures of Islam, he became known as Avicenna in the West, where his philosophical and medical works, notably the authoritative *Qānūn fī al-tibb* ('Canon on medicine'), exerted considerable influence.

Ibn Sīnā's main contribution to the development of musical theory is contained in the *Kitāb al-shifā'* ('The book of healing'), an encyclopedia in

which music is classed as one of the mathematical sciences (quadrivium). His general approach is similar to that of *al-Fārābī*, but the treatment, while necessarily terser, is sometimes more logical in its organization. The introduction dismisses the doctrine of ethos and discusses the nature of sound as both functional and expressive. The goal of the science of music is defined as knowledge of compositional procedures, and the first of the two main sections, fundamentally abstract and analytical, deals with pitch organization: notes, intervals (defined by ratios and ranked by degrees of consonance), tetrachord species and combinations thereof within the Greater Perfect System. The second is concerned with rhythm and, taking *al-Fārābī*'s account as its model, provides a schematic outline of possible structures; it is only towards the end that reference is made to those in current use. A briefer third section deals with processes of composition and with instruments; this introduces organological distinctions between, for example, ways of mounting strings or the presence or absence of a reed, and discusses the fretting of the lute. It also includes a valuable list – albeit one not always easy to interpret – of the more important melodic modes.

WRITINGS

OWEN WRIGHT

Ibn Zayla [Abū Mansūr al-Husayn ibn Muhammad ibn 'Umar]

(*d* 1048). Arab theorist. A pupil of Ibn Sīnā, his one work on music, the *Kitāb al-kāfi fī l-mūsīqī* ('Book of sufficiency concerning music'), is the last important surviving treatise on music before the rise of Systematist theory in the mid-13th century. In the choice and treatment of subject matter it generally follows the lines laid down by *al-Fārābī* and, particularly, Ibn Sīnā. It thus begins with the physics of sound, and surveys intervals, tetrachord species, octave divisions and melodic movement. The remaining subjects discussed are rhythm (treated methodically and clearly);

composition (dealt with in a slightly less abstract way than was customary, with mention of a few technical devices and different categories of song); and instruments (including a classification scheme as well as the traditional lute fretting). Following al-Fārābī, Ibn Zayla also included a general classification of means of sound production, the ordering principle being the degree of approximation to the ideal of the human voice. The *Kitāb al-kāfī fī l-mūsīqā* also lays considerable stress on a traditional threefold division of music emphasizing the variety of responses that different kinds of music can evoke.

OWEN WRIGHT

Ibo music.

See [Igbo music](#).

Ibrahim, Abdullah [Brand, Dollar; Brand, Adolph Johannes]

(*b* Cape Town, 9 Oct 1934). South African jazz pianist, flautist and composer. The development of his style was influenced by the work of Duke Ellington and Thelonius Monk and by South African *marabi*; he is known for his ballads and his skill in extended melodic invention and has released 63 recordings.

After making his name locally he moved to Zürich in 1962, attracted by its sociopolitical climate and the possibility of opportunities for performance. In Zürich Duke Ellington heard him perform; he arranged for Brand to make a recording in 1963 and to appear in the Newport Jazz Festival in 1965. Brand moved to New York, where he met Thelonius Monk; he subsequently toured Europe, performing as a soloist and with other musicians including Gato Barbieri, Don Cherry and Makaya Ntshoko.

From 1971 to 1976 he lived in South Africa, but he returned to exile in New York after defiantly organizing a jazz festival in his homeland. In the 1970s and 1980s the themes of his music and its reaffirmation of *marabi* showed the influence of his conversion to Islam and an intensification of his opposition to apartheid. During this period he recorded alone, in duos with Archie Schepp, Max Roach, Johnny Dyani and Carlos Ward, and as a member of small ensembles. With the Cape alto saxophonist Basil Coetzee he recorded *Mannenburg*, a slow version of an old Zacks Nkosi melody called *Jackpot*, which became an anthem of the struggle against apartheid

and a classic of the Cape jazz repertory. His septet Ekhaya may be heard in most of his later recordings. He returned to South Africa in 1992.

Ibrāhīm al-Mawsilā.

See *al-Mawsilā*, (1).

Ibrahimi, Feim

(*b* Gjirokastra, 20 Oct 1935; *d* Turin, 2 Aug 1997). Albanian composer, administrator and teacher. Essentially self-taught in his early years, he became the first significant Albanian composer to study exclusively in his home country, entering the newly-founded Tirana Conservatory in 1962 and studying there with Daija until 1966. He then taught counterpoint and composition at the conservatory (1966–73), subsequently serving as sub-director of its parent body, the Superior Institute of Arts (1973–7). His most significant post was as music secretary of the Union of Albanian Writers and Artists (1977–91); he later also served as artistic director of the Theatre of Opera and Ballet, Tirana (1991–2). From 1992 until his death he taught theory and composition at the Conservatory. He founded the Evenings of New Albanian Music in 1992.

As music secretary during Albania's period of cultural isolation, Ibrahimi showed himself a capable administrator, exerting a positive influence on Albania's musical life. Though obliged by his office to defend socialist realism, during his official travels abroad he tried, as much as was possible, to keep up with international musical developments, experimenting in secret with atonality (e.g. in the Cello Sonata, 1975, rev. 1990), expressing a private interest in Xenakis as early as 1981, and inviting to Albania such avant-garde figures as Stäbler. Ibrahimi's works of the early 1970s rank among the most progressive of that period. The First Piano Concerto (1971) shows a harmonic daring in advance of many Soviet composers of the time, while the Second (1975) is a dense and austere work, exploring a post-Bartókian sound-world. The ballet *Plaga e dhjetë e Gjergj Elez Alisë* ('The Tenth Wound of Gjergj Elez Ali', 1985) marks a watershed in his output, its tightly-woven motivic material, derived from northern Albanian folksongs, sustains a relentless rhythmic pace throughout, culminating in a shattering emotional climax. With the end of

the socialist period, Ibrahim revealed himself as a composer with an acute awareness of recent history, especially that of Albania and the Balkans. His works of the 1990s, including the beautiful songs on verses by Agolli, Essenin and Frashë, are often haunted by death and a sense of loss: his 'Tragic' Symphony (1990–92) is an ominous lamentation, reminiscent of the darker visions of Schnittke. In his last work, the atonal *Dialogo* (1997) that brooding element gives way to an emotionally detached yet musically intense interplay between cello and piano.

WORKS

(selective list)

dramatic

Film scores: Ngadhnjim mbi vdekjen [Triumph over Death] (dir. G. Erebara and P. Milkani), 1967; Përse bie kjo daulle [Why this daulle beats] (dir. Milkani, after I. GEORGE LEOTSAKOS

Ibrāhīm ibn al-Mahdī

(*b* Baghdad, July 779; *d* Samarra', July 839). Arab musician. He was a son of the Abbasid Caliph al-Mahdī and a Persian slave at court called Shikla. He became famous for his fine and powerful voice with its range of four octaves, and first took part in court concerts during the reigns of Hārūn al-Rashīd (786–809) and al-Amīn (809–13). Proclaimed caliph in 817 in opposition to al-Ma'mūn (813–33), he had to abdicate after barely two years and went into hiding. In 825 he was pardoned and became a court

musician once more under al-Ma'mūn and his successor al-Mu'tasim (833–42). He was a follower of the school of Ibn Jāmi' and represented a 'soft' style, probably influenced by Persian music, which also allowed freedom in rendering older works. His rival Ishāq al-Mawsilī accused him of stylistic uncertainty; fragments of their polemic writings are quoted in the *Kitāb al-aghānī al-kabīr* ('Great book of songs') of al-Isfahānī, and their disputes on questions of musical theory were recorded in a lost treatise by 'Alī ibn Hārūn ibn al-Munajjim (d 963). Ibrāhīm ibn al-Mahdī's *Kitāb fī l-aghānī* ('Book of songs') and a collection of his own songs, as well as biographical writings by his son, Hibat Allāh, and by his secretary, Ibn al-Dāya, survive in fragments in al-Isfahānī. He may have written a further musical work with 'Amr ibn Bāna. Shortly before his death he renounced music and wine on religious grounds.

ECKHARD NEUBAUER

Ibsen, Henrik

(b Skien, 20 March 1828; d Christiania [now Oslo], 23 May 1906).

Norwegian dramatist. He is generally regarded as the father of modern prose drama, with such plays as *A Doll's House* (1879), *Ghosts* (1882) and *Hedda Gabler* (1891). His early verse plays, written in the 1850s, attracted opera composers at the turn of the century – for instance, Stenhammar (*Gildet på Solhaug*, 1892–3) and Karel Moor (*Hjördis*, 1899). The subjects of these plays are epic and patriotic, evoking Norway's greatness during the Viking and medieval periods; and Ibsen's use of the *Volsung-Saga* in *Haermaendena på Helgeland* ('The Vikings at Helgeland' 1858) clearly aligns the play with a Wagnerian tradition. His later and more innovative work had less appeal for composers, though the revolutionary *Brand* (1866) leaves its mark on d'Indy's *L'étranger*, and Mark Brunswick's opera *The Master Builder* (1959–67) is based on Ibsen's 1892 play of the same name. In the latter part of the 20th century *Hedda Gabler* inspired settings by Robert Ward (1973) and Edward Harper (1985).

Ibsen had little feeling for music, although he made some early attempts at opera criticism, in which he expressed strong views on librettos (and wrote a verse parody of Bellini's *Norma*). His attempt in 1861 to rewrite his *Olaf Liljenkraus* (1857) for the operatic stage was abandoned (the play was later turned into a very successful opera by Arne Eggen in 1940), and he turned

down a request for a libretto from Grieg, who had written music for his play *Peer Gynt* in 1876.

WORKS

Gildet på Solhaug [The Feast at Solhaug] (verse play, 1856): Stenhammar, 1899
Olaf Liljekrans (play, 1857): A. Eggen, 1940
Haermaendena på Helgeland [The Vikings at Helgeland] (play, 1858): Moor, 1905, as Hjördis
Brand (play, 1866): d'Indy, 1903, as L'étranger
Peer Gynt (play, 1867): L. Heward, 1922, inc.; V. Ullmann, 1928, inc., Egk, 1938
Hedda Gabler (play, 1891): Ward, 1978, as Claudia Legare; Harper, 1985
Bygmester Solness [The Master Builder] (play, 1892): M. Brunswick, 1959–67, inc.

ANTHONY PARR

Ibycus

(fl c535 bce). Greek poet. He left his native city of Rhegium in southern Italy to go to Samos at the invitation of its ruler Polycrates. The surviving fragments of his poetry show that he employed the style of choral lyric established more than a generation earlier by Stesichorus, and (the argument becomes less certain at this point) that he further imitated his predecessor by devoting himself to themes taken from mythology. As a court poet at Samos (see also [Anacreon](#)) he seems to have explicitly renounced myth for more personal subjects, powerfully expressed through natural imagery. One poem (Edmonds, poem 1) contrasts the gentle coming of love in youth with its unseasonable, shattering onslaught upon the poet. Together with a comparable shorter fragment (Edmonds, frag.2), it is reminiscent of the passionate Aeolic monody of [Sappho](#) and [Alcaeus](#); yet both poems use choral metres. Although the strongly marked changes of emotional tone might appear to have demanded a shift in modality, Stesichorus had employed Phrygian for extremes of mood even more sharply opposed. The statement in Aristophanes (*Thesmophoriazusae*, 162) that Ibycus, Alcaeus and Anacreon 'spiced' the *harmonia* is deliberately frivolous; its meaning remains obscure.

There is little reason to take seriously the assertion by later writers that Ibycus invented the *sambukē*, a type of harp that is still occasionally confused with the lyre (see Bowra), or other claims which involve the *bukanē*, a spiral trumpet. Apparently all of these associations originated from the accident of mere formal similarity.

WARREN ANDERSON/THOMAS J. MATHIESEN

Icart, Bernar.

See Ycart, Bernhard.

Iceland.

Country in the North Atlantic. The history of Icelandic music has many gaps, since the country has always been sparsely populated. In the absence of cities of any size until recently, and without an aristocratic ruling class, Icelandic society has evolved in patterns different from those of other European nations. Iceland was first settled in the 9th century; it came under Norwegian rule in the 13th century and later under Danish, until 1944, when the country became a republic.

Icelanders possess an abundance of cultural information about their past from aural and literary traditions more than 1000 years old. Traditional music in Iceland exemplifies both insularity and cosmopolitanism, originally as part of Nordic interaction; later in connection with the political domination of Norway and Denmark; and, since independence, by assuming an increasingly international voice.

1. Pan-Nordic roots.
2. Traditional vocal musics.
3. Indigenous instruments.
4. Christian traditions.
5. European art music.
6. 20th-century trends.

Iceland

1. Pan-Nordic roots.

Early written sources document both instrumental and vocal traditions, although there is no evidence of instrumental accompaniment for vocal performance. Icelandic manuscripts dating from the end of the 11th century to the 15th contain written versions of legal, historical and mythological material that had been transmitted orally from previous eras; some concern

events occurring during the time of settlement (c870–c930 ce) and before colonization.

Two poetic genres emerge from written sources, categorized as eddaic and skaldic verse according to style, subject matter and function. Most eddaic verse comes from a single 13th-century manuscript known as the *Poetic Edda*, which includes lays about Norse gods (the *Aesir*) and verses concerning the exploits of Germanic heroes such as Sigurd (equivalent to Siegfried of the *Nibelungenlied*). Another important source for eddaic verse is the *Snorra-Edda*, which uses similar themes as models; it was a textbook intended to promote a dwindling tradition by explaining the complicated principles behind the highly stylized system of skaldic versification. This manuscript is a major source for skaldic verse, examples of which are found scattered throughout the sagas, prose narratives written in the vernacular (c1200–c1400). No extant manuscript contains skaldic verse alone; consequently, knowledge must be gleaned from fragmentary sources. Ancient literary manuscripts establish the historical importance of instrumental and vocal traditions in the pan-Nordic world, for instance the warrior-king Harold Sigurðarson (Harðraði) confirms the essential role of harp-playing and *riming* ('chanting') in Nordic culture by including them in his boastful description of gentlemanly accomplishments.

Scholars do not agree on the extent to which one can rely on these early materials for historical veracity; Snorri Sturluson (1179–1241), the earliest compiler of Icelandic epic materials, considered the matter in the opening pages of his monumental history of Norse kings (*Heimskringla*). Sturluson's introduction explains the inclusion of *kvaeði* (old chants) and *söguljóð* (epic songs) along with written sources for historical documentation: 'Now, while we cannot be sure just how close these are to the actual truth, we do know that the elder scholars had no doubt of their veracity' (1777).

Iceland

2. Traditional vocal musics.

(i) Pre-1400: courtly and domestic verse, incantations.

Three different functions for vocal music emerge from ancient sources: formal and esoteric skaldic recitation, narrative verses chanted or sung informally and incantations used for supernatural purposes. The last two, found principally in eddaic manuscripts, were composed in simpler metres and contain mythological and heroic subject matter. The manuscripts do not include musical notation; however, a new awareness of the sociological value of these documents has drawn attention to the manner in which ancient verse was performed. Most eddaic verse, drawn from Norse mythological or legendary sources, was meant either to function magically as part of a ritual context or to transmit traditional lore informally for entertainment or didactic purposes; in both cases, the complicated metres and esoteric metaphors of skaldic verse were avoided. Eddaic verse, which contains numerous references to the singing of *galdur* (incantations), sometimes provides insights into the shamanic practices of the time.

There is little doubt that skaldic verse was chanted in a manner somewhere between speech and song (Einarsson, 1986), although some scholars caution that we cannot determine how this sounded (Turville-Petre, 1976).

It is possible that the traditional mode of chanting *rímur* (see §3 below) may provide a key, since the informal, domestic *rímur* seems to have carried on some of the characteristics of elite skaldic style (e.g. subject matter and complex versification). *Rímur* is always described with the verb *kvaedi*, the term frequently used to denote skaldic recitation in ancient Icelandic literary documents. Indeed, judging from Sturluson's versification manual, an integral association between words and music is assumed in the definition of *mál* ('speech'); *mál* included *söngur* ('song'), *galdur* ('incantation') and *kvaedandi* ('recitation') as well as *tala* ('talk' or 'tale') and *saga* ('story' or 'history') (Faulkes, 1987).

The emphasis in skaldic tradition was on celebrating rather than describing important events and personages as well as on the technical craftsmanship with which this was accomplished. Nevertheless, Sturluson considered these chanted poems to be historical documents since they were performed in the presence of chiefs and courtiers who could tell fact from fiction and would consider fabricated praise to be mockery (1775). The original Norwegian settlers of Iceland brought with them the elaborate art of the Norwegian *hirðskáld* (court poet), and after the initial migration, Icelandic *skalds* continued to monopolize this position. Their celebrity status is reflected in the more than 250 names of individual *skalds* that have come down to us.

(ii) Post-1400: *rímur*, lausavisur, song-dances, tvísöngur.

The *rímur* tradition first appeared late in the 14th century; from its inception until well into the 20th century it was the most popular form of artistic communication in Iceland. The term *rímur* ('rhymes'; sing. *ríma*) refers to long narrative poems consisting of sequential verses chanted to repetitions of a short, usually pre-existent melody. *Rímnakveðskapur*, the composing of *rímur*, employs an intricate versification technique that involves esoteric features such as palindrome rhyme. *Rímur* stories include legendary historical tales drawn from the sagas, central European romances and tales of magic.

On farms *rímur* used to be performed at informal evening gatherings called *kvöldvaka* ('evening-awakening') during which members of the extended family would gather in the evening to listen to lengthy recitations by the *kvaðmaður* ('chant-master') who might be a family member, visitor or even an itinerant *rímur* chanter. This tradition continues today in special *rímur* clubs. *Rímur* are the dominant genre of indigenous Icelandic music.

Traditional performances of an entire *rímur* cycle (*rímnaflökkur*) might last an entire evening. Devices have developed to distinguish different sections from each other and gradually increase tension during lengthy recitation periods. Characteristic are shifts to new metres at the beginning of each *ríma* and the lengthening of the final note of each strophe, often articulated by a sudden rise in pitch. These elongated final tones are emphasized by an idiosyncratic ornament. Audience members often participate in these final tones at the end of each stanza. Two further musical traits of traditional *rímur* recitation are loudness and slowness of tempo. Another aspect of *rímur* performance is the peculiar vocal timbre that is used. While some modern performers tend to sing rather than chant texts, traditional performers use a thick, ponderous, guttural tone quality half-way between

speech and song. The Danish composer Svend Nielsen, fascinated by the idiosyncratic qualities of this vocal timbre, conducted research with the use of sound engineering equipment at the universities of Uppsala and Copenhagen that compared *rímur* chanting with the singing of hymns and with speech (Nielsen, 1982).

Lausavisur are improvised quatrains that are spoken or chanted and, like *rímur*, they normally feature elaborate versification. Whether new or derived, they may function as part of a metrical competition in which two people take turns challenging each other. A *sléttubönd* is a *lausavisur* the words of which also have meaning when read in reverse for some other unusual order. *Lausavisur* often contain coded messages; for example, if sung backwards or in other unusual sequences they may communicate contradictory sentiments.

According to contemporary references, Icelanders used to share the general medieval European practice of song-dancing. At one time *rímur* were danced, and this historical association is expressed in the metrical structure of the genre. Icelandic balladry is considered to be metrically related to the danced *rímur* and other dances dating from as early as the 13th century. Little is known, however, about individual ballads until the 17th century. Another type of song-dance was the *vikivakalag*, deriving its name from its refrain, *vikivaka kvaði* of strophic form it was sung responsorially by the dancers.

Tvísöngur ('twin singing') is a kind of improvised organum that has existed in Iceland since the Middle Ages; in its simplest form, it consists of two vocal parts sung in parallel 5ths or 4ths to a pre-existent melody functioning as cantus firmus from either a sacred or secular source (including *rímur*). More complex styles include a responsorial element, doubling of both parts at the octave, and passing notes. *Tvísöngur* is often taught in contemporary classrooms; it constitutes a performing practice, that is more an improvised variation of the melody than a form. The genre is of special interest to European musicologists who study the development of organum notated by church scribes in medieval manuscripts; it addresses the issue of whether the sacred manuscripts also reflect a more widespread, improvisatory practice that was applied to secular, as well as sacred, melodies.

The *rímur* tradition has been well documented in manuscripts containing musical notation and also through written descriptions of performances. Bjarni Þorsteinsson gathered material from both written and aural sources for his monumental collection containing *rímur* and *tvísöngur*, published in the early 20th century, some of his transcriptions were provided by the traditional musicians.

Iceland

3. Indigenous instruments.

(i) Pre-1400.

Medieval musical instruments have not been preserved in Iceland. For organological evidence, we are limited to literary sources. Despite the lack of precise descriptive information, the importance of musical instruments is

clear. Furthermore, literary evidence from both the sagas and the *eddas* affirms the predominance of chordophones.

The most frequent reference in ancient sources is to the *harpa*, knowledge of which was considered of importance in the élite pan-Nordic world. Playing the *harpa* was, along with *riming*, one of the recognized skills expected of properly educated young men. Icelandic references to the *harpa* testify to its cultural centrality. There has been considerable confusion about the precise meaning of *harpa*, which seems to have been used as both a generic term for string instruments and a specific type of instrument; witness its inclusion among the names of string instruments such as *fiðla*, *gígja* and *simfón* in a number of sources, including *Heimskringla*, *Ynglinga Saga* and *Didrik Saga*.

In its generic sense, *harpa* seems to have referred to the Nordic components of a category of bowed string instruments found in the ancient northern and north-central areas of Europe, some of which are still extant (Hopkins, 1986, pp.129–36). This genre had distinctive characteristics well-designed for thick-textured music, permitting more than one string to sound constantly. They were lute-, lyre- or zither-shaped; they do not have fingerboards (usually thought necessary for stopping strings); they do not have incurvations on the side of the body (considered a requirement for bowing); they often do not have a separate bridge (the string-holders serve a double function); they are often both bowed and plucked. The once-mysterious relief carving on the façade of the Nidaros Cathedral in Norway (c1325–50) is now posited to depict a bowed-lyre player in action (Andersson, 1970). The *simfón* (*sinphón*, *symphónie* or *fón*), with its wheel-activated strings and mechanical stopping jacks, was a type found in different versions and under various names in continental Europe from the early Middle Ages to the present.

The most extensive evidence concerning medieval Icelandic string instruments is in the so-called *Second Grammatical Treatise* of the late 13th century, a work whose author possessed specialized knowledge in musical organology and phonology. The cultural significance of this work lies in its originality, especially in its use of indigenous Icelandic modes of thought. Of particular significance is the fact that two musical instruments are utilized in the treatise in order to explain linguistic structure, a sure indication of cultural centrality. The instruments singled out for metaphorical usage are the *harpa* and the *simphónie*. The work's most recent editor and translator, Fabrizio Raschella (1982), points to the significance of the *simphónie* by stressing its interdependence with Icelandic culture.

(ii) Post-1400.

More recently, two Icelandic instruments sharing the principal characteristics described above emerged as prominent; both *fiðla* and *langspil* were bowed zithers. The oldest, the *fiðla*, has rarely been played after the early 19th century; it may well have been closely related to the instrument of the same name mentioned in the ancient sources, but this cannot be confirmed. The *fiðla* had a hollow, elongated, trapezoidal body and two to four strings that were stopped with a palm-upward technique. Two *fiðlas* may be found today at the Thjóðmannasafn Íslands (National

Museum of Iceland). One is a 19th-century four-string instrument from southern Iceland and the other is a two-string instrument reconstructed from memory in 1905 (Jóhannsdóttir, 1972).

The *langspil* survived into the 20th century. The left-hand stopping technique used on this box zither is the more usual palm-downwards variety; the absence of a bridge propels the two to four strings to constant actuation and creates the thick-textured sound characteristic of the northern genre. Charles Burney had reported in the 18th century that bigoted religious attitudes had all but suppressed the *langspil* tradition in Iceland. He asked why 'these arts [music and poetry], which were formerly held in such high estimation among the people of this bleak and rugged region, should be totally discountenanced and banished at present' (Burney, 1776, p.42). However, a Scottish geologist travelling in Iceland early in the 19th century reported with enthusiasm on his introduction to this instrument (Mackenzie, 1811).

During the 19th century, the *langspil* was appropriated for religious purposes. A manual for learning to play the instrument and 'for learning Psalm Melodies from the Notation' was published in 1855. Its author, Ari Saemundsen, was more interested in teaching parishioners how to sing psalm tunes than providing a method for *langspil* playing.

Iceland

4. Christian traditions.

Christianity was adopted in 1000, and soon schools were established, principally at the bishoprics of Skálholt in the south (1056) and Hólar in the north. The earliest fragments of music manuscripts and knowledge of the first church leaders point to close ties with England, Ireland and France until the 14th century. Bishop Jón Ögmundsson (*d* 1121), himself a noted singer, brought the singing and versification master Ricini from Alcase for his school at Hólar. Two centuries later the *rector chori* at Hólar Cathedral was instructed by Bishop Lárentíus Kálfsson (*d* 1331) to correct misuse in singing habits. The bishop furthermore forbade all singing in triplum or duplum, and ordered the clergy to revert to plainchant. Bishop Thorlák Thórhallsson of Skálholt (*d* 1193) studied at Paris and Lincoln. He was canonized in 1198, and an Office and Mass were compiled in his honour. A few musical documents containing a number of references to singing, playing and even organ building (Abbot Arngrímur Brandsson in 1329) indicate that during the Middle Ages attempts were made to follow musical developments in the rest of the Christian world.

In the 16th century the Reformation took root in Iceland and the Lutheran chorale was imported. (There are, however, no references to indicate that the chorales were ever sung in harmony.) In 1589 the first Icelandic book of hymns was printed, including some tunes; this was the achievement of Bishop Guðbrandur Thorláksson (1542–1627). Five years later he published the *Graduale*, a missal with traditional Latin chants alongside the new chorales, which appeared in 19 editions, little changed, until 1779. A short appendix to the sixth edition of the *Graduale* was the first and only instruction in elementary music theory available in print to Icelanders before the beginning of the 19th century. This appendix was written by Bishop Thórður Thorláksson (*d* 1697) who was an 'accomplished player of

the clavichord, regal and symphonium'. However, 19th-century critics of the 'old singing' describe the leading church singers as men who cared nothing for the written chants and chorales but embellished everything beyond recognition. Apart from the *Graduale*, there was no more music printing until towards the end of the 19th century.

Some early 17th-century manuscript fragments show attempts at three- and four-part writing, and a few accomplished canons from that time are also extant. In 1647 a petition was sent to the king in Copenhagen stating the need for singing teachers and describing how musical instruments were rapidly falling into disuse. The petitioner offered all his wealth, so that a school of music, including teaching of instrument-making and repairs, could be instituted. Unfortunately, this petition was never answered. A writer in 1800, bemoaning the decadence of singing, mentioned a few instruments which went out of use, along with traditional dances, during the 18th century. One of these instruments, the *langspil*, had a brief renaissance during the 19th century; a textbook for it was published in 1855 and the instrument has survived into the 20th century (see §3(ii)). Two valuable collections of monodic songs, mostly sacred, survive in manuscripts from the 17th and 18th centuries: *Melodia* (c1650; Arnamagnaean Institute, Copenhagen), containing about 200 songs, and *Hymnodia sacra* (1742; Reykjavík National and University Library) containing 110 songs. The former mentions 'foreign tones', interspersed with 'tones by Jón Ólafsson', the latter makes no such distinction. There are however many songs and texts in *Hymnodia* which do not exist anywhere else. It is possible that Pastor Guðmundur Högnason composed them himself.

The 19th century brought new musical influences from Denmark and Germany, and the importation of modern instruments. Reykjavík Cathedral acquired its first organ in 1840. Its organist, Pétur Guðjohnsen (1812–77), trained in Denmark, was also responsible for the first Icelandic hymnal (in three and four parts) printed with modern notation (1861 and 1874). Other musicians followed in close succession, advocating 'new singing' (i.e. partsinging).

Iceland

5. European art music.

The new patriotic poems required suitable songs. Many of these were imported, but many were also composed in Iceland. The first professional pianist-composer, Sveinbjörn Sveinbjörnsson (1847–1927), composer of the national anthem (1874), completed his musical studies in Copenhagen and Leipzig, and many followed his example. Most of his active career was spent abroad, chiefly in Edinburgh. Suddenly, there appeared a whole generation of prolific composers of songs (mostly for voice and piano accompaniment, but also for male or mixed choirs). Hundreds of romantic and nationalist songs were composed and published. Only a few of the composers were professional musicians; they were predominantly doctors, lawyers, clergymen, bankers or politicians. Some of their songs form the mainstay of the song repertory in Iceland today, especially the songs of Sigvaldi Kaldalóns (1881–1946).

The 1000th anniversary of the Icelandic parliament, Althing, in 1930 provided a new stimulus to musical development. The Reykjavík Music

Society was founded to establish a school of music and a symphony orchestra in Reykjavík, and all available musical forces were gathered for the performance of the prize-winning Althing Festival Cantata by Páll Ísólfsson (1893–1974). In the same year the Iceland State Broadcasting Service was founded with Ísólfsson as its first director of music. He was also principal of the Reykjavík School of Music (now the Reykjavík College of Music), and for 30 years organist of Reykjavík Cathedral. A parallel force in shaping modern Icelandic music was Jón Leifs (1899–1968), who strove to form a national style of composition. He founded the Icelandic Composers' Society in 1945 and STEF, the Icelandic performing rights society three years later. In 1995 there were 42 active members of the Composers' Society and about 70 members of a sister organization of popular writers. Fresh musical influences came during the late 1930s with immigrant musicians from Germany and Austria, who left a profound mark on music in Iceland as educators, composers, conductors or performers.

In 1950, the National Theatre in Reykjavík opened, and that year also saw the establishment of the Iceland SO. Ten years later, the Musica Nova organization started to introduce the newest developments in composition, including the first Icelandic electronic pieces by Magnús Blöndal Jóhansson (*b* 1925) in 1961.

In 1970 the biennial International Festival of the Arts in Reykjavík was launched, and four years later, the first full-length Icelandic opera *Thrymskviða* ('The Lay of Thrym') by Jón Ásgeirsson (*b* 1928) was given its première. In 1982 the opera *Silkitromman* (The Silken Drum) by Atli Heimir Sveinsson (*b* 1938) was performed for the first time at the National Theatre and in the same year, the newly founded Iceland Opera opened its doors. In 1993 the Northern Iceland SO was established in Akureyri.

Iceland

6. 20th-century trends.

Iceland's independence from Denmark was achieved over a period of years, from 1918 to 1944, and its new status was reflected musically in the development of major international institutions: 1930 saw the founding of the conservatory of music and the Iceland State Broadcasting Service. Symphonic activity began about the same year and culminated in the founding of the National Symphony Orchestra in 1950. At the same time institutions were founded in the 20th century to promote the indigenous *rímur* tradition: Kvaeðamannafélagið Iðunn (Iðunn Rímur Chanters' Society) in 1929 and Kvaeðamannafélagið Hafnarfjörður (Rímur Chanters' Society from Hafnarfjörður) in 1930. Kvaeðamannafélag Siglufjörður has since been founded in the north. A touring trio of musicians (Njáll Sigurdsson, Bára Grímsdóttir and Sigurður Runar Jónsson) was organized in the 1990s to give lecture-demonstrations on traditional music. The folk-rock group Íslandica (supported by Icelandair airline) has moved in the direction of traditional idioms. There is a movement to have the *rímur* tradition taught in schools; a textbook for grammar schools has been published by a member of the Ministry for Education (the traditional singer Njáll Sigurðsson), and a text providing instruction in *rímur* metrical composition is now used in secondary schools. Hallgrímur Helgason (1914–94) adapted traditional stylistic features to symphonic idioms; a

student of Hindemith, he also published the classic work on the Icelandic epic-song tradition (1980).

In 1987, the Sugarcubes became the first Icelandic rock group to win an international award; its star singer, Björk, is now a major solo star (see fig). Among her influences, she credits English rock groups, Icelandic folk music and the German composer Karlheinz Stockhausen.

In 1971 the manuscript collection named after Árna Magnússon, its original collector, began to be returned from the University of Copenhagen; the Stofnun Árna Magnússonar (Árna Magnússon Institute) is the prime source for the study of Icelandic traditional music. Other important collections and resources include Ríkisútvarp Íslands (Icelandic State Broadcasting Service), Thjóðminjasafn Íslands (National Museum of Iceland), Kvaeðamannafélagið Iðunn, all in Reykjavík, and the Willard Fiske Icelandic Collection of Cornell University, USA.

Icelandic trends in musical thought during the course of the 20th century can be traced through the history of the institutions constantly being established – from electronic music laboratories to *rímur* associations. Iceland has never become completely isolated from European intellectual traditions, often incorporating ideas and entire themes into its traditional modes of expression. After independence from Denmark in 1944, it was the general acceptance of (and official sanction accorded to) the new idioms that was unusual, resulting in (once again, as during the days of the Commonwealth) the active participation of Icelandic musicians in an élite international culture. Seen in the historic context, both the 20th-century shift away from the national culture and the recent signs of a reawakening interest in it are not new phenomena. By and large it has been (as it continues to be) individual Icelanders who make selections concerning what is to be changed, modified, merged or retained.

Ichiyanagi, Toshi

(b Kobe, 4 Feb 1933). Japanese composer and pianist. After taking lessons in composition with Ikenouchi and the piano with Chieko Hara, he went to study at the Juilliard School in 1952. He met Cage and was deeply influenced by his ideas. Ichiyanagi soon became active as a pianist and composer, giving experimental performances that often included chance procedures. He returned to Japan in 1961 and continued activities of the same nature; he organized concerts, took part in concerts sponsored by the Society for 20th-Century Music, founded the New Directions group (1963) and collaborated with Takemitsu in arranging the Orchestral Space Festival (1966). *Piano Media* (1972) marks his return to strict notation and demonstrates his use of repetition, a characteristic that permeated his many large-scale works in traditional Western genres. He has won the Otaka Prize four times, with the first and second piano concertos, the Violin Concerto and the Symphony 'Berlin Renshi'. At the end of the 1970s he also began to compose Japanese traditional music, such as *Ogenraku* (1980). He has promoted both Western contemporary music, becoming a director of the Interlink Festival (1984) and an adviser to the National Theatre (1991), and new Japanese traditional music, becoming a director of the Tokyo International Music Ensemble (1989).

WORKS

(selective list)

Op: Momo (3, after M. Ende), 1995

Orch: Pf Conc. no.1 'Reminiscence of Spaces', 1981; Vn Conc. 'Circulating Scenery', 1983; Pf Conc. no.2 'Winter Portrait', 1987; Sym. 'Berlin Renshi', S, T, orch, 1988; Pf Conc. no.3 'Cross Water Roads', 1991; Sym. no.2 'Undercurrent', 1993; Sym. no.5 'Time Perspective', 1997

TILMAN SEEBASS

Iconography

I. Introduction

1. Terminology.

The terms 'iconography' and 'iconology', were created by 16th-century humanists for the study of emblems, portraits on coins and other pictorial evidence from ancient archaeology. They referred to the description (Gk: *graphein*) or interpretation (Gk: *logos*) of the content of pictures as regards both visual symbolism and factual research. When, in the 19th century, art history became established as an academic discipline, a comprehensive analytical method was developed in which content and form became the main subjects of analysis. From then on, scholars used the terms 'iconography' and 'iconology' when they referred to the study of content as opposed to the study of form or style. In musicology, however, both approaches continued to exist, side by side. The twofold meaning remains an obstacle to the unequivocal usage of the term. Some treat the visual arts as supplier of special information pertinent to musical facts, using musical iconography as an ancillary tool for research in the pictorial documentation of instruments and performance. Others consider an image with musical subject matter as a work of art in its own right, using musical iconography towards research in the vision and visualization of music.

2. Method.

Any pictorial document requires for its interpretation an understanding of visual aesthetics. This is especially true for pictures dealing with a topic as invisible and immaterial as the world of sound. The musical iconographer must therefore be familiar with art-historical iconology as well as fulfilling the obvious methodological requirement of expertise in organology and performing practice. Exemplary descriptions of this method come from members of the Warburg school (see for example Panofsky, B1939, and

Białostocki, B1963): the student should first describe the formal elements of a picture and deal with the factual meaning of each element; secondly, he or she must take account of the cultural convention that influenced the depiction of those elements, tracing them back to a story or a scene, and discussing any intended 'transnatural', allegorical or metaphorical meaning (this is the stage of descriptive analysis that Panofsky called iconography); at the third level, the scholar may establish an iconology of the intrinsic meaning of the picture and discuss it as a manifestation of the artist's personality, the patron's ambitions and the onlooker's expectations. Iconology explains the picture as a paradigm of a given culture.

An analogy with the terms 'ethnography' and 'ethnology' may be illuminating. Iconography, of course, assumes knowledge of comparative material, leading to an informed description with qualitative weighting; iconology implies intellectual penetration on a hermeneutical level. Musicologists have come to adopt these methodological ideas for their purposes, and in the 1970s and 80s came to consider their particular relevance for musical iconography. Emanuel Winternitz advocated the term 'musical iconology', although he himself rarely penetrated to the analytical level that it implies. That term, because it is so loaded, is rarely used.

More recently, art history, like musicology has paid increasing attention to semantic pluralism in matters of interpretation. In musical iconography this pertains both to the subject matter (the way music has been appreciated in the course of time) and the medium (the way a painting has been seen in the course of time). Hence in musical iconography the hermeneutical equation operates with two unknowns because the codes for what can be represented in the visual medium and what can be performed in the aural one are not the same. For example: there was never a place where the hierarchy of pictorial genres was more codified than in France during the *ancien régime*. This must be taken into account in explaining the absence of representations of musicians in the iconography of ceremonies at that time. The cultural code assigned to minstrels was so low on the scale of pictorial subjects that they could not be allowed to appear in pictures although they played a crucial role in the ceremony itself (Charles-Dominique, E1996). But there are contrary examples: musical caricatures and satirical images can represent music that is not aurally acceptable or feasible.

Furthermore, analysis can be complicated by the juxtaposition of different cultures, when the creator of the picture, although a witness of the event, is not part of the music culture. Thus pictures even including photographs made by colonial explorers, travellers or ethnomusicologists originate with authors from a culture different from the one they are depicting. Here the second unknown in the equation appears whenever tensions arise between an 'emic' and an 'etic' viewpoint (in the literal sense).

Iconography

II. Sources

Any document that visualizes music either concretely or abstractly is an artist's reflection on music and hence an object for iconography. The material ranges from photographs to figurative and abstract art; it can be

an illustration of a text, or an image stemming from an orally transmitted story, or it may lack any textual base. One step further removed are decorations of musical instruments and the musical instrument as an image; stage decorations for musical theatre; the design of places and buildings where music is performed; the photo of a composer's studio and so on. A special case are pictures inspiring musicians to programmatic compositions. Finally, the study of synaesthetical concepts governing both music and the visual arts are also sometimes considered as belonging to the field of musical iconography.

Every culture provides us with sources of various types. The individual mix depends very much on the place the two arts have in a particular cultural system: their role in religion, their social importance and their relationship to a literate, semi-literate or non-literate tradition.

1. Manuscript and book illustration.
2. Pictures with no direct textual base.
3. The single picture.
4. Instruments.

6. Contextual sources: performance sites.
7. Music after pictures.

Iconography, §II: Sources

1. Manuscript and book illustration.

The typical procedure for producing an illustrated text begins with decisions about the overall design and the placement of text, musical notation (where given) and picture (Seebass, B1987). When the scribe has written his part, he hands the manuscript to the music scribe, and finally the illustrator takes over. It would be wrong to assume that the illustrator always fully understands the text. Often he is guided by any surrounding music, but if the music mentioned in the text has no equivalent in the painter's everyday world, he may cling to the text at the expense of visual coherence or feasibility, or may take his picture, partly or entirely, from another visual source – a model book or a woodcut, either by tracing through from an earlier manuscript or free copying.

A fascinating example is the illustration of Virdung's *Musica getutscht*, the product of a collaboration between the author (Sebastian Virdung), the publisher (Michael Furter, who decided how much decoration he could afford, hired typesetters and woodcutters and was responsible for the layout) and the main illustrator (Urs Graf, artist and mercenary). Virdung furnished some pictures of instruments from other books (such as the Dance of Death cycle) and sketches. Graf made only two sketches, a lutenist and two hands pulling strings, both technically challenging. The main work rested with the woodcutter who transformed these and other models into drawings and transferred them to the woodblock. With the typesetter, he arranged them together with the borders, which Furter had in stock in his print shop. The illustrations are thus a fairly heterogeneous compilation, while the text is laid out straightforwardly.

For a classification of such sources the nature of the text provides a natural criterion, distinguishing illustrations for treatises in music theory from illustrations of narratives that mention music-making.

(i) Theoretical texts.

The woodcuts in Virdung's treatise remind the reader of what he has seen and heard on various musical occasions; they are not very lucid for anyone with more detailed knowledge. But illustrators can go much further as far as details are concerned if the purpose is not merely to serve as an *aide mémoire* but to explain construction (even indicating scales, as in Praetorius's organography) and acoustical aspects: they may complement the text and enable the reader to build the instrument or better understand sound production.

Of another kind are illustrations that embody symbolical or numerological meanings of musical scales and instruments. They integrate concepts of their sister arts, arithmetics, geometry and astronomy, and transform schemes into *figurae*, visual symbols with spiritual power and emblematic quality (Seebass, B1987; van Deusen, 1989). The most prominent examples are the illustrations of the Carolingian treatise 'Cogor, ut te, Dardane' (Hammerstein, F1959) copied for over 500 years, and the illustrations of Isidore of Seville's treatise on musical instruments (*I-Tn* R 454, *olim* D III 19 ff.33v–34v).

(ii) Narrative and synthesis.

Byzantinists describing, identifying and classifying illustrated manuscripts differentiate significantly between continuous illustrations that are action-orientated (a practice in monastic redactions of Byzantine psalters) and illustrations that condense events, represent and interpret them in a christological and teleological fashion (aristocratic redaction in Constantinople). While the former are close to the text, with the miniatures typically placed in the margin, the latter interrupt the text across the columns or are placed on an extra page.

This differentiation also applies to manuscript illustration elsewhere, and is important to musical iconography in particular. Pictures of the synthesizing type may be complex constructions produced by multiple exegesis. Compiling various meanings into one image, artists apply two or more of the four doctrines of scriptural meaning, *sensus literalis*, *sensus allegoricus*, *sensus tropologicus* and *sensus anagogicus*. For example, in the literal sense, the figure of David is the musician in his various roles according to the story (shepherd, court musician, composer-performer of psalms, founder of the liturgy in the Temple). In the allegorical sense, he is the precursor of Christ and the founder of Christian liturgy, accompanied by his four liturgists (Asaph, Eman, Ethan and Idithun) as precursors of the four evangelists. In the tropological sense, he is the model musician, knowledgeable in music theory and modality (*musicus*) and the perfect singer (*cantor*). In the anagogical sense he is the leader for singing the celestial Alleluia. An example is the famous drawing at the beginning of the Cambridge Psalter (*GB-Cjc* B 18, f.1, early 12th century; Seebass, *Musikdarstellung*, E1973, pl.111) or the miniature illustrating Psalm cl in the Stuttgart Psalter (*D-Slv* bibl. f.23, f.163v, c830; Seebass, *Musikdarstellung*, E1973, pl.93).

The smallest version of the second type of illustration are figurative initials for the different sections of a text. One degree higher are larger images

covering the content of chapters, and a further degree higher are illustrated title pages and frontispieces (the *verso* of the leaf preceding the title ('looking at the title')). Here the content and meaning of the images extend to the most relevant aspects of the succeeding chapter or to the significance of the book as a whole. A famous example of a full-page miniature carrying meaning beyond the textual content of the following pages is the frontispiece of a manuscript of Notre Dame polyphony (*I-FI* plut.XIX.27), organized according to music-theoretical principles with figurative initials in which little scenes illustrate the song texts. The miniature is unrelated to them: instead it displays the Boethian threefold system of cosmic, terrestrial, and acoustical harmony, suggesting that the manuscripts should be understood as a symbol of human effort to emulate and prove concepts of divine harmony.

The idea of a marginal narrative illustration can also be seen at work in narrative frescoes and tapestries, while the synthetical illustration has a parallel in autonomous panel painting. Finally, the semantic richness of an illustrated manuscript or book may also include the decorative element in the form of geometrical or ornamental designs and the *drôlerie* in the margin.

[Iconography, §II: Sources](#)

2. Pictures with no direct textual base.

This category embraces figurative friezes, frescoes and tapestries. Once the textual 'support' is absent, the pictorial genre will change: the context is not textual in the literal sense and the reader is replaced by the onlooker. Tapestries, friezes on vase paintings and frescoes on the walls of temples and churches are not meant only for *litterati* and require a different technique of conveying content. Some of these frescoes do in fact tell stories, either already known to the onlooker or to be explained by an expert guide. They presuppose a text (sometimes providing hints by inserted short inscriptions or bands with texts) and in this respect can be analysed almost like illustrations. Some of them are narrative in character, for example some of the music scenes on Greek vase paintings of the classical period telling us about myths and rituals; others are more programmatic, such as the tympana of Romanesque and Gothic churches with the 24 Elders of the Apocalypse praising the Lord with their instruments, or the Buddhist paradise where musicians and dancers perform before the Buddha (cave paintings of Dunhuang in west China or reliefs at the upper level of the temple of Borobudur, Central Java). The group of viewers for which a picture is created has a decisive influence on the mode of depiction. Equally important is the homiletic essence of the theme. At Borobudur, the reliefs at the lower level tell stories taking place in the sinful world and represent music scenes involving the local Javanese population; the reliefs at the higher level represent music in a paradise modelled after South Asian court fashion.

A rare case of a narrative fresco is the *Beethovenfries* painted by Gustav Klimt in the Secession building in Vienna. It illustrates and interprets a musical text – Beethoven's Ninth Symphony – requiring the spectator to recall the structural layout and content of the movements in succession while walking along the frieze. When the visitor turns to the last wall, Max

Klinger's statue of Beethoven, in the centre of the adjacent room, comes into view, remaining in sight until he or she reaches the end of the frieze and the final chorus of the finale.

[Iconography, §II: Sources](#)

3. The single picture.

The most widely spread category of sources is the single picture, including paintings, sculptures and photographs. Occasionally it is extracted, with little change from a series of pictures and can be identified and analysed accordingly. But by far the most frequent case is the autonomous image. It must be analysed with the cultural context and pictorial tradition in mind, but on its own terms. If its content is related to music, it requires in addition an understanding of the musical culture at the time of its making, particularly of aesthetics, since these will shape the artist's horizon as much as the visible side of musical performance. With a subject matter as invisible as sound the process of its transformation into an image is complex. How this transformation is achieved depends on the theme and the medium. A devotional oil painting of St Cecilia would be on the abstract side, and so would a woodcut of an emblem. By contrast, a banquet scene with musical entertainment on a silk screen is to be understood in real terms (see also §§III–IV below).

[Iconography, §II: Sources](#)

4. Instruments.

For most cultures, musical instruments are not just tools that increase human ability to produce sound; they also possess an animistic component. Curt Sachs (J1929) was the first to point out that they were icons or musical spirits given concrete form. To emphasize this link they are often endowed with anthropomorphic elements, such as body outlines, facial features, sex organs. Where they belong to animal cults they may take on zoomorphic elements. Four examples may serve as illustration. First, there exist bowed instruments that show visual and terminological links to North Asian horse cults (Tsuge, J1976). Secondly, certain Latin American Indians wear zoomorphic clay whistles as charms and play them to evoke the spirit of the protecting animal (Olsen, J1986). Thirdly, a Beneventan double flute from the early 20th century, made from a single piece of wood but simulating two flutes bound together (fig.1), has an anthropomorphic appearance with the two air holes at the wedges suggesting the eyes, and the lowest part of the pipes (separated from each other) the feet. The flute is used as a wedding gift and the decorative carving in the central band shows a couple, man and woman, standing for the left and right pipes which are tuned a 3rd apart and called male and female; below, a larger hermaphrodite is shown between the two pipes. Thus the instrument both by its shape and by its decoration incorporates the idea of unification of male and female, also realized by the dyophonic playing (Guizzi, B1990). Lastly, a phallic slit drum, belonging to a village chief in Lombok (Indonesia), was positioned vertically and had the shape of a fish with its head bearing hermaphroditic elements; when it was played at a fertility ritual, the act symbolized the fruitful marriage between the chief and the village (Meyer, J1939).

In many cultures instrument makers do not stop at the level of functionality when they build instruments but invest additional labour and cost in decorating them with pictures, thus increasing their value. Sometimes the decoration has no figurative content and simply beautifies the object, such as the prospect of an organ, the burnt-in decorations of a Balinese *suling* or an East African *mbira*, or the intarsia of a music table. Sometimes the decoration has ritual or magic purposes and supports the ceremony performed with the instrument. Examples include Van Eyck's painted organ shutters (Ghent, St Bavo), Lucca della Robbia's balcony for the *cantoria* (Florence, Museo del'Opera de Duomo), with the reliefs illustrating music-making according to Psalm 113, or the cosmos painted on the shaman's drum showing the upper, central and nether worlds through which the shaman travels during his performance in search of spirits (Emsheimer, 1988). Sometimes the purpose is to heighten the prestige of the owner or to add visual pleasures to the aural ones during the performance, as is the case with painted harpsichord lids. The subject matter of such pictures reaches from concrete musical scenes to social or spiritual symbolism.

[Iconography, §II: Sources](#)

5. Stage decorations, record jackets.

One step removed from direct reference are the decorations and costumes for dance drama and musical theatre. Sometimes it is impossible to distinguish them from the stage decoration for theatre plays. But there is a difference between the texts of regular plays and opera librettos: libretto texts do not exhaust the subject but rather provide a dramatic and lyric frame for the composer. With the content of opera thus depending on both text and music, the visual component will also derive its purpose, style and subject matter from the music.

The character of stage decorations cannot be defined for the entire history of musical theatre. Sometimes it is a work of art in its own right; sometimes it has an auxiliary function like applied art for providing no more than a backdrop or platform for the dramatic action. Sometimes it is closely wedded to music and text, as in Richard Wagner's *Gesamtkunstwerk*. Sometimes it may add a further dimension to the content of music and text, as in the stage decorations that Schoenberg designed for his works and in the collaborative productions in Paris among Satie, Cocteau and Picasso (*Parade*, 1917) or Stravinsky's ballets.

Conceptually, the art of jackets for recordings belong to the same category. Here the thematic possibilities are innumerable and reach from historied pictures of performances and musicians' portraits to visual emulations of the structural, emotional, social or political content of the music.

[Iconography, §II: Sources](#)

6. Contextual sources: performance sites.

Places of ritual activity are not chosen by chance; ritual music is embedded in the visual and spiritual ambience of the site. Of course, in principle the spatial requirements of the ritual take precedence over musical ones. But, as long as the performance requirements are not in conflict with more important considerations, they will be observed so as to make the acoustical conditions, the space for dancing and the placement of

musicians as favourable as possible. The more the purpose of the event shifts from the sacred towards the secular, the more music and dance will be the primary aspect of the event and will dictate the setting. Concert halls, opera houses, ballrooms, and music pavilions provide the opportunity for architects and engineers to combine functional criteria with aesthetic ones; they are among the most neglected objects of music-iconographical research. (For harmonic proportions in the other arts, see below, §III, 5.)

As to the interior decorations of rooms in which music is performed, the most prominent instance of a music room in Western culture with completely integrated decoration is the *studiolo* of the Italian Renaissance. Musical instruments and music books are represented in intarsia technique together with bookcases and other symbols of learning and the sophisticated use of leisure. A visual element in every music room is the musical instrument itself, be it the upright piano in the 19th-century bourgeois household or the *qin* suspended on the wall of a Chinese scholar's study.

A very popular type of book is the illustrated biography of a composer that displays a hotch-potch of *visualia* with rarely any discrimination, let alone any iconographical commentary. Nevertheless, in as far as the visual environment of a musician shapes his or her personality, and as far as it influences the users of the book, it is relevant for a psychogram of the musician and for reception history.

[Iconography, §II: Sources](#)

7. Music after pictures.

The increasing interest of 19th-century European artists in synaesthetic experiences led to the search for inspiration from outside the original medium. In music the result is the cultivation of programme music with literary themes as the main source and paintings an additional one (see [Programme music, §2](#)). Liszt used both media as an inspiration for his compositions.

His *Totentanz* (for piano and orchestra, 1839–65) drew from the dance of death cycles and the 14th-century painting *Triumph of Death* in the Camposanto of Pisa. His *Hunnenschlacht* for two pianos was inspired by the painting of that title by Wilhelm von Kaulbach (1856–7). Together with Dionys Brucker he played it in front of the picture.

The popularity of musical ideas derived from the visual arts decreased early in the 20th century – just at the time when a new artistic medium, film, made its appearance. The successor of music after paintings was film music, which in turn was replaced by composition for the sound track of films (see [Film music](#)).

III. Themes

1. [Religious themes.](#)
2. [Secular themes.](#)
3. [Symbolic representations.](#)
4. [Portraits.](#)

5. Synaesthetics. Iconography, §III: Themes

1. Religious themes.

While a categorical split between sacred and secular music themes would frequently fail to do justice both to the contextual complexities of musical occasions and to the multiplicity of an image's meanings, it can nevertheless be said that in pictures with religious, metaphysical and philosophical subject matter the layers of meaning tend to be more numerous. It is no coincidence that the doctrine of fourfold meaning of scripture (and image) mentioned above was developed by theologians. On the other hand, sacred themes, in as far as they depict rituals, are also tied to the reality of any given culture, past or present. Some of the most important musical themes in religious art are considered below.

(i) The Christian and Jewish world.

In Christian and Jewish musical iconography Bible stories furnish a number of themes, in use for nearly 2000 years. The most important ones are:

(a) Acclamation to God after the crossing of the Red Sea by the prophetess Miriam and the women of Israel (after *Exodus* xv.20–21);

(b) Acclamation to a ruler by the women of Israel (*1 Samuel* xviii.6–7 for David; *Judges* xi.34 for Jephtha);

(c) Universal acclamation by the believer to God (after Psalm cl);

(d) Banquet scenes with music and dance (*Genesis* xl.20 in Egypt; *Luke* xv.13: lost son; *Matthew* xiv.6–7, *Mark* vi.21–2: banquet of Herod with Salome dancing);

(e) David playing his lyre or harp to soothe Saul's mental illness (*1 Samuel* xvi.14–23);

(f) The transfer of the Ark to Jerusalem with music and David dancing (*2 Samuel* vi.12–16);

(g) King David performing psalms with his lyre or harp (*Psalms*, *passim*);

(h) King David establishing liturgical service with instrumental music in the Temple (*1 Chronicles* xv.16–22; xxv.1–7);

(i) The derision at Christ on the Cross;

(j) The angels of the Last Judgment blowing trumpets or horns (*Revelation*, *passim*);

(k) The acclamation of the 24 Elders to the Lord (*Revelation*, *passim*).

In Western Christian history, many of these musical scenes gave rise to offsprings with theological, philosophical or music-theoretical conceptualizations. The most prominent examples are the canonized image of 'David and his four liturgists, Asaph, Eman, Ethan, and Idithun' (Steger, E1961), pictures of the eight modes (e.g. on two capitals of Cluny (Schrade, E1929) and in *F-Pn* lat.1118, ff.104r–114r (Seebass,

Musikdarstellung, E1973), the so-called 'Angel Concerts', paintings of angelic acclamations in Marian iconography (e.g. the Nativity or Mary's ascent to heaven), or as decorations of church interiors acting as analogies for the believer, and biblical or saintly figures serving as patrons for music, such as Jubal, Tubalcain, David, and St Cecilia and the Dance of Death cycles and its relatives. As a counterbalance to the elevated character of image or text, artists create a droll world where animalistic and grotesque elements may have a place.

(ii) Islamic and Buddhist images.

Two major non-Western religions, Islam and Buddhism, place 'Music and Dance in Paradise' at the centre of their dogma. Both shape their vision after the reality of courtly entertainment. For Islam, the setting – developed from the original Persian idea of a fenced hunting ground – is a garden with water sources and shady trees, where drinks are provided and music and dance performed. For Buddhism, the setting is more formal: the Buddha or a Bodhisattva is sitting on a throne, surrounded by followers, while in front of him, often on a stage, a dance performance with orchestral accompaniment is taking place.

(iii) Images of rituals.

Most non-Western religions match or surpass Christianity as far as the role of music for rituals is concerned. Whether or not music scenes are depicted depends on the value placed on visual representations. Examples include:

(a) outdoor rituals linked to fertility cults, such as the representation of mother cult with dancing women on Minoan gems or the veneration of the sun in a painting in an Aztec manuscript (Martí, C1970);

(b) shamanistic rituals linked to curing the sick, calling down rain, hunting or warfare;

(c) funeral rites, such as dance and music at the bier of the deceased on Greek vase paintings (Wegner, C1963), the soul-ship with bronze drums and mouth organ players on South-east Asian bronze drums (Pirazzoli-t'Serstevens, H1988) or dance and drumming at a funeral represented on a Yoruba clay pot (Willet, H1977); and

(d) temple rituals.

(iv) Myths.

Myths are related to both the sacred and the secular world, sometimes referring to rituals, sometimes to daily life with its ceremonies and entertainments. Not infrequently, in the course of history, they move from the sacred to the secular or change meaning in other ways. The European Renaissance and Baroque furnish examples, for example the split in the conception of the figure of Dionysus, who appears in the Renaissance not only as the divine representation of ecstasy and magic but also as Bacchus, the drunkard.

Particularly rich in music scenes are the myths of Near Eastern and Greek cultures of Antiquity and their offsprings (such as the tale of Alexander that

spread from eastern Christian cultures to the West and also far into Asia; fig.2), as well as Hinduism and Buddhism.

[Iconography, §III: Themes](#)

2. Secular themes.

The demarcation lines between ritual, liturgical and religious on one side and ceremonial, private, and secular on the other are not of course, always clear. Until the formation of an urban middle class, music and art as leisure activities were developed by the upper levels of societies with a literate tradition. Their economic surplus permitted the well-to-do to keep musicians who would entertain them and painters who would celebrate, among other themes, their musical activities.

In non-literate cultures, portrayals of musical esturity are usually connected with rituals; other musical occasions find their way only slowly into pictorial representation. This happens through two different avenues. One leads through secularization of the popular culture itself; it absorbs and there imitates the modalities of upper-class life. The other proceeds in the opposite direction: the upper class reflect in their art the culture of lower classes, for encyclopaedic or satirical purposes, out of a wish to regain Arcadian innocence, or through ethnic or social interest. When the borderlines between the strata disappear, the visual themes lose their attachment to the previous social environment and become available to everyone until new relationships are formed.

A list of secular pictorial themes that pertain to music should include:

(a) pictures celebrating the political power and cultural patronage of the sponsor with representations of court music of the formal type (acclamations, receptions, festive music with dance, triumphal processions etc.; fig.3);

(b) the genre painting and pictures originating in less formal contexts with representations of informal music-making at court and among the educated (music and art for their own sake, in the salon or the homes of the bourgeoisie, for leisure, hunting etc.). Two topics – music and love-making, and the music lesson – are preferred themes in genre painting; they are no less frequent in East Asia, often in combination with drinking and eating, on drinking cups and dishes and eating bowls made of silver or ceramic, in miniature painting, on silk screens etc.;

(c) representations of public music, for battles and tournaments, in processions and cortèges, at weddings and funerals, in the circus, at public baths, at the opera or concerts etc.;

(d) pictures of music as a healing force, sponsor of love etc.;

(e) pictures of popular music in the open, in the tavern, the bordello etc.;

(f) representation of popular music in popular art; and

(g) pictures of bucolic music-making, in which the patron seeks a projection of his world into Arcadia.

[Iconography, §III: Themes](#)

3. Symbolic representations.

(i) Allegory.

The spiritualization of the European culture of the *literati* in late antiquity and the Middle Ages led to the frequent use of allegorization (the personifications of concepts). In accordance with the feminine genus of conceptual terms in Latin, such concepts were personalized as women. Thus depictions of virtues (with *harmonia*) and vices (with *luxuria*), the five senses (with *auditus*), the seven liberal arts (with *musica*), the four winds (as four male wind players) and others remain pervasive in Western iconography until the 18th century. Since the Renaissance they have often been combined with secularized mythical figures from antiquity, such as the Muses, Orpheus, Apollo and Venus, and the astrological children of Venus and Mercury, music-making animals, fabulous creatures and *putti*. Allegories also play a prominent role in the iconography of Baroque feasts and musical theatre and still appear on title pages of music and printers' marks today. They were, before the advent of abstract art, the most important vehicle for the visualization of the ephemeral and magical qualities of music.

The observation above about veiled borderlines, with reference to religious and secular spheres, also applies to transitions from the natural to the ideal and from the ideal to the symbolical. The medieval world uses a few mythical figures and allegories (Prudentius *Psychomachia* and *Physiologus*); the Renaissance adds more of them. Very often allegory and symbolism are combined with naturalism in the same painting.

A famous and fascinating example is the oil painting begun by Giorgione and finished by Titian with the spurious title 'Concert champêtre' (fig.4). It combines shepherds with a lute playing courtier and two females in the country side; as the women are naked accordingly they are likely to be understood as allegories or deities (Nymphs or Muses). There is disagreement among scholars about the roles of these figures; interpretations range from a realistic depiction of a Renaissance music party to an allegory of Poetry, Virtue or Luxury and Abstinence to a neo-Platonic representation of divine and earthly love and finally to the image of 'musical inspiration'. Although the painters could have intended some degree of ambivalence, no interpretation can ignore the fact that there must be a purpose in juxtaposing myth and reality in this scene. A possible reading of the work could be 'Orpheus reborn', a demonstration of the musically educated *corteggiano* to the divine and mortal dwellers of Arcadia.

The relationship between image and idea is probably no less complicated in non-Western musical iconography, but it has yet to be studied. In the first place, the concretization of spiritual concepts in the musical instrument itself should be considered (see §II, 4 above); in the second, the connection between cultic images and cosmological concepts; and in the third, concretizations of synaesthetic concepts such as the Mandala or the Rāgamālā paintings.

(ii) Emblem, still life, vanity images.

Perhaps the most prominent case of a mixture between realism and symbolism is the still life, where various objects such as fruits and other edibles, skulls, musical instruments etc. are combined in an elaborate assembly of symbols for vanity, decay and death. Music, because of its ephemeral nature, is often chosen by poets and artists as a symbol for the fragility of the moment and the transitoriness of life. Because of the quality of its sound, the lute is particularly suitable for the evocation of such associations and is thus the most common instrument in this context, often depicted with a broken string or some other defect. But painters also liked it for its complex three-dimensional shape which challenges their skills in perspective. Still lives and emblems probably are the first areas where synaesthetic equations between silence and emptiness were tried out.

[Iconography, §III: Themes](#)

4. Portraits.

The history of portraits is closely related to the social position of the sitter. The first portraits of musicians appeared in China where musicians had ascended to the classes worthy of portraiture as early as the first centuries ce. In Europe, until the late Middle Ages, professional musicians did not belong to the class vested with highest political or ecclesiastical powers for which portraiture was reserved. The circle of possible sitters widened in the late Middle Ages with the admission of rich burghers and *literati*. It might have been expected that when music portraiture began to surface in the 15th century, the musician would qualify through his status as a *literatus* and his possible academic affiliation, but that is not the case. The portraits of Oswald von Wolkenstein emphasize his social and political position but in only one of them is a music sheet included (MS A-Wn 2777, verso of the front cover). The portrait of Binchois by Jan van Eyck (London, National Gallery) and those of Landini and Paumann on their tombstones celebrate their musicianship and virtuosity, not their compositorial or theoretical skill. Such aspects begin to exert influence only in the 16th century, when portraits appear as frontispieces of musical editions and treatises. The earliest portrait of a musician is the relief on the tombstone of the blind organist Francesco Landini (*d* 1397; Florence, S Lorenzo): his Florentine admirers decided to eternalize his art in stone. About 80 years later another blind instrumentalist, Conrad Paumann (*d* 1473), received the same honour (Munich, Liebfrauenkirche). Landini is shown with an organetto and a personal resemblance is attempted by the indication of the empty eye sockets; Paumann is shown playing the lute and surrounded by other instruments. In both cases the inscription and the musical instruments serve as identifiers.

A musician's portrait as a genre confronts the art or music historian with difficult analytical problems, because almost always the question arises as to how the motive for the commission is related to the content of the picture. If the purpose is, for instance, to portray the musician as a well-to-do bourgeois accepted by society, the painter will not try to represent him as a musical genius but rather will emphasize the impression of worldly wealth and will show the sitter in costly dress with jewellery. If, however, the painter is intent on the visualization of musical gifts, he can either resort to the professional attributes, such as a musical instrument or a music sheet (and these indeed remain throughout history the most common

labels) or he can associate the sitter with mythical models – Orpheus or Apollo for men, Venus, a Muse, or St Cecilia for a woman. Active and naturalistic music-making is surprisingly rare in portraiture; commonly the sitter only holds or touches an instrument. The secondary elements help to make the message of the image clearer or more sophisticated, individualizing the sitter, and defining social or spiritual context. The same function can be assumed by non-musical elements such as objects in the room or paintings on the wall. Sometimes, more ambitiously, the painter attempts a psychogram or even a visualization of that Orphic quality that separates the musician from others. Such paintings are fairly rare and have been little studied.

An exception is van Eyck's portrait of Gilles Binchois (see Panofsky, L1949; Seebass, L1988). Bernardo Strozzi's portrait of Claudio Monteverdi (Innsbruck, Tiroler Landesmuseum Ferdinandeum), Lange's unfinished Mozart portrait (Salzburg, Mozart Museum), Courbet's of Berlioz and Delacroix's of Chopin (both Paris, Louvre), Rodin's bust of Mahler (Philadelphia, Rodin Museum), and Schoenberg's self-portraits could be candidates for such studies.

With the 18th century, musicians' portraits became a favourite pictorial genre, often realized in different media. After the oil painting, the subject was frequently transferred to the miniature, the engraving and the silhouette, so moving from the privacy of direct ownership into the realm of booksellers and art shops, and portraits became accessible to a wider circle of connoisseurs and admirers. The demand created a market and led into the business of collecting. The 18th century also saw the spread of caricatures of musicians, first as sketches passed among friends and then as lithographs and wood engravings for newspapers. Caricatures widened the corpus of pictorial elements used in portraiture and included musical action and the reactions of the audience, to make a statement about the musician's personality. By the 19th century they had come to be the most telling visual mirror of musical reception.

[Iconography, §III: Themes](#)

5. Synaesthetics.

Synaesthetical experiences have a long tradition in East Asian cultures and are verbalized in poetry and visualized in drawings and paintings. The Taoist scholar-musician and the courtesan express in their *qin*-playing their experience of harmony in nature and the absorption of the visible and the poetic; they visualize in their ink-drawings and paintings and verbalize in their poetry musical experience of time filled with sound and silence.

An illustration to a book of Tang poems ([fig.5](#)) may serve as an example (see Gulik, H1940, 2/1969, pp.148–9). It shows a landscape with mountains and water and, in the lower left corner, a human abode where a scholar plays the *qin*. More than any other instrument, the *qin* is literally 'in tune' with nature. In this scene the musician is inspired by the flowering plum tree; there is a twig from it in a vase on his table. This plant is a symbol of spring, with strong erotic connotations and allegedly highly susceptible to music: music-making brings nature and man into harmonious union.

Except for architecture, Western art began to pursue these concepts only in the 19th century.

(i) Visualization of content and process of music.

Although traces can probably be found in earlier centuries (see §III, 4), the first attempts in Europe to visualize the content of music fall into the Romantic period (see 'Musik and bildende Kunst', MGG2).

The Viennese artist Moritz von Schwind, a member of the Schubert circle, often used musical ideas as inspiration for his drawings and paintings. There is, for instance, a series of drawings of a musical procession inspired by Mozart's *Le nozze di Figaro*. There is also *Die Symphonie* (Munich, Staatliche Gemäldesammlung, Neue Pinakothek), where he transformed the dramatic process of a symphony into the narrative of a love story. A third example is the painted ceiling of the foyer of the Vienna opera house with subjects from a number of operas, popular at his time. In all these instances Schwind perceives music and music drama as stories and transforms them into pictorial narratives.

Initiated by the Romantics but fully conceptualized only by the French Symbolists and Wagner is the idea of 'the total work of art' (*Gesamtkunstwerk*) in which the verbal, the visual, and the musical content are expressed by complementary or even mutual means. For the 19th century it was mostly the temporal and emotional musical experience that stimulated visualization in painting by ways of evocation, emotionalization and symbolism.

James McNeill Whistler (1834–1903), *Harmony in Green and Rose* (1860–61; Washington DC, Freer Gallery; fig.6), shows an interior in bright daylight with decorative curtains, a child reading, a woman standing in a black dress and another sitting woman visible through a mirror; there are very few elements in the colours indicated by the title. More programmatic are Fantin Latour's paintings illustrating Wagner's *Der Ring des Nibelungen* and Max Klinger's series of etchings inserted in the score of Brahms *Vier Lieder* op.96 (Berlin and New York, 1886), called *Brahms-Phantasie*. The latest monumental example of a visualization of the spiritual programme of music and of its creator is the display in the building of the Viennese *Secession* consisting of a combination of Gustav Klimt's frieze visualizing the ethical message of Beethoven's Ninth Symphony with Klinger's monument of Beethoven, the post-Christian genius (see above, §II, 2).

(ii) Visualization of structures.

The Pythagoreans established direct links between musical structures and those in the other arts and sciences. But it was only during the time of humanism, with architecture taking the lead, that these parallels began to be effectively explored. In painting, the Romantics were the first to pursue such parallels. Philipp Otto Runge wrote to Karl Privat (4 August, 1802) that his painting *Lehrstunde der Nachtigall* was analogous to a fugue: 'Here I learnt that similar things happen in our [visual] art, namely that it becomes easier if one understands the musical structure underlying a composition and if it repeatedly shines through the work' (Runge, M1942, pp.124–5). The 20th century relied mostly on structuralism as the sponsor of

synaesthetic ideas: the idea of the composer as a constructor, and music as a construction, fascinated artists. In most cases the parallels are sought out intuitively, as for instance in Satie's *Sports et divertissements*, composed after the coloured engravings by Charles Martin, or in Paul Klee's paintings with musical subject matter. Others experimented with almost mechanical transfers of the parameters of sound and colour, surface and line (see Skryabin's *Prométhée* or Robert Strübin's *Musikbild - Frédéric Chopin, Scherzo II, Opus 31...*, Basle, Kunstmuseum).

An interdisciplinary reflection between painter and composer occurred in the circle of the *Blaue Reiter* in Munich, where Kandinsky and Schoenberg developed parallel theories for abstract art and atonal, 12-note music. Kandinsky, in his epochal treatise *Über das Geistige in der Kunst* (1911), writes in Chapter 4 that music, for centuries, succeeds 'in using its means not for the representation of the phenomena of Nature but for the expression of the emotional life of the artist and for the creation of an autonomous life [*eigenartiges Leben*] of musical sound'. To imagine colours means to hear inner sounds. Shapes and colours have a musical resonance for the onlooker. Seeking representation of the internal, the visual arts use music as their model. 'This explains the contemporary artist's search for rhythm, for mathematical, abstract construction, the modern esteem for the repetition of coloured sound, the way in which colour can be made to move etc.' (ed. M. Bill, Berne, 8/1965, pp.54–5).

It is principally the idea of music as a composed work that provides the basis for synaesthetic experiments and the stipulation of colours and forms. Hence painters' frequent adoption of the term 'composition' or 'fugue' as titles for their canvasses. M.K. Čiurlionis, himself both painter and composer, did this (even with four-'movement' sets of paintings as 'sonatas' in the early years of the century). Lionel Feininger and especially Paul Klee were also leading figures. While Klee never reflected on the aesthetic inconsistency between musical structures of the past and abstract art of the present, Kandinsky saw in Schoenberg's compositions with 12 notes of equal importance the last consequence of a constructionism that had been immanent in music for centuries but absent in concrete art. Others, for example Franz Marc, emphasize the move into abstraction in both arts as the result of a revolutionary break with the past.

The most typical aspect of music, its process in time, is for obvious reasons rarely a subject for visualization (and even more rarely a subject of art historical analysis). A happy exception among modern works with musical subject matter is Mondrian's painting *Broadway Boogie Woogie* (1942–3; New York, Museum of Modern Art): using the flickering neon lights of Manhattan at night as a mediating metaphor, it successfully translates the ostinato pattern, the running rhythm and the exhilarating mood of the music into a network of coloured dots.

[Iconography](#)

IV. Depictions

1. Instruments.

The more historically remote a music culture is from the present time, the more difficult it is to assemble evidence. In non-Western cultures and in earlier periods of European culture musical notation was rare and covered only a select repertory. Scholars dealing with pre-history, ancient and medieval cultures have therefore long resorted to the study of pictures and texts. In the 19th century, with positivism prevailing, depictions of musical instruments were taken *prima facie*, but in the first quarter of the 20th-century attitudes began to change.

How much we can trust a picture over organological detail and the accuracy of its representation of performance depends on many factors, of which the most obvious is the picture's purpose. If its aim is the naturalistic representation of reality, if it wants to testify to a patron's musical taste and glorify his sponsorship, accuracy will be a major concern and the image may be suitable for organological analysis. A second factor is the stylistic environment, in art-historical terms. While Graeco-Roman art and the Renaissance seek the study and imitation of nature, the Middle Ages and the late 19th century set different priorities. A third point is the technical interest in creating likeness of image and object, for example in matters of perspective, colour or material – an endeavour typical for the painters of still lifes, for example. But if the content is emblematic or symbolical, if it crosses the borders of time and place, the artist may content himself with a few identifiers of shape or handling of an instrument.

In all contexts, organological eclecticism seems to be the norm among artists; they may pay attention to the correct handling of instruments but not to the grouping of players or overall proportions; they may be faithful to the combination of participants but not to the reaction of the audience, to details of the instrument or to the musical notation. Furthermore, the artistic medium may place limit upon accuracy. A thick brush would not allow the drawing of details necessary for the depiction of a Boehm clarinet or a mouth organ; the harp is unsuitable for representation in a clay sculpture.

Terminological considerations may be of crucial importance. The instrument in a picture (fig.7) may be determined in modern language as a triangular psaltery; following the organological terminology of Sachs and Hornbostel it may be called a box zither, in the class of chordophones; or the caption 'psalterium decacordum' (although it shows 20 strings) may be followed linking it to the scientific language of the contemporary medieval scholar; it can be called a 'rotte', as Herrad of Landsberg probably did in her mother tongue.

It is clear, then, that pictures of instruments yield the most reliable conclusions if the context is thoroughly explored and as much comparative material as possible (such as texts and other pictures) is assembled. In pre-historic and non-literate cultures, pictorial and archaeological evidence are the only source for the reconstruction of the past. In literate cultures of antiquity, in East and West, texts may join the two other sources; the three together (with pictures predominant) permit an amazingly detailed insight into the musical life of certain social strata, as can easily be gathered from the pertinent sections in a number of articles in this dictionary. This remains true for the Eastern Middle Ages too, but not for Western Europe, where literate culture almost disappeared. In the last 500 years, extant

instruments have slowly replaced other types of evidence and have relegated pictorial sources to a secondary role.

2. Scores.

The visual arts were of special importance to the invention of music engraving. The technique goes back to the image-motets of the late 16th-century Netherlands inspired by panel paintings with painted music leaves (Seiffert, F1918–19; Hammerstein, F1991). Musical notation in paintings usually poses fewer problems of interpretation than musical instruments and performance, because the line between the legible and the illegible is clear. If the artist merely wants to indicate that composed and written music is intended, a simile is sufficient. But if the musical text provides the key to an understanding of the picture, it will be given as precisely as necessary for identification.

3. Performance.

What has been said about organological analysis of pictures also applies in some degree to the study of performing practice. If the representation of musical execution is supposed to give details of handling, the reliability may be treacherous, because the artist is not generally also a musician, and, as the precise significance of (for example) a violinist's hand position will not be plain to him or her, will be likely to err. If the emphasis is on gesture, body movement, and physical expression, a good deal of 'truthfulness' can be expected. The visual aspects of music-making, the affect by which the musician is driven, and the effects music exerts on audiences are attractive features for artists whose goal it is to visualize music as a unique art form. Standard formations of musical ensembles such as the *capella alta* for dance music in the Renaissance or a string quartet are most likely to be captured unchanged, but where ensembles are large or not closely defined by the genre, non-musical considerations or technical limitation come into play (fig.3). After all, the impression of completeness in a caricature of a symphony orchestra or African ensemble of drummers and dancers is more relevant to the viewer than precise numbers or correct positioning. Aesthetic considerations of space and distribution of pictorial elements and colours may well take precedence over accuracy as far as aspects of performance are concerned. Finally there is an enormous mass of images where social messages or emblematic contents drastically overrule naturalistic depiction or where social factors take precedence over the hierarchy among musicians or where combinations of players stand for spiritual concepts rather than actual performance.

4. Dance.

A coherent theory of dance iconography, in particular of the visualization of rhythm, is still lacking (Seebass, E1991). But much of what has been said about the iconography of music applies equally to dance. A fundamental difference is that dance is visible; the primary element does not have to be translated. This gives the dance picture a proximity to the performance that is not open to the music picture.

The specific nature of dance has a direct impact on its visualization. Dance types based on improvised kinetic flow or on individualized expression resist depiction since their main feature is a process in time (fig.8). By contrast, dance types consisting of a series of positions lend themselves easily to depiction, since each position captures the essence of the meaning of the choreutic moment. Such dances are found in the courtly milieu in Asia and in the European ballet. Some Asian dance cultures – probably as a result of the cultivation of dance drama – have equated dance positions with emotions and thoughts. The most prominent example is the Indian *rasa* system, precisely described emotions formalized in positions of the body (or its parts) and representable through the visual arts, or actualized in dance. Here, too, as in the cases of the emblematic use of musical instruments, the term *figura* is useful. Artist and dancer can gain their vision of this *figura* in meditation and there is no fundamental difference whether it is ultimately carved into a stone relief, acted out in dancing or only through words. The dancing Śiva is experienced both as an act and an image.

Whenever the planometric design of a complete dance (Greek *orchēsis*) results in an image or a letter, it can obtain at least the quality of an emblem, if not a *figura*. Sometimes it remains observable as a groove in the ice or in the sand (e.g. an Indian snake dance) sometimes it leaves no trace on the ground but the painter or engraver can represent it as a summary (e.g. in engravings of Baroque dance festivities). Otherwise the iconographer will have to rely on the secondary elements as identifiers, such as the age and sex of participants, the headdress, the costume and specific paraphernalia (such as flowers or weapons).

See [International Council for Traditional Music](#).

Ictus

(Lat.).

A term which in prosody indicates the stress or accent schematically implied on a certain syllable of a foot or verse; hence, in music, it is a comparable stress or accent schematically implied on a certain beat of a bar, in a certain metre, whether or not this implication coincides with the stress or accent actually made. In the editions of Gregorian chant produced by the monks of [Solesmes](#), the *ictus* is a sign which indicates rhythmic groupings of two and three notes. The term is also used in relation to conducting patterns, to describe the downbeat.

ROBERT DONINGTON

Idakka [itekka, edakkyā].

A variable tension hourglass drum of Kerala, South-west India. The body, from 21 to 26 cm long and about 1 cm thick, is of acacia or red sandalwood; it is slightly waisted in the middle (see illustration). The shell-faces are about 11 cm wide, the drumheads about double that. The skins, made of the internal stomach-wall of a cow, are pasted to thick jakwood hoops (about 2 cm in diameter) with six holes drilled in each for the V-lacings which are tightened by a central cross-lacing. Four large decoratively turned wooden dowels hung with 64 multi-coloured tassels are inserted as tuning-sticks between the lacing. The heads are simply held over the faces by the lacing, usually off centre. Beneath them is a snare of two crossed palmyra fibres held on four copper nails. The drum is suspended from a strap on the left shoulder. The right hand beats the front face with a thin wooden or horn stick, slightly curved at the tip; the player varies the timbre and pitch over a range of up to two octaves by squeezing the lacing and pushing against the shoulder-strap with the left hand.

The *idakka* is a temple drum used by the hereditary temple musician caste, the Mārār, and by the Poduvāl in North Kerala; it is played in temple worship, processions, the ceremonial ensemble *pañcuvādyam*, the devotional music *sopānā sangīta*, performed on temple steps, and the Sanskrit drama *kutiyattam*. Its pitch range is so large that it is sometimes played melodically. There is a tradition that it must never be placed on the ground.

ALASTAIR DICK/R

Idée fixe

(Fr.: 'obsession').

A term coined by Berlioz to denote a musical idea used obsessively. When in 1830 he applied it to the principal theme of his *Symphonie fantastique*, it was a new term in the French language. At about the same time Balzac used it in *Gobseck* to describe an obsessive idea, and it came into use as a

clinical term for unreasonable or even criminal obsession. Berlioz used the theme to describe the artist's obsession with his beloved. In December 1832 Fétis drew attention to the novelty of the idea (*Revue musicale*, xii, 365–7). The theme recurs in each of the five movements of the symphony and in the first supplies the main thematic material of the Allegro. Subsequently it is transformed to fit the context of the various movements, for example into waltz time for the ball and into the grotesque, distorted dance for the final 'Ronde du Sabbat'. Berlioz recalled the theme in the sequel to the symphony, *Lélio*, and another recurrent theme occurs in his *Harold en Italie* (1834). Many later composers have taken up the idea of a recurrent, obsessive theme in symphonic works.

HUGH MACDONALD

Idelsohn, Abraham Zvi

(*b* Filzburg, nr Libau [now Liepāja, Latvia], 11 June 1882; *d* Johannesburg, 15 Aug 1938). Jewish cantor and musicologist of Russian birth. Raised in a traditional German Jewish environment, he trained as a cantor in Libau; he also studied briefly at Königsberg (now Kaliningrad) where he met Eduard Birnbaum. Later he studied at the Stern Conservatory in Berlin and at the conservatory and university in Leipzig; his claim to have studied at both institutions with Kretzschmar (history), Zöllner (composition) and Jadassohn (harmony) remains unsubstantiated. He served as cantor at the Adat Jeshurun congregation, Leipzig (1902). From 1903 to 1905 he was a cantor at Regensburg and then after a year in Johannesburg he was persuaded by the president of the Zionist movement, David Wolffsohn, to emigrate to Jerusalem, where he lived from 1906 to 1921. These were decisive years for Idelsohn's research into the diverse musical traditions of the Sephardi and 'Oriental' Jewish communities and Muslim and Christian sects. Although his plans in 1910 for an Institute for Jewish Music never materialized, he was invited in 1913 to present his early recordings to the Akademie der Wissenschaften in Vienna. He remained there for eight months and laid the groundwork for his monumental *Hebräisch-orientalischer Melodienschatz* (1914–33) with the help of the academy director. After serving in the Turkish army, he returned to teaching, research and composition in 1919: his five-act opera *Jiftah* was performed and published in Jerusalem in 1922, and he transcribed and composed much cantorial music (including the songs *Havah negilah* and *Orah, orah*). In 1921 he left Jerusalem and after an extended lecture tour he settled in Cincinnati (1922–30). He was appointed professor of Jewish music and liturgy at the Hebrew Union College in 1924. The college became a centre of research in Jewish music through his work, which was aided by the extensive Birnbaum collection. He wrote prolifically on the history and liturgy of Jewish music and his publications included two major books, the last five volumes of his *Melodienschatz* (on Ashkenazi music) and numerous essays. He also composed several complete synagogue services. He suffered a heart attack in 1930 and by 1934 he could no longer work; in 1937 he moved to be with his family in Johannesburg. Hebrew Union College conferred an honorary doctorate on him in 1933.

Idelsohn was the first to apply the methods of comparative musicology to the study of Jewish music, and was also first to record music on wax cylinders in Palestine. His articles on the *maqām* system in Arab music and the practice of singing Hebrew poems in 'Oriental' Jewish *diwans* (anthologies of poetry) according to a prescribed order of *maqāmāt* remain fundamental studies. He discovered relationships between ancient Hebrew (mainly Yemenite) and early Christian (Byzantine, Jacobite and Gregorian) chant that had hitherto remained undetected. His magnum opus, the *Hebräisch-orientalischer Melodienschatz*, summarizes his work in Palestine (vols.i–v) and Cincinnati (vols.vi–x). Although he was largely self-taught as a musicologist, his writings represent an impressive contribution to the study of Jewish music.

EDITH GERSON-KIWI/ISRAEL J. KATZ

Idiophone.

General term for musical instruments that produce their sound by setting up vibrations in the substance of the instrument itself. Idiophones form one of the original four classes of instruments (along with membranophones, chordophones and aerophones) in the hierarchical classification devised by E.M. von Hornbostel and C. Sachs and published by them in *Zeitschrift für Ethnologie* in 1914 (Eng. trans. in *GSJ*, xiv, 1961, pp.3–29, repr. in *Ethnomusicology: an Introduction*, ed. H. Myers, London, 1992, pp.444–61). Their system, which draws on that devised by Victor Mahillon for the Royal Conservatory in Brussels and is widely used today, divides instruments into groups which employ air, strings, membranes or sonorous materials to produce sounds. Various scholars, including Galpin (*Textbook of European Instruments*, London, 1937) and Sachs (*History of Musical*

Instruments, New York, 1940), have suggested adding electrophones to the system although it has not yet been formally extended.

Idiophones are subdivided into those which are struck, scraped, plucked, made to sound by friction or blown. The sound may be produced by the direct or the indirect action of the player. Each category is further subdivided according to the more detailed characteristics of an instrument. A numeric code, similar to the class marks of the Dewey decimal library classification system, indicates the structure and physical function of the instrument. The Hornbostel-Sachs classification (from the *GSJ* translation, with minor alterations) follows as an appendix to this article.

For further information on the classification of instruments in general see [Instruments, classification of](#).

APPENDIX

1 *Idiophones*: the substance of the instrument itself, owing to its solidity and elasticity, yields the sounds, without requiring stretched membranes or strings

11 *Struck idiophones*: the instrument is made to vibrate by being struck upon

111 *Idiophones struck directly*: the player himself executes the movement of striking; whether by mechanical intermediate devices, beaters, keyboards, or by pulling ropes, etc., is immaterial; it is definitive that the player can apply clearly defined individual strokes and that the instrument itself is equipped for this kind of percussion

111.1 *Concussion idiophones or clappers*: two or more complementary sonorous pans are struck against each other

111.11 *Concussion sticks or stick clappers* – found in Annam, India and the Marshall Islands

111.12 *Concussion plaques or plaque clappers* – found in China and India

111.13 *Concussion troughs or trough clappers* – found in Myanmar

111.14 *Concussion vessels or vessel clappers*: even a slight hollow in the surface of a board counts as a vessel

111.141 *Castanets*: vessel clappers, either natural, or artificially hollowed out

111.142 *Cymbals*: vessel clappers with everted rim

111.2 *Percussion idiophones*: the instrument is struck either with a non-sonorous object (hand stick, striker) or against a non-sonorous object (human body, the ground)

111.21 *Percussion sticks*

111.211 *(Individual) percussion sticks* – found in Japan, Annam and the Balkans; (also the triangle)

111.212 *Sets of percussion sticks*: several percussion sticks of different pitch are combined to form a single instrument (all xylophones, as long as their sounding components are not in two different planes)

111.22 *Percussion plaques*

111.221 *(Individual) percussion plaques* – found in the oriental Christian Church

111.222 *Sets of percussion plaques* (lithophone [China], and most metallophones)

111.23 *Percussion tubes*

111.231 *(Individual) percussion tubes* (slit-drum, tubular bell)

111.232 *Sets of percussion tubes* (tubaphone, tubular xylophone)

111.24 *Percussion vessels*

- 111.241 *Gongs*: the vibration is strongest near the venter
- 111.241.1 (*Individual*) *gongs* – found in South and East Asia (including the so-called metal drums, or rather kettle-gongs)
- 111.241.2 *Sets of gongs* (gong-chimes) – found in South-east Asia
- 111.242 *Bells*: the vibration is weakest near the venter
- 111.242.1 (*Individual*) *bells*
- 111.242.11 *Resting bells*: the cup is placed on the palm of the hand or on a cushion; its mouth faces upwards – found in China, South-east Asia and Japan
- 111.242.12 *Suspended bells*: the bell is suspended from the apex
- 111.242.121 *Suspended bells struck from the outside*: no striker is attached inside the bell, there being a separate beater
- 111.242.122 *Clapper bells*: a striker (clapper) is attached inside the bell
- 111.242.2 *Sets of bells* [chimes] (subdivided as 111.242.1)
- 112 *Indirectly struck idiophones*: the player himself does not go through the movement of striking; percussion results indirectly through some other movement by the player. The intention of the instrument is to yield clusters of sounds or noises, and not to let individual strokes be perceived
- 112.1 *Shaken idiophones or rattles*: the player executes a shaking motion
- 112.11 *Suspension rattles*: perforated idiophones are mounted together, and shaken to strike against each other
- 112.111 *Strung rattles*: rattling objects are strung in rows on a cord (necklaces with rows of shells)
- 112.112 *Stick rattles*: rattling objects are strung on a bar (or ring) (sistrum with rings)
- 112.12 *Frame rattles*: rattling objects are attached to a carrier against which they strike
- 112.121 *Pendant rattles*: rattling objects are hung from a frame (dancing shield with rattling rings)
- 112.122 *Sliding rattles*: non-sonorous objects slide to and fro in the slots of the sonorous object so that the latter is made to vibrate; or sonorous objects slide to and fro in the slots of a non-sonorous object, to be set in vibration by the impacts (*angklung*, sistrum with rods [recent])
- 112.13 *Vessel rattles*: rattling objects enclosed in a vessel strike against each other or against the walls of the vessel, or usually against both. NB West African and Latin-American gourd rattles with handle, in which the rattling objects, instead of being enclosed, are knotted into a net slipped over the outer surface, count as a variety of vessel rattle (fruit shells with seeds, 'pellet bells' enclosing one or two loose percussion pellets)
- 112.2 *Scraped idiophones*: the player causes a scraping movement directly or indirectly: a non-sonorous object moves along the notched surface of a sonorous object, to be alternately lifted off the teeth and flicked against them, or an elastic sonorous object moves along the surface of a notched non-sonorous object to cause a series of impacts. This group must not be confused with that of friction idiophones
- 112.21 *Scraped sticks*: a notched stick is scraped with a little stick, shell, piece of bone etc.
- 112.211 *Scraped sacks without resonator* – found in South America, India (pouched musical bow) and Congo
- 112.212 *Scraped sticks with resonator* – found in East Asia (ō)
- 112.22 *Scraped tubes* – found in south India
- 112.23 *Scraped vessels*: the corrugated surface of a vessel is scraped – found in South America and the Congo region

112.24 *Scraped wheels or cog rattles*: a cog wheel, whose axle serves as the handle, and a tongue fixed in a frame which is free to turn on the handle, when whirled, the tongue strikes the teeth of the wheel one after another – found in Europe and India

112.3 *Split idiophones*: instruments in the shape of two springy arms connected at one end and touching at the other: the arms are forced open by a little stick, to jingle or vibrate on recoil – found in China, Malacca [now West Malaysia], Iran and the Balkans

12 *Plucked idiophones*: lamellae, i.e. elastic plaques, fixed at one end, are flexed and then released to return to their position of rest

121 *In the form of a frame*: the lamella vibrates within a frame or hoop

121.1 *Clack idiophones* (cricri): the lamella is carved in the surface of a fruit shell, which serves as a resonator – found in Melanesia

121.2 *Guimbardes* (jew's harps): the lamella is mounted in a rod or plaque-shaped frame and depends on the player's mouth cavity for resonance

121.21 *Idioglot guimbardes*: the lamella is carved in the frame itself, its base remaining joined to the frame – found in India, Indonesia and Melanesia

121.22 *Heteroglot guimbardes*: a lamella is attached to a frame

121.221 *(Single) heteroglot guimbardes* – found in Europe, India and China

121.222 *Sets of heteroglot guimbardes*: several heteroglot guimbardes of different pitches are combined to form a single instrument – found in Africa

122 *In board or comb-form*: the lamellae are tied to a board or cut out from a board like the teeth of a comb

122.1 *With laced-on lamellae*

122.11 *Without resonator* (all lamellaphones on a plain board)

122.12 *With resonator* (all lamellaphones with a box or bowl below the board)

122.2 *With cut-out lamellae* (musical boxes): pins on a cylinder pluck the lamellae – found in Europe

13 *Friction idiophones*: the instrument is made to vibrate by friction

131 *Friction sticks*

131.1 *(Individual) friction sticks* (unknown)

131.2 *Sets of friction sticks*

131.21 *With direct friction*: the sticks themselves are rubbed (nail violin, nail piano, Stockspiele)

131.22 *With indirect friction*: the sticks are connected with others which are rubbed and, by transmitting their longitudinal vibration, stimulate transverse vibration in the former (Chladni's euphon)

132 *Friction plaques*

132.1 *(Individual) friction plaques* (unknown)

132.2 *Sets of friction plaques* [livika] – found in New Ireland

133 *Friction vessels*

133.1 *(Individual) friction vessels* – found in Brazil (tortoise shell)

133.2 *Sets of friction vessels* (verillon [glass harmonica])

14 *Blown idiophones*: the instrument is made to vibrate by being blown upon

141 *Blown sticks*

141.1 *(Individual) blown sticks* (unknown): possible example of the Mbuti of the Ituri Forest, Zaire, in the Turnbull Collection

141.2 *Sets of blown sticks* (Äolsklavier)

142 *Blown plaques*

142.1 *(Individual) blown plaques* (unknown)

142.2 *Sets of blown plaques* (piano chanteur)

Ifukube, Akira

(b Kushiro, Hokkaidō, 31 May 1914). Japanese composer. He studied forestry at Hokkaidō Imperial University and, after graduating in 1935, worked for ten years as a forest engineer. In 1935 his *Nihon kyōshi-kyoku* won the Alexander Tcherepnin Prize and in 1936 it was heard in Boston. Ifukube studied briefly with Tcherepnin, who was responsible for the première of his first ballet, *Bon odori*. This was performed at Vienna in 1938 and in the same year a piano suite he had written for George Copeland in 1933 was played at the ISCM Festival. Between 1948 and 1953 he composed five further ballets in quick succession before turning his attention primarily to orchestral works. His style has been described as 'ethnic exoticism'. He has been strongly influenced by the music of the Ainu and other folk traditions of Hokkaidō, and his flowing melodies make frequent use of pentatonic and other oriental scales. His rhythm and use of the percussion are often quite violent, even barbaric, in the manner of early Stravinsky and Prokofiev. An influential teacher, he lectured at the Tokyo National University of Fine Arts and Music (1946–53), and was president of the Tokyo College of Music (1975–88). His music for the film *Godzilla* (1954) has won great popularity.

WORKS

(selective list)

Ballets: Bon odori [Bon Dance], pf, perc, 1938; Tsukaretaru shiro [Enchanted Citadel], Tokyo, 1949; Nihon no taiko [Drums of Japan], Tokyo, 1951; Ningen Shaka [Buddha], Tokyo, 1953; Nihon nijūroku seijin [26 Martyrs of Japan], Tokyo, 1972

MASAKATA KANAZAWA

Igbo music.

The music of the Igbo (or Ibo), who live in [Nigeria](#), in an area bounded in the north by the Igala, the Idoma and the Tiv, in the west by the Edo or Bini, in the south and south-west by the Ijaw (Ijo), in the south-east by the Efik and Ibibio, and in the east by the borders with Cameroon ([fig.1](#)). Like the other two major ethnic groups in Nigeria, the Yoruba and the Hausa, the Igbo have had a considerable cultural influence not only on their immediate neighbours but also in other parts of the country and especially in Lagos.

1. Musical instruments.

The Igbo homeland varies from open grassland in the north and north-east to tropical rain-forest in the south. To some extent, these regional

variations influence the materials available for the construction of instruments, which, in turn, controls their forms and distribution and helps to explain the variety and often extremely local provenance of musical practices.

The variety of hardwoods available in the southern rain-forest is paralleled by an equal variety of slit-drums. The most common slit-drum is perhaps the *ekwe* (also *ekwo*, *ekwu* or *okwo*), a name often used as a generic term for any Igbo slit-drum (fig.2). The *ekwe* is 60 to 90 cm long and may have a single or a double slit. It is used in musical ensembles but is also beaten to call assemblies or to make announcements to the local community. Drums with a single slit include the *alakirija*, the *ekere*, the *ekwa* (up to 120 cm high), the *ekwe-mbako* (made from a length of bamboo with a node at each end), the small *okpokolo* (similarly made from bamboo), the *okwo-agida* (90 cm long) and the small *okwo-mata* (45 cm long). Drums with single or double slits include the large *ikoro* (also *ikolo* or *ukolo*; fig.2b), up to 180 cm long and 120 cm high, which is used to announce the death of a prominent member of the community, at funeral ceremonies of the eminent or in times of war. Drums with a double slit include the 210 cm long *ikoro-uta* used at Christmas, the 60 cm long *ikwirikwe* used for funeral ceremonies and certain festivals, the royal *ufie* (or *uhie*) and the *ufie-amadi* made from cam-wood.

There are two general groups of Igbo xylophones. The first consists of small instruments with a limited number of keys, often only two. The keys are attached to the top of an open clay pot by means of a peg at each end, but are at the same time separated from the pot by a woven grass collar. These xylophones include the *ekere-iko*, the *ngedegwu*, which also occurs in the second group of large instruments, and the *okobolo*. The second group consists of instruments with a greater number of keys, usually about 12. These instruments are considerably larger than those in the first group, and the keys are laid across two banana or plantain trunks to which they are attached by pegs at each end. They include the *abigolo*, the *igo*, the *ikwemgbo*, the *ngedegwu* and the *ngelenge* or *odome*.

Igbo lamellophones vary mainly in the shape and material of their resonators, which are made either of wood in the shape of a box or a boat, or from half a gourd and are thus hemispherical. The instruments include the *ubo* (a term also used generically for any lamellophone) with six to nine keys and a wooden or gourd-resonator; the *ubo-agana*, the *ubo-agbugba* and the *ubo-oba*, all with either a wooden box-resonator or a hemispherical gourd-resonator; and the *opanda* with a box-resonator.

Igbo bells occur both with and without clappers and may be made from wood or iron. Clapperless bells are either single or double; if double, the bells give different pitches, even when of equal size. Bells with clappers are used in sets attached to a belt or frame and worn by a dancer. Clapperless bells include the 90 to 120 cm high *alo* or *ivom* made from iron and used by women's groups to accompany song; the smaller iron *ogene* (also *ogele*, *ugele* or *ogenni*), which occurs both as a single and double bell; the double iron *njagba-ogene*, about 60 cm long; the large single iron *ibuma*, or *iboma*; the double wooden *oyara*; and the double iron *ugbom-eze*. Bells with clappers include the *ikpo*, a set of about 12 iron bells mounted on a square

palm frame and worn at various dances, including those at wrestling matches; and the *osa*, a set of wooden bells mounted round the rim of a wooden wheel and used at the *onyima* festival.

The greatest variety of Igbo instruments is found among the rattles, which may be plain vessel rattles, strung vessel rattles or plain strung rattles; they are held in the hand or worn on the bodies of dancers and may be made from seed pods, wickerwork, metal cylinders or gourds; played singly, in pairs or in sets, they may be used as solo instruments or more commonly in larger ensembles. Plain vessel rattles include the *oyo*, the *isaka* and the *osha*, all conical wickerwork rattles woven on a wooden or gourd base and usually played in pairs by a single performer holding one instrument in each hand. Other plain vessel rattles are the *ebeje*, a metal cylinder rattle, and the *okoroko*, the *ekpiri*, the *osha*, the *ujara* and the *nja*, all leg rattles worn by dancers and consisting of woven pouches filled with small rattling objects, or of seed pods strung together. Strung vessel rattles are made from gourds strung with beads or with beans and include the *oyo*, the *ichaka* or *achaka* and the *nyo*.

Other noteworthy Igbo idiophones are the *udu*, a percussion vessel in the form of a clay pot with an opening in the top and in the side, and various wooden clappers (fig.3) including the *ikwankwa*, the *akpatakpa* and the *oja*.

Igbo aerophones consist primarily of flutes and trumpets. Flutes are either vessel flutes with finger-holes, or end-blown flutes with or without finger-holes. The principal vessel flute, an ocarina, is the clay-bodied *ugene*, or *oja ufele*, with a single finger-hole opposite the mouth-hole. End-blown flutes include the *oja*, a wooden flute with two opposed finger-holes, the *opi-nta*, a bamboo flute, the *opi-ukwu*, a wooden flute with cupped embouchure, and the *nwakpo*, a bamboo flute with five finger-holes. Trumpets, which are side-blown, are made from animal horn or from gourd. Animal horn trumpets include the *opi*, the *okike* and the *odo*, all made of ivory, and the *opi* of cow horn. Gourd-trumpets include the *akpele* or *akbele*.

Drums are either single- or double-headed. Single-headed drums are usually vertical footed instruments, but also include small wooden kettledrums (fig.4). Double-headed drums, though less common, are usually horizontal portative instruments. Single-headed drums include the *aguma*, the *akama*, the *akpatakpa*, the *edere*, the *ejiri*, the *ekpere*, various *igba* drums, the *nkwa*, the *oriri* and the *ozu* funeral drum. Double-headed portative drums (fig.5) include the *okanga* and the *abia*, both cylindrical, and the hourglass *idi* or *odi*.

String instruments form the smallest class of Igbo instruments and include the *une*, a mouth-resonated musical bow, the *ubo agala*, an eight-string pluriarc, the *oboro ekpa*, a set of four or more idiochord stick zithers, and the *ubo akwala*, a six-string trough zither.

2. Musical occasions and ensembles.

There is a considerable number of communal occasions at which music is performed, some of them involving several ensembles. The major events are those associated with the *obi* (ruler), public proclamations, funeral

ceremonies for the eminent, seasonal festivals, wrestling matches and the visits of high-ranking officials and other dignitaries.

Royal music, or music for an *obi*, is performed daily in the palace and on intermittent special occasions. The *ufie* slit-drum, the use of which is a royal prerogative, is beaten to wake the ruler at dawn, to announce when his meals are ready and to send him to bed at night. Its timbre differs from that of other slit-drums, and its sound patterns are immediately recognizable to his subjects. It is sometimes replaced by a vertical footed drum with a single skin. An ensemble, known as the *egwu ota* and consisting of drums, slit-drums and clapperless bells, performs for the *obi* at the *ofala* ceremony, as well as when he leaves his palace to visit his subjects and on his return from such a visit.

Public assemblies in a community are called by means of the *ekwe* slit-drum, and public proclamations can be relayed on it. Igbo is a tonal language, and lexical and syntactical meaning is dependent on five syllabic tones: extra high, high, stepdown (which occurs only after a high tone and is one step lower), falling (which occurs only in certain contexts) and low. All the tonal patterns of Igbo speech, except those that involve the less common falling tone, can thus be imitated on the double-slit *ekwe*. Some communities still own and use the very large *ikoro* slit-drum for this purpose. There used to be considerable competition between neighbouring towns and villages to own the largest slit-drum in their area. The largest surviving *ikoro* is at Umunze in Aguata division. In addition to their use for summoning assemblies and sounding proclamations, they were also beaten in times of emergency, for instance on the outbreak of war.

The funeral ceremonies for an eminent member of a community include dancing and recitation of the heroic qualities of the deceased. Both the dance and the recitation are performed by close associates of the dead man, and the performance is known as *ekwe dike* (music for the brave). It may be accompanied by an ensemble comprising a set of *ekwe* slit-drums, a pair of *oyo* rattles, an *oja* flute and sometimes an *ogene* clapperless bell. If available, *ikoro* slit-drums are used, and the music is characterized by its tempo and polyrhythmic character, shown in [ex.1](#).

The instruments, ensembles and music associated with the various Igbo festivals vary considerably between communities; to some extent this is true of all types of Igbo music. However *egwu mgba*, music for wrestling, is frequently performed by an ensemble comprising a number of *ngedegwu* of the larger variety, a set of *ekwe* slit-drums, an *ogene* clapperless bell and an *oja* flute. The performance itself is intended to marshal and encourage the contestants representing the group to which the musicians belong.

Ensembles including a number of *ngedegwu* also perform for the visits of important people, such as ministers of state, to specific communities. In some areas, however, the *ngedegwu* is reserved as a secret and ritual instrument: at Nsukka, for example, it is housed in a special building that women are forbidden to enter; if they see the instrument, they incur heavy penalties, sometimes death. In other areas, the *ngedegwu* may be used as a solo instrument to accompany storytelling. A single performer accompanies the story teller by playing an ostinato-like reiteration of the phrase *ife o nekwu melu eme*, which affirms that what is said is true.

3. General musical features.

In spite of a well-established education system in Nigeria and a university in Lagos with a music department, there has as yet been little systematic study of Igbo music. The general features of Igbo music can be briefly summarized. Singing is often in unison, but combinations of voice parts in parallel 3rds and 6ths are also common. The use of these intervals may be a legacy of early European mission schools, as there appears to be a separate and older tradition of singing in parallel 4ths and 5ths, which sometimes may be heard in performances by women's groups accompanied by the *alo*, a clapperless bell. The most common vocal scale is equivalent to the diatonic major with a frequent use of modes similar to the E- and C-modes. Polytonality sometimes arises from the combination of voices with instruments. Combinations of instruments often result in polyrhythms, and instrumental music in particular is characterized by its extremely vigorous tempos.

Iges (Lebrancon), José

(b Madrid, 31 May 1951). Spanish composer. He graduated as an industrial engineer (1982) and obtained a PhD for his thesis *Arte radiofonico* at the Universidad Complutense, Madrid (1997). Musically he is in part self-taught, but also studied at the Laboratorio Alea in Madrid with Jesús Ocaña, at the University of Pau (France) with David Johnson (1977) and at the Madrid Conservatory with Pablo (1977–8). He has belonged to various groups and collectives, including the Seminario de Arte e Informática and Elenfante, and he has worked with the Laboratorio de Interpretación Musical. Since 1985 he has directed the programme 'Ars Sonora' on the music programme of Spanish National Radio.

As a composer Iges has focussed primarily on electronic and electro-acoustic music and on multimedia, and he has written 40 pieces for radio. Since 1984 he has also collaborated with the singer Esperanza Abad, for whom he wrote works such as *Ritual* (1986) and *Despedida que no despide* (1990). The performance artist Concha Jerez also collaborated on the latter and on several pieces written since 1990. Iges is also the author of several articles and of a monograph on Nono (Madrid, 1988).

WORKS

El-ac and tape: *Ritual*, Mez, tape, live elecs, 1986; *Tempus-tempi* (para la galería), tape, 1986 [collab. F. MARTA CURESES

Iggy Pop [Osterberg, James Newell]

(b 21 April 1947). American punk, rock and pop vocalist. He played the drums in blues bands (gaining his nickname in an act called The Iguanas) before forming the Psychedelic Stooges in 1967 with the brothers Ron Asheton (guitar) and Scott Asheton (drums), along with the bass player Dave Alexander, changing the band's name to the Stooges in 1969. He became known as an intense and transgressive performer who sometimes went so far as to roll in broken glass or otherwise wound himself. With albums such as *Raw Power* (Col., 1973), he made some of the harshest music heard during the late 1960s and early 70s, for which he is sometimes called the father of punk rock. In contrast to the peace-and-love messages of much psychedelic rock, his lyrics were bleak and perverse in their challenge to the status quo, and his music was unapologetically

raucous and amateurish. The Stooges broke up in 1974 and Pop released a series of solo albums beginning in 1976, often working in collaboration with David Bowie. Pop's later work, such as *Blah-Blah-Blah* (A&M, 1986), was less noisy and closer to mainstream pop in its tone and techniques. (l. Pop: *I Need More*, Los Angeles, 1982)

ROBERT WALSER

Iglesias Álvarez, Antonio

(b Orense, 1 Oct 1918). Spanish pianist, composer, conductor, administrator, critic and writer on music. He studied piano and composition with José Cubiles and Conrado del Campo at the Madrid Conservatory, taking diplomas in piano (1935) and composition (1944); later he was a pupil of Marguerite Long, Lazare Lévy and Yves Nat in Paris and of Isidore Philipp in New York, and studied conducting with Luís de Freitas Branco and Louis Fourestier. He has made concert tours of Europe, North Africa and the USA. His professional activities have included the founding (1957) and directing of the Orense Conservatory of Music, giving piano masterclasses and teaching the interpretation of Spanish music at Música en Compostela (from 1958) and organizing the Manuel de Falla seminars and courses at Granada. He created (1962) the *Semanas de Música Religiosa* at Cuenca and as music adviser to the Instituto de Cultura Hispánica planned music festivals in Spain and the USA in collaboration with the Organization of American States; he has served as secretary-general of the Spanish section of ISCM (whose festivals he organized in 1965) and of the Spanish National Committee of the IMC, and as music critic of the newspaper *Informaciones*, later known as *ABC*. In 1965 he began to serve as technical director of the scholarly series *Investigaciones* concerned with sacred music and sponsored by the Institute of Religious Music at Cuenca. At the Dirección General de Bellas Artes he has had a decisive role in determining current musical activities. He has written chiefly on early 20th-century Spanish composers. His compositions include the symphonic poem *Primera salida de Don Quijote* (1944), first performed in 1945 under Stokowski in San Antonio, Texas, and *Ao lonxe* for voice and piano (1961), as well as transcriptions and revisions of Marcial del Aldalid's piano works (1962). In 1989 he was made an Officier de l'Ordre des Artes et Lettres (Paris), and in 1996 he became secretary-general of the Real Academia de Bellas Artes de S Fernando (Madrid).

ISRAEL J. KATZ

Ignacio, Rafael

(*b* San Francisco de Macorís, 15 June 1897; *d* Santo Domingo, 1984). Dominican composer and conductor. He studied solfège and the cornet with Andrés Requena and Oguís Negrette in his home town, co-founding the town hall's Children's Band at the age of 10. He established several dance orchestras and studied the string bass with L.A. Betances, becoming a founder member of the Orquesta Filarmónica Beethoven (c1918). After moving to Santo Domingo in 1923 and teaching himself the tuba and the alto saxhorn, he joined the municipal band on the tuba under the direction of J. de J. Ravelo. In Azua in 1927 he was appointed director of the municipal Academy of Music and the municipal band, also conducting a dance orchestra. A captain in the army, he became the conductor of the regimental bands of Santo Domingo (1930) and Santiago (1941), later rising to become Supervisor of Bands of the Armed Forces and the Police. In the capital he was a founder member of the Orquesta Sinfónica de Santo Domingo (1932), which evolved into the Orquesta Sinfónica Nacional (1942).

Along with J.F. García, Ignacio was an early orchestrator of the *merengue*, the main folkdance of the northern region; its introduction into the dance hall legitimized its use by the urban élite. Popular abroad through recordings, his orchestrations were at the start of a process of evolution into a popular music of international commercial success. In his most well-known piece, the *Suite folklórica* (1939) for band, which he arranged for orchestra then chorus and orchestra, he included Afro-Dominican long drums and the *paloma*, an unaccompanied and unmetred work song of Spanish origin. His music, more than that of other composers of his generation, shows an authentic connection to folk sources, a link attributable both to his origins and to his work with band, a medium of musical interface between the non-literate and literate populations.

MARTHA ELLEN DAVIS

Ignannino, Pater Angelo [Ignanimus, Angelus]

(*b* Altamura; *d* Venice, 1543). Italian composer. His life and works are still to be documented. Fétis described him as a Dominican monk, and *maestro di cappella* at Venice, though presumably not at S Marco, since his name does not appear among the musicians in Francesco Caffi's transcripts of the registers. Without citing his source of information Fétis credited Ignannino with the authorship of masses, motets, psalms, Lamentations, responsories, and three books of madrigals for three to six voices, all published in Venice. He is also supposed to have written a treatise on plainsong and some 'ricercate con l'intavolatura', consisting principally of preparations and resolutions of 4th and 7th suspensions which, according to Fétis, are in a manuscript in Altamura. (*FétisB*)

DON HARRÁN

Igumnov, Konstantin (Nikolayevich)

(*b* Lebedyan, 19 April/1 May 1873; *d* Moscow, 24 March 1948). Russian pianist and teacher. He began piano lessons with Zverev in 1887, shortly after his family had moved to Moscow. The following year he was accepted as a pupil at the Moscow Conservatory, studying piano with Ziloti and Pabst, theory and composition with Taneyev, Arensky and Ippolitov-Ivanov and chamber music with Safonov. Igumnov graduated in 1894 with a gold medal for piano and subsequently entered the international Rubinstein Piano Competition in Berlin, at which Josef Lhévinne was awarded the first prize, and he an honorary diploma.

His long and illustrious teaching career at the Moscow Conservatory dated from 1899, and he remained there until his death; from 1924 to 1929 he served as rector. Igumnov continued to play in public throughout, and his interpretations were noted for their deep lyricism and a spiritual identification with the music that precluded all histrionics and overt

virtuosity. In his teaching he laid special emphasis on the relationship between singing and piano playing, as regards both phrasing and tone production. Renowned as an interpreter of Tchaikovsky and early Skryabin, he was also entrusted by Rachmaninoff with the first performance of the Sonata in D minor and the Russian première of the Rhapsody on a Theme of Paganini. Recordings, taken from recitals, exist of Tchaikovsky's G major Sonata and Piano Trio in A minor, Chopin's B minor Sonata, Schumann's *Kreisleriana* and Skryabin's Second Sonata. His pupils included Orlov, the conductor Dobroven, Oborin, Fliyer and Grinberg.

JAMES METHUEN-CAMPBELL

Ikebe, Shin'ichirō

(*b* Mito, 15 Sept 1943). Japanese composer. After piano and composition lessons from around the age of six, he joined brass bands, choirs, youth orchestras and private opera productions while at school. He studied composition to postgraduate level at Tokyo National University of Fine Arts and Music (1963–71) with Ikenouchi, Miyoshi and Yashiro, then served as a part-time lecturer there until 1977. At Tokyo College of Music he was a lecturer (1974) and assistant professor (1982), becoming professor in 1987. He has won prizes in the Fine Arts Festival in Japan (1974, 1982–4) and the TV-Opera Festival in Salzburg (1971), and has gained the Japanese Academy Award (1980, 1991–2, 1994, 1998), the RAI Prize in Italy (1976, 1989) and an Emmy award (1989).

A prolific and versatile composer, Ikebe is well known for his incidental music for ballet, film, theatre, radio and television. In his works he has renounced a dogmatic approach, and shows agility in managing diverse techniques and effects and an inclination towards witty and theatrical gestures. He has communicated with a wide public through his compositions, in which his awareness of social conflicts and global crises is often reflected. Also active as a concert organizer, conductor, essayist and TV commentator, he was vice-president of the Japan Federation of Composers, becoming its president in 1998. Further information is given in *Sakkyokuka no koten '93: Ikebe Shin'ichirō* ('An exhibition of a composer '93: Ikebe Shin'ichirō', Tokyo, 1993), edited by Tokyo Concerts.

Ikenouchi, Tomojirō

(*b* Tokyo, 21 Oct 1906; *d* Tokyo, 9 March 1991). Japanese composer and teacher. The second son of Kyoshi Takahama, a leading haiku poet, he spent two years at Keiō University and then decided on a musical career. He went to Paris in 1927 to study at the Conservatoire with Fauchet (harmony), Caussade (fugue) and Büsser (composition). Returning to Japan in 1933 he joined the Shinkō Sakkyokuka Renmei (later the Japanese Society for Contemporary Music) and in 1934 he presented a successful concert of his own works. In 1934–6 he was again in Paris, completing his studies with Büsser and taking a first prize in harmony. He was appointed lecturer at Nihon University, Tokyo, in 1936 and professor of composition at the Tokyo National University of Fine Arts and Music in 1947. He has served as president of the Japanese-French Music Society and of the Japanese Musicians' Club. He was admitted to the Légion d'Honneur (1962) and his achievements were recognized by the Japanese government (1986).

As a composer he is a perfectionist: his pieces are few and compact. Of all Japanese composers he is most clearly descended from the French school, from Impressionism and from the Conservatoire tradition, and his music shows his admiration for Mozart, Saint-Saëns and, above all, Ravel. At the same time he has been one of the most influential composition teachers in Japan; his pupils include Ichiyanagi, Ishii, Mayuzumi and Shinohara. With several of his students he formed the Shinshin Kai group in 1955. Ikenouchi is also a haiku poet, belonging to the Hototogisu group founded by his father.

MASAKATA KANAZAWA

Ikhwān al-Safā' ['Brethren of Purity'].

A 10th-century group of Islamic encyclopedists of Ismaili tendencies centred on Basra, one of whose epistles (*Rasā'il*) deals with music. Unlike most other music theorists of the 10th and 11th centuries, the Ikhwān al-Safā' were chiefly concerned with the neo-Platonic and Hermetic aspects of the Greek heritage. Their work is of some interest for its scientific aspects (in particular the theory of the spherical propagation of sound) and for its treatment of musical practice: for example, following al-Kindī, the discussion of the lute gives, in addition to a (simple Pythagorean) fretting, details of proportions and construction. But the most characteristic features of their work, again following al-Kindī, are to be found in their study of cosmology, where the notion of cosmic harmony (based on the Pythagorean concept of the primacy of number and numerical relationships) is the unifying principle in the discussion of such topics as the music of the spheres, the moral and medical effects of music, and the

sets of natural phenomena (including the elements, winds, humours, colours and perfumes) to which the rhythms and the four strings of the lute could be related.

OWEN WRIGHT

Ikil [ikel].

Two-string box or bowl spike fiddle played by Western Mongol groups, such as Baits, Torguts, Zakchins and Altai Urianghais. Use of this term by Western Mongols suggests connections with neighbouring Turkic groups: it may, for instance, be related to the Tuvan *igil*, Turkish *iqliq*, and Anatolian Turk *iki kili* ('with two hairs'). It may also be that the Mongolian name sometimes used for two- and four-string fiddles *hiil* (*kigili*) was more widespread before standardization of the term *huur* during the communist era. In 1933 Berlinskiy noted that the instrument was called *khil* in Khalkha Mongolia.

The instrument has rear-inserted tuning-pegs and deeply arched bow, indicating that it is an archaic instrument (see illustration). Sagittal pegs are sometimes found. The *ikil* and two-string plucked lute [Topshuur](#) are closely related: unlike the *huur*, the bass string is on the left in frontal aspect on both *ikil* and *topshuur* and both instruments are tuned to an interval of a 4th. Similarly, Bachmann noted that the Altai *ikili* and *topschur* are identical in every respect, though the former is played with horsehair bow and the latter plucked.

Different groups have their own methods, measurements and rules of construction for the instrument. Among Baits and Dörbets, the peg box was often traditionally decorated with a representation of the wish-granting jewel of Buddhist mythology *chandman*'. Neck and pegs must be made from different woods, dried birch and willow, so that wear does not occur, and the neck should be made so that the root points downwards, as a sign of respect. The frame of the body is made from poplar. Frames of both *ikil* and *topshuur* are traditionally covered by the stomach, bladder and ventricles of ruminants, as well as mares' udders. Resonators of some *ikil* are now made completely from wood but, when trapezoidal in shape, are more elongated than *huur*. Players stop the string at the lower end of the fiddle's neck by wrapping over it the fingers of the left hand and pulling the string towards its palm, away from the body.

The *ikil* is used to lead or accompany *biy*-dances (see [Mongol music](#), §3(i)), for which there is a special repertory of melodies (*biyelgeenii tatlaga*). A prelude to the dance is sometimes performed (*ehledeg tatlaga*) which, together with the *biy*-dance tune repertory, varies according to ethnic group. When the *ikil* is used to accompany satirical songs, 'teaching' songs, epics (*tuul*), praise-songs (*magtaal*) and legends (*domog tatlaga*), melodies from a different repertory are selected. As with the *huur*, *ikil* melodies often imitate natural phenomena as in *Eeviin Golyn Ursgal* ('Flow of the River Eev'), and the movements, vocalizations and sounds of birds and animals as in *Morný Joroo* ('Ambler'), they are also used to attract birds in springtime (*shuvuuny dallaga*) and to 'call' deer (*bugyn duudlaga*).

CAROLE PEGG

Ikonomov, Boyan Georgiyev

(*b* Nikopol, 14 Dec 1900; *d* Sofia, 27 March 1973). Bulgarian composer and conductor. He studied in Sofia (1920–26) and later in Paris with d'Indy and Guy de Lioncourt at the Schola Cantorum, and with Boulanger and Roussel; he also took a conducting course with Weingartner in Basle in 1934. In 1937 he returned to Bulgaria, where he held various appointments, working with the Bulgarian film institute (1948–56) and Sofia Radio (head of the music department, 1957–60). During his stay in Paris, Ikonomov had fruitful contacts with Stravinsky, Honegger and Milhaud. Predominantly a composer of instrumental music, he nevertheless wrote several works for the stage, including a historical opera in 1960 in the mainstream Bulgarian tradition – *Ihdzhe voyvoda* ('Indzhe the Resistance Fighter'). His style is largely rooted in Bulgarian folksong, and of particular influence were its modal inflections and unusual rhythmic characteristics.

WORKS

Ikonomov, Stefan

(*b* Sliven, 8 May 1937; *d* Sofia, 27 Aug 1994). Bulgarian composer. At the recommendation of Veselin Stoyanov he attended a boarding school in Sofia for gifted children. His first composition teachers were Vladigerov and Hadjiev. From 1955 to 1960 he studied the piano with Viktor Merdzhanov and composition with Anatoly Aleksandrov at the Moscow Conservatory. After graduating he returned to Sofia and was appointed lecturer in harmony at the State Music Academy; he later taught score reading and in 1993 was made full professor. His compositional method entailed thorough preliminary configuration of the material (on several staves) followed by precise arrangement of voicings. Stylistically, his output subscribes to the Romantic tradition, as suggested by the titles and instrumentation of his works as well as the manner in which texture is formed. The musical idea may be presented in several contrasting or variant forms, couched in a dramatic or balladic style or in a scherzo-like playfulness that betrays Ikonomov's in-depth knowledge of instrumental fingering. His erudite style serves as a bridge between most profound elements of the Bulgarian tradition, its place within a European context and a fusion of 'archaic' and 'new wave' folk music traditions in contemporary music.

Ikuta Kengyō

(*b* 1656; *d* Kyoto, 14/23 June 1715). Japanese instrumentalist and composer. He specialized in the *heikyoku*, which he probably studied with Imai Kengyō, and the *koto*, which he probably studied with Kitajima Kengyō. In 1696 he was promoted to the rank of Kengyō in the guild of professional blind musicians. He may have inaugurated the Ikuta-ryū school of *koto* playing. He has been attributed with transforming the *koto tsume* (plectrum) from the narrow, long version used by the *tsukushi-goto* into the modern *ikuta* form (square-shaped); with inventing two new tuning systems, *hon-kumoi-jōshi* and *nakazora-chōshi*; and with producing the first ensemble combination of *koto* and *shamisen* (*shamisen*) by adding a *jiuta*. All of these are significant milestones in the development of *sōkyoku* and its relationship with *jiuta*. However, there is no evidence that he made these innovations alone; it is widely thought that they should be equally attributed to Kitajima Kengyō, who died before Ikuta was promoted to the rank of Kengyō. The name 'Ikuta Kengyō' was later adopted by Ōmori Kengyō and Hideshima Kengyō on their respective promotions to the rank of Kengyō in 1715 and 1740.

The following works are probably by Ikuta: 3 *koto kumiuta* (*Kagami no kyoku*; *Koryū shiki genji* (also attributed to Yatsunashi); *Omoigawa* (also attributed to Kitajima)); the *danmono Godan no shirabe* (also attributed to Kitajima and Tomino Kōtō); *Kinuta*; the *nagauta* (*Ozasa*); and *Jūndan sugagaki* (for *shamisen*).

At first, Ikuta's music was transmitted orally and later it was transcribed and printed. *Omoigawa* and *Godan no shirabe* were printed in *Sōkyoku tailshū* (Tokyo, 1792), while *Kagami no kyoku* and *Koryū shiki genji* were secretly transmitted and notated only in 1941. *Kinuta* was printed in *Yanoichi zōhan bon kinuta no fu* (Tokyo, 1822) and its slightly transformed version is still practised. *Ozasa* was not notated and only its song text is preserved. Many of these works are in an edition by H. Kikuhara (*Jiuta Sōkyoku gskufu zensha*, Tokyo, 1987).

YOSHIKO TOKUMARU

Il Conte, Bartolomeo.

See [Le Conte, Bartholomeus](#).

Ileborgh, Adam

(fl c1448). German organist and composer, author of one of the earliest German organ tablatures, dated 1448 (since 1981 in a private collection, previously *US-PHci*; ed. in CEKM, i). Its title, as the sole source of information concerning his life, indicates that he was a Franciscan brother and rector of the town school at Stendal in the March of Brandenburg. As such he might have served as organist of the Marienkirche, which was consecrated in 1447.

The tablature consists of only seven folios 14.2 x 10.7 cm (the incorrect measurements, 28 x 21 cm, hitherto published, together with other mistakes in description based on Apel's research, have led to untenable hypotheses with respect to the significance of the source) containing eight settings. Five are free preludes with metrically undefined discant declamation over sustained notes in one or two parts in the pedals. They resemble similar pieces in the Erlangen tablature (*D-ERu* 554), obviously representing early practices in organ improvisation. The remaining three settings (*mensurae*) of the secular cantus firmus *Frowe al myn hoffen an dyr lyed* display strict mensural organization in two- or three-part writing, sometimes with additional notes to fill in the harmony. The primitive, ambiguous and partly faulty notation of all pieces prohibits conclusive decipherment.

The composition of the pieces is of much lower quality than that of the south German Paumann circle, particularly with respect to the rudimentary three-part setting and the mechanical discant figuration. The significance of the tablature has been over-emphasized, due to the general lack of sources of 15th-century keyboard music. The fact that Ileborgh as a musician is totally unknown beyond this tablature, taken together with the notational and stylistic peculiarities, suggests that he was an average peripheral figure in 15th-century organ music.

Iliev, Konstantin

(*b* Sofia, 9 March 1924; *d* Vidin, 6 March 1988). Bulgarian composer and conductor. Together with Lazar Nikolov he was among the first composers in eastern Europe after World War II to use modernism in music and to experiment with non-tonal techniques. His formative years coincided with the rise of the communist dictatorship in Bulgaria, and as a result of being at the forefront of Bulgaria's avant garde he was subject to harsh criticism and censorship; the vast majority of his compositions are unpublished.

In 1946 Iliev graduated from the Bulgarian State Music Academy where he had studied composition with Pancho Vladigerov and conducting with Goleminov. He continued his studies in Prague (1946–7) as a composition student of Hába, Řídký and Talich. Following his return to Bulgaria in 1947 Iliev established the Ruse State PO and, two years later, the State Opera in Ruse, becoming its principal conductor. From 1952 to 1956 he was the principal conductor of the Varna State PO and thereafter the chief conductor of the Sofia State PO, a position he held discontinuously until 1984. During his tenure as the latter's musical director he raised the standard of playing to international heights, and toured extensively with the orchestra in Europe, the Americas and Asia. From 1967 he was professor of conducting at the academy in Sofia; as an advocate of new music, he conducted the Bulgarian premières of works by Webern, Messiaen, Stockhausen and Boulez.

Iliev was a prolific composer who wrote in all genres but principally chose instrumental and symphonic music. Having viewed favourably the direction contemporary music was taking, he was sharply opposed to the folk and Romantic traditions typified by his teacher Vladigerov; he was also opposed to the official ideology of socialist realism. Believing that music should be 'clear, simple and logical', Iliev embarked on a study of technique that concentrated on the works of Stravinsky, Hindemith and the Second Viennese School with whose works he had become acquainted in Prague. In 1948–9 he made his first experiments in applying principles of 12-note serialism to the polyphonic style of Hindemith. This culminated in the *Concerto grosso* (1949–50), the third movement of which is a highly

effective six-part fugue. The most significant work of this period, however, is his Second Symphony (1950–51) which demonstrates his mastery of serial techniques. With *Fragmenti* (1968) Iliev began introducing folk elements into his music, finding a corollary between folk music and aleatory techniques, which he successfully fused in works such as *Bukoliki* ('Bucolics', 1977), *Glasovete na Ravninata* ('The Voices of the Plain', 1971) and the Sixth Symphony (1983–4) In spite of his death in 1988, his influence is still felt among Bulgarian composers. His monographs *Lyubomir Pipkov* and *Slovo i delo* ('Word and deed') were published in Sofia in 1958 and 1997, respectively.

ANNA LEVY, GREGORY MYERS

Iliński, Count Jan [Janusz] Stanisław

(*b* Romanów, 1795; *d* Brody, 23 Dec 1860). Polish composer and poet. He studied in Vienna under Salieri, Kauer and possibly Beethoven. He held posts in the senate in Warsaw and in the diplomatic service, and from 1853 was an adviser to the tsar. Active as a composer and man of letters, he employed a band on his estate at Romanów. His grandfather Jan Kajetan Iliński (1730–81), the *starosta* of Zhitomir, had founded a chorus and an orchestra of about 100 players; his father, Józef August Iliński (1766–1844), enlarged the orchestra and brought musicians and singers from Italy. The choir and band were conducted by Ignacy Dobrzyński (father of Ignacy Feliks), and there was also a band of horn players. Some of Iliński's compositions were published in Vienna by Mechetti and Cappi & Diabelli.

IRENA PONIATOWSKA

Il'insky, Aleksandr Aleksandrovich

(*b* Tsarskoye Selo, 12/24 Jan 1859; *d* Moscow, 23 Feb 1920). Russian composer and teacher. He studied in Berlin with Bargiel (composition) and Kullak (piano), and graduated from the St Petersburg Conservatory in 1885. From 1885 he taught at the music and drama school of the Moscow Philharmonic Society; he was appointed professor in 1896 and remained until 1905, when he became professor of theory, history and composition at the Moscow Conservatory. As a composer he is known for an opera *Bakhchisarayskiy fontan* ('The Fountain of Bakhchisaray') and for some choral and orchestral works. He also wrote a number of books.

JENNIFER SPENCER/R

Illario [Ylario; Illarius, Johannes]

(*fl* early 16th century). ?Spanish composer, not to be identified with [Hylaire](#).

Illica, Luigi

(*b* Castell'Arquato, nr Piacenza, 9 May 1857; *d* Colombarone, 16 Dec 1919). Italian playwright and librettist. At an early age he ran away to sea; in 1876 he fought against the Turks. Three years later he settled in Milan and became well known in literary circles. An ardent republican, he was associated with the poet Giosuè Carducci on a radical literary review. In

1882 he produced a collection of prose sketches, *Farfalle, effetti di luce*, and the following year wrote his first play, *I Narbonnier-Latour*, in collaboration with Ferdinando Fontana. His greatest success in this field was a comedy in Milanese dialect, *L'eredità di Felis* (1891).

Illica's activity as a librettist began in 1889 with the crudely melodramatic *Il vassallo di Szigeth* written for Smareglia. The association with Puccini began in 1892, when Leoncavallo suggested that Illica complete the much tormented libretto of *Manon Lescaut*. As much of Domenico Oliva's work remained in the final text, including the entire fourth act, Illica tactfully withheld his name from the title-page, and the libretto was published without an attribution. In Puccini's next three operas – *La bohème*, *Tosca* and *Madama Butterfly* – Illica worked in partnership with the playwright Giacosa, who versified the dialogue that his colleague had drafted out. When Giacosa died in 1906 Puccini turned to other librettists, while continuing for some years to keep Illica employed on the book of a *Maria Antonietta* which he never set. They discussed further projects until their contact was finally broken when in 1915 Illica volunteered for military service, although well over the age limit.

Illica's 35 librettos run the gamut of contemporary fashions, from near-*verismo* to historical drama, from *art nouveau* symbolism to evocations of the *commedia dell'arte*, and range as far afield as an adaptation of Thomas Hardy's *Tess of the D'Urbervilles*. Though negligible as literature, they show considerable stage sense as well as invention (he was one of the earliest librettists to devise his own plots, as in *Andrea Chénier* and *Siberia*). He was especially skilful with what could be termed the 'dynamic' or 'kinetic' ensemble during which the action moves forward (e.g. the roll-call of the prostitutes in *Manon Lescaut*, the Café Momus scene in *La bohème*, the parade of the People's Representatives in *Andrea Chénier*). Above all he was instrumental in breaking down the rigid system of Italian operatic metres into lines of irregular length, which Giulio Ricordi jokingly called 'illicasillabi' but which were eminently suited to the prevailing musical style.

JULIAN BUDDEN

Illinois, University of, School of Music.

The University of Illinois at Urbana-Champaign was founded in 1867; the school of music was established in 1895 and made a unit of the college of fine and applied arts in 1931. In the 1990s the school enrolled about 700 students per year and had more than 80 faculty instructors. Degrees are

offered in performance, composition, musicology, music education and theory.

The library, founded in 1943, houses over 750,000 items, including several instrumental collections and personal archives (including Harry Partch's), large quantities of American sheet music, the Musicological Archive for Renaissance Manuscript Studies (with more than 90% of known polyphonic sources from 1400 to 1550 on film), the Hymn Tune Index and an Archive of Ethnomusicology. The school's experimental music studios, founded by Lejaren Hiller in 1958, were the first of their kind in the western hemisphere and have led many of the major developments in electro-acoustic and computer music.

Illouz, Betsy.

See [Jolas, Betsy](#).

Il Verso [Lo Verso; Versus], Antonio

(*b* Piazza Armerina, Sicily, ?c1560; *d* Palermo, c23 Aug 1621). Italian composer, poet and historian. He was the central figure of the Sicilian polyphonic school; his long and prolific career forms the bridge between his teacher Pietro Vinci and the generation of his own pupils. His parents, Clementia and Matteo de lo Verso, were landowners; his name first appears in a notarial document of 19 January 1569 at Piazza Armerina. With the exception of one possible sojourn in northern Italy, he spent most of his life in Sicily. Il Verso studied with Vinci, probably in Piazza, between 1582 and 1584, and in 1588 began to publish Vinci's posthumous works together with his own early compositions. He moved to Palermo before this date, and spent most of his life there; all but three of his extant works were dedicated from Palermo, and Il Verso's presence may have been an impetus to the rise of music printing there. According to a passage in his own *Historia*, he was in Piazza in 1600, and between the end of March and the end of July of the same year he was still in Palermo, where he took part in the debate between Achille Falcone and Sebastián Raval as a supporter of Raval. Three books of his madrigals were dedicated from Venice between 1 October 1600 and 10 September 1603. During this period he probably lived in Venice, or at least in northern Italy. He apparently returned to Palermo from Venice before 1 April 1605, since it was left to the Venetian printer Amadino to dedicate the *Secondo libro de madrigali a tre*

voci to Il Verso's 11-year-old pupil Francesco del Pomo. It was during Il Verso's absence from Sicily that his death was mistakenly reported; an elegy was then written by his friend Sebastiano Bagolino who died in 1604.

Although Il Verso's compositions are dedicated to princes, prelates and rich citizens, he does not appear to have held an official appointment; he made his living as a freelance music teacher and composer. As an editor he was responsible for Arcadelt's *Primo libro de madrigali a quattro voci con una gionta di diversi autori* (RISM 1592¹⁷), while as a writer and poet he produced the *Historia della città di Piazza* (now lost) and was evidently acquainted with many literary figures in Palermo. Matteo Donia and Filippo Paruta praised him in Latin epigrams, and the latter wrote for him the dedication of his *Duodecimo libro de madrigali a cinque voci*. Among his many pupils were Giovanni Battista Cali, Francesco del Pomo, Domenico Campisi, Antonio Formica and, most important, Giuseppe Palazzotto e Tagliavia. A passage in the *Historia* records events of 1620, and in that year or perhaps in 1621 his last motets were published. On 23 August 1621 the Congregazione dell'Oratorio of Palermo granted him a free burial place in the church of S Ignazio all'Olivella.

Of Il Verso's 39 music publications, 23 are madrigal books; only Philippe de Monte was more prolific in this area. The starting-point of his secular music is often his teacher Vinci, and at least 20 pieces are setting of texts that Vinci had used. In these instances Il Verso's compositions are parodies of Vinci's; the melodic subjects are the same, but the style is very different. Vinci was a classicist, Il Verso a mannerist: his parodies are elaborations full of artifice, every effect is varied and enhanced, the textures are denser, the repetitions more numerous and varied, the harmony full bodied and the music more prolonged (e.g. *Passa la nave mia*: Vinci, *Primo libro*, 6vv; Il Verso, *Primo libro*, 6vv). He turned homophony into contrapuntal displacement (e.g. *Lasciatemi morire*: Vinci, *Primo libro*, 6vv; Il Verso, *Decimoquinto libro*, 5vv) and inserted single notes in the borrowed material to produce suspended dissonances (e.g. *Apri le porte il riso*: Vinci, *Settimo libro*, 5vv; Il Verso, *Primo libro*, 5vv). He applied similar principles in the seven *Ricercari a tre* of his own that he included in his edition of Vinci's *Secondo libro de' motetti e ricercari a tre voci* (1591^{2a}), where he remodelled ricercares by his teacher, preserving their structure, key and the distance between the entries, and using the same subjects.

The path from his first book of five-voice madrigals (1590) to his 15th (1619) is a long one, but all his works belong to the 'first phase' of the *seconda pratica*; the melodies articulate the meaning of the text but the harmonic fabric balances polyphonic structure and melodic flow. In his last book of five-part madrigals Il Verso pursued the ideal put forward by Zacconi in *Prattica di musica* (1592), turning the 'gracefulness of accent ... achieved by the fragmentation and multiplication of the notes' into an essential feature of his part-writing; each voice proceeds with ease and with rhythmic and melodic flexibility, each has accents and graceful ornaments, and none is given preferential treatment. This reinstatement of the equilibrium of classical five-part polyphony is all the more significant in view of Il Verso's far-sighted treatment of three-part madrigals, where he adopted the typical 17th-century texture of two high voices and a bass.

Among his preferred texts those by Tasso predominate: in addition to individual items, the missing five-part *Libro settimo* was entitled *I soavissimi ardori* after Tasso's poem, the likewise missing five-part *Libro decimoterzo* was based on *Aminta*, and he set six cycles from *Gerusalemme liberata* in the second and fourth three-part books and the eighth and 15th five-part books. He was also often drawn to Marino (some of whose verses he was the first to set), Petrarch, Vittoria Colonna, Luigi d'Heredia, Livio Celiano, Scipione de Castro and Guido Casoni (the last four being followers of Tasso). The verse of Guarini, on the other hand, he reserved almost exclusively for madrigals in a lighter vein and for villanellas.

Particular to Il Verso is his stylistic variety; he reconciled the most advanced *seconda pratica* with recovery of the roots of the *prima pratica*: for example, *Il bianco e dolce cigno* (*Secondo libro*, 3vv, 1604) is a parody of Arcadelt's setting in the modern structure of the Baroque trio. But many of his five- and six-part madrigals too are in the modern style, with limpid texture and articulation and the most audacious harmonic writing. In his sacred works, all published after his stay in Venice, he appears to have been a skilful follower of Giovanni Gabrieli whom he praised in the acknowledgment ('ai signori organisti musici') in the organ scoring of the *Brevi concerti* (1606).

PAOLO EMILIO CARAPEZZA

Imai, Nobuko

(b Tokyo, 18 March 1943). Japanese viola player. She studied at the Tōhō School, Tokyo, with Toshiya Eto and Hideo Saito (1958–65), the Yale Graduate School with David Schwartz and Broadus Erle (1965–6) and the Juilliard School with Walter Trampler (1966–8). She made her US recital début at Carnegie Hall in 1968 and was a member of the Vermeer String Quartet from 1974 to 1979. Her London début was in 1975, in Berlioz's *Harold en Italie*. In 1980 she took part in the world première of Tippett's Triple Concerto, which she later recorded, and in 1982 performed Walton's Viola Concerto at the Barbican Concert Hall, London, in a live TV broadcast by the BBC to celebrate the composer's 80th birthday. Imai also gave the world première of Takemitsu's concerto *A String around Autumn* with the Orchestre de Paris in 1989. She has taught at the RNCM (1978–81), the Royal Conservatory, The Hague (1980–85), and the Utrecht Conservatory (1982–5), and in 1985 was appointed professor at the Hochschule für Musik in Detmold. In 1995–6 she organized Hindemith centenary festivals in Tokyo, London and New York, at which all the composer's music for viola and much of his chamber music was performed. Imai's playing is elegant and her tone rich and mellow, as can be heard on many recordings, including the concertos of Takemitsu, Walton, Pettersson and Schnittke, *Harold en Italie*, her own viola transcription of Bach's six solo cello suites and much chamber music. She plays a viola by Andreas Guarneri, dated 1690. (M. Campbell: 'Going Solo', *The Strad*, xcvi (1984–5), 349–50)

MARGARET CAMPBELL

Imbault, Jean-Jérôme

(b Paris, 9 March 1753; d Paris, 15 April 1832). French violinist and music publisher. As a boy he studied with Pierre Gaviniès; at the age of 17 he made his début in a concerto in which he showed great promise, according to the *Mercure de France* of 1 April 1770. A performance 11 years later elicited only mild enthusiasm, and the soloist's 'noticeable shyness' was commented on (*Mercure de France*, April 1781). His later musical activity was for the most part confined to teaching and to participation in the orchestras of various societies (including the Concert Spirituel, the Concert d'Emulation, the Société Académique des Enfants d'Appollon, the Concert Olympique and, in 1810, the imperial chapel), although in these he sometimes performed as leader, and occasionally as soloist.

The music publishing house that Imbault founded operated during its first year in connection with the already established firm of Jean-Georges Sieber (their first joint announcement, in the *Journal de la librairie* of 2 August 1783, was for Devienne's Second Flute Concerto). Advertisements for Imbault alone appeared in various journals, beginning in November 1784 with one for J.B. Cartier's variations op.3 on *airs* from Grétry's *Richard Coeur de Lion*. Until January 1811 Imbault continued to describe himself on title-pages and advertisements as both 'professeur et éditeur de musique'.

The firm's considerable output is well documented by a series of catalogues issued between 1786 and about 1803 and by a 284-page thematic catalogue of publications (1791 or 1792). In addition to the opera arrangements and excerpts common to the period Imbault published many works by Haydn, Clementi, G.B. Viotti, Pleyel, Mozart, Boccherini, Gyrowetz, Paul Wranitzky and other respected composers. In 1798 or 1799 he bought the shop of a publisher named Leblanc and from that time the additional location in the 'péristyle du Théâtre de l'Opéra comique' (also called the Théâtre Italien or Théâtre Favart) at 461 rue Favart appeared in his address along with the original one, 125 rue St Honoré. Imbault is still listed in the *Almanach du commerce de Paris* for 1812, with the designation of music seller to 'their imperial and royal majesties'. On 14 July 1812 Imbault sold the firm to P.H. Janet and Alexandre Cotelle (Janet had earlier served Imbault as agent). Although the successors occupied part of the house for their commerce, Imbault continued to live at 125 rue St Honoré until his death. His bequest to his wife (there were no children) included four houses and valuable shares in the Bank of France.

RITA BENTON

Imbert, Hugues

(*b* Moulins-Engilbert, Nièvre, 11 Jan 1842; *d* Paris, 15 Jan 1905). French music critic and writer. He was educated in Paris and studied music privately. Despite the duties of an official career, he maintained his early friendships with musicians, including Chabrier, d'Indy and Fauré. He began writing on music in 1886 and contributed articles to *La musique populaire*, *La revue illustrée*, *Grande revue*, *L'indépendance musicale*, *L'artiste*, *La liberté*, *Revue d'art ancien et moderne*, *Revue bleue*, *The Musician* and the second edition of *Grove's Dictionary*. In 1900 he became chief editor of the *Guide musical*. He was, with Edouard Schuré, one of the few Parisian advocates of Brahms's music, and successfully nominated him as a member of the Académie Française.

Imbert's most important books are the three volumes of *Profils* (1888–97; Brahms and Tchaikovsky in the first volume and Rubinstein in the third are the only non-French musicians discussed). His writings also include *Portraits et études* (1894; with articles on Brahms's *German Requiem* and Schumann's *Faust*), *Rembrandt et Richard Wagner* (1897), *Charles Gounod* (1897), *Georges Bizet* (1899), *La symphonie après Beethoven* (1900; a reply to Weingartner's pamphlet), and a final collection of contemporary musical 'profiles', *Médailleurs contemporains* (1902). (C. Goubault: *La critique musicale dans la presse française de 1870 à 1914*, Geneva and Paris, 1984)

Imbrie, Andrew (Welsh)

(*b* New York, 6 April 1921). American composer. He began piano studies at the age of four with Ann Abajian, and continued with Pauline and Leo Ornstein until 1942. He also studied briefly with Nadia Boulanger (1937) and Robert Casadesus (1941). As an undergraduate at Princeton (BA 1942) he studied composition with Sessions. After serving in the US Army (1944–6), he followed Sessions to the University of California, Berkeley, where he received an MA in 1947 and was in the same year appointed an instructor. He postponed the start of his teaching career, however, to accept a fellowship at the American Academy in Rome (1947–9), to which he later returned as composer-in-residence (1967–8). Returning to Berkeley in 1949, he remained a member of the music department until his retirement in 1991. Highly respected as a teacher and scholar as well as a composer, Imbrie also taught at the San Francisco Conservatory and held distinguished visiting professorships at the University of Alabama, the University of Chicago, and Brandeis, Harvard, Northwestern and New York universities. He also served as composer-in-residence at the Tanglewood Music Center (1991) and the Festival at Sandpoint, Idaho (1989, 1990, 1992, 1993). His many honours include the New York Music Critics' Award (1944), the Alice M. Ditson Award (1947), two Guggenheim fellowships (1953–4, 1959–60), the Hinrichsen Award of the American Academy of Arts and Letters (1971) and a Citation from the University of California, Berkeley (1991), and commissions from the Koussevitzky (1954), Fromm (1957), Ford (1959, 1974) and Naumburg (1960, 1981) foundations, the New York PO (1977), the San Francisco Opera (1976) and the San Francisco SO (1984). He was elected to the National Institute of Arts and Letters in 1969 and, in 1980, to the American Academy of Arts and Sciences. He has also served as a board member of the Koussevitzky Foundation and as governor of the San Francisco SO (1982–91).

Imbrie's aesthetic was strongly shaped by his pedagogical encounter with Sessions. Like Sessions, he has remained committed to the principles of classical motivic development, harmonic structure and phrasing throughout his career, despite gradual changes in his musical idiom. His early works sometimes show a stylistic debt to Bartók; works of the late 1950s and early 1960s show a similar debt to Sessions. In these as well as in later works, he aimed to project maximum clarity and dramatic force even in complex, contrapuntal textures, and to mine the full potential of motivic and harmonic transformations particular to each of his compositional ideas. In published articles on Sessions and Beethoven, he has articulated concerns

that also inform his compositional work: the construction of long, nuanced musical lines, and the embedding of metrical relationships on different structural levels. The harmonic materials of his work are varied, though usually non-triadic. He has remained flexible and open to a broad range of possibilities, however. In the opera, *Angle of Repose*, for example, he incorporated bits of banjo music and other North American folk idioms into a predominantly atonal harmonic language. This and other large-scale works for voice and instruments (e.g. *Requiem*, 1984; *Adam*, 1994) also demonstrate his interest in the ways in which musical experience may model personal and historical memory. A similar concern inheres in many of his 'abstract' instrumental works.

Imitation.

In its broadest sense, repetition of the melodic contour of one part by another, often at a different pitch. Usually, in a passage referred to as 'imitative', the repeated passages are close enough together for the second part to overlap with significant material in the first, although the term is sometimes used to describe echoing or dialogue-like repetitions among parts (such as those between woodwind and strings in Mozart's Symphony in G minor k550, first movement, bars 153–64), or examples of [Voice-exchange](#) (e.g. between the upper voices of some 12th-century organa *tripla* and *quadrupla*). When the material of the succeeding voice follows exactly that of the preceding one for a considerable time, the term 'canon' (see [Canon \(i\)](#)) is used; when an entire piece is based on the imitation of a single, fairly concise theme in a strongly tonal context, the terms 'fugue' or 'fugato' may be used (but see [Fugue](#), §1, for the criteria that must be met before this term is correctly applied). The term 'imitation' is now normally reserved for fairly casual instances of the device, particularly in works of an otherwise non-contrapuntal nature.

The procedure of imitation has a long history. It can be found in organa of the Notre Dame school (e.g. Perotinus's *Sederunt*), in conductus (e.g.

Procurans odium) and in motets (*S'on me regarde/Prenez en garde/Hé mi enfant*) and occasionally it appears to be the central organizational procedure, as in the first *Tanquam clausula* in *I-FI* Plut.29.1, f.47v). The technique was intrinsic to certain medieval forms, such as the [Rota](#) (e.g. *Sumer is icumen in*), the Italian Trecento [Caccia](#) and the related French [Chace](#). In the early Renaissance the technique of imitation was only one of many contrapuntal devices, favoured by, for example, Ciconia and Hugo de Lantins, but it became increasingly important after the middle of the 15th century. The generation of Josquin, Compère and Isaac made imitation a basic part of their texture, particularly so-called [Paired imitation](#). By the middle of the 16th century, in the works of Willaert, Clemens non Papa, Gombert and Morales, the technique of 'through imitation' (Ger. *Durchimitation*) had become the main structural principle of composition. Gombert's *Super flumina Babylonis* and Palestrina's *Sicut cervus desiderat*, for example, consist of successive 'points of imitation', each with its own words, the points after the first one usually being dovetailed into the preceding contrapuntal texture. Imitation was an important organizational element in 16th-century instrumental music as well, particularly in forms such as the [Capriccio](#), [Ricercare](#) and [Canzona](#) that do not derive from dance or theatrical music. The device of imitation (as distinct from canon, fugue and fugato) has retained its currency in musical language as a means of introducing unity, particularly in non-tonal music of the 20th century, or variety in the restatement of a theme, or to produce an effect of psychological intensity.

In theoretical writing, imitation was first mentioned by Ramis de Pareia (*Musica practica*, 1482), who applied it to both strict and free repetitions of interval progressions. Pietro Aaron (*De institutione harmonica*, 1516) defined fugue and 'imitatio' in a single passage, as though they were interchangeable, but later (*Lucidario*, 1545) he declared that imitation was an intervallically inexact repetition. Zarlino (*Le istituzioni harmoniche*, 1558, iii) established imitation as the broader category of composition to which fugue belonged; only if the second entry occurred at perfect intervals (unison, 4th, 5th or octave) was the term 'fugue' to be used. Aaron, Zarlino and other 16th-century theorists also used the term 'imitatio' for the procedure now called parody (see [Parody \(i\)](#)), and for the aesthetic concept of 'imitazione della natura' borrowed from the visual arts (but having relatively little to do with musical imitation). In 1622 Lodovico Zacconi (*Prattica di musica, seconda parte*, iv) clearly defined imitation as it is now regarded, applying the term to situations in which the leading part is followed only in a general way, and Purcell's edition of John Playford's *Introduction to the Skill of Music* (1694) referred to imitation as 'a diminutive sort of Fugueing ... in some few notes as you find occasion'. Purcell's definition was corroborated in the final distinction between fugue and imitation drawn by Rameau (*Traité d'harmonie*, 1722), who recommended that 'imitation' be the term for limited, casual and essentially decorative application of the device. Theoretical discussions in the 19th and 20th centuries deal with imitation largely in historical terms, as an important aspect of the compositional procedures of the Renaissance and the Baroque.

See [Meinl.](#)

Immer, Friedemann

(*b* Duisburg, 8 April 1948). German trumpeter. He studied first with his father, and later with Freiherr Heinrich von Senden. After briefly turning to medicine, mathematics and physics he studied the trumpet from 1978 to 1984 with Walter Holy at the Hochschule für Musik, Cologne. In 1976 he began to specialize in the Baroque trumpet, an instrument on which he has given numerous performances worldwide and made more than 80 recordings. He has performed Bach's Second Brandenburg Concerto more than 200 times, and recorded it eight times on period instruments. He was the first to record Haydn's Trumpet Concerto on a keyed trumpet (1987, under Hogwood). In 1984 he was appointed to teach at the Hochschule für Musik in Cologne, and in 1993 began to teach at the Sweelinck Conservatory in Amsterdam. He founded the Trompeten Consort Friedemann Immer in 1988, and he has also made editions of little-known trumpet repertory.

EDWARD H. TARR

Immerseel, Jos van.

See [Van Immerseel, Jos.](#)

Immys, John

(*bap.* Aldersgate, London, 26 Feb 1724; *d* London, 15 April 1764). English amateur musician. 'In his younger days he was a great beau', said Hawkins, who is the chief source of information about Immys. 'He had been guilty of some indiscretions, which proved an effectual bar to success in his profession, and reduced him to the necessity of becoming a clerk to an attorney in the city'. He cultivated music assiduously, playing the flute, viola da gamba and harpsichord, and had a 'cracked counter-tenor voice'. As a member of the Academy of Ancient Music, and as a student and copyist to Pepusch, he became familiar with much old music, which he preferred to that of his own day. In 1741 he founded the Madrigal Society, which began as a small group of mechanics and tradesmen experienced in psalmody, meeting at a tavern in Fleet Street. Immys was 'both their president and instructor', and the music was confined to madrigals and other old music, by such composers as Ruffo, Lassus, Marenzio, Vecchi and Gesualdo; the English madrigalists were also explored. Immys copied

seven Palestrina motets for the society's use. From these modest beginnings sprang what is now the oldest musical association in existence.

Immyns's efforts were rewarded by official recognition: in 1752 he was made lutenist to the Chapel Royal, having learnt to play the instrument from Mace's *Musick's Monument* without any other instruction.

NICHOLAS TEMPERLEY

Imperfect cadence [half cadence; half close; semi-cadence]

(Fr. *cadence suspendue*; Ger. *Halbschluss*; It. *cadenza sospesa*).

A **Cadence** which comes to rest on the dominant; in some American writings, a cadence ending on the tonic in which the penultimate chord is in inversion, or in which the uppermost voice does not sound the tonic in the final chord.

Imperfect consonance.

The **Interval** of a major or minor 3rd or 6th, or any compound of one of these (10th, 13th etc); the term is contrasted with **Perfect consonance**.

Impressionism.

A philosophical, aesthetic and polemical term borrowed from late 19th-century French painting. It was first used to mock Monet's *Impression, Sunrise*, painted in 1873 and shown in the first of eight Impressionist exhibitions (1874–86), and later to categorize the work of such artists as Manet, Degas, Pissaro, Sisley, Renoir, Cézanne and Regnault.

'Impressionist' also describes aspects of Turner, Whistler, the English Pre-Raphaelites and certain American painters, as well as the literary style of Poe and the Goncourt brothers, and the free verse and fluidity of reality in symbolist poetry.

1. Aesthetic and scientific principles.
2. Stylistic innovation.
3. Social and political associations.

JANN PASLER

Impressionism

1. Aesthetic and scientific principles.

The word 'Impressionism' did not appear in conjunction with a specific musical aesthetic until the 1880s (although it had been used earlier in titles of travel pieces and descriptions of 19th-century programme music). Perhaps referring to the *Pièces pittoresques* of Chabrier, a friend of the painters and collector of their work, Renoir spoke to Wagner in 1882 of 'the Impressionists in music'. More importantly for historians, the secretary of the Académie des Beaux Arts used the word in 1887 to attack Debussy's 'envoi' from Rome, *Printemps*. Besides displaying an exaggerated sense of musical colour, the work called into question the authority of academic values, and so its 'impressionism' appeared 'one of the most dangerous enemies of truth in art'.

Several meanings underlie and accompany this concept, each with its own artistic implications. The oldest and in some ways the most important comes from Hume's *Enquiry concerning Human Understanding* (1748), in which he describes an impression as the immediate effect of hearing, seeing or feeling on the mind. The word entered discussions about art in the 1860s just as French positivists, echoing Hume's concerns and interest in physiopsychology, began their studies of perception. Taine and Littré among others focussed on sensations – the effect that objects make on sense organs – as an important area of empirical research. They believed that impressions (a synonym for sensations) were primordial, the embryos of one's knowledge of self and the world and, significantly, a product of the interaction between subject and object. Critics saw something similar in contemporary painting, particularly that which reflected a new relationship to nature. Jules-Antoine Castagnary, who in 1874 was the first to dub the painters 'Impressionists' observed that 'they render not the landscape but the sensation produced by the landscape'. Although these painters placed more emphasis on personal, subjective experience than did the positivists, they too believed that any art based on impressions had the capacity to synthesize subject and object. Impressions then were not ends in themselves, but the means to new experiences of reality. Responding to the breakdown of the visual spectrum into what was assumed to be characteristic of unreflective vision, that is the vibrations of colour and light, these artists simplified their palettes by using only colours of the prism, replaced light-and-dark oppositions with a new concept of visual harmony, and created mosaics of distinct rather than blended colours and forms. Critics considered this 'physiological revolution of the human eye' an attempt to render visual experiences more alive, and viewers more perceptive of nuances. In 1883 Jules Laforgue, one of the first to see an affinity between Wagner and Impressionist art, compared this kind of vision to aural experiences in which 'the ear easily analyses harmonics like an auditory prism'. As interest in optics and Charles Henry's 'chromatic circle' of colours grew, the more scientifically minded neo-Impressionists of the late 1880s focussed on the physics of coloured vibrations per se, the role of contrasting colours in the creation of visual harmony, and the effect of the artist's nervous system on the nature of the impressions.

Similar issues were associated with 19th-century music deemed Impressionist. Critics hailed Beethoven's Pastoral Symphony as the first attempt to 'paint the sensual world' in sound even though it followed a long tradition of programme music by composers as different as Janequin, Byrd, Marais, Telemann, Rameau and Gluck who used sound to suggest pictures

or the composer's emotion before nature. Wagner's nature music, especially the Forest Murmurs from *Siegfried* and vaporous moments in *Parsifal* and *Tristan*, also elicited vague references to musical Impressionism. Palmer argues that although Chabrier 'lacked the intense preoccupation with personal sensation so characteristic of Debussy', he was the 'first to translate the Impressionist theories' into music, his chiaroscuro-like effects predating those of both Debussy and Delius. However, it was Debussy's extension of these ideas which had a lasting impact on the future of music. *Printemps*, an evocation of the 'slow and arduous birth of things in nature', parallels not only the painters' turn to 'open-air' subjects, but also their exploration of unusual colours and mosaic-like designs. Debussy extended the orchestral palette with harp harmonics, muted cymbals and a wordless chorus singing with closed lips (later Delius did the same in *A Song of the High Hills* and Ravel in *Daphnis et Chloé*). In *Prélude à l'après-midi d'un faune* and subsequent pieces he increasingly emphasized distinct sound-colours (those produced by individual instruments, rather than the composite ones of chamber or orchestral ensembles). And, like the Impressionist painters and later the symbolist poets, Debussy wanted music not merely to represent nature, but to reflect 'the mysterious correspondences between Nature and the Imagination'.

Just as contemporary physics informed new ideas about painting, Helmholtz's acoustics and developments in the spectral analysis of sound fed composers' interest in musical resonance and the dissolution of form by vibrations. In much of Debussy's music, as in Impressionist pieces by Delius, Ravel and others, the composer arrests movement on 9th and other added-note chords, not to produce dissonant tension but, as Dukas put it, to 'make multiple resonances vibrate'. This attention to distant overtones, particularly generated by gong-like lower bass notes, produces a new sense of musical space, in effect giving a greater sense of the physical reality of sound. The wide dynamic and registral range – a complete scale of nuances – can effect subtle vibrations in the listener's nervous system. In one of his earliest essays (1899), Emile Vuillermoz reiterated concerns expressed earlier by Laforgue about the problems of line and fixed forms. Sounding like a neo-Impressionist, he suggested that 'the progressive refinement of our nerves [by this music] leads us to think that *this* is the path of musical progress'.

Impressionism

2. Stylistic innovation.

The second category of meaning associated with Impressionism, also derived from criticism of the early Impressionist painters, relates to the self-conscious individualism of the artists in the original exhibitions, and to what Shiff calls the 'technique of originality'. Like the concerts of the Société Nationale which began around the same time, Impressionist exhibitions were not unified by style, but started as an attempt by a diverse and complex group of young painters to show their own work independent of the juried Salons. The word 'Impressionism' rapidly became generic, referring to the avant garde of the 1870s and 80s, and later even the symbolists with whom the Impressionists shared more than is often acknowledged. What these artists agreed on was the inversion of

conventional hierarchies and values, sometimes by means of influences from the distant past and exotic places. Rejecting the use of imposing forms to project grandeur and promote intellectual reflection, Impressionists favoured delicate sensuality, immediacy and the idea of art as an invitation to pleasure. They sought to renew a sense of the mystery of life and the beauty of the world through perception itself, using art to reveal the deep intuitions of the unconscious. Not incidentally they believed that the way images and sounds are produced affects their perception. Instead of working from line to colour, artists like Cézanne conceived painting in terms of colour relationships, line and form being secondary to juxtapositions of colour and light. Neo-Impressionists like Signac and Seurat, by contrast, returned to more conscious thinking about compositional form and applied systematic principles concerning line and colour to elicit specific 'correspondences' for emotional states. These preoccupations paved the way for early experiments with anti-naturalistic flat surfaces by post-Impressionists like Matisse.

In music the association between Impressionism and innovation was more short-lived and more narrowly restricted to Debussy and those whose music resembled or was influenced by him. These composers' attempt to explore the fleeting moment and the mystery of life led them to seek musical equivalents for water, fountains, fog, clouds and the night, and to substitute sequences of major 2nds, unresolved chords and other sound-colours for precise designs, solid, clear forms, and logical developments. To convey a sense of the intangible flux of time, they used extended tremolos and other kinds of ostinatos as well as a variety of rhythmic densities. But, like the painters who stressed not new realities but new perceptions of it, Debussy explained that this music's 'unexpected charm' came not so much from the chords or timbres themselves – already found in the vocabularies of composers such as Field, Chopin, Liszt, Grieg, Franck, Balakirev, Borodin and Wagner – but from their 'mise en place', 'the rigorous choice of what precedes and what follows'. For Debussy form was the result of a succession of colours and rhythms 'de couleurs et de temps rythmés' or, as Dukas put it, 'a series of sensations rather than the deductions of a musical thought'. This concept in turn demanded new approaches to performance. In interpreting Ravel's *Jeux d'eau*, the pianist Ricardo Viñes used the pedals liberally when playing fast-moving passages in the high registers 'to bring out the hazy impression of vibrations in the air'.

Yet to describe Debussy's aesthetic as Impressionist is not entirely accurate, for his notion of musical line was as neo-Impressionist as it was Impressionist, and his musical innovations owed much to his predecessors. Like the Impressionist painters, who responded to Haussmann's transformation of Paris and sought to disguise the banality of its forms, Debussy gave the musical line a decorative function. Eschewing conventional melodies, he fragmented themes into short motives and used repetitive figurations resembling those of Liszt and in Russia, The Five. Quickly moving passages wherein overall direction and texture are more audible than individual notes and rhythms give the effect of quasi-improvisation. At other moments in his and other Impressionist music, two kinds of line interact. As in Monet's and Renoir's paintings where sketchlike images of people vibrating with the rhythms of nature are juxtaposed with

the straight lines of Haussmann's gardens and avenues or industrial railroads and bridges, sinuous arabesques in this music, liberated from their dependence on functional harmony and sometimes incorporating medieval, whole-tone or pentatonic scales, give a sense of timelessness, of a hypnotic turning in place, while clearly etched tunes focus the listener's attention. Here, however, the resemblance to Impressionist painting breaks down. While the straight lines of Impressionist painting came from modern life, Debussy's melodies were often derived from folksongs, as in music by The Five. Reflecting the return of traditional values more characteristic of neo-Impressionist art, they are simple and hark back to earlier times or pastoral settings, often with a nationalist subtext. This is also the case in music imitating or incorporating Spanish popular song (such as that of Ravel, Albéniz, and Falla), or the Celtic traditions of Brittany or western Ireland. The strongly melodic character of Ravel's music likewise places him outside the purely Impressionist style.

Impressionism

3. Social and political associations.

Two other meanings of Impressionism circulated in the late 19th century. One was an association with women. This came not only from the importance of nature, leisure, sensuality and idealism in the aesthetic, but also from the role painters such as Morisot played in the Impressionist exhibitions. Over time this connotation of the word has been used to discount other meanings, undermining the serious intentions of the aesthetic's original proponents and their contribution to artistic progress. A less obvious meaning of Impressionism relates to its socio-political implications. Although Impressionist painting was never explicitly political Paul Tucker argues that Alsace and Lorraine were on the minds of Parisians during the first Impressionist exhibition, and that the prevalence of French subjects in the paintings reflected the artists' patriotism. Castagnary considered their individualist stance a model for French citizens' emancipation from dogma, essential to the reconstruction of the country after the Franco-Prussian War and the Commune. Although Renoir was the only Impressionist painter who came from the working class, Mallarmé saw the new art as an expression of working-class vision and ideology: its pictorial flatness and simplicity mimicked the popular forms favoured by the rising class of workers. He compared the Impressionists with the Intransigeants, a radical and democratic, anti-monarchist and anarchist wing of the Spanish Federalist party which was feared by the French. This analogy was not unfounded: in 1876, as the Impressionists were growing in importance and winning acceptance for their desire to render all colours (and sounds) legitimate in a perpetually changing universe, a group of Intransigeants in Paris – the radicals – took 36 seats in the Chambre des Députés. Later Laforgue drew a similar comparison between art in which 'our organs are engaged in a vital struggle' and society as a 'symphony of the consciousness of races and individuals'. The neo-Impressionist painters were more overtly political. Signac, a staunch socialist-anarchist, equated artistic and social revolution and hoped that harmony in art, particularly that effected by juxtaposing contrasting colours, would be a model for justice in society.

In more general terms, the gradual acceptance of Impressionist art reflected the desire of the middle class to share in the old aristocracy's way of life. This gave rise to the popular definition of Impressionism as an aesthetic of 'dreaming and the far away', of escape – and not just from academic conventions. Herbert suggests that Impressionist paintings, with their emphasis on leisure activities, were agents of social change in that they encouraged the development of vacation resorts for the middle class and helped prop up the illusions of holiday-seekers. In music too there is a vague sense of a desire for middle-class empowerment in composers' breakdown of tonal hierarchies, incorporation of distant overtones and expanded notion of consonance. Charpentier, who like Debussy was of working-class origins, was among the few to give voice to working-class values and sensations, but it is his *Poèmes mystiques*, settings of symbolist poems, more than his opera *Louise*, that shares in the Impressionist aesthetic. Debussy, by contrast, allied himself with upper-class patrons more than anarchists, and Fleury points out that both he and Delius were more aristocratic than anarchic by nature. Many of Debussy's innovations reflect an attempt to create a specifically French musical style by appropriating materials from earlier times (medieval organum, 16th-century counterpoint).

After 1904, with increasing attempts to debunk Impressionist values, these socio-political associations became even more blatant, especially as they related to music. Those defending the aesthetic argued that the emphasis on vibrations would bring forth new forms of vitality in listeners and aid in the country's regeneration and repopulation. Others, focussing on issues of class, countered that the nuanced multiplicity of colours and imprecise forms of Impressionist art and music weakened the perceiver's sensibility by undermining 'hierarchical thinking' and the 'aristocratic language of lines'. As critics advocated a return to 'classical order', 'the science of composition' and 'life' in all the arts, some redefined Cézanne's painting and Debussy's music, shifting emphasis on to their abstract qualities. Debussy's style too changed after 1904 as melody and counterpoint became more important to him and his musical forms became more complex.

Impressionism

4. Neo-Impressionism and post-Impressionism.

It is at this point that one should speak of the emergence of musical post-Impressionism, for in its embrace of line, colour and form from another perspective, and constructions that bring pleasure to the mind as well as the senses, this aesthetic resembles that of post-Impressionist painters like Gauguin and Matisse. Stravinsky's *Rite of Spring* perhaps best exemplifies this tendency in music. In one sense it extends the Impressionist notion of sound for its own sake; in another, as Jacques Rivière put it, *The Rite* rejects the 'sauce' of its predecessors' music, with its language of nuance and transitions, in favour of larger-scale juxtapositions of violent emotions, brutal rhythms, robust colours and a more advanced harmonic language that includes polytonality. Both aspects of post-Impressionism laid the foundation for a Franco-Russian form of modernism. Respighi in Italy, Schmitt and Dukas in France, and Bax and Holst in Great Britain also represent this duality, in different ways. Perhaps only Satie, among French

composers of the time, rejected Impressionism completely. With humour and irony he attempted to rid music of its literary and painterly associations, setting the stage for the neo-classicism of the 1920s.

During this period and after Debussy's death in 1918 a large number and wide variety of composers, some of them falsely called post-Impressionists, continued to use Impressionist techniques, albeit sporadically. Among others, in England there were Delius, Vaughan Williams, Scott, Bridge and Ireland; in France, Koechlin, Aubert, Louis Vuillemin, Ropartz, Roger-Ducasse, Ladmiraault, Caplet, Lili Boulanger and later Messiaen; in Hungary, Bartók and Kodály; in Poland, Szymanowski; in Italy, Malipiero and Puccini; and in the USA, Griffes. Even at the Schola Cantorum, a Parisian school which inculcated different ideals, Impressionism made an impact on composers. Roussel, Albéniz and Le Flem reconciled the harmonic freedom and timbral nuances of Impressionist music with the solid construction, linear clarity and rigorous logic demanded by d'Indy and his followers. Ravel, who Landormy claims helped discredit Impressionism through his embrace of classical forms, continued to use Impressionist approaches to harmony and timbre even after his style changed around 1908. For a time the aesthetic even appealed to Schoenberg: although the emotional content of *Gurrelieder* is Expressionist – meaning that its form and language are subordinated to an inner resonance in the composer – its mystical concept of nature is altogether Impressionist.

Despite the pejorative connotations they have acquired since the 1920s (association with vague lines and structure, a style that lacks vitality), and revisionist notions of Debussy in the 1970s as a symbolist by scholars and as a modernist by composers, the Impressionist and neo-Impressionist aesthetics continue to exercise an important influence on music, especially in French- and English-speaking countries. Other traditions have found it fairly easy to assimilate certain elements of Impressionism because of its formal freedom and openness to non-Western philosophies of sound and music. In jazz Impressionism has permeated the harmonies of Duke Ellington, the orchestral textures of Gil Evans, and the piano styles of Art Tatum and Cecil Taylor. In the film music of Korngold, Herrmann and their followers it has affected audiences' perceptions of images on the screen. In Japan Takemitsu incorporated elements of Impressionism to infuse his music with Western nuances. In the USA Glass and Reich used simple, repeated Impressionist-like figurations, albeit in the service of another aesthetic, to slow down time in their early minimalist music. More recently a generation of French composers born in the mid-1940s – Grisey, Murail, Dufourt and others – have returned to the Impressionist notion of sound as an object of research. Using the computer to study the nature of timbre with scientific precision, they have also renewed attention to harmony as a factor of timbre, and composed 'spectral' music based on contrasts of registers, speeds and intensities. Misunderstanding of the term 'Impressionism' has thus never kept musicians from the music itself, and in borrowing from various times, places and cultures, the aesthetic can be seen as a precursor to the cross-culturalism of what is marketed as World beat and other contemporary musics.

Impressions, the.

American soul vocal group. Formed in Chicago in 1957 as the Roosters, its original members were Jerry Butler (*b* 1939), [Curtis Mayfield](#), Sam Gooden (*b* 1942) and the brothers Arthur and Richard Brooks. As the Impressions they made their first recording, *For Your Precious Love*, which was released on three different labels, selling most copies on Vee-Jay Records in 1958. Fred Cash replaced Butler, who was pursuing a solo career, and having signed for ABC-Paramount the group had a hit with Mayfield's *Gypsy Woman* (1961). Shortly thereafter the Brooks brothers left and the group continued as a trio. In 1970 Mayfield left, triggering a number of changes in personnel. Gooden and Cash continued to perform into the 1990s.

Led by Mayfield's talent for songwriting, guitar playing and production, the Impressions defined the sound of Chicago soul and achieved much success throughout the 1960s. Their records commonly featured extensive use of falsetto, a combination of clipped rhythm guitar and bright lead guitar, percussive (often pizzicato) strings, metallic timbres from vibraphone or glockenspiel, brass (as opposed to saxophones) and instrumental vamps instead of solos. Through the interplay of their multiple lead vocals, they evoked a sense of community. As earlier songs such as *People get ready* (1965) and *Keep on Pushing* (1964) reflected the spirit of the Civil Rights movement, by the end of the decade Mayfield's work showed a more militant stance, notably *This is my country* and *Choice of Colors* (both 1968).

Impromptu.

A composition for solo instrument, usually the piano, the nature of which may occasionally suggest improvisation, though the name probably derives from the casual way in which the inspiration for such a piece came to the composer. It was apparently first used in 1817 as the title of a piano piece by J.V. Voříšek published in the *Allgemeine musikalische Zeitung*. A set of six such pieces by Voříšek appeared in 1821; they are modelled on the eclogues of his master Tomášek, and the title 'Impromptu' appears to have been suggested by the publisher. H.A. Marschner's *impromptus* opp.22–3 appeared in the early 1820s.

Schubert composed his eight *impromptus* in 1827; the first four, d899, were so named by the publishers, but it is likely that Schubert himself chose the titles of the second set, d935. Only the first of the eight, in C minor, suggests an element of improvisation; the others, particularly the seventh, a set of variations on an original theme in B \flat , are highly organized movements. The form is chiefly a ternary one in which the central episode may be of a stormy and vehement character. The swift figuration and the thematic material of each of Chopin's four celebrated *impromptus* are so akin as to suggest that he intended them to form a coherent group – each one after the first to be, so to speak, improvised from, or casually derived from, the material of the previous one. The fourth, op.66 (in fact the first to be composed and possibly deriving from an *impromptu* of Moscheles), was edited by Julian Fontana, who added the prefix 'Fantaisie' to Chopin's title 'Impromptu'. The first and ninth of Schumann's *Albumblätter* op.124 are *impromptus*, and his op.5 is a set of *impromptus* on a theme by Clara Wieck; these are in the nature of variations. Balakirev and Rimsky-Korsakov both used the form in an interesting way: the former composed an *impromptu* (1907) on two of Chopin's preludes (those in E \flat minor and B major), a further example of the way in which *impromptus* tend to use variation technique; the latter wrote a *Prelude-Impromptu* and *Mazurka* (1894) for an album commemorating the 25th anniversary of the founding of V.V. Bessel's publishing firm. Further examples of *impromptus* can be found in the work of Sterndale Bennett, Skryabin, Fauré, Lennox Berkeley (op.7, 1935) and Roberto Gerhard (1950). Donald Martino's *Fantasies and Impromptu* (1980) represents one of the comparatively rare uses of the title by composers in the latter part of the 20th century.

Improvisation.

The creation of a musical work, or the final form of a musical work, as it is being performed. It may involve the work's immediate composition by its performers, or the elaboration or adjustment of an existing framework, or anything in between. To some extent every performance involves elements of improvisation, although its degree varies according to period and place, and to some extent every improvisation rests on a series of conventions or implicit rules. The term 'extemporization' is used more or less interchangeably with 'improvisation'. By its very nature – in that improvisation is essentially evanescent – it is one of the subjects least amenable to historical research.

Improvisation

I. Concepts and practices.

In virtually all musical cultures there is music that is improvised. Societies differ, however, in several ways: the degree to which improvisation is distinguished from pre-composition; the nature and extent of the musical material which improvisers use as a point of departure or inspiration; the kinds and amounts of preparation required of improvisers, either in their musical training or in relation to individual performances; the relationship of written to oral transmission; and the relative social and musical value assigned to improvisations, compositions and the musicians who practise them. For further discussion of specific traditions see entries on individual countries.

4. A sampling of genres.

BIBLIOGRAPHY

Improvisation, §1: Concepts and practices

1. Concepts.

The term 'improvisation', in suggesting a failure to plan ahead or making do with whatever means are available, may have negative implications. However, in many of the world's musical cultures the ability to improvise is often highly valued. In societies such as those of the Middle East and North India the improvised portions of a performance carry the most prestige.

The relationship between pre-composition and improvisation may be intricate. In Karnatak music the formal techniques of both composed songs and improvisations include repetition, variation, melodic sequences and returns to the point of departure. Similarly, in 19th-century European organ

improvisation one purpose was to produce well-crafted fugues that might not be distinguishable from the composed canon. Elsewhere composition and improvisation represent opposite ends of the musical spectrum, as in 19th-century piano music where the concept of improvisation, in composed genres such as *impromptu* and *fantasia*, was drawn upon to explain or justify departure from formal norms.

One of the typical components of improvisation is that of risk: that is, the need to make musical decisions on the spur of the moment, or moving into unexplored musical territory with the knowledge that some form of melodic, harmonic or ensemble closure will be required. While risk is always present, its character varies greatly. In the improvisation of a fugue the difficulty is in adhering to the predetermined form; in the *kalpana svara* of Karnatak music it is the juxtaposition of rhythmic patterns that depart from but return to the *tāla*; in Iranian music it is the maintenance of a balance between quoting memorized material and moving too far beyond it; in South Slavonic epics it is of keeping to a textual line structure while alternating memorized themes with commentary. In most instances audiences evaluate improvisations by their balancing of obligatory features against imaginative departures from them. They also appreciate exceptional virtuosity, either technical or intellectual.

Even in societies in which improvisation is not recognized it may play a role in the conception of music. Some Amerindian music is said to be created in a moment of ecstasy, with a suddenness analogous to improvisation. This is the case in songs learnt in visions or dreams by Amerindian peoples of the North American Plains who say that in the dream the song was sung to them by an animal guardian spirit only once. The visionary, however, rehearses the song before singing it for other humans. In Plains culture this way of composing is contrasted with another, in which someone may sing through the songs they know and will consciously combine sections to create a new work.

The concept of improvisation has also been dealt with variously in the history of Western musical scholarship. In the study of Western music history improvisation has principally attracted scholars interested in historically informed performing practice and was associated with the early music movement of the second half of the 20th century. Earlier it interested music educators who used it to enhance music learning, and it has continued to play a role in music education in Europe and North America. Nevertheless, before the 1970s the field of musicology tended to treat improvisation as a 'craft', in contrast to the 'art' of composition. Case studies of improvisation began in ethnomusicology in the 1960s, concentrating on three repertoires: jazz, Indian art music and Iranian music. To a substantial extent approaches to the study of improvisation in other cultures have been informed by the types of studies suggested by these three repertoires. However, since the mid-1970s the distinctions between improvisation and other forms of music-making have been investigated in research that deals with concepts of risk, competence, dealing with unexpected situations and making positive use of mistakes.

[Improvisation, §1: Concepts and practices](#)

2. Improvisation in musical cultures.

The improvising musician may play a special role in a culture's conceptualization of musicianship. In Western culture the musics that are most dependent on improvisation, such as jazz, have traditionally been regarded as inferior to art music, in which pre-composition is considered paramount. The conception of musics that live in oral traditions as something composed with the use of improvisatory techniques separates them from the higher-standing works that use notation.

By contrast, in West Asian societies improvised music (and music that gives the impression of being improvised) has been the ideal. These cultures associate it with the concept of freedom, with the ability of a musician to make his or her own decisions and with the absence of restriction such as metre. The respect for individual decision-making is extended to evaluating musicians, thus, for example, privileging the learned amateur who needs only to follow his or her own inspiration over the professional who is obliged to perform when and as directed. Improvised genres are regarded as central and composed ones as peripheral. Non-metric genres, which are always improvised, have the highest prestige.

Karnatak musicians are judged both on their knowledge of the repertory of composed songs and by their ability to improvise particularly the unmetred *ālāpanam*. However, it is the performance of *rāgam-tānam-pallavi*, the South Indian genre that relies most on improvisation, that is considered the greatest test of a musician's skill. According to Ki Mantle Hood (1964), in the group improvisations of Javanese gamelan, the performers on those instruments that hold the ensemble together (and thus depart from the model) as well as those that move most from the model, are the most highly esteemed.

Although some degree of improvisation may be said to be present in all musical performance, improvisation should be spoken of only when performances based on a model differ substantially or when a society distinguishes explicitly between the performance of a pre-composed piece and an improvisation on the basis of something given. Thus the many versions of an English folksong can be said to result from a personal interpretation of a local tradition passed on by a particular individual, rather like improvisation. Yet folksingers seemed traditionally to talk more about personal versions than improvisation. The concept of improvisation is readily accepted by the practitioners of West Asian music, although some musicians appear to memorize their improvisations and to perform these personal variants consistently. Japanese musicians ordinarily maintain that there is no improvisation in Japanese music. However, performances of the same piece of *shakuhachi* music may differ greatly in length and form, and to some extent in content.

Determining the presence or absence of improvisation in a particular culture depends to a great extent on the culture's own taxonomy of music-making and on its assessing of the relationship between what is memorized or given and the performance. The prominence of improvisation varies greatly from culture to culture. For example, it characterizes the dominant genres in the musical cultures of South and West Asia, in Indonesia and in Africa, whereas in certain other societies it typifies individual, and perhaps exceptional, genres: jazz in the West, *sanjo* in

Korea, the Philippine *kulintang* ensemble, and sections of the Cantonese opera from China.

Improvisation, §1: Concepts and practices

3. Models or points of departure.

A common feature of improvised music is a point of departure used as the basis of performance. No improvised performance is totally without stylistic or compositional basis. The number and kinds of obligatory features (referred to here as the 'model') vary by culture and genre.

The most prominent model may be that of mode or a modal system. As a model these can be found in South, Central and West Asia, in North Africa and, in a somewhat different form, in Indonesia. In South Asia the predominant model is *rāga*. The definition of *rāga* is a subject of much discussion and dispute among South Asian musicians: it may, however, be described as a collection of pitches in a hierarchical relationship, from which are produced sets of typical, and often obligatory, melodic practices, motifs and ornaments. *Rāga* are the basis of both improvised and pre-composed genres in Hindustani and Karnatak music. In performance each item (either improvised or pre-composed) is ordinarily based on only one *rāga*. However, improvisations based on a series of *rāga*, with an emphasis on the elegant transition from one to the next, are occasionally heard.

In West Asian musics, improvisations are based on concepts similar to those of *rāga*, albeit with significant differences. Known as *magām* in Arabic traditions, *makam* in Turkey, *mugam* in Azerbaijan, *makom* in Uzbek culture and *gushe* in Iranian music, the West Asian modes are less complex and subject to fewer explicit requirements than *rāga*, and they are, in each culture, fewer in number. In contrast to performances of *rāga*, a West Asian performance makes use of several modes, moving from a principal one to secondary ones and back again.

In the gamelan music of Indonesia a fundamental melody is varied in a different way by each instrument in the ensemble. There is relatively little improvisation in Balinese gamelan, but it is more definitively present in Javanese gamelan music, in a strictly controlled form, as the model comprises the mentioned skeletal melody, of a *pathet* ('mode'), and, for each improvising instrument, a specific pace and density.

The numerous musics of sub-Saharan African societies exhibit a great variety of improvisational practices. Prominent among them, in all parts of the continent, is the use of improvised variation. In this a vocal or instrumental soloist repeats a short phrase many times, varying it slightly each time but maintaining a consistent length and rhythmic framework. Similarly, a call-and-response form may consist of a refrain that alternates with a soloist's variations of a theme. The model for improvisation may also include a set of styles through which the improviser should pass, devoting an unspecified amount of time to each. Percussion ensembles in West Africa may consist of a number of performers, each of whom presents a single repeated rhythmic pattern, while an improvising master drummer selects from these patterns, juxtaposing and interweaving them, using them as the models. The xylophone orchestras of the Chopi of

Mozambique and South Africa include the improvisation of simultaneous variations of a theme, in a somewhat similar fashion to the gamelan.

Jazz musicians use a variety of sources for improvisation. 'Standards', a repertory of popular songs, often from Broadway musicals or tunes composed specifically by or for jazz musicians, provide not only melodic material but also the (chord) 'changes', underlying harmonic progressions which form the basis for improvisations. Ordinarily a small band will play the 'head' (tune) in unison before the musicians take it in turns to improvise on it. Recorded solos by other musicians, memorized and sometimes transcribed, may also serve as models for improvisation. A further technique is the inclusion of quotations from other pieces or solos in the improvisation.

European traditional music displays a variety of improvisational techniques. The South Slavonic tradition of epic singing consists of combinations of themes and motifs dealing with the historical deeds of military and royal figures. These are juxtaposed with a small number of melodic lines (and their numerous variations) and with melodic motifs performed solo on an accompanying instrument, the one-string, bowed *gusle*. The model for improvisation includes textual and musical content, but also stylistic elements. A line of text must consist of ten syllables, with a word boundary between the fourth and fifth. These materials, passed on orally, are then manipulated and varied to provide a performance (sometimes lasting several days) that is improvised but also predictable.

A further example comes from Genoa. There, groups of four to six sailors sing in ensembles in which each member assumes a stylistic and musically functional role, e.g. *la donna* (a falsetto obbligato) or *la guitarra* (a vocal imitation of strumming a guitar), the entire structure using simple chord progressions for guidance. It has been argued that most European traditional music repertoires consist of tune families, each a body of variants of one parent tune that has been developed through oral transmission with some improvisatory behaviour; explicit improvisation is not common. When it does occur it is found predominantly in southern, eastern and Celtic regions of Europe, and more in instrumental than in vocal music.

By comparison with non-Western and vernacular music, Western art music, in which improvisation plays a small role, uses a number of contrasting models. For example, forms such as fugue and specific themes were and still are occasionally the basis for improvisation by keyboard players. Themes from a concerto movement were the basis for classical cadenza improvisation. The rules and options for the use of a vocabulary of ornaments formed the model in Baroque and early Classical music. In contrast, some of the music of the second half of the 20th century has used non-specific models. A general style or sound provided guidance in improvisatory ensembles. A set of directions for volume and frequency served as the model for John Cage's *Imaginary Landscape no.4* for 12 radios. Here the actual sounds are 'improvised' by the natural and cultural environment.

Related to the question of model is the issue of learning improvisation, in which, too, societies differ greatly. South Indian musicians learn a series of

exercises intended to help them juxtapose rhythmic and melodic structures with the melodic grammar of *rāga*. Iranian musicians are told that memorization of the *radif*, a repertory of 250–300 short pieces, will automatically teach them the techniques of improvisation. Jazz musicians have a variety of learning techniques, including the notation and memorizing of outstanding solos.

Improvisation, §1: Concepts and practices

4. A sampling of genres.

The genres that follow are characterized by being from art music repertoires and are contrasted by the relative prominence of the model, the density of the obligatory features, and what is added creatively by the performer.

The genre of *ālāp*, *jor*, *jhālā*, *gat*, as played by North Indian instrumentalists like Ravi Shankar, Ali Akbar Khan and Bismillah Khan, is the first genre considered here. A full performance of a *rāga* consists of two sections. In the first, *ālāp*, *jor*, *jhālā*, the performer explores the *rāga* without pre-composed material as a model. The first subdivision, *ālāp*, presents the constituent parts of the *rāga* without a metrical structure, in what might be termed ‘free rhythm’. It brings in the characteristic motifs of the *rāga*, moves from the low tonic to the octave and beyond and eventually descends again. The second, *jor*, introduces a non-metrical pulse, and the third, *jhālā*, greatly increases the tempo. The second main section, *gat*, introduces the *tāla* (rhythmic cycle) and the accompanying *tablā*. The *gat* proper is a short composition which, once stated, becomes the basis for further improvisation, now within the constraints of the *tāla*. Improvisation here may consist of variations on the *gat* theme alternating with freely composed lines. The *tablā* may also improvise, and there is quickening of the tempo which leads to a climax ending the performance.

The most elaborate form in Karnatak music is *rāgam-tānam-pallavi*. This is a predominantly vocal genre but may also be instrumental. In the three sections the performer moves gradually from improvising on a general model (the *rāga*) to material that is substantially restricted. The first section, *rāgam*, is akin to the Hindustani *ālāp*, albeit differing stylistically. This is followed by the *tānam* (analogous to *jor*), sung to syllables such as *tā nam*, *ta ka nam*, *ā nan dam*. The model for the rest of the piece, which is now sung in *tāla* with drum accompaniment, is the *pallavi*. This is a composed line, often technically difficult, which is followed by *niraval* (variations on the composition) and *svara kalpana* (improvised passages which lead back to the given line). These may include techniques such as augmentation, diminution and imitation. The piece is concluded by a restatement of the *pallavi*. Hindustani and Karnatak genres, including *dhrupad* and *khayāl* in the North and South Indian *nāgasvaram* performances, have models that move from less to more specific forms and from non-metric to metric structures.

Āvāz is the central genre of Iranian art music and, like the South Asian genres, is cast in a complex standard form. Based on the memorized *radif*, an *āvāz* uses the material of one *dastgāh* (modal group). Non-metric (although occasional metrical structures occur), it is intended as vocal music but it is frequently performed on string instruments or flute. Since a

dastgāh consists of a number of constituent *gushe*, each with a characteristic collection of notes and at least one characteristic motif, the performer, in advance or during the performance, selects which *gushe* will be used and in what order. It is the degree of creative improvisation as against quotation and variation that distinguishes performances and performers. Those *gushe* that have metre or memorable motifs are less subject to elaborate improvisation than those whose content is melodically and rhythmically less specific. While improvisers are free to select from the available *gushe* and determine their treatment in performance, there are discernible characteristic patterns.

In performances of the *dastgāh Chahārgāh*, which has some 15 available *gushe*, the great majority use only *Darāmad*, *Zābol*, *Mokhālef* and *Hesar*, most frequently in that order. A large number of *gushe* that appear in the *radif* are virtually never used in performance. Several schools of improvisation may be distinguished, including those musicians who believe that an *avaz* should follow the *radif* strictly and contain improvisations which are variants of the *gushe* in the prescribed order, in contrast to others who eschew close adherence to the *radif* and others who emphasize the mixing of *gushe* and the elegant transition from one to another.

The most prominent improvisatory genre in the various schools of Arabic and Turkish art music is the *taqsīm*. Ordinarily non-metric, it is exclusively instrumental and sometimes used as an introductory piece for vocal performances. It is most frequently performed on one of the West Asian lutes (*ūd*, *bozuk*, *tār*) or on a flute (*nāy*). A *taqsīm* may have a consistent pulse which is relieved occasionally but non-metric cadential formulae. Cast in one principal *maqām*, a *taqsīm* ordinarily moves to others built on any of the scale degrees of the primary mode, to which it eventually returns. While an improviser may theoretically move from any *maqām* to any other, there are, as in Iranian music, clear patterns. A *taqsīm* in the *maqām* of *Nahawand* is likely to move to *Rast* and *Bayati* before returning. Other *maqāmāt* such as *‘Ajam*, *Hijāz* and *Sabā* appear only occasionally and others rarely or not at all. Geographic regions may be distinguished by improvisatory customs, and individual musicians develop personal styles that are easily recognized.

In the large Javanese gamelan composed melodies are played in slow notes by the *saron* (bronze metallophone) or sung, while instruments such as gongs mark subdivisions of the metric cycle. The drummer regulates tempo and dynamics. The other instruments such as members of the *gender* family, the family of *bonang* (sets of gong-chimes) and the *gambang* (wooden xylophone) embellish the *balungan* in various ways, the highest ones providing the greatest density. The *rebab* (two-string spike fiddle), the melodic leader of the gamelan, and the *gender barung* (bronze metallophone with resonators) play the main improvising roles. In this complex set of interactions the improvisation may be compared to the performance of a set of variations on a theme, rendered simultaneously.

Improvisation, §II: Western art music.

1. Introduction.

The concept of improvisation has been current in the West since the late 15th century to designate any type, or aspect, of musical performance that is not expressive of the concept of the fixed musical work. Its precise definition depends on the stability and perceived identity of the 'fixed musical work', which varies widely according to musical culture and historical period (see [Composition](#)). If the performance is of a work in the form of a notated composition, 'improvisation' tends to refer to departures from the text that would have been notationally available but were not actually written out, often for reasons of notational economy, and which rely on the existence of well-known, implied conventions of performance (such improvisations may therefore be recognized by the composer – perhaps within limits – as well as the performer as essential to the complete performance of the work). This definition normally excludes choices of tempo, but does include ornamentation and other kinds of melodic elaboration, as well as cadenzas in solo concertos. Looser definitions of the fixed musical work tend to allow much greater scope for improvisation. This is true of memorized harmonic schemes, as in 16th-century dance music or in jazz. Such schemes are usually identified by the performers as 'pieces' and may circulate under popular titles, even though the actual performances may obscure the identity almost beyond audible recognition. Even in musical cultures where there is no actual concept of the 'musical work', there may still be some perception of musical identity between one performance and the next, in terms of which 'improvisation' may also be identified. Typically, the definition of musical identity depends on the nature of the notational system or on methods of memorization; often it embraces versions that would be heard as different by Western listeners.

Musical traditions that do not rely on a strong conception of the fixed musical work tend not to have a concept of 'improvisation', but rather qualify performances in terms of a musical idiom or a set of performative conventions. For instance, polyphonic improvisation over plainchant

melodies was designated as discant or *contrapunctus* throughout the late Middle Ages, until the conceptualization of the musical work ([Res facta](#)) in the late 15th century necessitated the identification of 'singing on the book' (*cantare super librum*) or 'counterpoint made in the mind' (and, in the 16th century, such terms as [Sortisatio](#) and singing *ex tempore*, *subita*, *abrupta*, *improvvisa*, *repente*, *alla mente*). In such cases it may be inappropriate to speak of 'improvisation' as though it described the objective state of affairs in that musical tradition, and scholars often prefer to use terms less obviously premised on modern 'work' concepts (for instance 'oral' or 'idiomatic'). As this example suggests, since the 15th century the Western classical music tradition has developed an acute sense of what constitutes improvisation, though musicologists have become increasingly circumspect about projecting that sense on non-Western or popular musical traditions, or remote historical periods. It is now considered essential for historical and ethnographic research to make explicit whether the concept of 'improvisation' is being applied as an 'emic' (from within the culture) or an 'etic' (from the 'outsider's' point of view) concept.

This distinction is important also for another reason. Once the written – improvised distinction had become identified in the West, it allowed two interesting permutations to emerge: compositions written in the style of improvisations, and improvisations shaped with the distinguishing properties of musical works. In such cases, to insist on an etic, technical definition of improvisation – involving the absence of, or departures during performance from the texts of, written or memorized works – would be to overlook compositions that, although written, do shed light on the emic understanding of improvisatory style. One such piece, for example, is Josquin's motet *Stabat mater* which, according to Joachim Thuringus (*Opusculum bipartitum de primordiis musicis*, 2/1625), was fashioned 'in imitation of *sortisatio*', and is indeed virtually unique having a cantus firmus without rests, an essential feature of polyphonic improvisations. A composition like this is conceptually quite different from the many earlier compositions that were indistinguishable from improvised discant simply because they implied no distinction to begin with (an obvious example being the discant settings in the Old Hall choirbook). The same may be true of such improvisatory keyboard genres as the 16th-century fantasia and ricercare, of the 19th-century prelude and rhapsody. Conversely, the purpose of improvised fugues, variations, and fantasias on given material, in the 18th century, was surely that listeners should evaluate the performer's skill on the terms of written compositions. In this sense, improvisation and composition can also be viewed, over and above the strictly technical distinction between them, as musical styles distinguished by the degree to which they give the appearance of performative spontaneity or authorial planning. (This distinction is essential, for instance, to any understanding of the history of piano music in the early 19th century.)

For information about particular aspects of improvisation see [Aleatory](#); [Cadenza](#); [Continuo](#); [Division](#); [Jazz](#); [Notation](#); [Ornaments](#); [Performing practice](#); [Prélude non mesuré](#); and [Singing](#).

2. History to 1600.

After the breakdown of Greco-Roman civilization, music in western Europe was preserved by rote memory, and new music was presumably worked out in performance or created spontaneously in improvisation. Since our knowledge of this music is limited to traditional liturgical chants written down in imprecise notation long after they were created, it is difficult to draw concrete conclusions about any improvisatory techniques used in their creation. The most reliable extant evidence relates to the spontaneous improvisation of the *Jubilus*, a melismatic flourish found on the last syllable of certain alleluias preserved in the early Christian liturgy. Clear references to this type of improvisation appear in the writings of the early Christian Fathers. St Augustine (354–430) described this *jubilus* as the musical outpouring of ‘a certain sense of joy without words ... the expression of a mind poured forth in joy’. In its melismatic, virtuoso style it is not unlike the vocal cadenza added centuries later at the cadence of a Baroque aria.

A second, more controlled, improvisatory technique is hinted at in the structure of a number of surviving chant melodies. The chants in a particular mode, such as the Dorian, often use the same, or a similar, vocabulary of melodic motifs. This is taken as indicating an improvisatory practice in which the modes, like the *rāga* of India, included thematic materials as well as a roster of notes in their identities.

(i) Ensemble improvisation.

(ii) Ornamentation.

(iii) Improvisation on ‘perfect instruments’.

Improvisation, §II, 2: Western art music: History to 1600

(i) Ensemble improvisation.

Although melodic improvisation remained a factor in Western culture, it is indicative of its later development that the earliest substantial information about improvisation appears in treatises instructing the singer how to add another line to a liturgical chant as it was being performed. This is no doubt due to the fact that, although this early organum may have been derived from folk practice, the problem of improvising a melody to fit with a given chant required a technical knowledge of vertical consonance and dissonance and of the melodic materials available in the diatonic system. Furthermore, while at first the improvising singer may have relied on his memory of the chant to which he was adding a counter-melody, the improvisers eventually saw this chant in some sort of visual notation so that they could anticipate its notes. Thus the first manuals on improvisation are those concerned with the beginning of contrapuntal theory and practice and with the development of mensural staff notation.

Starting in the 9th century with the anonymous *Musica enchiriadis* and *Scolica enchiriadis*, which tell how to double a chant at the perfect intervals and to make oblique motion at the beginning and end of the chant, there was a steady growth and refining of the technique of organum. By the 11th century, when Guido of Arezzo described in his *Micrologus* the use of contrary motion and of rudimentary cadence formulae, there are also, in

one of the Winchester tropers, a number of two-voice organa written down in staffless neumes that apparently use these same devices. From this time on, many written-down organa are found outside theoretical treatises, but the precise relation of these to improvised style is not defined. Two- and three-voice organa which introduce the use of several notes against one in the cantus firmus, such as those found in 12th-century manuscripts at St Martial, Limoges, and Santiago de Compostela, have the appearance of written-down improvisations, and it is unlikely that a composition was yet worked out by writing it down. Musical forms of the 13th century – discant, organum, motet etc. – were created by adding one line at a time to a previously worked-out melody, each of the added lines agreeing with this melody but not necessarily with each other. The interrelation of the parts was the same as when two singers improvised on a cantus firmus. By the 14th century, when a precise visual notation for music was established, complex structures, such as the isorhythmic motet, that could be worked out only by being written down, had also developed. Thenceforward the dependence on notation for composing music as well as for preserving it became one of the distinguishing features of Western musical culture, and in due course composed music, precisely notated, became the primary basis for performance.

Improvised music, however, remained an important element in art music for several centuries, and the interaction of the two types was fruitful. A well-known instance of the influence of improvised style on composed music is the introduction of the fauxbourdon style into the music of Burgundian composers, such as Du Fay and Binchois, in the 15th century. In Britain in the late 14th and early 15th centuries, the practice of improvising above a 'sighted' chant took the forms of parallel 3rds (gymel) and parallel 3rds and 6ths together (English discant). Although scholars still differ as to the exact historical process and the meanings of certain terms, the musical effect of these techniques on styles of composition is clear. In Britain this resulted in compositions that were structurally based on a series of 3rds or 6-3 chords that were freely ornamented and sometimes interspersed with other combinations of intervals. In Burgundian music, sections of parallel 6-3 chords (fauxbourdon) are inserted into the common styles and are found frequently at cadence points.

It was also in the 15th century that theorists of counterpoint first made a distinction between improvised and written-down styles. In 1412 Prosdocimus de Beldemandis simply mentioned the existence of two types of counterpoint – the 'sung' or 'performed' and the written – but in 1477 Tinctoris clearly spelt out the difference between the two in his *Liber de arte contrapuncti*. Because each improviser could make his line agree with the cantus firmus alone, dissonances and awkward part-writing could not be avoided. Moreover, an improvised piece was looser in construction, whereas the composer could order such features as cadences and rhythmic motion, thus producing a finished work (*res facta*) with a distinctive character.

The difference between the two styles became even greater in the 16th century, when composition on a cantus firmus became less a normative and more a specialized technique. Composed works appeared in a number of new styles and forms, while singers still improvised over a cantus firmus

in long notes, often repeating a single figure as long as it fitted. At this period, improvisation was widely practised in Italian churches, where it was normally used over the chants of the introits in the Proper of the Mass, as well as over the hymns, antiphons and graduals. Since motets and the Ordinary of the Mass were set as artfully worked-out compositions, listeners will have apprehended two distinct usages.

It was not until 1553, when Vicente Lusitano's *Introdutione facilissima* was published, that a methodical procedure for learning to improvise on a cantus firmus was made available. His 'secrets' seem very simple, as he was presenting a basic method by which the technique could be learnt; it may well have been based on his own way of improvising. He first gave a number of mechanical patterns in long notes that fit over the different intervals found in plainchant, such as those in [ex.1a](#), where the syncopated line makes a series of 3rds, 5ths and 6ths over a succession of horizontal 3rds in the cantus firmus. Once the basic pattern was learnt, the singer could fill in the long notes with florid passages. Lusitano also included a number of single melodies in florid counterpoint above a cantus firmus ([ex.1b](#)). This exemplifies another of his suggestions: if a passage will fit more than once, the singer should continue to use it. He gave a number of florid examples above the same cantus firmus, and when two of these are combined, as they would be in performance, a number of dissonances and parallel 5ths appear between them.

Two years after Lusitano's treatise appeared, Nicola Vicentino, in *L'antica musica ridotta alla moderna prattica*, condemned these devices as old-fashioned and recommended more modern ways, such as having the imitating voices imitate each other rather than the cantus firmus. Zarlino, in the third edition of his *Istitutioni harmoniche* (1573), gave, for the first time, instructions for more sophisticated devices, such as the improvisation of strict two-voice canons on a cantus firmus and two- and three-part canons without a cantus firmus. These techniques signalled a great change in improvised counterpoint. Both require more technical skill on the part of the performers. The leading singer must know all the possible combinations at specific times over precise pitches, and those following him must have good ears and memories. But this kind of planning also makes correct part-writing and dissonance treatment possible in improvisation. Zarlino also introduced rules for creating invertible counterpoint and for adding a third part in the performance of an already composed duet. During the last quarter of the 16th century his successors expanded the possibilities inherent in these new devices and also continued with the old. The art of improvised vocal counterpoint came to a final climax among the theorists and practitioners of counterpoint in the *prima prattica* style.

Although there are many early visual and literary references to instrumental ensemble music, no direct discussion of improvisation by instrumental groups has been found. We can only surmise that when contrapuntal – as opposed to heterophonic – improvisation took place in instrumental performance it was by players who had been trained in the vocal practice of improvising on a cantus firmus. The first sure evidence of such a practice is in the improvisation of the music for the bassadanza and saltarello danced in 15th-century Italy. Surviving collections of bassadanza tenors in long notes, along with pictures showing two high instruments presumably improvising on a tenor played by a sackbut, indicate that the music accompanying these dances may well have been produced by just such an improvising group. Later compositions on one of these bassadanza tenors, *La Spagna*, in which the tenor in long, even notes is accompanied by florid melodies in the upper parts, add weight to this conclusion.

It is significant too that the only book in this period giving examples of ensemble improvisation (for violone and harpsichord), Diego Ortiz's *Trattado de glosas* (1553), still used the old *La Spagna* tenor when illustrating the technique of improvising on a cantus firmus. The beginning of one such improvisation ([ex.2a](#)), when contrasted with another ([ex.2b](#)) from the same book, shows the archaic nature of this improvisation. The one shown in [ex.2b](#) has a 16th-century Italian dance bass, which acts as a series of roots for triads, and the improvised melody is shaped by the notes of each chord and is organized motivically. The bass also gives the rhythm of the dance and is organized in phrases that are multiples of four bars. It is also short and is repeated several times, showing a series of improvised variations – a form and style that were to be used in improvisation for several centuries to come.

Improvisation, §II, 2: Western art music: History to 1600

(ii) Ornamentation.

A less difficult type of ensemble improvisation occurred in the 16th century when florid passages were added to a single line of a composed work while it was being performed. These ornaments were called diminutions, since they reduced the longer notes of a piece into a number of shorter notes; this practice was also referred to as the 'breaking' of a melodic line. Skill in diminutions belonged to the performer rather than to the improvising composer, and it required little theoretical knowledge, since the performer needed only to fit florid patterns into the longer notes of an already composed piece. More care had to be taken by the singer or instrumentalist who embellished the single line of a polyphonic work of which he saw only his own part than by the organist who had a complete work under his control, but the procedures taught by the various published manuals on diminution were designed to help him avoid these difficulties. There were lists of the numerous melodic patterns that fitted into each melodic interval and note length commonly found in music of the time, and these patterns could be transferred directly to the melodic line that the soloist wished to ornament.

Three general procedures were followed in creating these embellishments. The simplest was to have the substitute passage begin and end on the pitch of the notes being ornamented and then move immediately to the next note in the melody, a procedure shown in [ex.3a](#). This was considered the safest, for it preserved the original contrapuntal movement of the work. The second way, shown in [ex.3b](#), was to start on the original note but, instead of ending on it, to move on and arrive at the next note by conjunct

motion. Although this way might produce contrapuntal errors such as unauthorized dissonances or parallel 5ths, it was assumed that they would not be noticed by the listener because the notes were so short. The third manner was simply to be freer, perhaps encompassing a longer segment of the original line in the embellishment or replacing one of the main melodic notes with a pattern not touching on it. While it was not approved, this technique can be seen in the ornamented works that are given in the diminution manuals; it often involved motivic or sequential patterns, as seen in ex.3c. It could be successful, however, only if the performer knew what was going on in the other parts.

This type of improvised ornamentation was usually applied to only one voice of a polyphonic work, but when a madrigal or motet was performed by soloists, each improvising diminutions on his part, care was taken to agree in advance the order in which they would add ornaments, to avoid contrapuntal confusion and dissonant clashes that might result from simultaneous ornamentation. Care was also taken by the performer of the bass part not to let his ornaments go above the tenor part and to limit his embellishments, so that the overall structure of the supporting bass line was retained throughout.

The first manual teaching the art of improvising diminutions for a solo singer or wind or string player in ensemble performances of polyphonic works was the *Fontegara* of Sylvestro di Ganassi, published in Venice in 1535. It is believed, however, that this practice must have appeared early in the development of polyphonic music, since the earliest known keyboard tablature, the Robertsbridge Codex (*GB-Lbl* Add.28550, c1360), contains elaborately ornamented versions of contemporary motets, and it is generally considered that the published manuals of the 16th century were a late attempt to codify and make available to all musicians the 'secrets' of this technique.

Improvised diminutions had a definite influence on composed music, for they introduced elements into the performance of Renaissance music that became an integral part of Baroque style. The ornamentation of a single line of a polyphonic work by a solo instrument while the entire work was played on a keyboard instrument, as seen in the second book of Ortiz's *Trattado de glosas*, anticipated the solo instrumental writing of the early

Baroque period. In the same manner, the ornamented cantus parts of frottolas such as the anonymous *Aime sospiri* printed in Petrucci's sixth book of frottolas (1506), and the embellished top voices of selected four-part madrigals by Rore included in Girolamo dalla Casa's *Il vero modo di diminuir* (1584), which were sung while the other parts were played on the lute, were forerunners of early 17th-century monody.

[Improvisation, §II, 2: Western art music: History to 1600](#)

(iii) Improvisation on 'perfect instruments'.

For the Renaissance musician, the 'perfect instrument' was one such as the organ or lute, on which a single performer could play all the parts of a polyphonic composition. Starting with the Robertsbridge Codex and the Faenza Codex (*I-FZc* 117, c1400), elaborately ornamented versions of polyphonic motets and secular works appeared as a constant part of the repertory and can doubtless be seen as written-down examples of a common improvisatory procedure. Highly embellished intabulations of polyphonic vocal works continued to appear in keyboard manuscripts into the 16th century, when, with the development of music printing, a great many such arrangements for lute and vihuela, as well as for keyboard, were published. From the 14th century on, keyboard tablatures also included sacred chants and secular songs used as cantus firmi with florid countermelodies. The fact that a number of 15th-century manuscripts, such as the *Fundamentum organisandi* (1452) of Conrad Paumann, give practical instructions for adding keyboard-style countermelodies to fit with the intervals commonly found in such pre-existing melodies tends to confirm that contrapuntal improvisation on a chant in church or on a popular song in secular music-making was a common practice with the professional keyboard virtuoso. While these techniques were still important in 16th-century keyboard improvisation, the gradual abandonment of the central cantus firmus and the use of free forms based on fugal imitation in vocal music are reflected in the inclusion of canonic and fugal devices in Hans Buchner's *Fundamentum* (c1520) and the *Arte de tañer fantasía* (1565) of Tomás de Santa María.

A new form, the set of variations on a popular tune or dance bass already familiar to the listener, also became a major element in improvisatory practice in the 16th century. These variations used both the older technique of cantus firmus and the new one mentioned above (see ex.2*b*), which has a set of chords as the 'theme'. In some cases both the melody and the harmony of a popular song form the basis of a set of variations. This practice is paralleled in vocal music, where poet-composers, and less sophisticated figures too, improvised both words in fixed forms such as *terza rima* and ottavas, and vocal embellishments, over standard melodies, such as the *romanesca* and *Ruggiero*, and their attendant harmonies.

A special genre associated with the keyboard was the prelude or intonation, a free improvisation meant to establish the mode for a vocal or instrumental piece that followed it. The earliest written-out examples of this type are found in the keyboard tablature of Adam Ileborgh (1448). This genre was characterized from the beginning by idiomatic virtuosity, rhythmic freedom and loose thematic construction – features that listeners

have always considered the true hallmarks of extemporaneous improvisation.

The line between improvising and composing was less clearly drawn in solo improvising because here the player normally had his own repertory, playing from memory, improvising and often changing his compositions and re-using materials from earlier improvisations. The fact that there were so many famous keyboard composers was no doubt due to this practice. The large number of collections of printed works for keyboard, lute and similar instruments in the 16th century, bringing music from the repertory and inventions of the professional performer into the hands of the amateur, led to a great change. The works of the professional virtuoso, whether devised through his own improvisations, worked out on his instrument in playing or first created in written notation, became in published form the repertory for the amateur, and improvisation became associated with the professional virtuoso.

Improvisation, §II, 3: Western art music: Baroque period

(i) Early 17th-century Italian practice.

All the modes of improvisation practised in Italy during the Renaissance continued into the early Baroque. The two principal types were the embellishment of an existing part and the creation of an entirely new part or parts. Though fundamentally different in theory, the two types are not always separable in practice.

Important modifications were introduced to the practice of improvised embellishment. Composers, perhaps from a greater concern for the text, began to exercise more control over ornamentation, in two ways: by writing out embellishments in some instances, and by introducing symbols or abbreviations for some ornamental patterns. The written-out embellishments in 'Possente spirito', the great aria in Act 3 of Monteverdi's *Orfeo* – the words of which are, significantly, in *terza rima* – represent an extreme example, now in early Baroque style, of the type of embellishment earlier improvised by poet-musicians and referred to in §2(iii) above. Stylistic modifications of the old, melodically orientated embellishment occurred about 1600 through the establishment of a true basso continuo and as a consequence too of the new emphasis on emotional qualities in singing. The basso continuo, with its firm bass line and improvised chords, emphasized vertical rather than linear aspects, and embellishment gradually attained more harmonic implications, adding the spice of dissonance to the written notes. The new emotional style in vocal music

caused two modifications in the melodic lines: the smoothly flowing notes of 16th-century *passaggi* were sometimes alternately dotted to form either trochaic or iambic figures that might emphasize sobbing or sighing qualities; and a new vocabulary of short embellishments was invented for use on notes sung to the accented syllables of emotive words in the text. The new style of embellishment is first seen in G.B. Bovicelli's *Regole, passaggi di musica* (1594), but the aforementioned modifications came about largely through the influence of the Florentine Camerata and its insistence on correct and emotive declamation of the text. *Passaggi* were for the most part relegated to penultimate syllables of verses, where they did not obscure the meaning of the words; they can thus be seen as early forerunners of the later cadenza.

The preface to Caccini's *Le nuove musiche* (1601/2), the most celebrated expression of the passionate attitude of the men who invented the new style, contains much discussion of vocal embellishments. Some of these are illustrated in [ex.4](#): Caccini's cadential *trillo* and *gruppo* are shown in [ex.4a](#), and the early Baroque preference for dotted figures is seen in his illustrations of the desirable way of performing the phrases shown in [ex.4b](#). That the embellishment of penultimate (and sometimes other) syllables often reached cadenza-like proportions is demonstrated in several songs in *Le nuove musiche*, notably *Fortunato augellino*, and in those of other Italian monodists of the period.

Le nuove musiche also contains the only surviving portions of Caccini's opera *Il rapimento di Cefalo* (1600), one of which, the concluding chorus, is shown with embellished solo interpolations. In his accompanying remarks Caccini reiterates his position regarding the liberties that may be taken with the rules of counterpoint in making *passaggi*. The ornamented solos bear the names of three of the greatest singers of the age, Melchior Palantrotti, Jacopo Peri and Francesco Rasi. While Caccini apparently wrote all the embellishments printed here, according to the rubrics, Palantrotti sang

them as written, Peri substituted 'different *passaggi*, according to his own style' and Rasi sang 'some of the *passaggi* as given and some according to his own taste' (trans. H.W. Hitchcock, RRMBE, ix, 1970).

The new kinds of embellishment became known in due course in Germany, where descriptions are found in such works as *Syntagma musicum*, iii (1618) by Michael Praetorius and *Musica moderna practica* (1653) by J.A. Herbst. In addition to the *intonatio*, *exclamatio*, *trillo* and *gruppo*, discussed by Caccini, Praetorius illustrates the *tremulo* (in two forms, *ascendens* and *descendens*; [ex.5a](#) and [ex.5b](#)) and the *tirata* ([ex.5c](#)) and also provides numerous illustrations of the *accentus*, applied to various intervals. Four examples of the *accentus*, as applied to the ascending 2nd, are shown in [ex.5d](#).

Agostino Agazzari (*Del sonare sopra 'l basso*, 1607) discussed the role of instruments in concerted music, classifying instruments in two groups, those of foundation and those of ornament. He counselled restraint, decorum and the judicious enhancement of the written notes and outlined the roles appropriate to the various instruments (translation from *StrunkSR1*):

He who plays the lute ... must play it nobly, with much invention and variety, not as is done by those who, because they have a ready hand, do nothing but play runs and make divisions from beginning to end, especially when playing with other instruments which do the same, in all of which nothing is heard but babel and confusion, displeasing and disagreeable to the listener. Sometimes, therefore, he must use gentle strokes and repercussions, sometimes slow passages, sometimes rapid and repeated ones, sometimes something played on the bass strings, sometimes beautiful vyings and conceits, repeating and bringing out these figures at different pitches and in different places; he must, in short, so weave the voices together with long groups, trills, and accents, each in its turn, that he gives grace to the consort and enjoyment and delight to the listeners, judiciously preventing these embellishments from conflicting with one another and allowing time to each. ... The violin requires beautiful passages, distinct and long, with playful figures and little echoes and imitations repeated in several places, passionate accents, mute strokes of the bow, groups, trills, etc. The *violone*, as lowest part, proceeds with gravity,

supporting the harmony of the other parts with soft resonance, dwelling as much as possible on the heavier strings, frequently touching the lowest ones. The theorbo, with its full and gentle consonances, reinforces the melody greatly, restriking and lightly passing over the bass strings, its special excellence, with trills and mute accents played with the left hand. The *arpa doppia*, which is everywhere useful, as much so in the soprano as in the bass, explores its entire range with gentle plucked notes, echoes of the two hands, trills, etc.; in short, it aims at good counterpoint. The cithern, whether the common cither or the *ceterone*, is used with the other instruments in a playful way, making counterpoints upon the part. But all this must be done prudently; if the instruments are alone in the consort, they must lead it and do everything; if they play in company, each must regard the other, giving it room and not conflicting with it; if there are many, they must each await their turn and not, chirping all at once like sparrows, try to shout one another down.

Agazzari's advice is applicable in a variety of musical contexts, but it has particular relevance for the theatre. In early Italian operas, instrumental ritornellos and sinfonias are frequently indicated, but sometimes written either in skeletal form (bass line alone, or bass with treble) or not at all. Luigi Rossi's *Il palazzo incantato* (1642) begins with a sinfonia, for which only a bass line is given. Cavalli's *Didone* (1641) at one point has the rubric 'all the instruments enter', although no parts are written, and at another point, 'aria with all the instruments', accompanied by continuo only. There are many instances in operas of the Contarini Collection (*I-Vnm*) in which a dance is indicated in the score, but no music is supplied; in other cases a bass line only is given (Rose, 1965). The passacaglia seems to have originated as an improvised ritornello in theatrical productions (Hudson, 1981).

The quotation from Agazzari demonstrates a close affinity between improvisation over a cantus firmus and realization of a basso continuo. The continuo part replaced the cantus firmus, and the improvised parts became more harmonically based, partly because of the harmonic implications of the bass line itself.

For organists, improvisation was a functional task as much as an artistic one. During Mass or services of the Office, organists improvised versets over liturgical cantus firmi, in alternation with the choir. This practice has clear relationships to basso continuo technique, and in fact some of Banchieri's organ basses in *L'organo suonarino* (3/1622) contain occasional thoroughbass figures. Frescobaldi's organ masses offer some indication of the function of improvised music within the mass (e.g. *Tocata per le levatione*). Improvised toccatas, preludes and *intonazioni* frequently served to establish the mode or pitch (or both) for the singers. Some of the earliest keyboard toccatas (by Andrea Gabrieli, Merulo and others) are based on psalm tone cantus firmi, and undoubtedly reflect improvisatory origins (Bradshaw, 1972). Maugars wrote of Frescobaldi that while 'his printed works render sufficient evidence of his skill, to judge his profound

knowledge adequately you must hear him as he improvises toccatas full of refinement and admirable inventions' (trans. C. MacClintock, 1979).

A distinctively Italian type of improvisation was the *viola bastarda* technique, which appears in several Italian sources during the period 1580–1630. Taking a polyphonic composition as a model, the *viola bastarda* roams around the texture, embellishing now one voice, now another, and at times creating an entirely new voice (Paras, 1986).

The venerable practice of improvised vocal counterpoint over a cantus firmus (*contrappunto alla mente*) is mentioned by several 17th-century theorists. Its mastery was a requirement for members of the papal choir, who according to G.B. Doni (1647) were sometimes guilty of abusing it, insistently repeating a musical figure that did not always agree with the cantus firmus (Ferand, 'Improvised Vocal Counterpoint' 1956). It may have been a common feature of the training of singers, even in the *stile recitativo* (Hill, 1994). When two or more parts were improvised over a cantus firmus dissonances could result; this was tolerated and even prized by some commentators. Banchieri (*Cartella musicale*, 1614) states that the effect of *contrappunto alla mente* can be obtained even in a written composition if each voice is composed separately with reference to the bass only. He comments that there may even be hundreds of singers, and that although none of them knows what the others are doing, the result will be pleasing (Ferand, op. cit., 1956). A subspecies of *contrappunto alla mente* in which two or more singers improvise over a cantus firmus without contrapuntal errors is called *contraponto in concerto*. Vicente Lusitano describes it in *Introdutione facilissima* (1553), as does Pedro Cerone in *El melopeo y maestro* (1613)

Scipione Cerreto (*Della prattica musica*, 1601) describes canonic improvisation over a cantus firmus. His illustrations are designed to give the singer practice in improvising over common intervallic patterns (conjunct motion, rising 3rds, etc.) in the bass (ex.6). Improvising singers in the 17th century, like jazz musicians of more recent times, probably committed to memory a repertory of melodic figures for use in specific contexts.

Contrappunto alla mente and *contraponto in concerto* were applied principally in the context of sacred music. On the secular side were performers who sang vernacular lyrics, accompanying themselves, often on a plucked string instrument, to stock musical formulae. These singers ranged from purveyors of medicines and potions (*ciurmadori*), popular actors and street entertainers, to trained professional singers who intoned the works of leading poets. The formulae, each customarily consisting of a simple melody with bass line such as the *Aria del gran duca* and Ruggiero, were frequently subjected to strophic variation. Giovanni Stefani's collection *Affetti amorosi* (1618) contains an *aria per cantar sonetti* and an *aria per cantar ottave*, designed to accommodate the singing of any verses in their respective genres. The simplicity of both settings suggests that they are not finished compositions, but frameworks suitable for elaboration. Similarly, in several Italian publications for Spanish guitar (e.g. Millioni, Abbatessa), the performer was expected to sing standard poetic forms (*strombotti*, *ottave rime*, etc.) to an improvised or familiar melody over the chords indicated by the *alfabeto tablature* (Cavallini, 1989).

[Improvisation, §II, 3: Western art music: Baroque period](#)

(ii) 17th-century English practice.

In just the manner described by Agazzari, there was a flourishing school of instrumental improvisation in England in the 17th century. Variation was a process inherited from the virginalists, and English instrumentalists were fond of improvising diminutions or variations on popular songs such as *Greensleeves*, itself based on the *passamezzo antico*. From this practice it was only a simple step to composing an original ground and repeating it ad libitum while another instrumentalist or two improvised divisions on it. A valuable source for this practice is Christopher Simpson's *Division Violist* (1659); [ex.7](#) shows excerpts from a set of divisions from it for solo bass viol. The vocal lines of English continuo songs were also subjected to extensive embellishments of various kinds, and several manuscript sources are largely devoted to such florid songs (see Till, 1975).

Thomas Mace (*Musick's Monument*, 1676) is one of the most cogent witnesses to improvisatory instrumental practices in England. For him the Praelude is

a Piece of *Confused-wild-shapeless-kind of Intricate Play* ... in which no perfect *Form, Shape, or Uniformity* can be perceived, but a *Random-Business, Pottering and Grooping*, up and down, from one *Stop, or Key*, to another; And generally, so performed to make *Tryal*, whether the *Instrument be well in Tune*, or not ... After they have *Completed Their Tuning*, They ... fall into some kind of *Voluntary, or Fanciful Play*, more *Intelligible*; which ... is a way, whereby He may more *Fully, and Plainly* shew His *Excellency, and Ability*, than by any other kind of undertaking; and has an *unlimited, and unbounded Liberty*.

Mace also writes of improvising an interlude in order to make a transition from a 'suit[e] of lessons' in one key to one in another key: 'They do not *Abruptly, and Suddenly Begin, such New Lessons*, without some *Neat, and Handsom Interluding-Voluntary-like-Playing*; which may, by *Degrees*, (as it were) *Steal into That New, and Intended Key*'. In addition he offers an unusual account of the creation of the lesson entitled 'The Authors Mistress', published in *Musick's Monument*. In his description of playing his lute at random when alone he provides a rare account of 'spontaneous' improvisation, with no functional purpose nor any reference to a pre-existing framework.

Thomas Morley devoted a substantial proportion of his *Plaine and Easie Introduction to Practicall Musicke* (1597) to improvised vocal counterpoint, stating that 'when a man talketh of a Descanter it must be understood of one that can, extempore, sing a part upon a plainsong'. His examples of descant reveal sophisticated techniques: imitation, canon, double counterpoint and inversion. Morley stated that this art, though still very much in use in churches elsewhere, had declined in England by the end of the 16th century – yet Elway Bevin discussed it as late as 1631 in *A Briefe and Short Instruction* (see Ferand, op. cit., 1956).

[Improvisation, §II, 3: Western art music: Baroque period](#)

(iii) French practice.

While the influence of Caccini's expressive, text-orientated style of ornamentation can be seen in Guédron's declamatory *récits* for solo voice, notated diminutions in both polyphonic and solo forms of the early 17th-century *air de cour* show that, in general, performers imitated the purely melodic formulae of earlier Italian practice. 'Passages are especially pleasing when they are sustained, and last a long time', wrote Mersenne in 1637. Slow-moving songs for solo voice on melancholy subjects received the most profuse ornamentation. A specifically French practice arose in the *air de cour* as sung by a soloist, whereby florid diminutions were concentrated in the second and later verses, to give the effect of a musical variation on the 'simple' melody presented in the first verse. A melody thus embellished was termed a *diminution* in the *air de cour* and a *double* (or *second couplet*) in the later *air* and *air sérieux*. [Ex.8](#) shows an *air de cour* by Antoine de Boësset (taken from Mersenne) with Henry Le Bailly's

diminution for verse 2. Moulinié's lighter ornamentation for verse 1 features the *port de voix* that anticipates the beat, the appoggiatura type most favoured in France before the 18th century. According to Mersenne, French *airs* were set apart from those of Italy, Germany and Spain because good singers like Le Bailly added trills extempore in diminutions and at cadences, 'the more so as at those moments the voice is greatly softened and doubles its charming motion'. The signs for ornaments in ex.8, namely a cross for *cadences* (trills) with two to four repercussions, and the letter *m* for longer *cadences*, were not printed in the original text; Mersenne added them later by hand to his personal copy of his own treatise. Other graces besides trills and dynamic shadings regularly left to the performer's discretion included the *plainte* and the *accent*.

Diminution practice based purely on melodic and metrical considerations is still the focus of *La belle méthode, ou L'art de bien chanter* (1666) by the Besançon musician Jean Millet. However, from Mersenne onwards this approach had been censured for failing to take the text into account. Bénigne de Bacilly's *Remarques curieuses sur l'art de bien chanter* (1668) details the art of ornamentation typical of a new generation of singers, whose roulades were now tailored to the importance and length of syllables. Bacilly's exemplar was Michel Lambert, the greatest singer of

Louis XIV's reign. While Bacilly's list of specific graces is much longer than Mersenne's, most were still left to the discretion of the singer to supply. Lambert committed many of his *doubles* to print, yet remarked in the preface to his *Airs* of 1660: 'I would have dearly liked to be able to mark in my score all the ornaments [*graces*] and subtleties [*petites recherches*] that I try to bring to the performance of my *airs*, but these are things no-one has discovered how to write down'. Lully apparently disliked the practice of *doubles* for dramatic reasons, and later theorists devoted relatively little space to diminution techniques, but written-out examples in the songbooks show that *doubles* in the style of Lambert were sung well into the following century.

Improvised embellishment in instrumental music tended to reflect vocal practice. Jean Rousseau dedicated his *Méthode claire, certaine et facile pour apprendre à chanter la musique* (1678) to Michel Lambert, and in his *Traité de la viole* (1687) he set out to transfer Lambert's style to the viol. It contains the illustrations seen in [ex.9](#), together with elaborate rules for the placing of the *port de voix* and *tremblement* in performance. Anticipating the beat by taking value from the preceding note was a technique not generally used in keyboard music, although there are rare examples in the *récit* of Nivers' *Suite du 1er ton* from his third *Livre d'orgue* (1675). All the ornaments in Couperin's *L'art de toucher le clavecin* (1716) begin on the beat.

Notated *agréments* are often lacking in 17th-century instrumental music as well as in vocal music, and must be added by the performer. The music of Louis Couperin, for example, contains few written ornament signs. In the later Baroque period, by which time written symbols were in general use, the degree of precision with which François Couperin and Marin Marais set them down is nevertheless unique. Montéclair's section on ornaments in his *Principes de musique* (1736), a noteworthy attempt to standardize ornament names and signs, makes it clear that graces were still often left to the performer's 'taste and experience' to supply. Most important in his array of 18 *agréments* ('those who perform it badly will never sing

pleasingly') was the *tremblement* (trill), which he subdivided into four types. Expressive ornaments include the *son enflé et diminué* (crescendo and decrescendo), for which he claimed the invention of the modern 'hairpin' signs. Montéclair's examples, and the evidence of his own music, show that he did not object to virtuoso passage-work as such, but he was very much against free diminution (his term is *passage*) that obscured the melodic line. In his opinion, instrumentalists used it to excess out of their desire 'to imitate the style of the Italians'.

Du Mont advertised his *petits motets* of 1652 with continuo as being the first of their kind to appear in France, but, as in Italy, a tradition of adding instruments impromptu to accompany (or replace) voices preceded the advent of the continuo. Untexted bass notes, found from time to time in polyphonic *airs de cour* from Guédron's second book of 1612 onwards, indicate the need for an accompanying instrument. A 'basse continue pour le luth' is mentioned by name in Moulinié's third book (1629), and a 'basse continue pour les instruments' in Boësset's seventh book (1630).

Other typically French aspects of improvisatory practice concern rhythm. Stylish performance of French Baroque music in general called for a knowledge of conventions of overdotting and *notes inégales*, which for the sake of flexibility and subtlety were not expressed in the notation. Players of the harpsichord, lute and viol were expected to improvise the entire rhythmic fabric of many preludes, which were printed only in skeletal form in long notes and with very few ornament signs. (See [Dotted rhythms](#); [Notes inégales](#); and [Prélude non mesuré](#).)

[Improvisation, §II, 3: Western art music: Baroque period](#)

(iv) Later Italianate embellishments.

In the early 18th century, French composers like François Couperin, and some German masters like J.S. Bach, included their desired ornamentation in the text of the music, either with symbols for single-note graces (Fr. *agréments*; It. *abellimenti*), or with actual florid notation for passages. Their specificity, unusual in its day, was, however, to continue to the present, eventually eclipsing the more prevalent 18th-century trend, favoured especially by Italian composers and those working in their styles, of leaving embellishment to the performer. It was generally felt that, with less specific notation, the music served as something of a blueprint, and could be constantly refreshed and kept current by the idiomatic addition of improvised graces. While the greatest practitioners of this lavish, expressive improvisatory vocabulary were the solo violinists and singers, all soloists, vocal and instrumental, were expected to enter into this kind of creative collaboration with the composer. Although the practice is frequently seen as Italian, by the middle of the 18th century as impressive a contribution in this area was being made by French and Germanic musicians, especially violinists. Quantz, recognizing the basic difference between what he saw as French and Italian aesthetic (*Versuch*, 1752; chap.10, no.115), referred to the frequently notated single-note ornaments as 'wesentliche Manieren' (necessary ornaments) and the more elaborate personal improvised graces as 'willkürliche Veränderungen'. Burney remarked later of Italian practice that 'an adagio in a song or solo is generally little more than an outline left to the performer's abilities to

colour'. The best-known examples of improvisation in Italian adagios appear in Estienne Roger's edition of Corelli's Sonatas for violin and violone or harpsichord op.5 (Amsterdam, 1710), which the publisher prefaced by a declaration that the adagios were graced by Corelli himself: 'Composez par Mr A. Corelli comme il les joue'; ex.10 presents the opening bars of the third sonata. Further, in Roger's 1716 reprint the injunction has changed to 'comme M. Corelli veut qu'on les joue'. These are significant samples to be emulated by the performer in his or her own manner, in addition to their value as documents of Corelli's playing; Corelli, like any other 17th- or 18th-century musician, would have varied his graces at every performance.

In his *Compendium musicae signatoriae et modulatariae vocalis* (1689; chap.5, §19) W.C. Printz described some Italian ornaments – *figure corte*, *messenze* and *salti* (ex.11) – that are somewhat less florid than those encountered in adagios. Even Montéclair, who was against *passages* (see §(iii) above), admitted this type, which he called *diminutions*. The best way to see how they can be improvised is to strip the *figure corte* from a written-out piece, for which the aria ‘Singet dem Herrn’ from Buxtehude’s cantata of the same title (buxwv98) has been selected (ex.12). Bach’s cantatas are replete with examples of written-out *figure corte*. These are interesting because genuine Italian sources of the late 17th century are scarce. They reflect the earlier division type, related to some of the patterns from which Corelli’s ornamental style is ultimately derived, especially in anonymous 18th-century decorations for Corelli’s fast movements; Corelli’s graces for the adagios are largely elaborations of the *gruppi*, tremolos and other figuration typical in 17th-century ornamentation. It is therefore puzzling that Roger North should have referred contemptuously to Roger’s newly published Corelli graces as ‘so much vermin’, when they appear to be no more alien than familiar Italian patterns grouped under a single bowstroke. Beginning with the Corelli sonatas, the notation of florid ornamentation, however rhythmically approximate, appeared regularly in published and manuscript sources, examples of a composer’s or performer’s style or milieu. For Corelli’s op.5 sonatas alone there are over 20 known sources of preserved improvisation, each adding new forms of passage-work idiomatic to the period and provenance of the example. The density of notated embellishment increases noticeably throughout the century, even encompassing the chromatic inflections of the *galant* and Classical styles. The most ornate late example of a decorated movement for violin and bass may be seen in the fold-out of J.-B. Cartier’s 1798 compendium of 18th-century violin literature, *L’art du violon*, where a Tartini ‘Adagio’ is varied in 17 increasingly complex ways (see illustration). Throughout it one can still perceive the original text, however, and identify much of the figuration with its 17th-century roots. Other examples in the solo violin literature of the period include William Babell’s *XII Solos ... with Proper Graces* (London, c1725), Franz Benda’s 33 sonatas for violin and continuo (*D-Bsb* Mus.ms.1315/15), Geminiani’s Sonatas for violin and bass (London, 1716, 2/1739 ‘carefully corrected and with the addition, for the sake of greater ease, of the embellishments for the adagios’), Telemann’s *Sonates corellisantes* (Hamburg, 1735) and *Sonate metodiche* (Hamburg, 1728) and Vivaldi’s Sonata in Arv29 (plain in Malipiero edition; second movement ornamented in *D-Dlb*, Pisendel collection).

Improvisation, §II, 3: Western art music: Baroque period

(v) Varied reprises.

Until now, the discussion has centred on examples of improvised ornamentation in slow movements where improvised graces are substituted for a simpler notated text. In fast movements, virtually all in binary form, the varied reprise of each section was considered essential. Quantz wrote about it as follows (op. cit., from the translation *Easy and Fundamental Instructions*, c1790):

It is a principal Rule with regard to Variations that they must have a just reference to the plain Air, the variation is made upon ... the first Note of the Variation must for the most part be the same with the original or plain Note ... or any other Note may be chosen instead of it from the Harmony of the Bass, provided the Principal or plain Note be heard immediately after it ...

Brisk and lively Variations must not be introduced in an Air that is soft, tender and mournful, unless the Performer knows how to render them more suitable and agreeable in the manner of executing them.

Variations are only to be introduced after the simple Air has been heard first, otherwise it will be impossible for the Hearer to distinguish the latter from the former; nor does an Air, compos'd in a pleasing and graceful Stile, require any such additions, unless one was sure to improve still more upon it, they being used for no other end, than to render an Air in the cantabile Stile more melodious, and Divisions in general more brilliant.

Those that consist in a continual series of swift Notes or quick Passages, though ever so much admired by some, in general are not so pleasing as those of the more simple kind, the latter being more capable of touching the Heart, a Point that certainly is most to be aim'd at, and indeed at the same time the most difficult Part in Music; for which reason a young

Beginner is advis'd to be cautious and moderate in the use of Embellishments and Graces.

However, it is quite clear that in many performances both playings were freely embellished. Extant Corelli material other than the Roger edition of 1710 contains heavily decorated examples of fast movements, some with more than one ornamental option. And the fact that the practice of embellishing both first statement and repeat is discouraged, in the name of good taste, by writers of the period proves how widespread the practice must have been.

Practical consideration occasionally led a composer to write out varied reprises, as C.P.E. Bach did in his *Sechs Sonaten für Clavier mit veränderten Reprisen* (1760). He wrote in the foreword (translation, 1961, from Ferand, *Die Improvisation in Beispielen*, 1956):

Variation upon repetition is indispensable today. It is expected of every performer. The public demands that practically every idea be repeatedly altered, sometimes without investigating whether the structure of the piece or the skill of the performer permits such alteration. It is this embellishing alone, especially if it is coupled with a long and sometimes bizarrely ornamented cadenza, that often squeezes the bravos out of most listeners. How lamentably are these two adornments of performance misused. One no longer has the patience to play the written notes the first time; the too long absence of bravos is unbearable. Often these untimely variations, contrary to the setting, contrary to the *Affect*, and contrary to the relationship between the ideas, are a disagreeable matter for many composers. Granted, however, that a performer has all the qualities necessary to vary a piece in the proper way; is he always ready to do so? Are not new difficulties raised thereby in unfamiliar pieces? However, aside from these difficulties and from misuse, good variations always retain their value ... In writing these sonatas I have had in mind mainly beginners and such amateurs as ... no longer have enough time and patience to practise especially assiduously. I have wanted to give them ... the satisfaction of being heard playing variations without having either to invent them themselves or to have others write them down and then themselves learn them by heart with much effort. I am happy to be the first, so far as I know, to work in this manner for the use and the pleasure of his patrons and friends.

Ex.13 shows the beginning of no.1, with the embellished reprise below (the right-hand part is shown; there are only minor differences in the left).

The varied reprise is mandatory in da capo arias. P.F. Tosi gave good advice to singers on this matter in his *Opinioni de' cantori antichi e moderni* (1723), here cited in J.E. Galliard's translation of 1742 (chap.7, §4):

In the first [part] they require nothing but the simplest Ornaments, of a good Taste and few, that the Composition may remain simple, plain, and pure; in the second they expect, that to this purity some artful Graces be added, by which the Judicious may hear, that the Ability of the Singer is greater; and, in repeating the Air, he that does not vary it for the better, is no great Master.

Because the principle of embellishment in arias did not change radically during the 18th century, except perhaps in the 'reform' operas of Gluck, the rules given by J.A. Hiller in his *Anweisung zum musikalisch-zierlichen Gesange* (1780; see §4(ii) below) are equally applicable to Baroque music.

He stated that an aria must first be performed as the composer wrote it, though the singer could add one or two small graces. The varied da capo must appear easy and pleasant, but should actually be difficult in order to give the singer an opportunity to demonstrate his skill. In slow arias it is best to introduce legato ornaments, in *allegro*, staccato ones. *Passaggi* and similar ornaments should never be sung twice in the same way, and generally speaking the same graces should not be used too close to one another or too often in succession.

[Improvisation, §II, 3: Western art music: Baroque period](#)

(vi) Melodic variations.

In addition to the free-form ornamentation described above, it seems to have been customary for shorter movements to receive added sets of figural, melodic variations following the playing of the movements that served as their 'theme', even if that theme already had its reprises decorated. Georg Muffat referred implicitly to this practice in the preface to his concerti grossi of 1701, saying that the 'liveliest airs [are to be played] thrice (with all [their] repeats)'. By using a system of distinct characterized variations, a short movement of this type could gain added cohesive structure as well as length, while demonstrating the improvisatory skill of the performer. Once again, the best period examples are found in the music of Corelli, where gavottas and gigas are extant both in freely decorated versions and extended with sets of variations. Frequently, individual movements with added variations exist without reference to the entire sonatas that originally contained them – the basis for the later Classical theme and variations.

[Improvisation, §II, 3: Western art music: Baroque period](#)

(vii) Cadenzas.

A special instance of free improvisation is the cadenza (for a fuller account see [Cadenza](#)). In his section on cadences Quantz defined them as

those Embellishments commonly introduced on the last Note but one, mostly on the Fifth of the Key ... the Productions of the momentary Invention of the Performer. Regular Time is seldom to be observ'd in Cadences ... Those for Voice or Wind Instruments ought to be short and so manag'd that they may be perform'd in one Breath, but those for String Instruments are not limited, but the Performer has so much Latitude given him, as his own skill and fruitfulness of Invention will permit, but notwithstanding will gain more Applause from the Judicious by a moderate length than otherwise.

The short cadenza 'within a breath' and the extended solo fantasy are exemplified and contrasted in the works and performing practices of two famous early 18th-century violinists, the Roman Corelli and the Venetian Vivaldi. At the close of Corelli's sonata and concerto grosso movements it is not uncommon to find, immediately before the final cadential trill, a flourish that recalls the slurred *gruppi* of the 'graces' in the Sonatas. By contrast, reports of Vivaldi's pyrotechnic abilities, not always immediately evident in the texts of his concertos, are amply demonstrated in the lengthy

manuscript cadenzas for the Concerto in Dv208 ('il Grosso Mogul'), which came to light in the 1980s. Further, Pietro Locatelli, the most technically accomplished virtuoso before Paganini, published as *Capricii* the extended and difficult cadenzas for the concertos of his 1733 *L'arte del violino* op.3. C.P.E. Bach, in his *Versuch über die wahre Art das Clavier zu spielen* (1753; end of chap.2), also discussed cadenzas in terms of fermatas appearing at cadences as well as other places (trans. W.J. Mitchell, 1949):

Fermate are often employed with good effect ... there are three places at which the *fermata* appears: over the next to the last, the last, or the rest after the last bass *note* ...
Fermate over rests appear most frequently in allegro movements and are not embellished. The two other kinds are usually found in slow, *affettuoso* movements and must be embellished if only to avoid artlessness. In any event elaborate decoration is more necessary here than in other parts of movements.

The cadenzas improvised in da capo arias by singers such as the famous castrato Farinelli often ran to inordinate length, notwithstanding the stricture that they should be sung in one breath. Tosi (op. cit., 128–9) criticized such cadenzas thus:

Every *Air* has (at least) three *Cadences*, that are all three final. Generally speaking, the Study of the Singers of the present Times consists in terminating the *Cadence* of the first Part with an overflowing of *Passages* and *Divisions* at Pleasure, and the *Orchestre* waits; in that of the second the Dose is increased, and the *Orchestre* grows tired; but on the last *Cadence*, the Throat is set a going, like a Weather-cock in a Whirlwind, and the *Orchestre* yawns.

The gigantic written-out cadenza for the harpsichord in the first movement of Bach's Fifth Brandenburg Concerto is an excellent example of its type, though it may be considered too extensive for the usual extemporization and even to constitute an example of the soloist's abuse of privilege. When the two outer movements of a Baroque concerto – or indeed any two movements in any other type of work – are separated only by two chords, usually constituting a Phrygian cadence, the first of them should be elaborated into an improvised cadenza; a familiar instance occurs in Bach's Third Brandenburg Concerto.

[Improvisation, §II, 3: Western art music: Baroque period](#)

(viii) Continuo realization.

Developments in the realization of the thoroughbass kept pace with the elaboration of the melodic line in the late Baroque period (for a fuller account see [Continuo](#)). The most exhaustive treatment of this subject is by Heinichen in *Der General-Bass in der Composition* (1728). He declared that the simple three-part realizations of the 17th century were old-fashioned and advocated the doubling of chords in both hands and the introduction of improvised ornamentation. He provided (i, chap.6) three realizations of a single bass line ([ex.14](#)), first in a simple manner ([a](#)), which can be avoided by introducing ornamentation and a true melodic line in the

right hand (*b*); or, to give even more freedom to the melodic line, the chords may be played entirely by the left hand (*c*).

Early 18th-century Italian continuo practice went far beyond Heinichen, especially in the accompaniment of recitatives. Gasparini's *L'armonico pratico al cimbalo* (1708), Joseph de Torres y Martinez Bravo's *Reglas generales de acompañar, en organo, clavicordio y harpa* (enlarged 2/1736), which cites Gasparini with clearer musical examples, and Alessandro Scarlatti's *Varie introduzioni per sonare e mettersi in tono delle compositioni* (GB-Lbl Add.14244) give rules for the addition to triads of handfuls of acciaccaturas, to be played 'quasi arpeggiando'. But other examples, now and later in the century – for instance in Niccolò Pasquali's *Thorough-Bass Made Easy* (1757) – are more subdued.

There are first-hand accounts of Bach's continuo improvisation. L.C. Mizler wrote (1738) of his accompanying 'every thorough-bass to a solo so that one thinks it is a piece of concerted music and as if the melody he plays in the right hand were written beforehand' (translation from Aldrich, 1949). C.P.E. Bach related that his father liked to extemporize a fourth part when accompanying a trio. Bach's pupil J.C. Kittel described (*Der angehende praktische Organist*, iii, 1808, p.33) how Bach would become impatient with the inadequate accompaniment of a pupil and how 'one had to be prepared to find Bach's hands and fingers mingling with the hands and fingers of the player and, without further troubling the latter, adorning the accompaniment with masses of harmony, which were even more impressive than the

unexpected proximity of the strict teacher'. Two of Bach's accompaniments are thought to be examples of his own realizations in written-out form, since they are marked 'cembalo obligato' and are not in the same style as his usual composed harpsichord parts: they are those of the second aria in the solo cantata *Amore traditore* bwv203 (thought to be by Bach) and of the second movement of the Sonata in B minor for flute and harpsichord bwv1030.

Improvisation, §II, 3: Western art music: Baroque period

(ix) Complete pieces.

Improvisation of complete pieces of music was not new to the Baroque period, but some of the great composer-performers of the era achieved new heights of virtuosity. In the 17th century the organ improvisations of Sweelinck, Frescobaldi and Buxtehude won the admiration of crowds who were attracted from far and wide. Bach is known to have improvised a prelude and fugue, an organ trio in three obbligato parts, a chorale prelude and a final fugue, all on a single hymn tune. Forkel remarked on Wilhelm Friedemann's impressions of his father's improvisations at the organ, saying that his organ compositions were indeed

full of the expression of devotion, solemnity and dignity; but his unpremeditated organ playing, in which nothing was lost in the process of writing down but everything came directly to life out of his imagination, is said to have been still more devout, solemn, dignified and sublime.

A famous story that hardly needs repeating tells how in 1747, while visiting Frederick the Great, Bach extemporized a fugue on a 'royal theme' given him by the king that he later worked out in his *Musical Offering*. Two of the rare places in music by (or attributed to) Bach where the performer is allowed some freedom to improvise are seen in the bars of minim chords in the Chromatic Fantasia bwv903 and the semibreve chords that constitute the entire prelude of the keyboard fugue in A minor bwv895.

Handel was equally famous for his improvising, as is attested by Hawkins's description of his playing of his own organ concertos:

His amazing command of the instrument, the grandeur and dignity of his style, the copiousness of his imagination, and the fertility of his invention were qualities that absorbed every inferior attainment. When he gave a concerto, his method in general was to introduce it with a voluntary movement on the diapasons, which stole on the ear in a slow and solemn progression; the harmony close wrought, and as full as could possibly be expressed; the passages concatenated with stupendous art, the whole at the same time being perfectly intelligible, and carrying the appearance of great simplicity. This kind of prelude was succeeded by the concerto itself, which he executed with a degree of spirit and firmness that no one ever pretended to equal.

Indeed, in the scores of the opp.4 and 7 organ concertos the soloist is frequently directed to play an 'Adagio ad lib' or 'Fuga ad lib'. While

Handel's own improvisatory skills must have been prodigious, the publication of such instructions indicates that he expected no less from his colleagues.

A new type of improvisatory piece called a *partimento* arose in the Baroque period with the inception of the thoroughbass. In thoroughbass practice both the bass line and the melody are given, while in the *partimento* only the bass line with figures is given, over which it was the performer's responsibility to improvise self-contained pieces, character-pieces often called toccatas, and even fugues. Practised mostly in Italy, the *partimento* is closely related to the English practice of making divisions on a ground (see §(ii) above). *Partimento* improvisations were cultivated extensively as pedagogical exercises in the later Baroque period, when numerous collections were published by Gaetano Greco, Francesco Durante, Carlo Contumacci, Gaetano Franzaroli and Giuseppe Saratelli.

The art of improvisation flourished to the very end of the Baroque era in the free fantasia. J.S. Petri, in his *Anleitung zur practischen Musik* (1767), claimed that the fantasia was 'the highest degree of composition ... where meditation and execution are directly bound up with one another'. The whole final chapter of C.P.E. Bach's *Versuch* (1753) is devoted to the improvisation of fantasias. A free fantasia is given at the end both in written-out form and as a *partimento*. The absence of bar-lines emphasizes the freedom of such a composition.

Beyond the feats of the 17th- and 18th-century virtuosos, improvisation was certainly a customary skill among competent, less renowned musicians. Extemporizing over ground basses, for instance, was an essential part of any musician's training, and the extemporization of dances, suites and even more complex forms was not considered unusual. The incomplete scoring of 17th-century Italian operas seems to indicate that much of the instrumental music was improvised: at many junctures, one finds simply a bass line with two to four cleffed blank staves above it. It is clear that five-part texture (either two violins and two violas with bass, or one violin and three violas of differing sizes with bass) was usual in music throughout Europe, yet few viola parts or viola lines in scores can be found. There is little doubt that these were improvised, particularly given the more aural and less page-orientated training of most musicians of the period; unquestionably musical literacy was not a critical requirement for a practising musician of the day.

[Improvisation, §II: Western art music.](#)

4. The Classical period.

(i) Instrumental music.

(ii) Vocal music.

[Improvisation, §II, 4: Western art music: The Classical period](#)

(i) Instrumental music.

Performers and composers of the Classical period perpetuated three types of Baroque improvisation: embellishment, free fantasies and cadenzas. (The present article treats the two former; for discussion of the latter see [Cadenza](#).) Although all three practices gradually declined, the universality of their use is confirmed in contemporary reports of concert performances

(Burney), in treatises (e.g. by C.P.E. Bach, Manfredini and Türk – who in turn drew from earlier treatises e.g. by Marpurg and Quantz), and in composers' written-out embellishments of their own and others' musical texts. It seems likely also that soloists performing keyboard concertos improvised during orchestral ritornellos.

Reports and histories of the period inveigh against excessive amount and length of improvisation and embellishment. Such polemics confirm that these practices were widespread. Their aesthetic prescriptions are best evaluated in comparison with written-out embellishments, for example those by Haydn and Mozart, and the pseudo-improvised modulating preludes Mozart wrote for the use of his sister Nannerl; such documents show what was actually done (as opposed to what some observers would like to have heard). Of the authors whose treatises contain detailed descriptions of the use and methods of improvisation, C.P.E. Bach is the only one whose music elicits the same respect as his writings; the disparity in proficiency between composers and performers of Haydn's or Beethoven's level and those of, for example, Türk's cannot be overlooked. Nor can the fact that exhaustive treatises often tend to the categorical and pedantic. While writers and composers of the period may have agreed generally on the decisive role of taste, that of the master Classical composers is not necessarily identical with that of their writer contemporaries.

(a) Improvised embellishments.

Treatises affirm that competence in prepared or improvised embellishments is dependent on thorough knowledge of the basic types ('Manieren') and their execution. The sources give sample embellishments but cannot clarify what proportion was prepared and what was improvised in 18th-century practice, although they do show that there were discrepancies between original text and actual performance. Composers wrote out embellishments for the benefit of amateurs or students, who, unlike the composer or virtuosos, were not expected to have mastered the art of improvisation. Mosel (1813), following in the footsteps of Gluck, Leopold Mozart, Quantz and C.P.E. Bach, specifically mentioned Mozart as a composer who wrote out precisely the ornaments he desired. Bach (1753–62, p.165) warned:

many variants of melodies introduced by executants in the belief that they honour a piece, actually occurred to the composer, who, however, selected and wrote down the original because he considered it the best of its kind.

He elaborated his reservations elsewhere:

Today varied reprises are indispensable, being expected to every performer. A friend of mine takes every last pain to play pieces as written, purely and in accord with the rules of good performance. Can applause be rightfully denied him? Another, often driven by necessity, hides under bold variations his inability to express the notes as written. Nevertheless, the public holds him above the former. Performers want to vary every detail without stopping to ask

whether such variation is permitted by their ability and the construction of the piece.

Often it is simply the varying, especially when it is allied with long and much too singularly decorated cadenzas, that elicits the loudest acclaim from the audience ... Often these untimely variations are contrary to the construction, the affect, and the inner relationship of the ideas – an unpleasant matter for many composers. Assuming that the performer is capable of varying properly, is he always in the proper mood? Do not many new problems arise with unfamiliar works? Is not the most important consideration in varying, that the performer do honour to the piece? ... Yet, regardless of these difficulties and abuses, good variation always retains its value.

The *locus classicus* of improvised instrumental ornamentation was the restatement of the principal theme, particularly in slow movements and rondos. Composers did not always notate such restatements, but signalled them in the manuscript with da capo signs. Thus the literal reprinting of the theme in modern editions creates an implication – not found in the sources – that the composer desired a note-for-note repetition of the opening music. Composers themselves often provided embellishments of principal themes immediately before performances by pupils or before publication. The differences between the texts Mozart used himself and those he presented to the general public may be seen by comparing autograph manuscripts and first editions of the second movement of the Piano Sonata in F k332/300k (ex.15) and the third movement of that in D k284/205b, variation xi. By the 1790s composers were writing elaborate embellishments into thematic reprises, having expropriated embellishment from the domain of improvisation (ex.16 shows an example by Beethoven).

Performers improvised embellishments mostly in works having a primary melodic line, for example solo piano works, duo sonatas with an obbligato instrument, string quartets with dominant first violin, chamber works for a wind instrument and strings, or instrumental concertos. Nonetheless, orchestral players of the 18th and early 19th centuries evidently improvised embellishments; indeed, in an account dated 19 December 1816 Louis Spohr decried an orchestral performance conducted by him in Rome that was constantly marred by untrammelled embellishment by individual members of the orchestra. Spohr remarked that he specifically forbade the players to make any additions to the music as printed, but acknowledged that ornamentation was second nature to them. He cited the horns as converting ex.17a into ex.17b and the clarinets as rendering ('perhaps simultaneously') ex.17c as ex.17d.

Mozart's piano concertos are a special case. Most of them were written for his personal use. In a number of them the solo part is occasionally notated in sketch-like shorthand. This occurs when melodic and rhythmic activity suddenly slacken without obvious dramatic or expressive motivation, such as slow-movement sequences (e.g. in the second movement of the concerto in C k503; ex.18); and also during 'piano recitatives' in the slow movements, in which a melody in the piano's right hand is accompanied by repeated quaver chords in the strings (e.g. in the concertos in D k451; D minor k466; C k467; C minor k491; D k537; and B \flat k595). A surviving

embellishment to the recitative from the second movement of K451 written out by Mozart for his sister Nannerl hints at his expectations for such passages (ex.19). Mozart also used such shorthand, for example long notes delineating outer boundaries, for arpeggiated or connective passage-work (e.g. in the concertos K451 in D, K482 in E \flat , K595 in B \flat and especially K491 in C minor). In such places the soloist's sudden reduction in rhythmic speed is not compensated for by activity in the orchestra. Suggestions for filling in the gaps appear in Badura-Skoda (1957), Neumann (1986) and the NMA scores of the concertos, which identify them as editorial (ex.20 shows a representative passage from the third movement of K482 in which suggested fill-ins by the NMA editors Hans Engel and Horst Heussner, by the Badura-Skodas and by Robert Levin, are shown above the autograph version).

The large leaps commonly found in dramatic arias of the period were often mimicked in instrumental music. Even in the 20th century treatises continued to warn against filling them in; but an extremely elaborate written-out embellishment to the second movement of Mozart's Piano Concerto in A K488 in the hand of his pupil Barbara Ployer fills in such leaps. The content of the decoration hardly concords with Mozart's personal language, but it gives a useful indication of the quantity, if not the quality, of what Mozart provided in his own performances.

Given the direct relationship between individual works and specific performers and circumstances, a performer wishing to supply the most idiomatic embellishments will use the instrumental range observed by the composer (this precept also applies to cadenzas and lead-ins).

(b) Free fantasies and other improvised pieces and passages.

By the Classical era solo improvisation was carried out mostly by keyboard players, and few excelled at it. Dittersdorf declared that he liked hearing only 'Mozart, Clementi and other creative geniuses', whose improvisation had been incompetently aped everywhere. The free fantasy occupies the final section of C.P.E. Bach's treatise. He made it clear that the key to successful improvisations of this kind is a solid knowledge of progressions and consistency of harmonic rhythm. The ametrical fantasy that illustrates his points recalls many of his compositions.

Mozart's and Beethoven's improvisatory abilities were celebrated; their concerts frequently featured solo improvisation. The fantasias composed by Mozart, which may represent revisions of pieces improvised in concert, are mostly metrical; despite their free declamation, they give the appearance of having been carefully worked out. In addition to such fantasies the most common types of keyboard improvisation were spontaneous variations on a given theme, and improvised preludes used either to try out an unfamiliar instrument before a formal performance or to link works in different keys. A number of Mozart's modulating preludes survive. These little-known works (all published in NMA) are mostly ametrical. Beethoven's Fantasia op.77 (which may be a revision of an improvisation at his Akademie at the Theater an der Wien on 22 December 1808) is primarily metrical, though it contains several striking ametrical passages. Schubert's fantasies are metrical.

Keyboard improvisation was not limited to solo performances. Walther Dürr suggested that the lack of piano introductions to many of Schubert's songs implies that the accompanist improvised a brief *Vorspiel*. Dürr theorized that many of the piano introductions in the posthumous lieder that are not known definitely to have been composed by Schubert were derived from his improvisations; Dürr characterized these not as forgeries ('Fälschungen') but as necessary complements ('Ergänzungen') to the text in a printed edition for dilettantes.

(c) Continuo in piano concertos.

There is considerable evidence that Classical composers expected the soloist to improvise from the bass – figured or unfigured – during the orchestral ritornellos of keyboard concertos. 18th-century published editions of the keyboard part usually contain a figured bass in those sections, and Mozart notated 'col Basso' ('with the bass') in the left-hand staff of the keyboard part on virtually every page of the score where the soloist does not have an obbligato part. The reasons for this practice are still debated. Such concertos were normally conducted from the keyboard; it has been argued that the keyboard played chords to keep the orchestra together or that the bass line was nothing more than a cue to prevent the soloist from getting lost.

The Badura-Skodas (pp.207–8), pointing out the obvious differences in timbre between fortepiano and modern piano and between Classical and modern orchestral instruments, adduced criteria for the discreet use of continuo in modern performance. Neumann (1986, p.255) was more categorical, rejecting its use except on old instruments, and Charles Rosen (2/1972, p.192) stated flatly, 'In the concertos of Mozart there is absolutely no place where an extra note is needed to fill in the harmony'. Two documents pertinent to the controversy survive. The first is an autograph continuo part of Mozart's Piano Concerto in C k246. The Badura-Skodas and Szász argued that it shows how Mozart played continuo. The second is the carefully notated continuo part in the autograph to Beethoven's Fifth Piano Concerto op.73. The lack of similar explicit directions in the earlier keyboard concertos can be explained by the fact that Beethoven personally performed them; the fifth was the only one he never played. The continuo part contains scrupulous figuration and indications of *tasto solo*, *a l'ottava* and *Telemann-Bögen*, and occasionally doubles the bass in octaves. Even if these annotations served a purely pedagogical purpose as part of Beethoven's instruction of Archduke Rudolph, as argued by H.-W. Küthen in his edition, it seems unlikely that Beethoven would use the manuscript of one of his most important works merely to teach an art which had no practical use. Beside the debate about the applicability of continuo in Classical concertos lies the question of how it was played. Some present-day scholars consider continuo to be a purely functional element of 18th-century music: the player merely plays a chord at each change of harmony, so as to complete the texture and keep the orchestra together. However, purely chordal continuo playing would contradict both the tradition of thoroughbass and the treatises of the period. Quantz and C.P.E. Bach specifically suggested that the continuo player vary the number of upper voices and improvise linear and quasi-linear music when appropriate. All thoroughbass textbooks treat voice-leading as primary, dealing not merely

with the interpretation of the figures but with their contrapuntal implications. It would be as fallacious for the Classical period as for the Baroque to assume a composer to be unconcerned with a chord's qualitative presence merely because it was not written down. Notated accompaniments were unnecessary because players were able to improvise them.

[Improvisation, §II, 4: Western art music: The Classical period](#)

(ii) Vocal music.

Instructional and theoretical works came, through their sheer quantity, to assume a new importance to the student of ornamentation as the Classical period began and music publishing flourished. Some 20 comprehensive vocal methods or critical studies appeared in the period between 1763 and 1825 (after which the Rossinian revolution begins to be reflected). Many contain extensive notated examples, and these are of especial value in a period both of operatic reform and of virtuoso vocalism. The latter was cultivated with care, ambition and respect, although its extreme manifestations found cogent and persuasive detractors. Most writers on the subject discuss questions of taste and judgment, balancing the claims of composer and virtuoso; there is much thoughtful argument, and subtle differences of emphasis are found between writers. But without matching such accounts to detailed, notated examples it is impossible to determine what might have sounded restrained and what daring, still more to establish what were considered the idiomatic ways of carrying out standard ornamental procedures.

Domenico Corri is probably the most valuable single theorist as far as the provision of practical examples is concerned: he printed details of execution that were normally left unwritten, over a wide range of music; he was more reporter than advocate; and he was respected by his contemporaries. Other important writers were Giambattista Mancini, J.A. Hiller, J.B. Lasser, A.M. Pellegrini Celoni, J.F. Schubert, Giuseppe Lanza, Alexis de Garaudé, G.G. Ferrari, J.B. Rocourt, Isaac Nathan and R.M. Bacon. Annotated performance materials are plentiful but not readily accessible for study; in London, following Corri's lead, publishers began to issue arias with embellishments and nuances indicated by small note heads, and there and in Paris arias were published showing a particular performer's 'realizations' on a separate staff.

Little or no ornamentation is advised for plain recitative; Hiller (1780) stated that ornaments should be confined to occasional mordents and *Pralltriller*, though he accepted the need for more in scenes in accompanied recitative. J.F. Schubert advocated 'appropriate free embellishment' for fermatas but cautioned that this should be avoided where the word to which it would be sung made it inappropriate. In slow arias, or the slower sections of two-part rondò arias, the use of portamento was advocated by Corri, with *messa di voce* on longer notes, and the line might be highly graced, with appoggiaturas (single or compound) and acciaccaturas as the most common ornaments; little running passages might bridge leaps or fill out long notes, and syncopation, echo effects and division-like passages might be used. The surviving examples embellished by Mozart show the use of such devices ([ex.21](#)). *Allegro* arias or sections were less subject to decorative ornament, largely because of their greater speed and stricter

tempo. Passing notes, appoggiaturas and the like are found, but in less profusion, and unmeasured flurries of quick notes are rare. Staccato and syncopation are sometimes used as ornamental devices, and running passages of semiquavers may be constructed on the outlines of melodies in longer note values. Hiller (1780) explained the distinction: 'in slow and pathetic arias, slurred and drawn-out ornaments are the most appropriate, just as thrusting ones belong more to the Allegro'. In both styles, ornamentation generally involves adding notes of quicker rhythmic denomination rather than rerouting existing semiquavers into another region of the voice or simply recomposing the melodies (a practice often followed in modern revivals). Some degree of thematic variation, however, was expected in the case of an aria with a recurring theme as it reappeared.

Many complete arias survive with ornamentation attributable to specific composers or singers. The Czech composer Václav Pichl noted, in Milan in 1792, the variants sung by Luigi Marchesi in different performances of Zingarelli's *Pirro* (ex.22); its opening line gives some indication of what theorists meant when they decried ornamentation that overwhelmed the original. At least eight examples were published of the decorations sung by Angelica Catalani, which were equally florid. Mozart's preferred style of ornamentation, ascertainable from ex.21 and from his elaboration of an aria from his *Lucio Silla* (1772), shows a number of features: (a) the use of passing notes and other small ornaments in the first statement, increased in the repeat; (b) the standard use of appoggiaturas on feminine line endings (and often elsewhere; the speed of their resolution should be noted); (c) the variety of pace in the passage-work, with the prevailing semiquavers often enlivened by a burst of demisemiquavers or uneven groups of quick notes; (d) the tendency to use embellishment to increase the complexity and speed of figuration (as opposed to altering melodic shape or tessitura: the idea of adding 'excitement' through high notes seems to play no part); (e) the use of syncopation and phrasing to vary the line, and (f) the increase in elaboration as cadences are approached. In the *Lucio Silla* aria it is worth noting, additionally, that the wide leaps in long notes are left unornamented.

Several theorists stress the importance of exactitude and curtailment of liberties when two or more voices are singing together. Pellegrini Celoni wrote:

Duets, trios, quartets etc. must be sung as they are written, and though it is permissible to vary this or that in the solos, in the remainder it is necessary to proceed with unanimity, and to pay close attention to *forte*, *piano* and *pianissimo*; to smooth out, connect and separate ... in concerted pieces, ... appoggiaturas, trills and mordents are still permitted, but always with moderation.

Others emphasized that cadenzas for two voices or for voice with obligato instrument (which was expected when the accompaniment featured one) must be prepared in advance and were often written out by composers. Many examples survive, among them several for the duet for Susanna and Countess Almaviva in *Le nozze di Figaro* and for 'Ah perdona' from *La clemenza di Tito*.

Most of the foregoing discussion applies primarily to Italian music. Outside the Italian sphere, the application of italianate style decreased in proportion to the distance of the music itself from Italian models. Germans noted approvingly (and Italians complainingly) that sophisticated German accompaniments made vocal freedom and ornamentation less appropriate. J.F. Schubert admonished that the 'compositions of Mozart, Haydn, Cherubini and Winter will bear fewer embellishments than those of Salieri, Cimarosa, Martín and Paisiello'. French singers seem to have carried from earlier generations some of their system of well-defined and differentiated ornaments which they preferred to the bolder manifestations of italianate passage-work, and to have applied them quite liberally to the *ariettes* and the strophic songs in their operas. In one kind of English song, where the voice moves predominantly in octaves with the bass, it is implied by Corri that the voice did not normally break the unison to add ornamentation; the basic shape of the vocal melody is retained, but passing notes and other smaller graces might be added. These, along with the *gruppetto*, or turn, and portamento, seem to have been regarded more as a part of tasteful execution than as ornamentation.

5. The 19th century.

(i) Instrumental music.

(ii) Vocal music.

[Improvisation, §II, 5: Western art music: The 19th century](#)

(i) Instrumental music.

The early 19th century witnessed a meteoric rise in the popularity of improvisation and then its near-extinction post-1840 after suffering an 'apotheosis of bad taste' (Wangermée, 1950). The Romantic mind revelled in the spontaneous creativity of improvisation and its unique incarnation of musical genius. But improvisation also served more prosaic ends by pandering to a music-consuming bourgeoisie that craved brilliance and sensation, thus encouraging its rapid decline as trivialization threatened the artistic originality that had distinguished it in its 18th-century heyday. Other

factors leading to the eradication of public improvisation included the rise of the performer as interpreter and the divorcing of composition from performance; the concomitant ascendancy of the 'work concept', itself inimical to the notion of music in flux so vital to improvisation; and an evolution in musical technique away from bass-orientated, syntactical structural outlines towards more melodically, generically or programmatically conceived frameworks which loosened the 'inner thread' (Schumann, 1854) that previously had held much extemporized music together.

In the first decades of the century, however, improvisation claimed a central role within musical culture – thanks to the pre-eminence of the piano, the instrument on which it was most commonly practised. Advances in design and construction thrust the piano on to centre stage in the concert halls of increasing importance in the era; greater virtuosity and expressivity resulted in particular from the instrument's enhanced sustaining powers, enriched timbral palette and repetition action (patented 1821). These were ruthlessly exploited by the 'lions of the keyboard' touring Europe, who inevitably included at least one improvisation in their concert programmes. Generally the last item to be heard, such an improvisation often featured popular melodies or operatic airs. Masters like Hummel and Liszt improvised on themes provided by the audience, partly to counter critics' charges that extempore performance was 'little more than playing from memory' (*The Harmonicon*, June 1830). Even Chopin – whose improvisations on Polish national melodies charmed audiences in Warsaw, Vienna and Paris – used this trick on occasion, once to please three clamouring princesses typical of the more private salon audiences, or *Damenwelt* (Moscheles, 1872), for whom improvisation was also *de rigueur*.

Another celebrated improviser was Beethoven, whose extemporizations, according to Czerny, were 'brilliant and astonishing in the extreme', 'whether on a theme of his own choosing or on a suggested theme' (ed. P. Badura-Skoda, 1963, trans. 1970). They generally took 'the form of a first movement or rondo finale of a sonata', a 'free variation form' or 'a mixed form, one idea following the other as in a potpourri' – formal procedures laid down in Czerny's own *Systematische Anleitung zum Fantasieren auf dem Pianoforte* (1829), perhaps the most important (certainly the most informative) improvisation treatise from the period. Others were published by the likes of Corri, Hummel and Kalkbrenner for the benefit of less skilled professionals and 'conscientious amateurs' (Kalkbrenner, 1849).

Czerny's treatise elucidates in turn the improvisation of preludes, cadenzas, fermatas and independent 'works' (fantasies, potpourris, capriccios etc.) but says little about their common characteristics. Dahlhaus (1979) argued that any improvisation – by definition spontaneous, though not necessarily original – involves the realization of one or more 'models', however defined. In the early 19th century, such models included chromatic bass progressions, discursive 'nocturne' accompaniments (usually supporting stylized vocal figuration), and harmonic sequences embellished by chord-outlining passage-work (arpeggios, scales, *Rollfiguren* etc.), all of which the hands might execute 'almost without any consciousness of the mechanical operations which they perform' (Hummel,

1881). Czerny too noted that the improviser frequently succumbs to 'an almost subconscious and dream-like playing motion of the fingers' while nevertheless 'adhering constantly to his plan' (1829, trans. 1983; compare Fétis and Moscheles, 1840).

As Czerny indicated, improvisers also utilized higher-order plans refined through practice and experience to lend coherence to their extemporizing. In contrast to the simple figured-bass 'skeletons' (*Gerippen*) exemplified in C.P.E. Bach's *Versuch*, larger-scale improvisatory models after 1800 often comprised loose formal templates defined in thematic terms. The prevailing *stile brillante* offered a ready-made paradigm with its characteristic alternation between virtuoso and lyrical episodes, an approach also taken in countless 'brilliant' compositions by Hummel, Chopin, Liszt and lesser contemporaries. The cement binding successive phases of the occasionally sprawling improvisations that resulted from this and similar formal strategies was melodic and motivic 'imitation' – 'a study of the utmost importance to a pianiste who is desirous of extemporizing' (Kalkbrenner, 1849). Ironically, the requirement of ever-greater organic unity in improvisation hastened its demise by inhibiting an essential freedom (Dahlhaus, 1979).

Czerny insisted, however, that an improvisation, although 'in a much freer form than a written work', 'must be fashioned into an organized totality as far as is necessary to remain comprehensible and interesting' (1829, trans. 1983). Improvisations on a single theme were 'the most difficult of all' but could be crafted in an 'interesting and orderly fashion' simply by combining 'several styles into one and the same fantasy' (for instance, 'Allegro', 'Adagio or Andantino', 'fugal', 'modulatory', 'lively rondo') while avoiding 'an eternal, wearisome, continuous repetition of the theme through all octave ranges and an irrational journeying back and forth among the keys'. A somewhat freer fantasy could be devised with several themes (the first – 'the pillar on which all else is constructed' – must 'recur frequently between the remaining themes' and again at the end); as a potpourri (a 'combination of such themes that are already favorites of the public'); or as a capriccio ('an arbitrary linking of individual ideas without any particular development'). Other possibilities included theme-and-variation and 'strict, fugal' formats.

Preludes had more practical functions than the fantasy, among others to test the instrument, establish an appropriate mood and warm up the fingers. Although mostly 'introductory', preludes were also improvised as links between pieces, a practice resurrected on occasion long after the demise of precluding mid-century. Typically restricted in motif and harmony, preludes might commence in a remote key but normally ended on the dominant 7th chord of the main tonality, thus resolving to the ensuing composition. Stylistic possibilities ranged from unmeasured recitative to bravura virtuosity, as demonstrated in the numerous collections published from 1810 to 1830 for both professionals and amateurs (e.g. by Hummel, Cramer, Haslinger, Moscheles and Kalkbrenner).

Recitative passages also infiltrated period compositions (for instance, Chopin's Nocturne op.32 no.1; Beethoven's Sonatas op.31 no.2, op.110), along with other improvisatory devices like cadenzas (i.e. in solo pieces)

and embellishments (often vocally inspired). Ironically, the latter features lost their earlier improvisatory purpose in that cadenzas were increasingly notated by composers in concertos, while improvised embellishments (portamentos, *fioriture* etc.) came to be viewed as ‘concessions to bad taste’ and ‘sacrilegious violations of the spirit and letter’ of composed music (Liszt, 1837).

As for fantasies committed to paper, these reveal the evolution in the models used by improvisers even if they lack the spontaneity of live improvisation. Although dubbed a capriccio by Czerny, Beethoven's Fantasia op.77 (published 1810) amounts to a ‘Fantasy-Prelude’ preparing a theme-and-variations set with coda, this formal succession corresponding to a background bass motion (ex.23) from B♭/A♭ (‘Fantasy-Prelude’) through B♭ (theme and variations) and C♭ (final variation) back to B♭ (coda). This simple turning shape – recalling the structural foundation in Mozart's Fantasiak475 (see Rink, 1993) – may be typical of tonally conceived early 19th-century improvisatory models, likewise the starkly juxtaposed keys (f–f♯) in Schubert's Fantasia for piano duet d940 (1828; ex.24); the extended chain of 3rds (f–A♭–c–E♭–G♭–[B]–G♭–b♭–D♭–f–A♭) spanning Chopin's Fantaisie op.49 (1841); and, in Chopin's Polonaise-Fantaisie op.61 (1845–6), the linear bass ascent A♭–B♭–C♭–D♭–E♭ uniting seemingly disparate thematic and virtuoso episodes (see Rink, 1993). In contrast, Liszt's *Réminiscences de Don Juan* (1841) derives structural logic through a reordering of Mozart's operatic plot: after a *Grave* opening intoning the Commendatore's music from Act 2 (D major) follows a lengthy theme-and-variations treatment of ‘Là ci darem la mano’ (A major), then a brilliant finale in B♭ based on ‘Fin ch'han dal vino’ (typical of the ‘rousing, dazzling conclusions’ recommended by Czerny in longer fantasies). Liszt's dramatic conceit – whereby dissolution triumphs over virtue – controls the Fantasy, not an underlying tonal framework inherited from earlier improvisatory traditions. In contrast, his B minor Sonata (*quasi una fantasia?*) directly exploits tonally defined improvisatory models, a simple key progression b–D–F♯–b/B stabilizing the alternation between thematic and bravura passages.

The assimilation of improvisatory styles and procedures into formal composition (as shown in Liszt's Sonata) was yet another factor contributing to improvisation's decline, as the bold liberties or ‘stretched conventions’ (Carew, 1981) that once characterized it became compositional norms, thus undermining its special status. Improvisation did

not however disappear altogether but became restricted to domains like organ playing, often in the 'strict, fugal' style described by Czerny and contemporaries. Thus pursued, its purpose was chiefly academic, although Bruckner's exceptional organ improvisations in concerts in Paris (1869) and London (1871) thrilled audiences.

Though dominated by the solo piano and, later, the organ, 19th-century improvisation was also practised by violin-piano duos (e.g. Clement and Hummel, Reményi and Brahms) and other instrumentalists, while Beethoven and Wölfl, Mendelssohn and Moscheles, and Chopin and Liszt improvised publicly on two pianos.

[Improvisation, §II, 5: Western art music: The 19th century](#)

(ii) Vocal music.

Pedagogical sources of the Romantic period tend to concentrate more on technical and physiological matters than on questions of performing practice; but the increasing publication of vocal scores provides a rich surviving body of annotated performance material. By the end of the period a far more specific and illuminating type of evidence is available in the form of sound recordings. Among many informative vocal methods may be singled out those of Lablache (for its brief, intelligent overview of ornamental practices), Duprez (for the new dramatic style and cadenzas), Garcia (the most comprehensive), Faure (valuable for the distinction between French and Italian practices) and Delle Sedie. Sieber, Lemaire and Lavoix, and Bach provided valuable stylistic information with emphasis on practices in their respective countries. There also survive, published and in manuscript, arias 'realized' or annotated by Rossini and Donizetti and by (or after) many of the leading singers of the time, as well as isolated ornaments by Verdi and various singers. Additional clues may be obtained from instrumental adaptations or fantasias.

In orchestrally accompanied recitative, cantabile, arioso elements and ornamental vocalization continued to be important; composers increasingly wrote the ornaments into the score. [Ex.25](#) shows part of Tancredi's opening recitative, as scored and then as realized by Rossini for a singer. Examination of this, along with recitative realizations by Rubini, Garcia and others, shows that the greater floridity and greater variety of note values observed in Verdi's recitatives reflect an increase not so much in elaborateness of recitative style as in the specificity of notating it – indeed, the elaboration of execution probably decreased somewhat, in contrast to the notational practice.

The 'aria cantabile' continued to be the principal locus for melodic embellishment. Garcia, who is more explicit even than Domenico Corri,

gives details of phrasing, dynamics and expression as well; [ex.26](#) shows a section from one of his examples. A decrease in density of figuration across the first half of the century is easy to discern; extending the examples backwards to, say, Catalani, at the beginning of the century, and forward to the artists heard on early recordings, would show this to be a steady, continuous process.

The cabaletta, the fast final section of the aria from the time of Rossini until the dissolution of standard aria structures into the more flexible forms of the mature Verdi, consisted of a strophe, a ritornello, an exact repeat (occasionally abbreviated) and a coda whose length and complexity varied considerably. Rossini wrote to Clara Novello that 'The repeat is made expressly that each singer may vary it, so as best to display his or her peculiar capacities'. The transitional passage from the slow section (sometimes in recitative) often concluded with a vocal flourish, which could recur between the strophes. These flourishes most often expressed a simple, unresolved dominant 7th. Surviving examples include variants by Pauline Viardot (for a pupil) for the lead-in to 'Sempre libera' (*La traviata*) and one in the role-book for Azucena used to launch 'Deh! rallentate, o barbari' in the French version of *Il trovatore* in Paris (1857).

Ornamentation in the cabaletta itself is of three kinds: elaboration of fermatas, most often at the end of each strophe or during the coda; variation of the basic stanza on repetition; and elaboration of the coda's stock cadential sequences, whose similarity from piece to piece facilitated free improvisation. In contrast to the usual gracings of cantabile, cabaletta repeats took the form of genuine variations, freely altering the melodic

shape at times. Orchestral doublings of the melodic line were often removed to facilitate ornamentation, as can be seen from numerous sets of 19th-century parts. Many examples of cabaletta variation (by Jenny Lind, Giuditta Pasta and others) survive; Rossini's for several of his own cabalettas, and one each by Bellini and Nicolini, were published (with imperfect but decent fidelity) by Ricci.

In Rossini, Bellini and Donizetti, the coda is based on the same chord sequence observed at the end of the cantabile, but in tempo and usually with accelerating harmonic rhythm ([ex.27](#)); this portion was elaborately and freely varied. Garcia, Lanza and others give tables showing the multiple possibilities, and examples by Rossini and many singers exist. Cabalettas continued to be embellished in early Verdi (Giulia Grisi's variations for *I due Foscari* survive in Rome). By the time he stopped writing them – his last orthodox solo cabaletta is in the 1863 version of *La forza del destino* – the repeat was commonly omitted in performance. It seems likely that cabalettas were ornamented only as long as they were repeated.

Up to, and probably throughout, Rossini's time, the end of the coda seems to have been taken without *rallentando* and with a burst of florid virtuosity, often concluded in the low register. But as the excitement of the held top note gradually assumed a greater role in vocal expression, it became customary to add one just before the final note of the cabaletta while the orchestra pauses or sustains. This is sometimes found in Verdi's scores, and occasionally earlier, although it became a universal practice only later. Increasingly, towards the end of the century, much or all of the coda was omitted; the singer proceeded from the final fermata of the strophe directly to the last few bars of coda or to the postlude. The conclusions in ex.27 clearly envisage an ending in tempo. Ex.28 shows two more cabaletta conclusions: one by Naldi, clearly ending in tempo, and one by Viardot from about 1880, showing a hold before the final note, now taken in the high register. Many sets of cabaletta variants break off at this point, suggesting a conclusion more or less as in the score or with conventionalized elaboration, and many sources that are specific about

accompaniment practice (above all Garcia) show the conclusions of their cabalettas with no hint that the tempo was to be retarded.

It is clear from Rossini's revisions of his Italian music for Paris that the norm there was less florid than in Italy (despite the fact that the Paris operas were still liberally embellished, as we know from Cinti-Damoreau and numerous other sources). The strong penetration of the Italian repertory in the 1840s and 50s by translated versions of Meyerbeer and Auber (to be followed by Gounod, Thomas and Massenet) led the way towards a simpler style of impassioned lyricism in Italian singing. Nevertheless, it was the French who maintained the old Italian skills of florid singing rigorously to the end of the century, while their Italian contemporaries had long simplified Rossini's *Otello* and were beginning to do the same to the less demanding *Barbiere*. In Germany and eastern Europe, a tension between the dominance of Italians and emerging native styles was felt throughout the century, with the Italians essentially ranged on the side of more freedom for the soloist. By the middle of the century in Germany, and by its end throughout Europe, schools of singers had emerged as specialists in national repertory (eventually in Wagner).

Recordings provide valuable evidence on ornamentation. The first opera singer known to have made a surviving record is Peter Schram (1819–95), who in 1889 sang two excerpts from the role of Leporello into a cylinder machine; although it provides interesting testimony to the transmission of Classical music, the record has little bearing on the performance of Romantic music. Seven singers born in the 1830s, and 24 born in the 1840s, also recorded, as did several dozen born in the 1850s and 60s. This body of evidence brings the priceless opportunity to observe many aspects of vocal technique. Ornamentation was still practised, mostly by Italian singers but also by foreigners who made their careers in Italy or who became part of the budding 'international' scene in New York and London, and by some of the more old-fashioned artists based in France and Germany.

The ornaments are simpler and fewer than those in use earlier in the century. Most were staples of ornamental practice going back at least to the Classical period: *gruppetti* of four or six notes, *acciaccaturas*, two-note slides, and the accented reiteration of the antepenultimate note of a cadence that Garcia traces back to the castratos and that was popularized by Rubini. These ornaments were all started on the main note, even the *acciaccatura*: though notated with a single 'small note' above the main note, it was uniformly executed as what we would now call an inverted mordent (unless approached by step from below, in which case it was sometimes sung in the 'modern' one-note fashion). The only prominent ornament not found in earlier sources, and that seems to have developed in the second half of the century, is the extended *acciaccatura* figure (ex.27c); this was widely used in Verdi. French singers – less often Germans, almost never Italians – still introduced trills and executed the written ones with great clarity and elegant resolutions.

In early recordings, the preoccupation with interpolated high notes had not reached its peak; singers with good high notes often added them, but many recordings of favourite arias lack the familiar extra high notes. These, like the 'standard' *coloratura* variations of 'Una voce poco fa' and the *Lucia* Mad Scene, are mostly products of the earlier part of the 20th century, when Italian conductors and coaches set about the task of establishing

more or less fixed texts for surviving Italian operas from the period of improvisation.

[Improvisation, §II: Western art music.](#)

6. The 20th century.

In addition to the continuing traditions of improvisation associated with functional music (e.g. social dance, organ playing in church), the early 20th century added a new kind, that of extempore piano accompaniment to silent films. But of course the richest new manifestation of improvised music was jazz. This had an influence on almost every composer from Debussy onwards, but not as improvisation. The first half of the 20th century was, on the contrary, a time of great emotional exactitude, except in the music of a very few composers, including Ives and Grainger, and even in their scores the performer's freedom is limited to such matters as choice from among different versions, or how to achieve a compromise with idealistic demands. Composers' performances of their own music (the recordings made by Stravinsky and Bartók, for example) reveal how much liberty could be taken in practice with music that looks, on paper, to be complete and precise in its requirements, but such liberty did not extend to improvisation. Where the term was used in a title (e.g. that of Bartók's *Improvisation on Hungarian Peasant Songs*, 1920), it was to denote an impromptu style in music fully written out.

The lapsing of improvisation is understandable in a musical culture that was rapidly losing those elements of common practice on which improvisation depends: the idea of extemporizing cadenzas to, for example, Schoenberg's Violin Concerto is almost unthinkable. However, composers who abandoned traditional culture in order to make up their own ways of doing things (e.g. Partch and Cage) found themselves bound to improvise, and sometimes let their performers do so too – although Cage consistently resisted this, and preferred to have his musicians follow exacting rules if not scores. Improvisation, as a spontaneous expression of intention, was just what he wanted to avoid.

Nevertheless, his influence may have contributed to the re-emergence of improvisation in composed music during the 1960s – along with other factors including the growth of live electronic music (and hence of unpredictable situations), the development of jazz to a point where it could embrace almost everything in the contemporary classical tradition (so that the definition of a performance as 'free jazz' or, from the classical standpoint, 'free improvisation' became arbitrary), the arrival of performers who wanted to go their own ways, composers' growing knowledge of non-European music, their extension of [Aleatory](#) procedures, and a general movement in Western culture towards democratization and universal self-expression. Yet that movement did not extend so far, or for so long. Improvisation was rapidly reaffirmed as secondary to composition, in that improvising artists (except those also known as composers, such as Vinko Globokar, La Monte Young or Terry Riley) gained no broad platform, and composers (Stockhausen, for example) soon retracted the freedom they had permitted. Once the 1960s had passed, the old division between creative and performing musicians was restored.

In the performance of older music, however, that division came increasingly under attack, as musicians pressed forward their efforts at period style. Any attempt to perform, for example, troubadour song demands some contribution from the singer, although this is more likely to be prepared in advance rather than truly improvised. The same is true of ornaments and cadenzas, which gradually, though not everywhere, came to be expected in the performance of 18th-century music. However, some musicians (such as the keyboard player Robert Levin) began in the 1980s to emulate their colleagues of two centuries' distance in improvising cadenzas and fantasias on the spot. The revival of silent-film accompaniment at the same time might suggest an acceptance, by the musical culture, of improvisation as a reawakened historical phenomenon.

5. Intangible elements.

BIBLIOGRAPHY

Improvisation, §III: Jazz.

1. Introduction.

Improvisation is generally regarded as the principal element of jazz since it offers the possibilities of spontaneity, surprise, experiment and discovery, without which most jazz would be devoid of interest. Almost all styles of jazz leave some room for improvisation – whether a single chorus or other short passage during which a soloist may improvise over an accompaniment, a sequence of choruses for different soloists, or the entire piece after the statement of a theme – and some jazz is spontaneously created without the use of a predetermined framework (see §3 below). Improvisation is the defining characteristic of much of New Orleans jazz and its related styles, some big-band music, nearly all small-group swing, most bop, modal jazz, free jazz and some jazz-rock.

It is, however, demonstrably untrue that all jazz must involve improvisation. Many pieces that are unquestionably classifiable as jazz are entirely composed before a performance, and take the form of an arrangement, either fixed in notation or thoroughly memorized by the players; this approach to jazz is characteristic of much music for big band, notably that of Duke Ellington, extended works that combine elements of jazz and Western art music (see [Progressive jazz](#) and [Third stream](#)), and much jazz-rock.

Since improvisation is by nature evanescent, its study poses certain obvious difficulties. The principal medium for the preservation of jazz is the recording, and most of the observations made about jazz improvisation result from repeated listening to recorded performances. In many cases, however, scholars and musicians have made transcriptions from recordings in order the better to be able to examine or reproduce jazz works.

[Improvisation, §III: Jazz.](#)

2. Solo and collective improvisation.

The element of improvisation in jazz is sometimes described in terms of the relationship between the members of the ensemble. Generally speaking, attention is concentrated on individual musicians, who, in the succession of choruses (statements of and variations on a theme) that make up the most common form of jazz performance, play (or 'take') solos; a solo normally consists of a single chorus or a continuous succession of choruses during which the player improvises on the harmonies (maybe also to a greater or lesser degree the melody) of the theme, while some or all of the other musicians provide an accompaniment. The terms 'solo', 'to play a solo', and 'soloist' are therefore often used as synonyms for 'improvisation', 'to improvise', and 'improviser'. This conflation of meanings can, however, be misleading: not all solos are improvised and not all improvisations are played by soloists. For example, the accompaniment played by some or all of the ensemble while a soloist improvises may itself to some extent be improvised: in jazz that contains no element of written arrangement the musicians are restricted, if at all, only by the fixed chord sequence and metric structure of the theme, and each may elaborate the harmonies and rhythms at will, as is appropriate to each performer's role within the ensemble. In such a context it is the nature of the improvisation – the freedom of invention, virtuosity and ornamental elaboration allowed by the player's function – and not the mere fact of improvising that distinguishes the soloist from the accompanists.

The degree to which an accompaniment is improvised increases as the framework on which a piece is based becomes less and less rigidly fixed. In a performance by a big band, for example, the accompanists often play from written arrangements and only the soloist is free to improvise; in a bop quartet, playing without music but working on an existing theme, the members of the ensemble have considerable freedom in the choice of harmonies and rhythms; in modal jazz the confines are those of a scale or a general tonal area; in free jazz the restrictions are fewer still, the style being characterized chiefly by the lack of fixed elements such as tonality, chord sequences and metre.

The use of the term 'collective improvisation' is related to the concepts of soloist and accompanists. Where these functions are sharply differentiated the term is not normally used, even though all or most of the players may be improvising more or less freely. It is commonly applied in contexts where some or all members of a group participate in simultaneous improvisation of equal or comparable 'weight', for example New Orleans jazz (in which it is used chiefly of reeds and brass) and its related styles,

and free jazz; it does not preclude the presence of a soloist but it implies a degree of equality between all the players in the ensemble.

[Improvisation, §III: Jazz.](#)

3. Improvisation and form.

The interaction of fixed and free elements in jazz may be examined not only in terms of the functions of different players but also in terms of structures or forms. Almost all jazz consists of a combination of predetermined and improvised elements, though the proportion of one to the other differs markedly.

In all periods of jazz history there may be found examples of pieces in which improvisation is allowed only a minor role; commonly a soloist improvises a brief interlude or a single chorus in an otherwise rigidly fixed context. The majority of instances are found among performances by those big bands of the swing era that had few or no distinguished improvisers and which therefore favoured a repertory of written arrangements; the improvisations allowed in these scores are short passages, which are not the main attraction of the performance. For example, in the second chorus of Charlie Barnet's *Cherokee* (1939, Bb 10373) the pianist Bill Miller improvises softly beneath the ensemble, but the only principal soloist in the piece is Barnet himself, playing tenor saxophone. After presenting, in the first chorus, a slightly ornamented version of the first half of the 64-bar theme in *AABA* form, he improvises during the second a section of the second chorus a rhythmically stiff melody, which consists of a simple blues riff, slightly altered in the repetitions, a quotation of the military call 'reveille' and a variation on it, and a brief variation on a riff familiar from Count Basie's *One o'Clock Jump*. Barnet's improvisation here is much less interesting than the complex melody composed by Billy May for the trumpet section at the end of the first chorus of the piece, which has more of the character of an improvised swing melody; nor does it rival the main attraction of the performance – the delicate riffs traded among sections of the band. The reason why Barnet takes a solo is partly because he is the bandleader but more importantly because, as a result of Coleman Hawkins's overwhelming influence, big bands of the swing era mostly included an improvising tenor saxophone soloist who imitated Hawkins's sound (as Barnet did).

By far the majority of pieces of jazz involve variations on an existing theme, such as a popular song, the blues progression or a newly composed piece. Two statements of the theme in a more or less fixed form customarily frame a series of variations, several or all of which involve improvisation by a soloist or soloists over an accompaniment supplied by the ensemble. The freedom with which the theme is treated varies from piece to piece and according to the style of the players; indeed, the main reason for the popularity of this form is that it offers so adaptable a scheme within which improvisatory skills can be explored.

The fertility of invention of the greatest improvisers may be gauged by the variety of possibilities they find in a single theme chosen again and again as the basis for a performance. For example, the popular song *What is this thing called love?*, a 32-bar theme in *AABA* form, has served as the basis for numerous improvisations by distinguished players. A version for solo

piano by James P. Johnson (1930, Bruns. 4712) in the stride style includes sharp contrasts between thundering bass notes and tinkling treble melodies, and incorporates passages of boogie-woogie playing. Norman Granz's *Jam Session no.2* (1952, Clef 4002) presents a performance that consists of an informal succession of 26 choruses of individual swing and bop improvisations by Oscar Peterson, Flip Phillips, Charlie Shavers, Johnny Hodges, Barney Kessel, Benny Carter, Ben Webster, Charlie Parker, Peterson again, and Ray Brown, followed by three choruses during which the soloists 'trade fours' (take turns at playing four-bar solo phrases). The rendering by the trio of Bill Evans on the album *Portrait in Jazz* (1959, Riv. 1162) is devoted primarily to Evans's bop piano playing, but also includes improvisations by the double bass player Scott LaFaro (one and a half choruses) and the drummer Paul Motian (half a chorus). A lengthy, radically altered version, retitled *What Love*, on the album *Charles Mingus Presents Charles Mingus* (1960, Candid 9005) includes improvisations by Ted Curson and Eric Dolphy (who both combine characteristics of bop and free-jazz playing), an unaccompanied solo by Mingus, and a hilarious improvised 'conversation' between Mingus's double bass and Dolphy's bass clarinet. A much later performance is recorded by the singer Bobby McFerrin accompanied on piano by Herbie Hancock on the album *The Other Side of Round Midnight* (1985, BN 85135).

The completely spontaneous creation of new forms by means of free improvisation, independent of an existing framework, is rarer in jazz than might be expected, not least because where two or more musicians play together, no matter how intimately they know one another's work, some agreed decisions about the progress of a piece are normally necessary. Free jazz often gives the impression that musicians follow their inspiration and invention, reacting to and interacting with one another from moment to moment; but, as Eberhard Jost has demonstrated by means of detailed analyses of recordings, free-jazz performances may be as dependent on themes as other styles of jazz, though the themes and the way they are treated are often of unusual character. Even where no theme is used, certain prearranged schemes, such as the sequence in which soloists should play and the signals by which players will communicate decisions, are usually followed.

Two of Jost's analyses provide good examples of the kinds of formal determinant present in free-jazz performances. In discussing Cecil Taylor's difficult and largely spontaneously created piece *Unit Structures* on the album of the same name (1966, BN 84237) Jost supplies a running commentary, detailing textural contrasts, delineating whenever possible the roles of the instruments (e.g. 'one double bass player plays pizzicato in the low register, the other arco in the high register'), transcribing brief themes and motifs, and noting the 'soloists' who in turn come to the fore during the collective improvisation that is central to the piece. On the two takes of John Coltrane's *Ascension* (1965, both issued, at different times, as Imp. 95) Jost identifies the succession of soloists whose improvisations alternate with passages of collective improvisation; he describes several recurring modal areas, which provide a loose underpinning for each solo, and exposes Coltrane's technique of holding pitches to signal a movement from one modal area to another. Such factors do not compromise the extraordinary originality and creativity of free-jazz performances; rather

they call attention to the necessary limits of spontaneity. An entirely spontaneous improvisation might well be incoherent.

[Improvisation, §III: Jazz.](#)

4. Techniques and procedures.

Although no two jazz improvisations ever evolve in exactly the same way, certain techniques and procedures may be identified as common or even standard. For the purposes of description they may be regarded as falling roughly into three categories, though in practice a player may use several or even all in the course of a single improvisation, often overlaying one with another. Paraphrase improvisation is the ornamental variation of a theme or some part of it, which remains recognizable. Formulaic improvisation is the building of new material from a diverse body of fragmentary ideas. And motivic improvisation is the building of new material through the development of a single fragmentary idea. The last two types may be developed either in response to or independently of a theme.

(i) Paraphrase improvisation.

This may be melodic or harmonic. Melodic paraphrase is a crucial procedure in jazz. It is heard in any piece based on a tuneful theme, especially in early jazz, swing, jazz-rock and performances in any style based on ballads, but regularly in other contexts as well. The paraphrasing of the melody may be no more complex than the introduction of a few ornamental flourishes into an otherwise faithful repetition of the original tune, but at its most inventive it may involve a highly imaginative reworking of the melody, which remains recognizable only by its outline or the preservation of certain distinctive turns of phrase or figure. The underlying harmonic structure, which in jazz is the element that chiefly identifies a theme, remains essentially unchanged, though that too may be subjected to local alteration and embellishment. This may be termed harmonic paraphrase, the ornamentation of the harmony of the theme or some part of it. The chord progressions of American popular songs are not immutably fixed: the copyrighted version of a song is usually simplified, and versions transcribed in fake books (collections of scores used by performers: some are published and distributed 'informally' and illegally break restrictions on copyrighted material) normally disagree in numerous cases about the identity of individual chords.

(ii) Use of motifs and formulae.

Where paraphrase improvisation is not used, attention is commonly focussed on musical fragments used in various ways. The fragments may be called variously and often interchangeably 'ideas', 'figures', 'gestures', 'formulae', 'motifs', and so on; in jazz parlance they are often referred to as 'licks' and in early jazz specifically as 'hot licks'. Substantial differences of technique and procedure lie not in the structure or character of the fragments as they stand alone but rather in the ways in which they are combined and manipulated in improvisation. For the sake of clarity the word 'motif' is used here in the discussion of motivic improvisation, and 'formula' in the discussion of formulaic improvisation.

The fragmentary ideas used in jazz are usually distinguished by rhythmic and intervallic shape and can seldom be described as melodic in the tuneful sense, though they provide the material on which most of the players in the ensemble improvise; their tempo, outline, tonal implications and so on are determined by stylistic conventions, so that an idea used in free jazz will be different in nature from one used in jazz-rock. The introduction of a new fragment or new stages in its development occur in response to a particular context (a certain tempo or key change, for example), determined by the players in advance or enshrined in the conventions of the style. In some types of jazz in which the form of the piece is built up from fragments, most notably jazz-rock, a foundation is often supplied by an ostinato, a short phrase strongly stating (on chordal instruments) or implying (on melodic ones) a sequence of harmonies, which is repeated virtually unchanged by the bass instrument.

(iii) Formulaic improvisation.

The principal manifestation of the fragmentary idea in jazz is in formulaic improvisation. This is the most common kind of improvisation in jazz, spanning all styles. In formulaic improvisation (a concept borrowed from studies of epic poetry and Western ecclesiastical chant) many diverse formulae intertwine and combine within continuous lines; particular musicians and groups often create a repertory of formulae (their 'licks') and draw on it in many different pieces. The essence of formulaic improvisation is that the formulae used do not call attention to themselves, but are artfully hidden, through variation, in the improvised lines; the challenge presented by this type of improvisation is to mould diverse fragments into a coherent whole.

Formulaic improvisation may be based on a theme, the rhythmic and harmonic structure of which remains inviolate in terms of metre, phrase lengths, tonal relationships and principal harmonic goals. But the way in which the theme is treated is altogether freer than melodic paraphrase; the harmonies are often considerably varied, by the use of altered and substituted chords and extended harmonies, while above the repetitions of the harmonic structure new lines are improvised.

The greatest formulaic improviser in jazz was undoubtedly Charlie Parker. Owens has identified a central repertory of about 100 fragments which Parker works and reworks with astonishing facility. In a piece such as *Koko* (1945, Savoy 597), based on the theme *Cherokee*, a surprising amount of formulaic material recurs within the brief solo; given the great speed at which the solo proceeds and the artful way in which Parker re-uses material the repetitions are hardly noticeable.

Where formulaic improvisation is not linked to a theme it may be founded on the imitation of established performers, on the collective invention of members of a group working together, or on the individual's own explorations. The procedure may be detected in music as difficult as Albert Ayler's free-jazz improvisations from 1964, in which recurring formulae – leaps over wide intervals, rapid, unmeasured, sweeping lines of undistinguished pitches, freely placed, vocalistic exclamations in extreme high or low registers – provide a basis for improvised lines. By comparison with the types of formula that are normally played in response to a familiar

theme, such gestures as Ayler's may seem highly distinctive and hardly in accord with the idea that the essence of formulaic improvisation is to disguise the presence of the formulae: however, in the context of a free-jazz performance such sounds are characteristic rather than distinctive, and the formulae are both difficult to hear precisely and sometimes impossible to transcribe. Hence in formulaic improvisation, regardless of the style, sustained accomplishment may be measured in terms of the improviser's ability to avoid turning formulae into clichés.

(iv) Motivic improvisation.

In motivic improvisation one or more motifs (but never more than a few) form the basis for a section of a piece, an entire piece, or a group of related pieces. The motif is developed or varied through such processes as ornamentation, transposition, rhythmic displacement, diminution, augmentation and inversion. Unlike those used in formulaic improvisation, musical ideas in this type of improvisation call attention to themselves by the way in which they are treated, and indeed they must be recognized and followed through a piece or section if the music is to be properly appreciated; the difficulty here lies not in disguising the motif but in avoiding both trivial restatement and variations that effectively obscure its character. The most commonly occurring form of motivic improvisation is that in which a single motif forms the basis of a piece or section, but sometimes two or three motifs are used simultaneously, and elsewhere one motif follows another by a process of chain reaction, each being varied until it is transformed into the next. Fine examples occur in Coltrane's solo on *So What* from Miles Davis's album *Kind of Blue* (1959, Col. CL1355) and on the title track (1961) of Coltrane's album *Impressions* (1961–3, Imp. 42).

In some pieces motivic procedures are applied not to freely invented material but to a motif or series of motifs drawn from a theme stated at the outset; this subcategory of motivic improvisation may be termed thematic improvisation, though the derivation of a motif from the theme is generally incidental and merely convenient rather than structurally significant. Thematic improvisation is regularly mentioned in jazz literature in connection with the music of Sonny Rollins, but it has scarcely any meaning for Rollins's work (for further discussion see [Rollins, Sonny](#)). It is a more appropriate concept in some free jazz, where musicians develop fragments of thematic material in ways that cannot be construed as melodic paraphrase. Examples include Albert Ayler's deconstruction of the theme in early versions of *Ghosts* recorded in 1964 (on the albums *Spiritual Unity*, ESP 1002, and *Ghosts*, Debut 144) and Don Cherry's and Gato Barbieri's improvisations on Cherry's album *Complete Communion* (1965, BN 84226).

Before the late 1950s, motivic improvisation occurred in jazz far less often than either paraphrase or formulaic improvisation. The reasons are clear: until that time a jazz improvisation was expected to accord with an underlying theme; the given theme usually involves a functional progression, which moves at the rate of one, two or four chords per bar; the improvisation itself often moves along quickly. Given these conditions it is extremely difficult to develop a motif systematically without stumbling.

Hence among the greatest improvisers in early, swing and bop styles, perhaps only three players consistently utilized motivic techniques: Benny Carter, Count Basie and Thelonious Monk (see *also* [Lewis, John](#)).

From the late 1950s new styles have provided a more suitable framework within which motivic improvisation can occur, and it has become more regularly used, rivalling paraphrase and formulaic improvisation in importance. On the one hand free jazz has discarded the characteristic themes of previous styles in favour of ad hoc structures, and, on the other, modal jazz, jazz-rock and other fusions of jazz and popular music have discarded them in favour of simple drones or ostinatos. In all cases improvisers, freed from the need to follow a fast-moving chord progression, have been able to give greater attention to motivic improvisation. Furthermore the repetition and development of motifs provides an element of coherence and stability, which in a sense fill the same role as a conventional theme.

(v) Interrelated techniques.

The ways in which the different procedures of improvisation are combined can be complex and constantly changing. Different members of an ensemble may simultaneously employ several improvisatory techniques, or a keyboard player may employ one in the right hand and another in the left (as Wilson does). In a bop quartet's performance of a popular song, for example, the saxophonist might paraphrase the theme and then invent a new, fast-moving formulaic melody, while the pianist maintains the harmonic structure, though with his own local variations, the double bass player creates a formulaic walking bass line from the given harmony, moving in crotchets, from chordal root to chordal root, and the drummer plays strings of rhythmic patterns, including variations on swinging cymbal rhythms and irregularly placed bass-drum beats (or bombs). At a higher level an improvisation that was originally generated by motivic or formulaic procedures may be adopted as a pre-existing theme and subjected to melodic paraphrase in its turn; such an approach is characteristic of Louis Armstrong (see §5(ii) below) and of Miles Davis's blues playing.

(vi) Modal improvisation.

Performances may also be analysed in terms that cut across the categories already drawn and which may employ variously the techniques of paraphrase, formulaic or motivic improvisation. For example, an improvisation may be described in terms of pitch – not so much how the pitches are put together as what pitches are selected – and indeed much of the conceptual discussion of improvisation in the realm of jazz education has been directed towards this issue. The use of tonal or atonal vocabulary, though it deeply affects the character of the music, has no bearing on the improvisatory techniques used, each of which applies to all or many styles of jazz. However, in one important case, improvisation based on modal scales, the controlled, systematic approach to pitch selection gives the music a sufficiently distinct identity to warrant separate discussion.

The defining characteristic of modal improvisation is that it explores the melodic and harmonic possibilities of a collection of pitches, often

corresponding to one of the ecclesiastical modes or to a non-diatonic scale from traditional or non-Western music. The mode is expressed harmonically through drones or through two or more chords that oscillate beneath melodic lines using the same pitches; a typical feature of modal improvisation is therefore harmonic stasis and consequently an absence of incident and progression in the short term. Modal improvisation is not conterminous with **Modal jazz**, a style in which improvisers regularly select pitches in a loose, perhaps free, perhaps chromatically complex relation to underlying modes. It is much more likely to be found in jazz-rock and other fusions, which not only involve a simple, static harmonic underpinning, but in which the soloist is expected to improvise in close accord with such an underpinning.

A fine example of modal improvisation is in *Gardens of Babylon*, from Jean-Luc Ponty's album *Imaginary Voyage* (1976, Atl. 19136). Ponty plays for the most part within a six-note scale (F \flat -G \flat -A-B-C \flat -E); his occasional use of D and its recurrence as an element in the ostinato bass line identify the mode as Aeolian on F \flat . It should not be presumed that such a single-minded procedure as modal improvisation necessarily yields an uninteresting result. In this example Ponty enriches the limited collection of pitches with an abundance of blue notes, bends and glissandos; he achieves these effects not only by exploiting the possibilities for pitch variation inherent in the violin but also by using a wah-wah pedal.

[Improvisation, §III: Jazz.](#)

5. Intangible elements.

(i) Extra-musical meaning.

As with any form of music, the extent to which jazz performers succeed in communicating ideas or images through their music depends not only on their own approach but also on that of the listener. Indeed, the listener may make his or her own subjective interpretations of the music, whether representational or abstract, which the player would entirely repudiate. A straightforward extra-musical meaning, of course, attaches to pieces that have lyrics; purely instrumental improvisation may form part of this connection, especially where the singer engages in an exchange with an improvising player (as in the call-and-response passages of pieces in which Billie Holiday is accompanied by Lester Young, the two having an extraordinary rapport and quickness of reaction to each other's music). A similar conversational impression, often with humorous overtones, is created by the dialogues between the double bass player Charles Mingus and the bass clarinetist Eric Dolphy (see §3 above), the unison singing and double bass playing in improvisations by Slam Stewart, and the hilarious mumbling discussions with himself that colour Clark Terry's playing. Soul-jazz musicians may convey the effect of black gospel preaching, seeming to translate the preacher's typical formulaic phrases into formulaic melody. The instrumental howls and exclamatory noises of free-jazz players have been interpreted by some as protests against racism in the USA, but for the most part such interpretations of improvisation are of little importance except to those who feel the need to make them.

(ii) Risk and repetition.

The essence of improvisation in jazz is the delicate balance between spontaneous invention, carrying with it both the danger of loss of control and the opportunity for creativity of a high order, and reference to the familiar, without which, paradoxically, creativity cannot be truly valued. Improvisation allows a musician to experiment and, in the process of exploring timbres and techniques, to redefine conventional standards of virtuosity. Musicians learn to transform accidents, instantaneously adjusting the direction of a line to accommodate an unintended, but perhaps refreshing, 'mistake'. The element of risk in improvisation is the source of great vitality in jazz, but many improvisers do not take risks constantly. Repetition may permeate not only general improvisatory procedures to a greater or lesser degree but also specific solos, which from performance to performance may change only gradually if at all.

Widely recognized as the two greatest jazz improvisers, Charlie Parker and Louis Armstrong best illustrate the extremes of risk and repetition. Parker never repeated an entire solo, and successive performances based on the same tune are sometimes startlingly different (as, for example, in the two takes of *Embraceable you*, recorded on 28 October 1947 and issued on Dial 1024). By contrast, Armstrong, once having arrived at a successful approach, might repeat the contour and many details of a solo in different performances (as on two recordings of the same tune made on 13 and 14 May 1927 and released as *S.O.L. Blues*, Col. 35661, and *Gully Low Blues*, OK 8474). In inventing his ideas Armstrong was no less creative or original an improviser than Parker; moreover, his well-rehearsed reiterations of many of his solos convey, if not surprise, at least all other qualities of great improvisation.

Impulse.

American record company. It was established in New York in 1960 as a subsidiary of ABC-Paramount and began issues in 1961 with a recording by the jazz trombonists Kai Winding and J.J. Johnson. It rapidly became the most important jazz label of its time, recording the work of John Coltrane, Archie Shepp and Cecil Taylor, and it also built up a valuable catalogue of bop and mainstream jazz by Gil Evans, Coleman Hawkins, Art Blakey, Benny Carter, Max Roach, Duke Ellington and others. Over 100 albums were released in five years.

During his final years Coltrane made studio recordings exclusively for Impulse; with his death in 1967 the company lost its most important and successful musician, and from that time its fortunes declined. It remained active into the 1970s and issued posthumously much of Coltrane's unreleased material, but otherwise the catalogue grew more commercially orientated and gradually lost impetus. In the 1980s Impulse reissued much of its early material and some then appeared on other labels as well as under the Impulse name.

In alt

(from It. *in alto*: 'high').

A term often found in vocal music to denote those notes that lie above the highest line of the treble staff and within the compass *g*" to *f*". The notes of the octave above this are said to be *in altissimo*. See [Pitch nomenclature](#).

Inbal, Eliahu

(*b* Jerusalem, 16 Feb 1936). Israeli conductor, of Israeli and British citizenship. After studying the violin at the Jerusalem Conservatory, he took part in Celibidache's conducting classes in Hilversum and studied conducting at the Paris Conservatoire, winning the 1963 Guido Cantelli

conducting prize at Novara. After working chiefly in Italy, he made his British début in 1965 with the LPO and subsequently conducted other British orchestras, creating a strong impression in the standard repertory. In 1969 Inbal made his opera début with *Elektra* at Bologna; this was followed by *Don Carlos* at Verona the same year. In Siena (1971) he conducted the first performance since 1803 of Cherubini's *Anacréon* with the original French text. He was chief conductor of the Frankfurt RSO (1974–90) and chief conductor at the Teatro La Fenice, Venice, from 1986 to 1989. Among the premières Inbal has given are Xavier Benguerel's Percussion Concerto (1977), Allende-Blin's edition of Debussy's unfinished *La chute de la maison Usher* (1977) and Isang Yun's first Violin Concerto (1982). His recordings include Donizetti's *Maria de Rudenz* with La Fenice, the complete orchestral works of Berlioz, Ravel, Skryabin and Schumann, and the complete symphonies of Bruckner, Mahler and Shostakovich. He received the French Ordre des Arts et des Lettres in 1990, and in 1996 was named conductor laureate of the Frankfurt RSO and honorary conductor of the Orchestra Nazionale della RAI.

Inca music

1. Introduction.

The Inca *Tahuantinsuyo* ('Empire' or 'state') was the peak of a long process of development, starting with the first migrants, who arrived in the Andes approximately 15,000 years ago, culminating in the Zapac Inca, who shaped and extended the *Tahuantinsuyo* in the years 1450–1535. The empire reached its maximum size under the Inca Huyna Capac (1493–1527). When the Spaniards arrived, the Tahuantinsuyo extended in length from the extreme south of Colombia as far as the River Maule in Chile and in breadth from the Pacific Ocean to the high ground of the Amazon.

The Inca capital was Cusco, a city of magnificent architecture built with enormous polished stones set with precious metals. Only some stone remains can be seen today. Other splendours have survived only in the descriptions of chroniclers. Little is known of musical instruments made of precious metals as they fell victim to the invaders' insatiable greed to possess the Incas' dazzling riches of silver and gold. Objects made of precious metals, including musical instruments, were melted down into exportable ingots. Later, when the Viceroyalty of Peru was established, the Spaniards also destroyed instruments made of organic materials, because they were associated with Inca ceremonies, which were considered idolatrous rites and thus banned by both Catholic clergy and the colonial government.

Ceramic objects survive from between 2000 and 100 bce, including sound-producing instruments of fine quality that show individual stylistic traits

The cultures of that period include: Chorrera, Guangala, Bahía, Jama Coaque, Guayaquil, Tolita, Capulí, El Angel, Tuncahuán, all situated in what is now the country of Ecuador, and Tembladera, Jequetepeque, Guañape, Chavín, Paracas, Salinar, Vicús, Tablada de Lurín, Pukara in modern Peru.

Later cultures, between 100 and 600 ce, produced the highest achievements of ceramic instruments in terms of technique and construction. The greatest exponents were the Mochica and the Nasca (Peru), and, the Cuasmal, Manteño, Cosanga and Purhua (northern Andes and Ecuador). The Wari (600–1000 ce) were the first to attempt to create an empire in the central Andean region. From Ayacucho, they dominated an area extending from Cajamarca and Lambayeque to the north, and as far as Cusco and Arequipa to the south. Little is known about their instrument-making, but they did overpower the Mochica and Nasca in the course of their expansion.

By approximately 1000 ce Wari society had disintegrated, giving way to the Sicán, Chimú, Chincha and Chancay in Peru, and the Cuasmal, Manteño, Cosanga and Purhua in Ecuador. These peoples had not been dominated by the Wari and had therefore continued the development of their societies without the strong influence exercised by the Wari on those they conquered. In a similar way the Gentilar in Arica and Tarapacá in Chile, among others, were also outside the ambit of the Wari.

In 1450, after almost 100 years of large-scale aggression, the Incas came to dominate virtually all the peoples of the Andean region. They were thus able to choose the best instrument-makers; those who had inherited a long history of both knowledge of acoustics and techniques of construction.

The customs of the Incas and the peoples of the Tahuantinsuyo are known only through the accounts of the Spanish conquerors and the chronicles and documents which describe the period. Such writers had no knowledge of the lengthy history of Andean culture and as a result the information they provide is limited to the previous 100 or 150 years of Andean customs and heroic legend. Through their imperial position the Incas organized new social, political and economic structures and new means of productivity and technology, in what was to become the final stage of the Andean culture's long history. Yet at this moment of cultural evolution, the territory was destined to be invaded, leading to its destabilization and the destruction and loss of all that had been achieved over many thousands of years. A great deal of knowledge, including that related to instrument-making, was lost for ever.

An account by Cabello de Balboa explains one of the causes, as well as the tragedy, of this destruction, reporting how after Francisco Pizarro ordered his army to seize the gold from Cusco and Pachacamac, the Spaniards pillaged the palace, taking gold, silver, and everything else of value. Among those objects must have been drums and other musical instruments. Once the colony was established, not even burial places went unmolested. The ransacking for gold of burial places high up on the dry land of the Chíncha valley is related in chronicles. Other narrators reported on the customs, dances and instruments encountered.

[Inca music](#)

2. Musical instruments of the Tahuantinsuyo.

The Tahuantinsuyo consisted of many diverse peoples with their own particular musical instruments dominated by the Incas. From the chronicles it is known that *taqui*, which designated both dances and songs, were used to celebrate joyful as well as sad and mournful occasions, using musical instruments kept essentially for such dances and revels. Playing was spontaneous: whoever took up an instrument was considered as mastering it at the first lesson, 'there was little sweetness in the sound, and even less artistry' (Cobo, 1956 p.270). The most common instrument was the drum, called *huancar*, made in both large and small sizes from a hollow branch, each end covered with a llama skin, like a thin dry parchment. The largest drums were compared to European military drums, but considered to be even bigger in size, while the smaller ones were described as being 'like a little jar of preserves', and the middle-sized like a European tambourine. All were played with one stick, which on gala occasions was sometimes covered with different coloured wools, while the drums were painted and decorated. The drums were played by both men and women; some dances were accompanied by just one, while at others everyone carried a little drum, dancing and playing at the same time. Cobo also reports the use of a kind of Moorish tambourine, called *huancartinya*.

Cobo noted that while some instruments were similar to those found in Spain, others were unfamiliar, original to the Andean people. Thus we learn that the *pincollo* was like a fife; the *quenaquena* was like a reed, and was used to accompany dirges; the *quepa* was a small trumpet made from a large gourd; the *ayarachic* was a kind of *antara* (panpipes) used in dance;

the *zacapas*, bells made of seeds and attached to the toes; the *chanrara*, handbells made of copper and silver. The most common of all, according to Cobo, were called *churu*, made of large and various coloured sea shells.

Musical polyphony was a speciality of the Collas, achieved through the playing of instruments which were almost certainly *antara* (panpipes), combined together in a manner similar to that of present-day *sikuris* groups of the altiplano. Without naming the instrument, Garcilaso (1943) describes: There were four of these little reeds attached to each other, some different from others. One of them sounded the low notes, another the higher, and another even higher and higher, like the natural range of four voices: treble, tenor, alto and bass. When one Indian played a little reed, another replied in harmony.

Cobo (1956) describes a similar instrument, although not played as part of a group: Also, in their dances, they usually play an instrument made of approximately seven little flutes, placed like organ pipes, side by side, and unequal, the largest as big as the palm of a hand and the rest in descending order. They call this instrument *ayarachic*, and they play it placed on the lower lip, blowing into these little flutes to produce a muffled sound which is not very sweet.

Inca music

3. Huacas: the place of ritual and its musical instruments.

All Andean religious activities regularly took place at ceremonial places called *huacas*; here rituals were carried out that were considered idolatrous by Catholic clergy and therefore harshly persecuted. So-called 'extirpators of idolatry' zealously dedicated their lives to discovery of these rituals and the punishment of those who participated. Tireless campaigns were waged, with some extirpators leaving behind detailed descriptions of the places, the ritual events and their own methods and rules of punishment. Father Francisco Pablo de Arriaga gave detailed descriptions of ritual effects expressed his disapproval of various instruments which were not seized, including those used to summon people to the feasts of the *huacas* and to celebrate them. These included many very old copper or silver trumpets of a different shape and form from those of the Spaniards, large shells called *antara* or *pututu pincollo*, and flutes made of bone and of cane. He also reported heads and horns of *tarucas* (a kind of stag), calabashes, calabash drinking vessels and other *aquillas*, drinking vessels made of silver, wood and clay, of various shapes, used for the feasts of the *huacas*, as well as large numbers of tambourines used for revels (Arriaga, 1920).

The *runatinya*, a drum made of human skin (*runa* means man; *tinya* means drum), of which no physical or iconographical evidence has been found in earlier cultures, is known only through the description of certain chronicles. It appears that this was not in fact a drum to be played, but a hideous object that the Incas made out of the human skin of conquered chiefs and leaders in order to show their power and intimidate opponents. Vivid accounts exist: one from Cusco, written by Alonso de Meza, who took part in the conquest of the Andean territory, tells how the Incas made such drums by killing the person but leaving the head and arms intact, removing the bones from inside and filling them with ash; making a drum out of the belly; and placing the hands and head on the drum, so that when they blew

through them, 'the drums emitted sounds by themselves' (Meza, 1920 p.129).

An account from Montesinos tells how Sinchi Roca, after defeating the Señores of Andagüáylas, entered Cusco. He was preceded by songs of praise, trumpets and drums, followed by two thousand soldiers, with 'six drums shaped like men, made from the skins of the caciques and captains they had marked out in the battle. They skinned them alive, and when filled with air, they looked very like their owners, and they played on their stomachs with little drumsticks to show their contempt. Four thousand soldiers came marching along to these sounds. Behind them came many captured chiefs and captains, and they were followed by more soldiers, and then by six more drums like the first.' One captive, the Señor de Andagüáylas, was held naked on a platform surrounded by 'six drums made of the skins of his relations, and they made sounds come out of these drums' (Montesinos, 1930).

[Inca music](#)

4. Inca festivals and dance.

Andean peoples' practice was to celebrate daily activities, both regular and special, with music and dance. Grand dignitaries had at their disposal a variety of musical instruments, performers and dancers for different occasions. Guamán Poma describes feasts of the Capac Apo, or 'great señores' of the Tahuantinsuyo, which used various musical instruments for dance, including very large drums called *pomatinya* made of puma skin; *guayllaquepa* trumpets, made of shells; the *pototo*, made of calabash or 'lagenaria'; a flute called a *pingollo*; the *antara*, made of reed; and other wind instruments such as the *pipa*, *catauri*, *uaroro*, *kena-quena* and *chiuca*. Each instrument, particular to each 'ayllo' (extended family unit), was used at festivals of the Incas and at those of the chiefs of each region.

The Incas were extremely exuberant in their ceremonies and festivals. Santa Cruz Pachacuti describes how the Inca Roca, to celebrate the birth of his son Yabarvaca, the future Inca, decorated the streets and square with arches made of feathers, and how 'they made up songs with eight drums and *caxas temerarias* (large drums), the songs were called *ayma*, *forma*, *cave* and *vallina*, *chamayuricsa* and *haylli* and *cachua*' (Pachacuti, 1927 p.171).

Garcilaso pointed out that each and every province of Peru had its own specific way of dancing; dances were never changed or exchanged, and peoples were recognized in this way, as well as by their different head-dresses. He noted how the Incas' dancing was solemn and uncomplicated, with no hopping or leaping or other movements found in other dances. Only the Inca men danced, women were not permitted to dance among men. One solemn dance involved each participant holding the hands of the next-dancer-but-one, that is, the person second, rather than immediately, in front of them, at times creating a chain of 200 to 300 men or more depending on the solemnity of the occasion. The dance was begun at a distance from its focus, the Inca king, its movements involving all dancers coming out together, taking three steps at a time, the first backwards, the next two forwards, repeating this movement and gradually moving forwards until they reached the middle of the enclosure where the Inca sat. Songs

were recited to the rhythm of the dance, composed in praise of the Inca dignitary present, of his ancestors and others of the same blood, mentioning deeds carried out in peace or in war, with singing alternated between groups to avoid tiredness. The Incas watching would join in while the Inca king sometimes danced at the festivals to solemnize them more.

Inca music

5. Inca parades, processions and customs.

For the practice of the *Qispiranpa*, the Inca and his wife, the *Colla*, would parade through the city, carried on a platform. Guamán Poma describes how in processions, the Inca, accompanied by servants, adorned with his royal decorations and his standard, would bring musicians playing trumpets and flutes. His whole retinue would dance along to the sound of *taqui* (Guamán Poma, vol.1, p.249). The Inca would participate in some festivals, particularly one at which the *uaricza* was danced and sung with a red-coloured llama called the *puca llama*, the song intoned to imitate the gentle cry of the puma. Such a dance–song would be repeated gradually and rhythmically for half an hour, the sound characterized by the ‘y-y-y’ cry emitted by the llama, simultaneously intoned by the Inca by several repeated ‘yn’ sounds while maintaining appropriate rhythm and tone. Verses interjected and responded to by others taking part, including the *Colla* and *Nustas*, were at first intoned loudly, with voices gradually lowered until a gentle tone was reached, a tone thought to characterize the *uaricza* and the *araui*. Guamán Poma also noted that the *Colla*, Cusi Chimbo, the wife of Inca Roca, was fond of singing, making music, playing the *tinya* drum, arranging festivals and banquets (ibid., vol.1, p.96). Raula Ocllo, the wife of Huayna Capac, is also noted for her fondness for music, with a thousand people at her disposal for festivals, some dancing, others singing to the sound of the drums or making music with *pingollos* flutes. She also had singers of *araui* living in her house (Guamán Poma, vol.1). The Incas and their wives were not only fond of music, dances and festivals in themselves, but also as symbols of status and power. This was not unique to the Incas, but was common throughout the Andes region and necessitated the retention of expert musicians and dancers.

Inca music

6. Andean music at the beginning of the Colonial era.

Following the establishment of the Spanish Viceroyalty, Inca customs and those of the peoples of the Tahuantinsuyo underwent inevitable transformations, including the introduction of new musical instruments, some of which were subject to considerable modifications. While some ecclesiastics decreed the use of Andean music, songs and dances inappropriate for Catholic worship, Guamán Poma tried to get this decree altered, indicating that in his opinion certain Inca music and dances were suitable for Christian festivities. In his writings he argued that the principal chiefs, Indian men and women, should have the right to dance and to sing *taqui* (songs); the *haylli* (song of victory) the *uacón uauco* (song of the Chinchaysuyos) the *sainata* (mask song); the *llamallama* (song of the shepherds); the *hayachuco* (war song); the *Cimo Capac* (song of the great Chimu); the *Ayanya* (song of the dead one); the *Guarmi Auca* (song of the woman warrior); the *Antisuyo* (song of the Anti); the *chipchillanto* (brilliant

song); the *uaruro* (light song); the *hahiu*a (song of the punished *acollas* or adulterous women); the *apac* (song of the absent); the *llamaya* (song of the llama shepherds); the *harauay* (song of the craftsmen); the *uaricza* (song of the creator); the *tumipampa* (song of the *tumi* ceremonial knife); the *harau*i (a triumphal song for harvests and time of war); the *pingollo* (song to the sound of the *pingollo* flute); the *quenquena* (song of the *kena* flute); the *catauri* song that is danced while spinning round); as well as Spanish, 'negro' and other Amerindian dances. He advised that they should be danced in front of the 'Most Holy Sacrament of the Virgin and all the Saints, at feasts of vigil, at Easter and at all the feast days of the year marked out by the Holy Mother Church. Those who do not observe this will be punished' (Guamán Poma, 1956).

While there were objections to the principle of accepting the music and dances of the peoples of the Tahuantinsuyo, the Spaniards expressed surprise at the remarkable musical qualities and facility for music of the Andean people, their ability to learn to read, write and sing organ chants, play hornpipes, flutes, organs and all kinds of music (Herrera, 1726). Deductions can be made regarding the music of the Incas and the Tahuantinsuyo, and of earlier periods, by studying both old and contemporary genres and melodies of Andean music. While certain kinds of music have been modified in both form and expression, characteristic features are preserved. Through these endure the surviving traditions and customs with each modification signalling a new phase.

Incardona, Federico

(b Palermo, 13 May 1958). Italian composer. He studied music at the University of Palermo with Paolo Emilio Carapezza and Antonino Titone, and made his public début as a composer at the Teatro Politeama Garibaldi in Palermo with *Mit höchster Gewalt* for instrumental ensemble (1977). This work immediately characterized Incardona's initially delicate aphoristic style. After four years of further study and silence (during which he established friendships with Bussotti, Evangelisti, Nono, Togni and the musicologist Heinz-Klaus Metzger, who had a profound influence on him), he embarked on a particularly fertile period (1981–9). *Avec un morne embrassement*, his first chamber symphony, performed at the Venice Biennale in 1981, brought him to international attention. According to Restagno, the work displays, 'dark, glutinous sonorities, filled with obscure echoes' and the 'will to sing ... blunted by tragic exhaustion'. A striking series of extended pieces have followed, including *Soave sia il vento* for 6 instruments (1982), *Des Freundes Umnachtung* for large orchestra (1985), *Postludio alle notti* for large orchestra (1988) and *Malor me bat 'Graffito da Ockeghem: per Luigi Nono'* for string trio, three bottles and crotales (1995). The source and set of compositional rules for almost all these mature works lies in the 12-note row of Webern's projected third cantata, which remained unfinished at the time of his death. Incardona transforms the series into one of 24 quarter-tones, out of which darkly brilliant, sensuous textures are formed. He has written extensively on music, including numerous articles in *L'ora*.

Incatenatura

(It.: 'chaining').

A term used by modern scholars to refer to the [Quodlibet](#) of 16th-century Italy. Torre Franca divided such works into two types: the *villotta d'incatenatura*, in which a succession of borrowed fragments in one part is accompanied homophonically by other free voices; and the *incatenatura da villotta*, in which every voice is a different patchwork of quotations. Examples of the former include *L'ultimo di di maggio*, *Che mangerà la sposa* and P. da Hostia's *Vray dieu d'amor*. In the latter category are such works as *Non dormite o cacciatori*, Lodovico Fogliani's *Fortuna d'un gran tempo*, Matthias Werrecore's *Horsu* and Isaac's famous *Donna di dentro*. In the last piece, 'Donna di dentro' is skilfully combined with the well-known tune 'Fortuna d'un gran tempo' and a comical plea, 'Dammene un pocho di quella maza crocha'. The printed and manuscript sources for the frottola repertory include examples of related procedures in which elements of independent songs are recombined either simultaneously or in formal juxtaposition. The *incatenatura* may have developed from an improvised practice of quoting popular villotta refrains at the ends of pieces, which often contain 'lilolelas' (onomatopoeic imitations of instruments). Patchwork refrain led to the *filastrocca*, a long villotta coda.

MARIA RIKA MANIATES/RICHARD FREEDMAN

Ince, Kamran

(b Glendive, MT, 6 May 1960). American composer of Turkish descent. He moved to Ankara with his parents in 1966, where he studied composition with İlhan Baran (1970–75) and the cello and piano at the Ankara Conservatory (1971–77). He entered the Izmir Conservatory in 1977 to pursue composition studies with Muammer Sun. In 1980 he returned to the USA, maintaining dual Turkish and US citizenship. He attended the Oberlin College Conservatory (BM 1982) and the Eastman School (MM 1984, DMA 1987), where his teachers included David Burge (piano), Joseph Schwantner, Christopher Rouse, Samuel Adler and Barbara Kolb (composition). In 1987 he won the Prix de Rome and a Guggenheim fellowship, followed in 1988 by the Lili Boulanger Memorial Prize. He has taught at the University of Michigan (1990–92) and the University of Memphis (1992–), and served as composer-in-residence of the California SO, Walnut Creek (1991–3). His commissions include works for the Minnesota Orchestra, Meet the Composer, and the Fromm and Koussevitzky foundations.

Ince's musical influences range from Turkish folk tunes to neo-romanticism. His instrumental palette is equally broad, incorporating timbres from serpents to synthesizers. Most of his music is programmatic. *Night Passage* (1992) evokes an evening spent wandering through bars in a Mediterranean town, while the Symphony no.2 'Fall of Constantinople' (1994) was inspired by the victory of the Ottoman Turks in 1453. In 1996, Ince wrote his first film score, *Love Under Siege*, and in 1997 received a commission for the film *Aphrodisiac*.

ROGER SAVAGE

[Incidental music](#)

1. Definitions.

Music has been closely linked with theatre since theatre began. Dance music and song have played important roles in much folk drama. The classic forms of Asian theatre from India to Japan rely heavily on music, as do the dramatic rituals of sub-Saharan Africa and of the indigenous peoples of the Americas. The major Western theatrical forms include several in which music is all but continuous (medieval liturgical drama, *ballet de cour*, *ballet d'action* and classical ballet, 18th-century pantomime, some types of opera, much 'modern dance'), as well as several in which extended musical sections alternate on at least equal footing with passages of spoken dialogue: zarzuela, masque in most of its varieties, *comédie-ballet*, semi-opera, 18th-century vaudeville, ballad opera, Singspiel, *opéra comique*, operetta, musical comedy, the 'musical' and some music theatre. That only leaves the kinds of Western drama which put especially strong emphasis on spoken dialogue ('plays'); and these too have very often availed themselves of music between their dialogue

scenes and/or at points during them. There is no one term that groups together all the types of predominantly spoken drama using music in this latter way; but the music they call on is known in several European languages as 'stage music' (Fr. *musique de scène*; Ger. *Bühnenmusik*; It. *musica di scena*) and in English as 'incidental music'.

The English term seems not to have been current before the middle of the 19th century and may have been a borrowing at that time from the collateral German term *Inzidenzmusik*, a category of 'theatre music'. In English at that time it designated only those musical numbers within dialogue-scenes – occasional songs, dances, marches etc. – which were specifically called for by the script of the play in hand. These were thought of as 'incidental' in the lexicon sense of 'following on from, or incurred in the execution of, some plan or purpose' – the purpose in this case being getting a play on to the stage. (In such a context the adjective did not then, and arguably should not now, carry with it the trivializing connotations of other senses of 'incidental' such as 'fortuitous', 'casual', 'not strictly relevant'.) Usage by the end of the 19th century, as the second edition of *Grove's Dictionary* had rather grudgingly to concede, stretched the 'incidental' category to cover orchestral mood music, and later musical lexicographers (Apel, *HDM*, 1944; Illing, *A Dictionary of Music*, 1950) raised no objection to this inclusion. However, they did feel that a line should be drawn at calling theatrical overtures and entr'actes 'incidental' too. Yet within a few years their successors (*Grove*⁵, 1954; Cooper, *The Concise Encyclopedia of Music and Musicians*, 1958) were allowing that such preluding and interluding could reasonably be included in the 'incidental' bracket; and this capacious definition – all the music performed as part of the performance of a play – has been fairly standard since.

The widening of the definition between the 1860s and the 1950s can be linked with the increasing expectation in British theatre over the intervening decades that all the music used in connection with a particular staging would be written by one composer, and hence perceived as a kind of unity meriting a single term to embrace it; and it is certainly useful to have such a term to cover the totality of music used in any play performance even if its origins are more diverse than that (as they often have been). However, the term is not watertight. For one thing, all the constituent elements of incidental music so defined – overture, entr'acte, dance, song, chorus, *mélodrame* etc. – can also be found in other musical contexts; and for another, spoken plays that have a very considerable quantity of incidental music can approach, straddle and sometimes cross a boundary beyond which some other term might more usefully be applied to them. Thus, for example, Adam de la Halle's *Jeu de Robin et de Marion* (c1283), which might quite reasonably be thought of as a pastoral play with a host of incidental songs, is perhaps better seen as a Singspiel or 'musical' *avant la lettre*; a self-styled 'tragedy' which adds several masque-like scenes of spectacle and music to its spoken text, such as Charles Davenant's *Circe* (1677), is clearly on the threshold of semi-opera (and indeed in the case of *Circe* was remembered as an 'opera' by some of Davenant's contemporaries); and a remark of Federico García Lorca's about his *Amor de don Perlimplín con Belisa en su jardín* (1933) – that in the performances he directed himself its action and dialogue were 'embedded in music like a

chamber opera' – might suggest we would be better off thinking of the piece as music theatre than as a spoken comedy with an incidental score.

Incidental music

2. Outside dialogue scenes.

Incidental music in the Western tradition effectively begins with the choric odes that were an important feature of Athenian drama in the 5th century bce. In Greek tragedy, and quite often in comedy too, these odes (sung and danced by a male chorus supported by an aulos) were sited between the several extended episodes of linear, argumentative spoken dialogue in a play, and supplied a perspective on its events and ideas different from that of the principal characters, both ideologically and aesthetically. Apart from a few phrases in a fragmentary state, none of the music for these odes, which was composed by the dramatists themselves in the main, has survived; but the phenomenon does have three significant links with later incidental music.

First, ode texts from the Greek have been reset by composers since the Renaissance for such restagings of the original plays as have chosen to use song for the choric episodes rather than the common alternative of heightened speech: for instance, the epoch-making revival of Sophocles' *Oedipus rex* in Giustiniani's Italian version which inaugurated the Teatro Olimpico at Vicenza in 1585, its choruses set by Andrea Gabrieli; the performances in German of Sophocles' other 'Theban' tragedies at the Prussian court theatre in the 1840s, with music for the choruses by Mendelssohn; and the triennial productions of tragedies and comedies in the original language given at Cambridge from 1882 onwards, which have had scores (inclusive of chorus settings) by several British composers, notably Vaughan Williams's for the *Wasps* of Aristophanes in 1909.

Secondly, in emulation of these Greek models, classicizing European dramatists have sometimes incorporated choric odes intended for singing into their own play texts: notably Racine in his two biblical plays for the college at St Cyr, *Esther* and *Athalie* (1689, 1691), with scores initially by J.-B. Moreau (the *Athalie* choruses being set again several times later, by Gossec and Mendelssohn among others). Some more recent experiments with the articulation of dramatic form have incorporated a singing chorus, though sometimes adding elements to it from beyond the Greek tradition: witness Brecht's *Caucasian Chalk Circle* (1945), with its linking songs for a balladeer-narrator (set first by Paul Dessau), and several of Yeats's partly Japanese-inspired dramas from the 1910s and 20s, with their three-musician choric lyrics. (Among his composers, Yeats especially admired Edmund Dulac for his music to *At the Hawk's Well* and George Antheil for *Fighting the Waves*.)

Thirdly, a further and more widely felt influence of the Greek chorus derives from the mutation of Aristophanic 'old' comedy into the 'new' comedy of Menander in the 4th century bce, as a result of which the comic chorus lost its ideologically significant, role-playing function but kept its structural, episode-separating one. (Surviving Menandrian texts simply stipulate at certain punctuation points in the plot that there should be choric performances, linked sometimes to the arrival of a band of revellers; but no words are provided for them.) So comes into being the idea that a comedy

should comprise several distinct dialogue-sections separated by something in a different performance medium, allowed for but not pre-scripted by the playwright. This sectional concept made a vital contribution to the development of Roman, and later of Renaissance Italian, 'act' theory; and from around 1500 it became theatrical practice in Italy when staging ancient or modern five-act 'new comedies' to place articulating *intermedi* between the acts: instrumental and/or vocal pieces (performed sometimes on stage, sometimes behind the scenes), or dances or brief musico-dramatic divertimentos. This quasi-choric practice – in conjunction with the use in 15th- and 16th-century spoken drama north of the Alps of the instrumental *silete* and *pause* (designed there to attract an open-air audience's attention at the start of a show, hold it during changes of location in the action, or mark scene breaks of other sorts) – opened a rich seam of incidental 'entr'acte' music which was to be very productive for the next four centuries.

The musical *intermedi* for an Italian Renaissance drama – six of them, often: four between the play's five acts and two more as quasi-prologue and epilogue – had three possible functions beyond the purely structural ones of punctuating the spoken play and covering time lapses in its plot. They could dazzle and divert by their novelty and inventiveness (e.g. the sudden explosion of rustic hoeing, sowing, mowing and threshing danced to a *moresca* after Act 1 of Terence's *Eunuchus* as given at Ferrara in 1499); they could establish links with the ideas and/or situations of their 'host' play (e.g. the madrigals of Verdelot to texts by Machiavelli designed to go between the acts at a mooted revival of Machiavelli's own *Mandragola* in 1526); and on special occasions they could reach outwards to honoured guests in the audience, as in the sets of very grand and costly mythological-allegorical *intermedi* which paid tribute to noble brides and grooms attending plays in the course of dynastic wedding festivities, as at Medicean Florence in 1586 (*L'amico fido*) and 1589 (*La pellegrina*).

Following this latter tradition in their scale and texture, lengthy and elaborate balletic or operatic *intermèdes* became a feature of the spoken Latin tragedies performed at the Jesuit colleges in France in the 17th century (the *intermède*-set constituting M.-A. Charpentier's *David et Jonathas* of 1688 is an example); but entr'acte practice closer to that of the earliest Italian *intermedi* in scale, strategy and kind developed in English court theatricals and in productions by children's companies in London in the decades around 1600 – see, for instance, Marston's *Sophonisba* (1606) and Beaumont's *Knight of the Burning Pestle* (c1607) – spreading eventually to London's adult commercial companies, where it was common by the 1620s. The practice survived the Puritan closure of the London theatres (1642–60) to return with new vigour in the Restoration period, a vigour maintained until the Italian operatic invasion of London moved the focus of interest in musical novelty there from playhouse to opera house.

Dispensing largely with song and dance, Restoration and early 18th-century entr'acte music, as composed by Locke, John Banister (i), the Purcell brothers, Paisible and Croft among others, was generally designed for string bands which would perform in 'music rooms' above the stage and later in the newly fashionable orchestra pits which were to become a feature of European playhouses for the next 250 years. The entr'actes

made up part of a show's standard set of seven to nine pieces: four 'act tunes' between the acts, preceded by an overture or 'curtain tune', itself preceded by two 'musics' (each comprising one or two numbers) which were played while the audience was assembling and which music lovers might make a special point of arriving early to hear. As with the *intermedi* of the 16th century, the act tunes could simply function as ingenious or airy diversions from the plot of the spoken play, or they might occasionally allude to events outside the theatre (as with the 'Lillibulero' Henry Purcell smuggled into the Jig for his music for *The Gordian Knot Unty'd*) or mirror the moods of the scenes they followed or preceded. Some members of the audience doubtless chattered vigorously through all such pieces: a response to entr'acte music still being recorded painfully, by Bizet and Sullivan among others, two centuries later. But others listened carefully; and John Dennis, in line with some 16th-century theorists, drew neat parallels between Greek chorus and modern entr'acte in his *Impartial Critick* (1693), and in 1699 gave John Eccles careful instructions as to how the act music in their *Rinaldo and Armida* was to meld with the action, since 'all the Musick in this Play, even the Musick between the Acts, is part of the Tragedy'.

This is an idea that recurs in Germany a few decades later. By then there were German troupes taking over from France a tradition of public theatre entr'acte-playing parallel in some respects to the English. (In the French line, for instance, between 1672 and 1686 M.-A. Charpentier had written not only danced *intermèdes* for spoken plays given by the company that became the Comédie-Française, but also several sets of purely instrumental ones.) It is a German essay by J.A. Scheibe on such orchestral stage music in his periodical *Critischer Musicus* (no.67, 8 Dec 1739: commended and summarized in no.26 of Lessing's *Hamburgische Dramaturgie*, 1767) that definitively articulates the concept of carefully integrated, ingeniously mood-specific orchestral overtures, interludes and postludes. It was a concept called on increasingly throughout the Classical and Romantic periods, notably at first in German-speaking areas. Thus a reviewer in 1774 can say of Haydn's entr'actes for a revival at Eszterháza of Regnard's 80-year-old comedy *Le distrait* that 'Haydn and Regnard vie with each other in producing *distrait* caprice' so that 'the play's value is much increased'. Leopold Mozart could add detailed plot and character allusions to the manuscript of the near-symphonic entr'actes his son composed for a Salzburg staging in the same decade of Gebler's *Thamos, König in Ägypten*; and Beethoven could divide a couple of the entr'actes he wrote for a Viennese revival of Goethe's *Egmont* in 1810 into two sections each, the first reflecting the mood of the scene just past, the second adumbrating that of the scene to come: a practice recommended decades before by Dennis and Scheibe. Later and further north, narrative relevance remains important to composers, playwrights and actors. So Bizet in 1872 was praised by Alphonse Daudet for enhancing his peasant tragedy *L'Arlésienne* with, *inter alia*, 'the lovely entr'acte of the family council ... wonderfully beautiful, elegant, heart-warming'; and Stanford, writer of the incidental music for the actor-manager Henry Irving's production of Tennyson's *Beckett* in 1893, proudly remembered that Irving 'always came down to listen behind the curtain to the last entr'acte (The Martyrdom) in order to get into the right mood for the final scene'.

However, by no means all plays in the 18th and 19th centuries had complete or even partial sets of specially composed preludes and interludes. Where some kind of integration of music with spoken script was at a premium, the best hope often was that music might be found from *somewhere* that would fit the occasion well enough and contribute the desired sense of consequentiality and/or fizz. The need for such may well have been at the back of Locatelli's mind when he published six *Introduzioni teatrali* as part of his op.4 in 1735: pieces which by then may well already have opened some plays satisfactorily (in Amsterdam quite possibly) and could well do the same for others in the future; and it was certainly at the back of Schubert's when, short of time to write an overture to complete his set of incidental pieces for Helmina von Chezy's *Rosamunde, Fürstin von Cyprien* in 1823, he first called on the one that he had written for *Alfonso und Estrella* to fill the gap, and later perhaps approved the plan of replacing it with that to *Die Zauberharfe* (the piece which as a result came to be known as 'the Overture to *Rosamunde*').

Levels of engagement with the drama could be much lower than that. In London in the mid-18th century, for example, inter-act music, like the three 'musics' before the show, was generally much more in the audience's domain, so to speak, than in the play's, comprising a kind of popular concert of songs, dances and orchestral numbers in rather unsteady harness with the tragedy or comedy in hand: as when a playbill for Shakespeare's *Merry Wives of Windsor* at Covent Garden in 1762 promised 'Between the Acts some *Favorite Songs* from the English Opera *Artaxerxes*'. Things were not always much steadier in the 19th century. In 1892, for instance, the acts of Wilde's *Lady Windermere's Fan* at its première were preceded and separated by orchestral selections from Mozart, Schubert, Mendelssohn, Auber, Suppé, Delibes and Godard among others; and a few weeks before, Bernard Shaw, in a piece on incidental music for *The World (Music in London, 27 Jan 1892)*, roguishly affected to hold that the proper music to *Hamlet* comprised two grand marches by Handel during the action, 'the *entr'actes* being selected from no longer popular overtures such as *La Sirène*, etc.'. Such things make it clear why there was space for Norman O'Neill, musical director at the Haymarket Theatre in London near-continuously from 1909 to 1932, to gain a reputation for increasing the aptness and subtlety of *entr'actes* for plays lacking purpose-made scores by introducing appropriate novelties and making adaptations from unhackneyed earlier music (by Purcell, Corelli and Vivaldi among others). O'Neill on occasion also continued a late 19th-century practice of writing short, atmospheric preludes to individual acts, played under lowered auditorium lights, so as to ease the audience back into the mood of the play itself after hearing a not over-apt *entr'acte* or hurrying back from the theatre bar. However, by O'Neill's time some theatre and music critics were questioning the relevance of orchestral overture, *entr'acte* and/or act prelude in the spoken theatre. As early as the mid-19th century, Ferdinand Hiller had attacked the whole *entr'acte* phenomenon (*Kölnische Zeitung*, 20 Aug 1855) and some German theatres had stopped playing them altogether; such views gained wider currency especially in connection with performances of the novel 'naturalistic' drama of modern life and the intellectually demanding 'drama of ideas'. Theatre managers too were beginning to jibe at maintaining expensive pit bands (even ones that composers tended to find

constrictingly small) outside opera, operetta, ballet and pantomime. And developments in electronics were poised to bring about a radical change in how things musical were managed between, and during, the acts.

Incidental music

3. Within dialogue scenes.

- (i) Dance and song.
- (ii) Supernatural music.
- (iii) Mélodrame.

Incidental music, §3: Within dialogue scenes

(i) Dance and song.

The drama of the ancient Mediterranean saw the beginnings not only of inter-act music but also of dancing and singing set into scenes of spoken dialogue. Aulos music, and sometimes choral song too, are called for in Greek 'old comedy' to accompany episodes of ritual dancing – Aristophanes' *Frogs* and *The Poet and the Women* are examples – and also dances marking the resolution of a play's action, as in *Lysistrata* and *The Assembly Women*. This starts a long line of festive and/or climactic dance in European spoken theatre. It is later manifest in, for example, medieval French farce and Shakespearean romantic drama (the Capulets' ball in *Romeo and Juliet*; the 'measures' to celebrate the happy endings of *As you Like it* and *Much Ado about Nothing*), in the *comedias* of Lope de Vega and the Italian *commedia dell'arte*, in Enlightenment comedy (such as the wedding fandango in Act 4 of Beaumarchais' *La folle journée ou Le mariage de Figaro* of 1784 and the 'ballet général' that concludes the play) and the picturesque, sometimes exotic dance-*fêtes* and dance-pantomimes ingeniously set into the early 19th-century melodramas of Pixérécourt and his school. A darker line runs through these centuries too: for example, the dances of medieval 'vice'-figures, sour antimasque-type numbers such as the Dance of Cuckolds that ends Wycherley's comedy *The Country Wife* (1675) or the sinister Walpurgis dances in the first part of Goethe's *Faust* (1801). In later naturalistic, *verismo* and avant-garde drama, dance that is ostensibly celebratory is often used with tragic irony: the farandole in the Daudet-Bizet *L'Arlésienne*, the wild tarantella danced by the trapped Nora in Ibsen's *A Doll's House*; the Dance of the Seven Veils which brings about the climax of Wilde's *Salome* (and which combines with Japanese nō-dance precedents to influence Yeats's 'Plays for Dancers'). Beckett's post-World War II drama bids an 'absurdist' farewell to the tradition, presenting dance music that cannot be danced to and dancing without dance music: as when the terminally immobilized heroine of *Happy Days* can only sway to the *Merry Widow* waltz played by her musical box and the slave Lucky in *Waiting for Godot* (who 'used to dance the farandole, the fling, the brawl, the jig, the fandango, and even the hornpipe') moves through his one sad surviving routine in silence.

As for song in spoken drama, the monody and *kommos* of Greek tragedy (i.e. the 'aria' occasionally given to a principal character, and the sung lament shared between a principal and the chorus) plus the *cantica* of Latin 'new comedy' (passages of verse dialogue, especially frequent in Plautus, where a change of metre signifies a change from speech to some kind of singing): these are early instances of the Western 'inset lyric', providing

precedents for later play songs, should precedents be necessary when – before the late 19th century, at least – song's links with the spoken theatre are manifestly so widespread.

Solo song given to flesh-and-blood *dramatis personae* over the last 500 years is broadly divisible into two categories. First there are the songs sung by characters – principal characters sometimes – who make no claim to any 'professional' musical skill. These may find themselves singing in a *métier*-revealing and/or self-characterizing way as they go about their daily lives: the Grave-Maker in Act 5 of *Hamlet*, for instance, or Gretchen singing her Ballad of the King of Thule in the Evening scene of *Faust*. They may be adept at making conversational points through snatches of ballads, chansons, folksongs and other pop tunes, as are Calbain and his wife in the late 15th-century farce *Savetier nommé Calbain*, Old Merrythought in Beaumont's *The Knight of the Burning Pestle* and several of the peasants in Büchner's *Woyzeck* (1836). Their wits may have gone lyrically astray, like Ophelia's in *Hamlet* or Lyonel's in Thomas D'Urfey's *A Fool's Perferment* (1688), his six mad songs set for the première by Purcell. Or they may simply be so full of unbuttoned, companionable bonhomie that they burst out with what Feste in *Twelfth Night* calls a 'song of good life', or so full of parental, filial or romantic feeling that they have to express it in a lullaby, a lament or (most often) a love song. (Clärchen in Goethe's *Egmont* and Solveig in Ibsen's *Peer Gynt* are exemplars of the latter, their songs memorably set by Beethoven and Grieg.) Some lovers – Pantalone on occasion in the *commedia dell'arte*, for instance, Almaviva in Beaumarchais' *Le barbier de Séville*, Peer Gynt himself – even risk personally serenading their mistresses. Others, like the boorish Cloten in Shakespeare's *Cymbeline* (with 'Hark, hark, the lark'), choose more prudently to have their aubading and serenading done for them by paid musicians: and this introduces the other category of solo singers in spoken drama: characters whose singing is a quasi-professional skill, and who can therefore be relied on to deliver more complex songs in a more polished way – and songs on any subject germane to the play. These may be foreground characters like Shakespeare's fools and clowns and ballad seller Autolycus, or like the guitar-carrying servants (Scapino, Mezzetino) common in *commedia dell'arte*; or they may be the often anonymous attendant gentlemen, waiting women, music masters, servant musicians and (by definition songful) shepherds or shepherdesses so often called on, in 17th-century Spanish and English theatre especially, to put a musical brake on the action with a song whose sentiments reflect or ironically invert those of the principal characters at that point in the plot. In certain circumstances the 'professionals' may be virtually the whole cast of a play, as in such Brecht pieces as *Happy End*, *Die Mutter* and *Mutter Courage und ihre Kinder* (their lyrics set by Weill, Eisler and Dessau respectively): plays embodying Brecht's belief that characterization should incorporate, not obliterate, the presence of the performer as such, a performer whose skills should include the ability to sing ballads, cabaret-type numbers etc. when such things are ideologically apt and effectively 'alienating'.

An extension of the solo song is the group song set similarly into the spoken dialogue. Medieval French *farceurs* had a habit of interrupting the action of their plays with a surprise group-chanson and rounding off the show with another; and (under the influence of 18th-century vaudeville)

group singing as a means of unanimous self-expression can break out anywhere in sophisticated mid-19th-century French farce: witness the vocal behaviour of the massed villagers visiting Paris in Labiche's otherwise almost wholly spoken *La cagnotte* (1864). But most choral singing in dialogue scenes tends to be more event-specific than that. At appropriate moments there are simple overflows of shared euphoria (songs for cheerful sailors, soldiers, drinkers, harvesters, hunters, gypsies, patriots, wedding guests, nymphs and swains and such) or of shared distress (dirges for mourners, howls for madfolk), and more lengthy and elaborate 'production numbers': sung for example by the incense-burning Ancient British priests in Fletcher's *Bonduca* (as revised in the 1690s with a Purcell score); the yet more ancient Egyptian priests worshipping the sun to Mozart's music in *Thamos, König in Ägypten*; the villagers processing with their Shrovetide effigy in Ostrovsky's *The Snow Maiden* (1873), their sung processional set by Tchaikovsky; or the decadent emperor's retinue in the 1888 revival of Dumas père's *Caligula* making a sybaritic anthem out of the *Pervigilium Veneris* to music by Gabriel Fauré.

Incidental music, §3: Within dialogue scenes

(ii) Supernatural music.

If the beginnings of song and dance for earthbound characters can be traced to Greco-Roman antiquity, the Middle Ages made a major contribution to incidental music through the convention developed in the spoken vernacular religious drama of the time that scenes associated with heaven should in some way be musical. This was a scriptural matter in part: angels are described as 'cantantes' in the Vulgate, for example at *Revelation xv.3*. But it was also partly a philosophic one, since Pythagorean-Platonic-Boethian doctrine held that heaven in a sense was identified with music, and partly an associational one too, since the liturgy in medieval cathedrals and abbeys was wholly sung. Hence in open-air civic theatricals (French miracle-plays and *mystères*, English Corpus Christi cycles etc.) music accompanies angelic visitations; characters touched by God such as Simeon and the Nativity shepherds may sing; and there is instrumental minstrelsy around God's throne. The angelic songs were often performed by choristers from religious foundations nearby, hired specially, dressed for the part and bringing with them appropriate chanted (or on occasion polyphonic) Latin psalms, hymns, antiphons etc. (in France sometimes vernacular *chansons spirituelles* as well).

Similarly in the professional theatre of Golden Age Spain, the theatre of Lope de Vega and Calderón de la Barca, traffic with the Christian heaven (angels descending, saints ascending, the Voice of Conscience, the Word of God) was regularly presented with music. In post-Reformation Protestant countries, on the other hand, there was much less call for such things. However, stage music's links with the supernatural continued even there, though now largely under a pagan sign. Shakespeare, the crucial (because eventually a hugely influential) case in point, presents the ceremonies of fairies and elves, the doings of a magus and his familiar spirit, and (in dream-visions or inset entertainments) the epiphanies of classical deities. In almost every case some kind of music is involved: partly because such things are direct emanations of a musically ordered cosmos, partly because folklore at the time associated faery with song and dance, and

partly because the entries of pagan deities in Elizabethan and Jacobean drama derive from similar entries in courtly masquing, which had music wherever it went. In the long run, Shakespeare's international fame and his pandemic restaging from the late 18th century onwards were to ensure that supernaturally connected incidental music for his works would be written in many lands and idioms – by Mendelssohn, Sullivan, Chausson and Sibelius, among others. In the shorter run, his musical scenes of the pagan supernatural take their place within the wider 17th-century English convention that music should figure in scenes of spoken drama which involved the operation of magic (white or black) and the presentation of mythological or allegorical 'visions' and 'shows' of gods, demigods and spirits: as with the moonlit rites of Hecate in Middleton's *The Witch* (incorporated in part into the First Folio printing of Shakespeare's *Macbeth*) and the Orpheus masque in Settle's *The Empress of Morocco* (1673), set for the première by Matthew Locke. (A preponderance of such invocations, epiphanies, visions and shows in the later 17th century – all of them full of song, spectacle and often dance as well – turned a 'play' into a 'semi-opera'.)

A similar convention operated at the time on the continental mainland: in the elaborate mythological plays that Calderón wrote for the court of Philip IV of Spain, for instance. During his prologue to *Fortunas de Andrómeda y Perseo* (1653), he has the personified Música declare that 'it is better that the gods do not speak as the mortals do' but rather 'have a different harmony in their voice'; and accordingly (as the anonymous surviving score for *Fortunas* shows) Calderón's Olympians discourse in song while his earthlings rely mainly on speech. North of the Pyrenees, plays with a high level of Olympian spectacle, like the *pièces à machines* of the Corneille brothers, called for music at moments of epiphany, heavenly flight, mythic combat, etc. This music, provided by Dassoucy, M.-A. Charpentier and others, added pomp, circumstance and perhaps some echo of the high-Renaissance idea of the harmony of the superlunar cosmos; but it had its pragmatic dimension as well. It ensured sonic continuity through the show. As Pierre Corneille explained in the 'Argument' to his *Andromède* (1650), the *concerts de musique* in those plays were for 'the satisfaction of the ears of the spectators while their eyes were taken with the descent or ascent of a machine, or fixed on something which stopped them attending to what the actors might have to say'.

Baroque theatre does not see the end of the tradition that in spoken drama 'the grateful and needful role of representing what is supernatural and out-of-the-ordinary falls to the lot of music', as Busoni put it in 1911 *re* his music for Gozzi's *Turandot* (1765). The tradition extends to the less precise otherworldlinesses of the 19th and 20th centuries. These have been on the biggest, most elaborate scale, as in the visions of the Mountain King's court, the Great Boyg and the singing Leaves, Dewdrops and Broken Straws in Grieg's music for Ibsen's *Peer Gynt* and the mingled mysticisms of D'Annunzio's neo-medieval *Martyre de St Sébastien* (where 'the cult of Adonis joins that of Jesus', as Debussy, D'Annunzio's composer, put it); or on a scale more easily manageable in a fairly well resourced early 20th-century theatre, as in the seductive 'call' of the Hebridean island in O'Neill's music for Barrie's *Mary Rose* (1920) and the peremptory orchestral summons from the beyond which Britten wrote for J.B. Priestley's *Johnson*

over Jordan (1939); and on the smallest scale too, as with the use of single instruments in Strindberg's *Ghost Sonata* (1907: a mysterious golden harp) and Arthur Miller's *Death of a Salesman* (1947: an invisible flute) to symbolize the desirable 'otherwheres' of those plays.

Incidental music, §3: Within dialogue scenes

(iii) **Mélodrame.**

Instrumentalists in the spoken theatre from the 14th century to the mid-18th did not only perform preludes and interludes, accompany songs and dances, and underscore supernatural happenings. On stage, behind the scenes or in the pit they also provided 'realistic' music: music for ceremony (flourishes, triumphal entries, dead marches, etc.), for hunting scenes, for episodes of psychotherapy and stimulus (sweet airs to cure disordered brains, induce sleep, increase desire) and for war: the whole repertory of alarms, charges, retreats, parleys and the like needed for a theatrical battle. Such music does not sound of its own accord; it is almost always attributable to and commissioned by specific human or supernatural agencies within the fiction of the play itself. It was for the later 18th century to add a further resource to a spoken drama in the shape of 'unattributable' music: music rising from the orchestra pit which seems to come directly from the minds of a play's characters or indeed the mind of the playwright, heightening the mood of certain scenes by sounding unbidden between or beneath the characters' speeches. Several factors may have contributed to the growth of this phenomenon: music's earlier use to support dumbshows and pantomimes; the spilling over of entr'acte music into adjacent dialogue scenes; the influence of ritornello and *recitativo stromentato* in opera. But the dominant influence was a new musical form, the *mélodrame*, as pioneered by J.-J. Rousseau and Georg Benda in the 1760s and 70s (see [Melodrama](#)). Spoken plays were soon borrowing and building on its techniques and related ones, and the way was open to a century and a half of within-the-scene mood music. This came in three principal kinds:

(a) First, there were the orchestral scores for the new kind of spoken drama which came itself to be called 'melodrama': a genre of Romantic theatre highlighting strong situations, black-and-white morality and sensational turns of events, set often against exotic backgrounds. The scores for melodrama in this sense of the word (by specialist or semi-specialist composers such as Adrien Quaisin, François Amédée, Henry Bishop, Etienne Singla, Robert Stoepel and Henry Sprake) comprised not only the by-now-expected overtures, entr'actes, dances and songs, but also music to underline all of a play's highly charged dialogue episodes, significant entrances and exits, stirring incidents, strong scene ends and striking tableaux. The music supplied could be extensive (making particular use of the varied repetition of a set of melodic motifs associated with particular characters); but in general it did not force itself on an audience, operating instead in a way rather similar to the period's versatile new stage lighting by gas, limelight and eventually electricity. Still, like that lighting, it was a crucial determinant of a play's impact.

(b) The second sort of mood music was something of a poor relation to the first: 'off-the-peg' melodrama music, so to speak. For this, a theatre's musical director would recycle the same all-purpose collection of tried and

trusted musical devices over and over again from one melodrama to the next. He might assemble his collection personally, or buy a convenient *passe-partout* compilation like one advertised (quite late in the tradition) in 1912: 'Incidental Music Suitable for Lively Rise of Curtain, Entrance of Characters, etc., Hurry, Combat, Apparitions, Pathetic Situations, Martial, etc., etc. Price Piano 4s., Full Orchestra 5s.' Thereby in part hung the bad name that melodrama began to get in the later 19th century.

(c) At the other pole of mood music was musical *mélodrame* as it featured in plays other than melodramas. Quite early in the 19th century E.T.A. Hoffmann had written some observations on the use of choruses and *mélodrames* in spoken plays (*Allgemeine deutsche Theater-Zeitung*, 17–20 May 1808), warning against uncritical profligacy with under- and inter-speech music, and stressing the need for taste and economy in its deployment. It is in this spirit that most of the major composers who used *mélodrame* as an element in their scores for tragedies and other kinds of poetic drama do deploy it. Thus there is only one, four-minute *mélodrame* in the whole of Mozart's *Thamos* score, and only one – at a place indicated by the dramatist – in Beethoven's for *Egmont* (though there are more in his *König Stephan* music). The three in Weber's 1821 score for Wolff's Cervantes play *Preciosa* all focus strongly on the heroine. Mendelssohn in his music for *A Midsummer Night's Dream* (1843) restricts *mélodrame* to scenes involving fairy characters, as Elgar later restricts it in his score for Pearn and Blackwood's fantasy *The Starlight Express* (1915) to dialogue concerned with imagination and 'star-sympathy'. All but one of Schumann's *mélodrames* in his music for Byron's *Manfred* (1848) involve invocations of, or communion with, supernatural or cosmic presences, as all but one of Bizet's for *L'Arlésienne* underpin intimate scenes for the two brothers at the centre of Daudet's tragedy. Where theatrical effect is concerned, 'less' in each of these cases arguably means 'more'.

Incidental music

4. Full sets and changing circumstances.

An overture, songs and entr'actes, a *mélodrame* leading to music for a supernatural vision, death scene music, a concluding *Siegessymphonie*: Beethoven's score for *Egmont* lacks only dance and chorus music to make it a conspectus of all the 'incidental' modes known up to his time. His authority in the 19th century came near to making a set of such pieces in all or most of these modes a canonical 'form': a form, indeed, that was worth attempting even if there was no prospect of an actual production of the play to which one's set was incidental. Thus Schumann had no commission when he imagined an ideal performance of Byron's *Manfred* and composed his extensive score for it, detailed down to a two-bar cue to cover the exit of a witch; Sullivan chose as his 1861 graduation exercise from the Leipzig Conservatory an unsolicited set of *Tempest* pieces; and in 1905 Busoni wrote his set for Gozzi's *Turandot* on the pure off-chance that it might one day be useful for a staging of the play in Italy, where since the birth of opera (and outside the *commedia dell'arte*) incidental music had not flourished. (Weber's *Turandot* score of 1809 was not a contender, since it was written for what Busoni considered the over-germanized adaptation of the Gozzi by Schiller.)

If the *Egmont* set became canonic in status, it was also quasi-symphonic in its method: the final section of the overture is reprised at the very end of the play and one of the heroine's inset songs is developed in an orchestral entr'acte. In emulation, Schumann and Sullivan (Bizet also in *L'Arlésienne*) allude to motifs from their overtures later in their incidental sets, Schubert in *Rosamunde* makes substantial links between his entr'actes and an inset chorus and ballet movement, and Mendelssohn in *A Midsummer Night's Dream* mines his overture (independently written 15 years before) and two of his entr'actes for *mélodrame* material. The drift towards symphonic procedures in these and other composers (something Bernard Shaw describes wittily in the 1892 article on incidental music referred to above) is matched in the late 19th and early 20th centuries by a drift towards Romantic symphonic scale. Thus the scores by Grieg, Debussy, Elgar and Sibelius for, respectively, *Peer Gynt*, *Le martyre de St Sébastien*, *The Starlight Express* and *The Tempest* are all well over an hour in length – two indeed are close to an hour and a half – and all ideally call for a large orchestra with at least two solo singers and (the Elgar excepted) a chorus as well.

However, the last of these to be written, Sibelius's *Tempest* score of 1925, proved to be something of a *ne plus ultra*. Full sets calling for such large resources and with such extended components became rarities after that, and were all but extinct by the middle of the century. Several factors contributed to this: the increasing reluctance of managements to maintain large pit bands for spoken drama; developments in stagecraft which tended to render lengthy inter-scene music (useful in the 19th century to cover elaborate scene changes) logistically unnecessary; and the spread of the feeling that anyway such music was often aesthetically superfluous ('beastly tootlings between the acts', as one objector put it). Modernism had its say too. Four years after Sibelius's graphic storm-prelude to *The Tempest*, twice as long and for forces well over twice as big as Locke's equally graphic 'curtain tune' to the play of 250 years before, Paul Claudel wrote in an essay on 'Modern Drama and Music' that his preference where theatrical storm music is concerned was in fact not for a large, hidden symphony orchestra but a single and thoroughly visible Japanese *kabuki* performer 'with a tiny cup of tea by his side and in front of a tremendous drum, which it is his role to beat'.

The idea of using a visible and minimal band for modernist stage music had already been embodied at its most radical in the single (and musically versatile) figure of the *Peuple de Zanzibar* in Apollinaire's 'drame surréaliste' of 1917, *Les mamelles de Tirésias*. And later in the century small 'chamber' ensembles, often hidden behind the scenes (as orchestra pits were going out of fashion outside the operatic and balletic world), but sometimes appearing on stage as a static or even actively moving part of the play's visible presentation, came more and more to be the norm for incidental scores in such theatres as chose, and could afford, to use 'live' music. These ensembles, especially when visible to audience and actors, could mesh their music intimately and extensively with their host plays, as for instance in Birtwistle's score for the *Oresteia* of Aeschylus as directed by Peter Hall in 1981 – 'composed around' (Hall's phrase) the actors' verbal responses to the text in rehearsal – and in the music, its materials

prepared by Toshi Tsuchitori, that was partly improvised during the performances of Peter Brook's 1985 staging of the Hindu *Mahābhārata*.

However, resources for another kind of integration of music and stage had by then become available through 20th-century advances in acoustics and electronics. Between the 1920s and the 1980s these generated the electrical gramophone (with short-playing, then long-playing records, then compact discs) and along the way the tape recorder, synthesizer, computerized sampler and advanced theatrical sound system. This technology could be used simply to play recordings of existing incidental scores, or indeed of operatic and concert music made incidental (sometimes with strong possibilities for irony) by its new use on disc or tape in the playhouse. It could also be used to transmit recordings of specially composed scores for singers and instrumentalists performing in traditional ways. Beyond that, the technology could create its own music (*musique concrète*, electronic and computer music), either in a 'pure' form or blended with sonic 'atmospheres' and other sophisticated developments of what traditionally had been the territory of theatrical 'sound effects'.

So was produced the late 20th-century electronic equivalent, and to an extent descendant, of the assiduous orchestral scores (supplemented with 'live' sound effects) of 19th-century melodrama and spectacular drama, able to support or point up any word, mood, movement or visual aspect of a play's *mise en scène*. The descent was a direct one in that 19th-century practices had had an impact on the extremely complex musical contributions to the stagings of classic texts directed in the first decades of the 20th century by such consequential figures as Reinhardt (who worked with several composers, Humperdinck especially) and Meyerhold (Mikhail Gnesin, Vissarion Shebalin etc.); and these in their turn influenced later creative directors with more various and 'advanced' sound sources at their disposal. A more oblique lineage was by way of the cinema. Melodrama music of the 19th century was the major influence on the music accompanying silent movies, and the latter's conventions infiltrated the soundtracks of the first talkies, whose influence was later to be felt in the theatre. Film music, however, is another topic, if a closely related one.

Incidental music

5. Afterlives.

Once the sequence of performances of the play for which it was composed has come to an end, incidental music has rarely had much permanence in a theatrical context. Plays often fall out of the repertory, and where they do not, revivals have seldom felt duty-bound to revive all or any of the original score. For example, the surviving music written for *The Tempest* in its various forms on the London stage in the first century and a half of its existence reveals a complex process of evolution, with contributions from at least ten composers; Racine's *Athalie* had its choruses set at least five times; and Maeterlinck's *Pelléas et Mélisande* generated at least three different sets of incidental music (by Fauré, Sibelius and William Wallace) in the first dozen years of its stage life. Even those few sets of incidental pieces which have come in particular ages to seem all but inseparable from their host plays tend to find themselves discarded eventually by progressive directors: most notably (after about 70 years in each case)

Mendelssohn's *Midsummer Night's Dream* score, dropped by Granville Barker in 1914 – Cecil Sharp found him English folkdance and song with which to replace it – and Grieg's score for *Peer Gynt*, dropped in 1948 by Hans Jacob Nilsen who preferred to commission new, tougher and rougher music from Harald Saeverud.

True, stage music has sometimes been kept alive in the theatre by transference from one show to another, as when Grigory Kozintsev re-used Shostakovich's music for his 1941 production of *King Lear*, only slightly supplemented, in his 1954 *Hamlet*. In the name of organic unity, there have been occasional successful pleas since the time of Arnold Dolmetsch's association with the Elizabethan Stage Society in the 1890s for the re-establishment of the original (or something like the original) incidental music in the case of modern revivals of plays from the past, and less frequently (and less successfully) for special revivals of classic plays incorporating notable scores that they have inspired in intervening periods – though Stravinsky surely had a point when he opined that a modern production of Shakespeare's *Dream* with Mendelssohn's 1840s music would have to be 'clothed in the provincial German court style of the period'. But by and large, where 'live' performance is concerned, most incidental music has been bound for oblivion, unless, that is, some new use can be found for it outside the theatre. Several new uses have in fact been found.

One has been the concert presentation of a complete theatre score with a specially written linking narration performed by an actor: a *verbindender Text*, early instances being the *Egmont* narratives by Friedrich Mosengeil (1821) and Franz Grillparzer (1834). Another has been the publication of incidental items for use in non-narrative contexts: for example the several printed collections with such titles as 'the newest and best songs sung at the court and at the public theatres' appearing in the English Restoration and aimed at domestic music-making and the new-fangled public music-meetings. In 1697 London saw an ambitious and influential extension of this to purely instrumental music: the publication of *A Collection of Ayres, Compos'd for the Theatre*, which posthumously printed Purcell's pre-musics and act tunes for 13 shows (nine plays and four semi-operas), reordering the items into effective free-standing suites, each with an overture followed by a sequence of airs, dances and sometimes 'song tunes' arranged from inset songs. The collection is a notable early instance of the idea of a published sequence of incidental pieces meant for non-theatrical performance. This idea had a brief English vogue around 1700, but did not become common until the concert-loving 19th century. There was a growing taste by the 1830s for the concert performance of orchestral stage music – for instance, Henry Bishop had a great success with a programme of his own in Manchester in 1839 – and from the 1870s the published concert suite named after its source play becomes a standard form. Composers preserving some of their incidental music in this way (sometimes reorchestrating it in the process for the bigger forces available in the concert hall) include Bizet, Fauré, Grieg, Sibelius, Nielsen, Vaughan Williams, Korngold, Roussel and Milhaud.

Further, some incidental items have gained new lives as concert miniatures, almost wholly divorced from their theatrical past (the *Valse*

triste of Sibelius, once part of Arvid Järnefelt's *Kuolema*; Debussy's *Syrinx*, from Gabriel Mourey's *Psyché*), and substantial sections from scores originally for the spoken theatre have been given new identities in larger forms by composers not wanting to lose sight of good material. In the 18th century, for example, Handel, loath to see the quite extensive score he had written for Smollett's unperformed (and now lost) play *Alcestis* go to waste, reworked it into the all-sung *Choice of Hercules*; Haydn used his music for Regnard's *Le distrait* in his Symphony no.60 in C; and Mozart seems to have had a hand at least in the scheme to provide the sun-worshipping choruses he wrote for Gebler's *Thamos* with Christian texts which might encourage frequent church performance. Similarly, in the 20th century, Elgar used elements of his music for Binyon's play *Arthur* in the sketches for his unfinished Third Symphony; Ibert turned his score for Labiche's *Un chapeau de paille d'Italie* into the independent orchestral *Divertissement*; and Britten recycled his music for a nightmarish dance of typists and office clerks in Priestley's *Johnson over Jordan* as the march variation of his *Diversions* for piano (left hand) and orchestra.

On the other hand, incidental music has also provided composers with the stimulus and/or part of the substance for an even more ambitious stage work on the subject of the host play. Tchaikovsky and Debussy thought well enough of their big scores for, respectively, *The Snow Maiden* and *Le martyre de St Sébastien* to plan turning them into operas, though the appearance of Rimsky-Korsakov's *Snow Maiden* put an end to Tchaikovsky's project as terminal illness did to Debussy's. But Humperdinck's very elaborate *mélodrame* score for Ernst Rosmer's *Königskinder* (1897) did develop into his opera of the same name (1910); Busoni's music for Gozzi's *Turandot* was the substantial basis for his *Turandot* opera of 1917; and Vaughan Williams's involvement before World War I with the provision of music for Shakespeare's 'Henriad' and *Merry Wives of Windsor* at the Shakespeare Memorial Theatre, Stratford-on-Avon, led eventually to his Falstaff opera, *Sir John in Love* (1924–8). But perhaps it is the travels of a few bars of a later Shakespeare score that best exemplify the afterlives of incidental music. Tippett's music for a production of *The Tempest* at the Old Vic Theatre in London in 1962 includes a setting of the invocation 'Come unto these yellow sands', which was published the same year with keyboard accompaniment as one of Tippett's three *Songs for Ariel*, was then alluded to in the *Tempest*-based Act 3 of his opera *The Knot Garden* (1966–9), and appears fleetingly in the orchestral *Songs for Dov* (1970) which grew out of the opera before being given a final home in the cumulative *Suite: The Tempest* assembled in 1995. So are incidental music's revals extended.

Incipit

(Lat.: 'it begins').

The opening words or music in a text or composition. First used in the cataloguing of medieval texts – which tend not to have titles as such – the word has been taken as a noun into English. A 'text incipit' is the opening fragment of text entered below the music in certain song manuscripts; or it is the text opening in an index. A 'melodic incipit' or 'musical incipit' is the opening fragment of music used in a melodic index or [Thematic catalogue](#).

Incedon, Charles [Benjamin]

(*b* St Keverne, Cornwall, bap. 5 Feb 1763; *d* Worcester, 11 Feb 1826). English tenor. The son of a medical practitioner, he disliked his baptismal name and took the name Charles instead. He was a chorister at Exeter Cathedral under William Jackson and was locally renowned as a boy soloist before he joined the navy, where he attracted attention as a singer. In 1784 he made his stage début in Southampton as Alphonso in Arnold's *Castle of Andalusia* and the next year moved to Bath, where he sang with the Bath-Bristol theatre company and studied with Venanzio Rauzzini, who helped him get an engagement in London at Vauxhall Gardens. He sang at Covent Garden (1790–1815) quickly establishing himself as the leading

English stage tenor. He made many guest appearances in the provinces and Ireland and from 1802 toured widely with a series of solo entertainments. Incledon made a successful visit to North America in 1817–18, although his voice was then past its prime. His acting was not generally admired but his dramatic rendering of the ballad *The Storm* (with painted backdrop of a ship in distress) held audiences spellbound. His West Country accent and somewhat flashy personality limited his success as a concert artist, but he sang in several Covent Garden oratorio seasons and was a soloist in the first London performance of *The Creation* (1800). Haydn had heard him in Shield's *The Woodman* (1791) and noted: '[Incledon] has a good voice and quite a good style, but he uses the falsetto to excess. He sang a trill on high C and ran up to G'. For many of his contemporaries his impassioned performances of nautical and sentimental ballads exemplified true English singing. Robson (1846) remembered that 'never was so sound, so rich, so powerful, so sweet an English voice as Incledon's'.

His eldest son, Charles Venanzio Incledon (1791–1865), sang at Drury Lane in 1829–30 and later lived in Vienna as a teacher of English.

OLIVE BALDWIN, THELMA WILSON

Incorporated Society of Musicians (ISM).

British organization founded in 1882 by James Dawber of Wigan and Henry Hiles of Manchester. Its objectives were 'the union of the musical profession in a representative society; the provision of opportunities for the discussion of matters connected with the culture and practice of the art; the improvement of musical education; the organisation of musicians in a manner similar to that in which allied professions were organised; and the obtaining of legal recognition by means of the registration of qualified teachers of music as a distinctive body'. At first the society grew mainly in

the north of England, but in 1886 it held a conference in London to recruit members from the rest of the country, gaining the membership of a number of influential London musicians. In 1892 it was incorporated as an artistic association and took its present title; in 1893 groups were formed in Scotland and Ireland. The society was reconstituted in 1928 to become more generally representative of the musical profession. While a concern for music education remained an important part of its activities, it no longer holds music examinations. Its stated objectives – ‘to promote the art of music, and maintain the honour and interests of the musical profession’ – still stand in its constitution. In its day-to-day work the ISM pursues three aims: to represent and protect those who work with music; to raise standards within the music profession; and to provide its members with advice and benefits. The society is regularly consulted by government departments and agencies on matters of policy. It has established its own professional development schemes, including postgraduate diplomas for private music teachers. In the late 1990s its membership was some 5000. Past presidents have included Boult, Beecham, Menuhin, Pears, Groves, Mathias, Brymer, Hurwitz and Partridge.

HENRY RAYNOR/NEIL HOYLE

Incredible String Band.

British folk-rock band. Its leading members were Mike Heron (*b* Glasgow, 12 Dec 1942) and Robin Williamson (*b* Glasgow, 24 Nov 1943). It was among the most imaginative of the many British groups which attempted to create new musical fusions as part of the underground and psychedelic cultures of the 1960s. Their eponymous début recording (on which Heron and Williamson were joined by Clive Palmer) used Celtic musical forms onto which were grafted elements of blues, pre-1945 American string band and classical Indian music. These wide-ranging stylistic interests were matched by the formidable instrumental skills of Heron and Williamson, who played over 20 instruments between them. The following albums, *The 5000 Spirits or the Layers of the Onion* (Elek., 1967) and *The Hangman's Beautiful Daughter* (Elek., 1968), brought these rhapsodic fusions to a peak in such compositions as *First Girl I Loved*, where shifting melody lines between verses mirrored the fluidity of Williamson's straggling lyrics and melismatic singing; these albums also underlined the pantheism which was a principal preoccupation of the duo's lyrics. This precarious musical and poetic synthesis began to unravel on later recordings and performances, and the Incredible String Band split up in 1974. Heron and Williamson have continued to write, perform and record as solo artists. C. Ford: 'Gently Tender: the Incredible String Band's Early Albums' *Popular Music*, xiv (1995), 175–84

Cultural region of South Asia. The present Republic of India (Hind. Bharat) has an area (excluding the Pakistan- and China-occupied areas of Jammu and Kashmir) of 3,165,569 km² and an estimated population of one billion people. Before Independence and Partition in 1947, the name 'India' referred to the larger region that now includes the nation-states of India, [Pakistan](#) and [Bangladesh](#) (see [Bengali music](#)), also known, along with the nation-states of [Bhutan](#), [Nepal](#) and [Sri Lanka](#), as South Asia or the Indian subcontinent. In addition to reflecting imperfectly the cultural diversity of South Asia, the modern political boundaries obscure the equally important continuities manifested throughout the region as much in music as in other areas of culture. This article addresses 'India' as both a cultural and political entity, and while it focusses on the state of India, much of its content is relevant to the region as a whole. The musical cultures of the other nation-states, and the regions of [Kashmir](#) and [Bengal](#), are separately described under their own names.

4. Social change.

India, Subcontinent of, §I: The region: cultural context and musical categories.

1. Land and people.

South Asia comprises three broad physical regions: the valleys and plains of the Indus and Ganges river systems, separated from each other by the Thar desert; south India with its heartland of the Deccan plateau, surrounded by coastal regions and including the island of Sri Lanka; and the encompassing ring of mountains that separates South Asia from West, Central and South-east Asia (fig.1).

South Asia's geographical position gives rise to a climate that has three main annual divisions: winter, summer and the monsoon. These may be further divided, and the resulting seasons have played a prominent role in literature and song, particularly the coming of spring, the onset of the monsoon and, to a lesser extent, the end of the rains.

Although the surrounding mountain ranges and seas have confined and defined South Asia and its populations, people have migrated through the passes and valleys of the north-western mountains and hills for thousands of years. These migrations include the arrival of the Vedic Aryans (c1500 bce), the invasion of Alexander the Great (327–324 bce) and that of Nadir Shah (1739 ce). After Vasco da Gama's arrival at Kozhikode in 1498, however, the sea became the main medium for the passage of goods, people and ideas into South Asia. By the time of Nadir Shah's land invasion in 1739, European colonial powers and institutions had established themselves along the coast and in the Ganges delta.

The major movements of populations and cultures in South Asia are reflected in the distribution of languages, peoples and religions, and in the broad outlines of South Asian political history. In the west and north-east the languages and populations reflect those of neighbouring peoples. Baluchi and Pushto, spoken in western Pakistan, are Indo-Iranian languages; the languages of the north-east are Tibeto-Burman. Within South Asia, principally in the central and eastern hills dividing north from south India, remnants of Ādivāsī ('indigenous') groups survive, e.g. the Santāls. They have their own religions and speak Austro-Asiatic languages known collectively as Mundā. The Mundā speakers are probably part of the aboriginal population of South Asia, driven into the hills by later migrations of Dravidian-speaking peoples.

Dravidian languages are spoken in south India. Kanada, Malayalam, Tamil and Telugu are the state languages of Karnataka, Kerala, Tamil Nadu and Andhra Pradesh respectively (fig.2). Another Dravidian language is Gondi. Once widely spoken, this is now restricted to small groups of hill peoples. Dravidian languages probably once dominated South Asia, but north of the Vindhyas the only remnant of (and the strongest evidence for) a once widespread Dravidian population are the Brahui in Baluchistan.

In north India most languages belong to the South Asian branch of the Indo-European group. The most widely spoken language is Hindi, used from Delhi to Varanasi. The closely related and Persianized language Urdu is spoken across Pakistan and by many Muslims in India. Punjabi and Rajasthani are closely related to Hindi, and several languages in Bihar

(Bhojpuri, Maithili and Magadhi) are usually considered dialects of Hindi. Bengali is spoken in West Bengal and Bangladesh. In western India the languages of Gujarat and Maharashtra are Gujarati and Marathi respectively. Sanskrit is an ancient Indo-European literary and ritual language.

The culturally dominant religions of South Asia are Hinduism and Islam. Although substantial Buddhist populations now remain only in Sri Lanka and the Himalayan region, Buddhism originated in South Asia and, along with Jainism, was dominant there between c500 bce and c500 ce . Around 600 ce Hinduism, driven by the *bhakti* philosophy of the Tamil Ālvār (Saivite) and Nāyanmār (Vaisnavite) saints, underwent a great reformation and revival. By the 10th century ce Buddhism was already declining in South Asia when a series of invasions from Afghanistan and Turkestan brought Islam to the north. By the 13th and 14th centuries the Delhi Sultanate had established a pattern that remained unchanged until 1947, despite a long succession of political changes: throughout north India a small, predominantly Muslim ruling class governed a mixed population of Hindus and Muslim converts.

In south India the patterns were rather different. By the 14th century the Tughluk sultans of Delhi had established Muslim rule in the north and west of the Deccan plateau, governing an overwhelmingly Hindu population. In the southern Deccan the Hindu population was ruled by the Hindu Vijayanagar kings (mid- 14th to mid-16th century), with Hindu governors and a Hindu landed class. Even when Vijayanagar power was finally broken, predominantly by the Muslim states of Bijapur and Golconda, there were areas further south, such as Thanjavur and Travancore, which came under only nominal Muslim rule for no more than a few years, if at all.

These patterns were disrupted by the partition of South Asia in 1947. Independence from British rule meant the creation of the nation-states of India, a secular republic, and East and West Pakistan (since 1973 Bangladesh and Pakistan), an Islamic state. The mass exchange of populations that followed, with Hindu and Sikh refugees fleeing to India and Muslims to Pakistan, altered the religious demography of north India and, in particular, that of Pakistan.

South Asia's climate and geography combine to create extremely fertile agricultural regions, producing surplus economies that have sustained large populations, feudal rulers and non-producing specialists, including musicians. Industrialization has added to this long-established system of production, which principally served an élite and produced an elaborate culture. Mass production, technology and urban expansion have led to an increase of the urban working and middle class, with business élites joining or replacing a landed ruling class.

A highly stratified social order has served to articulate and regulate economic, gender and power relations through group endogamy and through an asymmetry of status relations, where dominance and deference exist between patron and client, resource owner and producer, senior and junior, male and female. Marriages take place largely within the same caste, class or hereditary group, thus maintaining its relative status and preserving the transmission of heritage, including musical skills. Within

extended families the asymmetrical principle of seniority permeates kinship relations. Life-cycle music plays a major role in negotiating these relations, performed by women who are the traditional managers of the domestic sphere. Complementary gender roles run throughout the social order, resulting in gendered music-making for both men and women. However, gender may intersect with many other aspects of social identity. Women are often perceived in terms of their relationship with and to male members of their family, including their husband. This private identity has traditionally clashed with the public identity of professional female performers, from temple dancers to courtesans.

This system of social stratification draws on Hindu Vedic thought. At its heart lies the idea that any number of population groups could be accommodated together in vertical and horizontal hierarchies, provided that the groups had separate and clearly defined obligations to society as a whole. Furthermore it was necessary that (in principle at least) such groups were endogamous, so that the membership of a group was purely hereditary. Individuals could leave the group or be expelled from it, or even become the nucleus of a new group, but they could not become members of another group. Such a group is a *jāti* or caste. Each *jāti* had its proper duties and forms of behaviour, its own *dharma*. If what was required was onerous or degrading, an escape was available through the doctrine of rebirth. Faithful performance of *dharma* (performing rituals, trading, disposing of polluting wastes etc.) would ensure a higher status in the next life.

In practice, the doctrine of social identification and articulation through separate castes or sub-castes enabled invading groups and conquered groups, successful groups and depressed groups, to be accommodated easily into a larger society. Successful invaders could be seen as a warrior sub-caste high in status; a group of forest-dwelling Ādivāsīs absorbed as a low sub-caste. Other religious communities have adapted themselves to this system. Muslims, Sikhs and Christians have distinct endogamous groups, especially among artisans and musicians, albeit with some degree of social mobility.

Around 70% of the population of South Asia lives in socially interlinked regional networks of agricultural villages. Urban centres have also been important from the early Indus valley civilizations onwards. Some cities, such as Trivandrum or Varanasi, grew up around pilgrimage sites or important temples. Others developed as political centres, either because of their strategic location, such as Delhi or Gwalior, or as centres of administration, such as Lucknow or Thanjavur. Cities also grew as market towns or trading centres, including Madras (Chennai), Bombay (Mumbai) and Calcutta, which developed as port cities under British rule. These functions are not mutually exclusive, and many cities have developed in multiple ways; Bombay is now as famous for its film industry as its stock exchange. Often, however, a traditional speciality, of religion, politics or trade (mirroring those of the three twice-born Hindu castes (*varna*), Brahman, Ksatriya and Vaisya), may still be discerned.

[India, Subcontinent of, §I: The region: cultural context and musical categories.](#)

2. Music and musicians.

(i) The South Asian musical realm.

South Asia may be seen as a 'linguistic area', with certain phonetic and syntactic features found only in South Asian members of the Indo-European language family in the north and shared by them with the Dravidian languages of the south. Anthropologists have come to consider the special articulation and role of social hierarchies to be characteristic of South Asian societies, pointing to, among other things, the existence of caste among Muslims as well as Hindus. South Asian civilization has also accepted, assimilated and ultimately transformed whatever musical elements have come into its embrace.

The modern South Asian musical realm shares with West Asia an emphasis, at most socio-musical levels, on plucked string instruments and on melodic lines in conjunct motion. A practice shared with South-east Asia is the use of idiophones – cymbals, clappers or gongs – to mark off the spans of musical time cycles.

Another characteristic of the South Asian musical realm is a special emphasis, distinctive both in degree and kind, on drumming. Drummers in South Asia have been free to develop traditions of independence and virtuosity. As in South-east Asia, they are released from having to keep time, as that primary function is assigned elsewhere: in South Asia hand-clapping and hand-waving, cymbals and even cyclically repeating melodic phrases are also available to control the metric cycles. At the same time the South Asian drummer, as in West Asia and unlike in South-east Asia, is associated with only one melodic line at a time.

In the South Asian border regions musical styles, like languages and social practices, are likely to reflect certain features of neighbouring musical practice. Kashmiri singers use a vocal quality similar to that of Persian classical singers, and the plucked *sehtār* and the mallet-struck *santūr* are both played with the rapid repeated-note *rīz* characteristic of West Asian string-instrument technique. The songs of the Sherpas in eastern Nepal use segments of the anhemitonic pentatonic systems common to neighbouring Chinese regions. The Gonds of the hills of eastern south India also use similar systems. However, the more such peoples mix with the settled agricultural populations of the northern plains or south India, the more their song styles are assimilated with or even replaced by those of their neighbours.

Music in South Asian villages is richly diverse, especially in domestic and community song and dance genres bound to both the seasons and life-cycle events. Often linked to agricultural cycles, village music also influences, and is influenced by, urban and art music styles. A distinction may be made between art and non-art musics, with the category of 'art' or 'classical' music being distinct from those of 'folk' or 'popular'. The Sanskrit tradition recognizes this in the terms *mārga* ('way, path [to salvation]'), which implies both the universal and salvific, and *deśī* ('provincial, of the country'), implying localized to a region and a community. During the 20th century, decades of recording and broadcasting generated other pan-South Asian musical categories:

devotional song, both Hindu and Muslim; popular song, especially film music; and 'folk' music in standardized versions of local traditions.

Classical or art music is identifiable not only by its highly regularized systems and rich aesthetic, but also by its patronage by dominant élites. These range from the historical temple and court establishments that included the Moghuls and regional rulers of all religions (e.g. Hindu Vijayanagar and Thanjavur, Muslim Lucknow and Sikh Amritsar), to a coalition that evolved during the 20th century among landed, commercial, professional and government élites across South Asia (e.g. Baroda, Kathmandu, Rampur, Calcutta, Bombay and Madras). The resulting 'public culture' of a cosmopolitan bourgeois art music rests on a normative synthesis of musical principles and practices that today define Indian classical music as a cultural and sonic system. Based on the cumulative work of Indian musicologists from V.N. Bhatkhande to the contributors to the current *Indian Musicological Journal*, this normative conception of an Indian art music is articulated in teaching and performance by music academies in large urban centres (e.g. the Music Academy, Madras, and the Sangeet Research Academy, Calcutta); it also forms the basis for the teaching of South Asian music internationally.

(ii) Art music.

(a) Legitimizing criteria.

In South Asia the concept of art music is based on an amalgam of scriptural foundation and oral transmission. Authoritative theoretical doctrine and a disciplined oral tradition of performance extending back over several generations are the two complementary criteria that serve to legitimize Indian art music and its theoretical and historical foundation.

The Sanskrit term *śāstra* means either a text containing an authoritative exposition of doctrine in a particular field, or the body of doctrine itself. A field of knowledge or an art must be embodied in a *śāstra* to be fully legitimate; *nāṭya-śāstra* is the theory of dramaturgy, and its junior branch, *sangīta-śāstra*, is the theory of vocal music, instrumental music and dance. *Nāṭya-śāstra* now generally pertains only to representational performance, including dance, and *sangīta-śāstra* governs only vocal and instrumental music.

Varying aspects of *śāstra* may have varying degrees of relevance to practice, or no relevance at all, but for South Asian art music the legitimizing agent is *śāstra*. For music theory and practice there is one aspect of the traditions of *sangīta-śāstra* that must be represented for a performance tradition to be deemed 'classical': melodic configurations must be governed by one or another *rāga*. *Rāga* is usually translated as 'mode' or, more accurately, 'melody type' (see §III, 2 below; see also [Mode, §V, 3](#)). In Hindi the formal expression for 'classical music' (besides the English) is *śāstrīya-sangīt*, but the common equivalent for 'classical' is simply *rāgdār* ('having a *rāga*'). Most widely used in the oral tradition of hereditary musicians is the term *pakkā* ('mature', 'cooked', 'perfected'). A generic term for classical music, it is always applied to vocal music, as in *pakkā gānā*.

The terms used to refer to the second legitimizing criterion of authenticated performing practice are *sampradāya* ('tradition') and *paramparā* ('succession'). These criteria and the Sanskrit terms associated with them are valid for all South Asian 'classical' traditions, Muslim and Hindu alike, with differences only in balance or emphasis. A 'pure tradition' (*śuddha sampradāya*) authenticated by a reputable 'master-disciple succession' (*guru-śiṣya paramparā*) may be considered to denote that musicians performing classical music should have a 'professional' standing; however, such a standing need not be confined to those who practise their art as a means of livelihood. The standing of an artist is determined by disciplinary pedigree, by a reputation for devotion to the art, and by what the artist knows, as well as by his or her skill as a performer.

It is essential not only for an artist to have learnt from a master but also that the master have a reputable artistic pedigree. Sometimes (particularly in Muslim musical traditions) the art is a hereditary family property, and in the past the most revered items or techniques were sometimes given only to the eldest son. Usually in Hindu musical traditions, and often in Muslim traditions also, the succession from master to disciple is outside the family. However, the ideal relationship requires the disciple to live in the teacher's house and serve him devotedly, as though a member of the *guru's* household (*guru-kula*). Although this requirement is often necessarily abrogated, it is still followed to whatever extent may be possible. Important is the religiously sanctioned tie (both Hindu and Muslim) that binds teacher to disciple, as expressed in the *gandā bandhan* (thread tying) or *shāgirdī* (discipleship) ceremony.

Honour to one's teacher and a reputation for concentrated hard practice extending over many student years (Sanskrit: *sādhana*; Persian: *riāz*) are two of the main proofs of an artist's devotion to the artistic heritage. Another aspect is devotion of a purely spiritual kind. Although most musicians earn a living by their art, both the years of discipline and the resultant knowledge and skill would in an ideal world be a devotional act.

Finally, of course, high professional standing as a 'classical' artist entails a minimum standard of performance, and many classical artists are technically very highly skilled. Knowledge and control of a large repertory of musical items not otherwise widely known, but recognized as part of a reputable tradition, are also particularly esteemed.

(b) Northern and southern styles.

In South Asia there are two traditions of art music. Hindustani (or north Indian) classical music represents the region where Indo-European languages are spoken (including Pakistan and Bangladesh). In the Dravidian-speaking areas (i.e. most of south India) the tradition is that of Karnatak (or south Indian) classical music. Hindustani and Karnatak music are the same in essential abstract features but different in detail. The basic structure of typical ensembles is common to both: in addition to a drone there are three separate and independent musical roles, assigned to three classes of medium. The primary melodic material is traditionally carried by a singer, a plucked string instrument or a reed instrument. Antiphonal or accompanying melodic material is sometimes provided by a bowed instrument (with the singer) or a second reed instrument; bowed

instruments and transverse flutes are now used as solo melodic instruments. Drums provide an independent rhythmic stratum, from simple configurative cyclic patterns to complex virtuoso passages. Rhythmic and melodic parts in ensemble are held together on a third level, provided by idiophones or hand-clapping or both, marking out the time cycles. This threefold melodic, rhythmic and metric distinction of role is not only common to both South Asian classical styles but is relevant for non-classical ensembles as well. However, the specific characteristics of these three basic roles differ, and even vocal production is strikingly dissimilar in the two styles.

Likewise an adherence to *rāga* and *tāla* (time cycle) and their basic principles is common to the two styles, and many *rāga* and *tāla* names are identical, although the actual pitch content of the *rāga* and the measures of the *tāla* are usually different. In similar fashion, fundamental categories of performing practice are nearly the same, but the preferred expository techniques, ornamental styles and use of tempo are different and differently apportioned. The two musical styles are in essence very similar but not mutually intelligible.

A parallel set of observations can be made with respect to the socio-musical features of the recent past, still reflected in many aspects of the current scene. Hindustani classical musicians from the 17th to the 19th century were mostly Muslim, largely associated with courts, normally considered fairly low in the caste hierarchy, and concerned less with *śāstra* (doctrine) than with guarding their *sampradāya* (oral traditions); the common pair of terms for 'master-disciple' was the Persian *ustād-shāgird*, which carries the connotation of master craftsman and apprentice. In the south the Sanskrit equivalent *guru-śisya* has a cultural connotation nearer that of spiritual teacher and disciple, and the musicians were almost entirely Hindus, certain of the melodic sub-categories, even being dominated by high-caste Brahmans. Art music was strongly associated with temples and with more individualized religious devotion, as well as with courts.

From the 17th to the 19th century the stylistic distinction between Karnatak and Hindustani can be closely correlated with the more general South Asian dichotomy between Hindu and Muslim, and there is a corresponding contrast between Sanskrit and Persian words in much of the technical terminology of practising musicians, particularly with reference to instruments. From this it has been almost universally inferred that the differences in the two art music styles are a result of Muslim influences and importations in the north that caused an originally unified tradition to divide into a northern, foreign-influenced branch and a southern branch that was more conservative and truer to its ancient heritage. This is true only if the categorical types are confounded: two general classes of *sampradāya* and one accepted tradition of *śāstra*. The two kinds of classical music are demonstrably quite separate and distinct from one another from at least the 16th century onwards and probably were for some time before that, yet both are equally distant from what is reported in the 13th-century treatise *Sangīta-ratnākara* by Śārngadeva.

[India, Subcontinent of, §I: The region: cultural context and musical categories.](#)

3. Musical categories.

The considerable diversity in local and regional musical practices in South Asia and the variety of contexts in which music plays an essential role may be distinguished in terms of purpose, setting and medium. Purpose refers to a continuum extending from entertainment to ritual and devotion, and usually incorporating aspects of both. Setting denotes in general outside versus inside, village versus temple (or shrine) and court, and city street versus concert auditorium. Medium is not concerned with only purely musical performance but also associated arts; its three basic varieties may be designated as vocal, instrumental and representational. These categories are based on the three branches ascribed to *sangīta* ('music') in the oldest stage of *śāstra*, namely, *gīta* ('song'), *vādyā* ('instruments') and *nṛtta* ('dance'). Vocal music is linked with a verbal text; instrumental music may exist independently or accompany vocal music; representational music may be vocal, instrumental or both, and it accompanies visual representation of one sort or another. These categories interact: the voice sometimes sings no meaningful text or is otherwise treated as an instrument, and in certain kinds of representational musical performance the entire burden of evoking specific images may rest on the vividness of a spoken or sung narration.

(i) Ritual and ceremonial music.

(ii) Representational music.

(iii) Devotional songs and musical form.

India, Subcontinent of, §I, 3: The region: cultural context and musical categories., Musical categories.

(i) Ritual and ceremonial music.

Some purely ritual music falls outside the normative domain of music; the oldest ritual music of this type is Vedic recitation. In one Sanskrit source, the *Nārādīya śikṣā*, the pitch names used for singing the *Sāmaveda* are equated with classical note names; the first half of this work is in fact a summary treatise on music theory incorporated into what is primarily a manual adjunct to the Veda. On this authority modern writers often begin historically orientated discussions of Indian classical music by referring to or discussing the chanting of the *Rgveda* and the elaborate transformation of some of its hymns in the *gāna* (singing or chanting) of the *Sāmaveda* through interpolated syllables and an expansion of the pitches. However, *sangīta-śāstra* (musical theory) does not discuss Vedic recitation or singing beyond giving the equivalent note names, nor are Vedic specialists considered musicians, by themselves or by others (see §V, 2 below).

Certain quasi-musical aspects of temple ritual are also not normally considered music, such as the sounding of bells during temple *pūjā* (worship). Similarly, the blowing of the conch-shell (*śankha*) is normally a ritual, not a musical, event, although the conch is also used evocatively in a musical event, for example to symbolize divine intervention in performances of *kathakali* in Kerala. On the other hand, such special instrumental practices as the accompaniment of temple ritual with the *pañca-mukha-vādyam* (five-faced pot drum) and *maddalam* (drum) in the temple at Tiruvarur (in the Kaveri delta) are well within the domain of

music, since drums as a class are by no means exclusively ritual instruments, unlike large bells or the conch.

Also associated with south Indian temples is the processional *periya melam* ('major ensemble'), comprising double-reed *nāgasvaram* (shawm), the *tavil* (drum) and *tālam* (cymbals). The *cinna melam* ('minor ensemble') accompanies the temple and formerly court dance now called *bharata-nāṭyam*. The music of both ensembles is Karnatak. The Hindustani equivalents of the *periya melam* are based on the somewhat smaller double-reed *śahnāī* (shawm), used formerly in the ceremonial *naubat* ensembles of Muslim courts and shrines, and in most Hindu temples (see §III, 6 below). Musicians of all these ensembles belong to low-status castes; in the north they are also normally Muslims, even those employed at Hindu temples.

[India, Subcontinent of, §I, 3: The region: cultural context and musical categories., Musical categories.](#)

(ii) Representational music.

The nucleus of most traditional entertainment is story-telling. Narrative in its broadest sense ranges from verbal exposition of a tale to its presentation with pictures, puppets, acting, costume, make-up or dance, in any combination, accompanied by recitation, singing and instruments. Since in South Asia the Islamic prohibition against human depiction (apart from manuscript illustration) has considerable force, representational music is almost entirely Hindu.

The Chitrakars of West Bengal paint scrolls illustrating scenes of stories from the Hindu epics and travel about telling the stories in song as the scrolls are unrolled to show the individual pictures. The same is done by travelling groups in south-western Rajasthan. Shadow-puppet theatre is found in four areas of southern India – Orissa and Andhra Pradesh to the north-east, Karnataka and Kerala to the south-west – and puppet shows are seen in Thanjavur, Orissa, Rajasthan and elsewhere. In Rajasthan the puppeteer's wife sings and plays the drum; the shadow puppets of the Andhra *tolu bom-malāttam* are accompanied by singing, flute and drums.

Varying relationships with Karnatak music are well illustrated by an interlocking complex of traditional genres of musical representation with human actors in south India. In 16th-century Vijayanagar there was a genre called *yaksagāna*, which consisted of a long narrative poem in Telegu to be sung and acted. Several varieties of *yaksagāna* still survive, and in all cases the performing practice calls for an ensemble that includes one or more singers who sing the narrative verses freely, using traditional melodic types, and who also sing a number of set pieces. Instruments provide melodic, rhythmic and time-keeping accompaniment. In some varieties of the genre the actors too may sing, or even speak, in amplification of the text, but their main function is to enact the text in the coded performance called *abhinaya*.

Two forms of *yaksagāna* in the south-east are the dance-drama from the village of Kuchipudi in the Krishna-Godavari delta and the *bhāgavata-melanātakam* ('devotee-singers' group-drama') from Melattur village, inland from the Kaveri delta. Both are in principle associated with temples. The

performers are male Brahmans whose ancestors were endowed with property so that they and their descendants might continue performing *yaksagāna* on Hindu religious myths. All three fundamental musical functions are represented in the Kuchipudi ensemble of flute (melodic accompaniment), *mrdangam* (rhythmic drumming) and cymbals (time-keeping), which are played by the leader (who also represents the most important secondary character). The musical procedures, rāgas and vocal production are those of Karnatak music.

The *yaksagāna* of Karnataka is performed by travelling troupes. Its affinity with Karnatak music is hardly less than that of the Kuchipudi and Melattur traditions. In its musical ensemble it has a strong affinity with Kerala, in that there is no melodic accompanying instrument for the singer, the two drums are Keralan types, and the time is sometimes kept by a flat gong as well as by cymbals. Also reminiscent of Kerala is the fact that many of the male characters have elaborate stylized head-dresses.

The ensemble that accompanies the *kathakali* dance-drama of Kerala comprises two singers, *maddalam* (barrel drum), *centā* (cylindrical drum), *itekka* (hourglass drum), *cennalam* (flat gong) and *ilatālam* (cymbals). The system and the tālas in *kathakali* music are not those of Karnatak music, although each individual tāla has a parallel in the Karnatak system. Most of the rāgas, however, have become largely assimilated as Karnatak rāgas, and few *kathakali* rāgas have different names.

Similar kinds of partial affinity with art music traditions may be observed in all other areas of South Asia. An example is the evolution of Marathi musical theatre after the 1840s from a form in which narrative and songs were sung by one person throughout in a single style, while actors handled only dialogue, to a complex musical genre using singers specializing in different styles for different roles, and incorporating not only stylistic influences but also rāgas and actual tunes from Hindustani classical and semi-classical music.

[India, Subcontinent of, §I, 3: The region: cultural context and musical categories., Musical categories.](#)

(iii) Devotional songs and musical form.

(a) Tamil: the oldest songs.

The oldest surviving poetry is in Tamil and dates from the 7th century to the 10th. The poems were assembled c1000 into two great collections: the *Tēvāram*, which contains songs to Śiva, and the *Nālāyirativviyappirapantam*, which is devoted to Visnu. Hymns from these collections are still sung in temples of the respective sects in Tamil Nadu. The Saivite *Tēvāram* are sung only in temples, by a class of temple singer called *oduvār*; they are grouped according to melodic types called *pan* and specific tunes called *kattalai*. Most of the *pan* now correspond quite precisely to melody types in the current canonical roster. Songs from the Vaisnava *Nālāyirativviyappirapantam* are sung not only in Vaisnava temples (such as the Ranganāthan temple at Srirangam) but also in private devotions and in concerts; tunes in Karnatak rāgas are used. Modern tunes in Karnatak rāgas are also used for singing the 15th-century *Tiruppukal* ('blessed praises') of Arunakiriyār, a devotee of the god Murukan, very

popular in Tamil Nadu; the rhythms, however, are usually sung to follow the complex metres of Arunakiriyār's verse.

(b) Gīta-govinda: the model form.

Sung throughout India, Jayadeva's 12th-century Sanskrit poem *Gīta-govinda* is a sequential series of 24 songs set in a matrix of verses concerning the love of Kṛṣṇa for his mistress-consort Rādhā. The *Gīta-govinda* has flourished alongside later devotional songs in other languages, and songs from it may still be heard in many areas in India, rendered in many different ways. Its content, saturated with *mādhurya bhāva*, the 'tender emotion' of erotic love, is perhaps no more than an intensification of the emotional theism of the *Bhāgavata purāna*; in its form, however, the *Gīta-govinda* is a departure from the traditional conventions of Sanskrit poetry and gives a clear illustration of new aspects of devotional song, ranging from syllabically sung *nāmāvali* (lists of divine names) to the complex vocal performance traditions of Hindustani and Karnatak music.

The narrative verses of the *Gīta-govinda* are set in conventional classical Sanskrit metres, each line with a fixed number and distribution of long (—) and short () syllables (+ = —). The songs, however, use metres based on the number of short syllables to a line. The most common is the four-unit *catur-mātrā* (—, —, —, —, and, with some restriction, — —), but the five-unit *pañca-mātrā* (—, —, —, —, —, and, with some restriction, — — and — —) is used in several songs. Metres of this kind play a minor role in Sanskrit but are essential to poetry meant to be sung.

Classical Sanskrit poetry uses consecutive four-line stanzas; the songs in the *Gīta-govinda*, conversely, are closed refrain forms. Each of the 24 songs comprises a refrain (*dhruvā*) and eight stanzas, called *pada*; hence the common designation *asta-padī* ('having eight stanzas') for a *Gīta-govinda* song. After each stanza the refrain is sung, and the text is structured semantically and often grammatically so that the independent refrain is also a logical or even a necessary completion of the stanza. In the performance of *bhajan*s (devotional songs) a leader and a group normally sing the stanzas and refrain alternately. There is a musical as well as textual contrast between the theme of the refrain and the theme of the verse, and there is usually a musical and a textual end-rhyme common to refrain and verse. These three textually determined features – leading back, contrast of refrain and verse, and musical rhyme – are fundamental to the performing practice not only of *bhajan* singing but also of Hindustani and Karnatak music. The very structure of *rāgas*, quite apart from their embodiment in performance, has to be seen in terms of these same three features: connections in line, contrast in registers and parallelism in melodic motifs.

(c) Devotional poetry in north India.

Each of the 24 *asta-padī* of the *Gīta-govinda* is designated in the manuscript sources as to be sung in a specific *rāga* and *tāla*. In no part of India is it sung with the varying *rāgas* and *tālas* prescribed in manuscript sources, but it is often locally associated with series of *rāgas* and *tālas*; the common current south Indian traditional settings are said to date from the 17th century. Later devotional songs in the vernacular, such as the *Sūr*

sāgar of Sūr Dās, are also frequently found with *rāgas* (not *tālas*) specified in manuscript sources. The sacred book of the Sikhs, the *Guru Granth Sāhib*, is a compilation completed in 1604 of devotional songs not only by the founder of the sect, Guru Nānak, but also by other 15th- and 16th-century devotional poets, especially Kabīr. The main body of the collection is divided into 30 sections called 'rāga' (the 31st was added later), each named after a specific *rāga*.

Devotional songs from the 15th and 16th centuries in Indo-European languages, like the 12th-century *asta-padī* songs of Jayadeva, are now not usually sung in the *rāgas* ascribed to them in manuscript sources, and usually not in a *rāga* at all.

(d) Kanada and Telugu devotional songs.

The oldest repertory of Dravidian-language devotional songs to extend throughout south India are the Kanada *kīrtana* of Purandara Dasa (*d* 1564); although their actual melodic tradition is now effectively lost, they were (and still are) sung in *rāgas* and *tālas*. Purandara Dasa was active in the area of the Deccan where the imperial court of Vijayanagar was located and died just a year before the battle in which that court was destroyed and the remnants of the imperial family fled southwards. The tradition of *bhakti* (devotional) song in Kanada declined after his death and was revived in the 17th century.

Two important Telugu *bhaktas* (devotees) from Andhra in the 17th century were Ksetrayya from the Krishna-Godavari delta and Rāma Dāsa from Bhadracala (in the then Muslim sultanate of Golconda, later Hyderabad). Bhadracala Rāma Dāsa's songs are sung only by *bhajan* groups, but the songs (*padam*) of Ksetrayya devoted to Krsna became a basic element of the temple dance of the *cinna melam* and an essential part of the south Indian musical repertory. Ksetrayya spent some time at the court of Vijayaraghava Nāyak of Thanjavur (reigned 1634–73), for whom he composed several laudatory songs, but most of his *padam* compositions concern Muvva-gopāla, the image of Krsna in the temple of his native village.

In the latter part of the 18th century the most important modern south Indian procedures of devotional *bhajan* (or *kīrtanam*) were devised, and the musical repertory assembled or provided, by devotional poets Bodhendra, Ayyaval and Sadgurusvāmi. At this time Tyāgarāja (1767–1847) was undergoing his musical and spiritual training. Tyāgarāja is now esteemed as the foremost composer of the modern south Indian tradition of classical music. Early in his life he became a devotee of Rāma, who (like Krsna) is believed to be an *avatar* (incarnation) of Visnu. The characteristic devotional attitude of the Krsna cult is *mādhurya bhāva* ('attitude of sexual love'), exemplified by the *gopī* ('milkmaids') and especially Rādhā; the devotees of Rāma, conversely, tend to favour the *dāsya-bhāva* ('attitude of devoted service'), as exemplified by Rāma's brother Laksmāna and especially by the monkey prince Hanūmān. In Tyāgarāja in the early 19th century two major streams of south Indian musical tradition were fully united: Vaisnava devotional song and the tradition of the Thanjavur court musicians. Tyāgarāja's *kṛitī* compositions are now part of the central

repertory of Karnatak music, yet the songs he made for his own *bhajan*s also play a major role in any organized session of devotional singing.

(e) Muslim devotional music.

For Hindus music was and is an integral part of worship, temple and private alike, while for Muslims even 'secular' music was frequently subjected to orthodox attack, and in principle no music was used for public worship, even the most artful cantillation of the Qu'ran being defined as non-musical reading. Thus, for Muslims, devotional music and classical music at court were necessarily much more distinct from one another than they were for Hindus. Nonetheless, there are some connections.

The most important type of Muslim devotional music is *qavvālī*, sung at the shrine of a Sufi *pīr* ('saint'), especially at the saint's anniversary, and traditionally performed by specialist musicians called Qavvāl. There is now no necessary connection with classical music, but in the 18th and 19th centuries Qavvāl-bacce sang the *khayāl* (a classical song form) and were among its important exponents. Some items of the traditional repertory of compositions for Hindustani music were drawn from *qavvālī*. A number of traditional *khayāl* dating from the 18th century, which are still sung, honour important *pīr* of the Chishtī order. These *khayāl* texts on Sufi saints differ from other *khayāl* texts only in vocabulary.

Another Muslim devotional practice that has some connection to classical Hindustani court music is the music used by Shi'a Muslim groups in the month of Muharram, lamenting the martyrdom of Hasan and Husayn. One of the songs used is called *marsiyyā*, and some classical musicians used to specialize in *marsiyyā* singing. Singers of Shi'a mourning hymns like *sōz* and *marsiyyā* still use classical *rāgas*.

[India, Subcontinent of, §I: The region: cultural context and musical categories.](#)

4. Social change.

Distinct musical categories are traditionally associated with distinct performing communities consisting of specialist performers who are linked to particular patrons and musical associations. Bismillah Khan playing *śahnāī* for temple rituals in Varanasi, Sufi Qavvāls at Delhi's Nizamuddin Sufi shrine, musicians at the Jaipur court, mendicant singers in north Indian villages or hereditary dancer-singers, both male and female, among the Mundā in Bihar, have all provided appropriate music and dance for quasi-feudal patrons. However, urbanization and the waning of feudalism have also generated opportunities for social mobility among hereditary performers. Among the Barot, many Gujarati genealogist-musicians who by birth are attached to minor feudal patrons have moved into better paying urban *métiers*, leaving less endowed non-Barots to replace them and take on their caste name.

Among Muslims, social mobility has long been demonstrated by the Mīrāsīs' rise from Punjabi village entertainers to court musicians, and today to higher education and international stardom. Most remarkable has been the middle class initiative across the country to become classical performers, a move that has fundamentally altered the social structure of

music-making by replacing hereditary professional identity with bourgeois professionalism. This movement has, however, also profoundly damaged the musical standing and livelihood of lower-status hereditary musicians, especially women who as courtesans or *devadāsīs* (temple dancers) have been stigmatized by the now dominant Indian middle class.

After 50 years of independence the established musical conservatism and categories generated by nationalist agendas are beginning to give way to questions and innovations under the influence of new sound technologies that have enabled local control of musical production as well as the international dissemination of and participation in all kinds of South Asian musics.

India, Subcontinent of, §II: History of classical music

1. Introduction.

For South Asian classical music the primary historical sources are the same as the legitimizing agents: authoritative traditions (*sampradāya*) of existing musical practice (*prayoga*) and canonical theory (*śāstra*; see §I, 2(ii)(a) above). Because the two 'classical' performing traditions were until modern times transmitted entirely orally, evidence documenting musical details of actual past practices is sparse. Doctrine, however, has been transmitted through manuscripts for centuries.

Divisions in South Asian music history, therefore, are primarily determined by the nature of the sources, which are then correlated as much as possible with more general political and cultural history. Considered in this light, there are three major epochs in music history: up to the mid-13th century; from the mid-13th century to the mid-16th; and from the mid-16th century onwards. They may be termed ancient, medieval and modern respectively.

No existing *sampradāya* of classical music has any direct connection with the ancient period, whose sources for music history are only textual and iconographic. Textual sources are technical discussions in Sanskrit treatises and passing references in literature, mainly in Sanskrit, Prakrit and Tamil. Iconographic sources consist of numerous sculptures of musicians and their instruments. Both types of source suggest regional diversity as well as historical change, but the absence of immediately apprehendable evidence of incompatible musical practices and the use of Sanskrit as the language of discourse have encouraged a monolithic view of ancient music. This attitude is furthered by the monumental *Sangīta-ratnākara*, a treatise on music composed between 1210 and 1247 in Devagiri (modern Daulatabad), in the north-west of the Deccan, by

[Śārngadeva](#), a Brahman of Kashmiri descent. This work is a watershed in South Asian music history. It contains a vast amount of older doctrine and lore, organized in seven coherent sections. The substance of ancient *śāstra* was transmitted to later writers through the *Sangīta-ratnākara*, whose form determined the categories of South Asian music theory from then on.

Between the clearly marked end of the ancient period in the 13th century and the earliest documentation of prototypes of modern classical practices in the 16th century lies what is here called the medieval period. During these centuries the attempted southern expansion of the Delhi sultanate took place, followed by its fragmentation after Timur's invasion of 1398 and ultimately the reconquest of the fragments by Akbar. The Deccan Muslim courts and the Hindu empire of Vijayanagar in peninsular India were also established during this period. Although direct connections from these centuries to the present traditions of music cannot be firmly proved, the outlines of the modern period are unmistakable. Historical sources (although from a much later period) abound in anecdotes about historical personages and music, and some of the musical traditions reported may well be sources for those we know directly. From this period it is already possible to infer a distinction between northern and southern musical regions, a distinction that is historical and ultimately geographical in its origins. Anecdotes show that musicians moved back and forth with the shifting fortunes of the various Muslim and Rājput courts in the Indo-Gangetic plain and similarly between the closely neighbouring Muslim and Vijayanagar courts in the peninsula. Musical exchanges across the Vindhyas, on the other hand, are reported only as a consequence of major military excursions. The familiar equation of Hindustani–Karnatak with Muslim–Hindu, thence hybrid–pure, and ultimately foreign–native, is a result of the fact that the radial centres of the latest phases of the two styles were Muslim Delhi and Hindu Thanjavur. However, before the shift of the centre of gravity of Karnatak music from Vijayanagar in the Deccan to the Kaveri delta in the far south in the late 16th century, the Hindu and Muslim courts in the peninsula had been as close as the Hindu and Muslim courts of the Rājputs and the Ganges-Yamuna Doab, and for almost as long.

Devotional theism had its most phenomenal development during the period from 1300 to 1600. The deep connection of not only its content but also its form with the underlying bases of the modern classical musical practices has been outlined above. Where both practices and historical anecdotes of the medieval period appear to look forward to the modern period, Sanskrit theoretical writings on music contain only fragmentary (though very interesting) foreshadowings of practices and ideas that take on a familiar look in both theory and practice only in the late 16th century.

The third period of music history is dominated by the history of *sampradāya* as embodied in the canonical traditions of Hindustani and Karnatak music. Both traditions can establish a claim to 16th-century roots, of which something demonstrably still survives. *Dhrupad* compositions of Akbar's court musician [Tānsen](#) are known, and many existing musical lineages are traced to Tānsen's family and immediate successors at the Mughal court. In the south the elementary teaching system for Karnatak music is

attributed to Purandaradāsa (c1484–1564), although the *padam* compositions of Ksētrayya (fl 1635–59) constitute the oldest repertory whose actual performance tradition is reasonably certain to be continuous. From succeeding centuries evidence for the continuity of northern and southern traditions becomes more plentiful and more consistently dependable, and by the mid-19th century, names are known and practices confirmed that belong wholly to the modern era. In addition, some regional traditions of religious, devotional or dramatic music have been formalized with theoretical and procedural terminologies. In Bengal there are well-developed traditions of *kīrtan* performance, and attempts have been made to secure for Orissan music a canonical status analogous to Hindustani and Karnatak music.

The beginning of the modern period is even more clearly marked by the abrupt appearance of new theoretical work. Between 1550 and 1800 many technical treatises were written that are recognizably connected with practices musically ancestral to the present performance traditions. These treatises, by their attempts to incorporate or refute the doctrines of the *Sangīta-ratnākara*, often show that their understanding of the written remnants from the ancient period was no better than ours. During the 19th century, however, little theoretical work was produced, and almost none in Sanskrit; important new theory appeared only in the 20th century.

Before 1250, South Asian musical historiography is concerned with icons, literature and especially treatises. So little can be inferred of actual musical practices that it is practicable, even desirable, to consider the subcontinent as a whole. After 1250, and particularly after 1550, treatises continue to play a major role in musical historiography until the 19th century, but they now have to be considered from several angles. The history of *sangīta-śāstra* ('musical doctrines') can still be studied in its own right, but treatises should also be examined carefully for the considerable light they shed on ever more recognizable features of modern canonical performance traditions. Furthermore, the sources after 1550 generally have clear affinities to either northern or southern musics, affinities that must be established and discriminated as closely as possible. Nijenhuis (1977) made a survey of the Sanskrit works then printed, and several treatises have been published since then.

India, Subcontinent of, §II: History of classical music

2. To the mid-16th century.

(i) The ancient period.

(ii) The medieval period.

India, Subcontinent of, §II, 2: History of classical music, To the mid-16th century.

(i) The ancient period.

(a) Treatises.

Because of the nature of the sources, the ancient period can be divided further, in terms of music theory, at the 8th century. The first part of the period comprises material contained only in the *Nāṭyaśāstra*, whose musical portions probably belong to the Gupta period (4th and 5th centuries). New theoretical material in the *Brhad-deśī* from the 8th or 9th

century, and from later treatises up to and including the *Sangīta-ratnākara* (13th century), belongs to the second part of the ancient period.

The *Nāṭyaśāstra* ('dramaturgy') is the earliest surviving source not only of dramatic theory but also of musical theory, poetics, metrics and general aesthetics. Although parts of the treatise had been summarized, verses from it quoted and [Bharata](#), its traditional author, regularly cited and revered, when the rediscovery of the *Nāṭyaśāstra* began in 1865 it had in fact been many centuries since the work had been known as a whole. Furthermore, although the *Nāṭyaśāstra* has now been published several times, a properly critical edition is still a remote prospect, with numerous problems of textual transmission and recension. One of the major obstacles to such an edition is the music section, which is full of technical discussions and long lists of terms, most of which have not been understood or used for more than a millennium.

Musical doctrine was originally included in dramaturgy because music was (and still is) an essential part of theatre. It was an element of production, along with gesture, movement, level of language, vocal inflection, costume and make-up, all of which were highly stylized. In the *Nāṭyaśāstra* (chaps.1–27) important references to music occasionally appear in connection with other elements of production technique; other parts of it are devoted exclusively to music. There is a discussion of instrumental music in general, dealing with tunings, scales, modal patterns (*jāti*, which may or may not be melody types) and modal functions (chap.28). There is one chapter on each of the four classes of instrument: strings, wind, idiophones and drums. The sections on strings (chap.29) and drums (chap.33 or 34) include discussions of playing technique, manner of accompaniment for songs and how the instruments are used in connection with the actions and the sentiments of the drama. The discussion of idiophones (chap.31) deals not with the instruments themselves but with their function, which was marking off the time cycle (*tāla*). The flute section (chap.30) is very brief. There is a discussion of *dhruva*, the kinds of song with which a play was ornamented in production, their texts and character and their dramatic applications (chap.32). An extra chapter in the Baroda edition lists the good and bad points in singing and the playing of instruments. Another interesting text surviving probably from this early period is the *Dattilam*, ascribed to the sage [Dattila](#). This is more restricted in scope than the *Nāṭyaśāstra*, and if we are to assume that it has survived in its entirety and was intended by its author to be self-sufficient, it appears to deal with *gāndharva* (music), defined as a discrete form or body of forms of music different in nature and function from the later *sangīta*. It seems that the repertory of music it describes was that of the ritual preliminaries (*pūrva-ranga*) of Sanskrit drama, while the *Nāṭyaśāstra* was concerned with the drama as a whole.

A later important work or compilation, originating in part perhaps as early as the 8th or 9th century, is the *Brhad-deśī* attributed to [Matanga](#). The first published edition of this work was based on two incomplete manuscripts from the same place in Kerala. No other primary sources for the work have yet been found, but the new edition (1992 etc.) takes into account the frequent and sometimes lengthy paraphrases and quotations from the *Brhad-deśī* in later works. The surviving portions of the *Brhad-deśī*

reproduce, augment and supplement material in the *Nāṭyaśāstra* and incorporate lengthy passages from otherwise unknown early works, along with original material. On two counts the *Brhad-deśī* marks a turning-point in South Asian music theory. Firstly, theories of sound based on the metaphysical and physiological theories of Tantric yoga are propounded for the first time and argued with standard logical techniques, for the *Brhad-deśī* is a work of learning, not a practical manual. Secondly, the term *rāga* is introduced and defined, with the specific observation that it had not been discussed 'by Bharata and others'. In the *Nāṭyaśāstra* the closest equivalent to *rāga* is *jāti*. This term and its doctrine continued to be carried in the later treatises as part of the inherited *śāstra*. It is generally assumed that an evolutionary process is indicated by the addition of the new term *rāga* to the old one *jāti*, but it seems more likely that two different traditions are represented. In the *Brhad-deśī* much of what is reported about *rāgas* and related entities called *bhāsā* is attributed to other named writers as well as to its own author, Matanga. In any case, the *Brhad-deśī* supplies for its *rāgas* and *bhāsā* the kinds of names, and many of the actual names, which still designate *rāgas*, sometimes exactly, as with Varātī, Hindola and Gurjarī, sometimes in slightly different forms, such as Sauvīrī (Sāverī), Saurāstrī (Sorath, Sūratī, also Saurāstram) and Mālava-kaiśika (Mālkoś). For both the old *jāti* and the newly reported *bhāsā* and *rāgas* not only are modal functions and dramatic applications reported, but musical illustrations in scale degree letters are given as well. These reappear in the corresponding portions of the *Sangīta-ratnākara* and some later medieval works.

Additional evidence for early Indian tonal and melodic systems is found in the 7th- or 8th-century rock inscription beside the temple at the fort of the hill of Kudumiyāmalai in Tamil Nadu. Recent work on the notated musical examples of this inscription suggests that they relate to actual melodic practice and may represent a didactic tradition reflected also in the conservative music examples found in the considerably later *Sangīta-ratnākara*. In the late 11th or early 12th century, Nānyadeva, ruler of Tirhut in north India, wrote or commissioned a commentary called *Sarasvatī-hṛdayāṅkārā* or, more simply, *Bharata-bhāṣyam*, on the *Nāṭyaśāstra*. In addition to its explanation of theoretical and technical matters, this contains some valuable early notated musical examples of song compositions (see Widdess, 1981 and 1995).

More is added to the store of ancient doctrine by Abhinavagupta's commentary on the *Nāṭyaśāstra*, which includes another long list of *rāgas* with their dramatic applications from another ancient writer. Much of both the *Brhad-deśī* and Abhinavagupta's *Abhinava-bhāratī* is incorporated bodily into the highly syncretic *Sangīta-ratnākara*. In this work all the threads of ancient doctrine are woven into a complex but systematic pattern. It is divided into seven large chapters, hence its frequent sobriquet *saptādhyāyī*. The first chapter discusses sound, including its generation, microtones and intervals, scales and scale degree patterns, and the *jāti* (ancient modal patterns). The second chapter discusses *rāga* (melody type), both doctrinal and current. The third chapter is miscellaneous, dealing largely with performing practice, including ornaments, improvisation and ensembles. The fourth chapter is on composition (vocal) and includes discussions of metres, form and songs in vernaculars. The fifth chapter

deals with *tāla* (time cycle), both doctrinal and current. The sixth chapter discusses instruments (strings, wind, drums and idiophones) and includes lists of *rāgas* with a few of their characteristics for the *kinnarī-vīṇā* and the flute, plus playing techniques for strings (both doctrinal and current) and for drums, along with drum syllable patterns. The seventh chapter is on dance.

(b) Instruments in iconography.

Paralleling the distinction of older and newer layers of content in the treatises is a very significant change in the type of string instrument depicted in sculpture. Iconographic remains from the 2nd century bce to the 8th century ce, the era when Buddhism was still dominant in South Asia, abound in bow harps and short-necked ovoid lutes. From the 7th century ce to the 13th and after, these two string instruments disappear from sculpture and are replaced by stick zithers with one or more strings and often with bowl-shaped resonators or supports. These instruments are direct ancestors of the modern *bīn* of Hindustani music.

In the *Nāṭyaśāstra* (chap.29) the two principal types of *vīṇā* are called *vipañcī* and *citrā*. They correspond to the bow harp and the ovoid lute, respectively, of iconography. The names of these instruments continue to appear in later treatises, including the *Sangīta-ratnākara* (they are a part of inherited *śāstra*), but to them are added descriptions of several varieties of the later stick zither *vīṇā*. Furthermore, one passage in the *Nāṭyaśāstra* (chap.29, 95–100 in the Ghosh edition) describes playing techniques for the *vīṇā*. Although the variety of *vīṇā* is not specified, some of the techniques clearly refer to an instrument with open strings, plucked with the left hand as well as the right, such as a harp. Again, the *Sangīta-ratnākara* reports this by then purely historical material, but it also describes in some detail a very different playing technique for the one-string *eka-tantrī vīṇā*, a variety of stick zither. Furthermore, the technique is declared applicable to all instruments of the class. It is based on a separation of the functions of left and right hands. The right hand has nine modes of plucking, whereas the left hand, while holding a stick against the string, can produce either a shake or a slide; 13 special two-hand techniques are also described.

Whenever *a priori* pitch relationships have been important in South Asian music theory, the instrument of reference has always been the current form of *vīṇā*. A radical change in string instrument types and their techniques, therefore, should be correlated in some way with an equally radical change in the underlying concept of pitch relationships. On open-string instruments (such as the bow harp) the basic pitch collection has to be tuned in advance. Any pitch is potentially as important as any other, and in different musical contexts different pitches will assume the central role. A stopped-string instrument differs in that all the stopped pitches can easily be conceived as a function of the pitch of the open string, and ultimately as subordinate to it. That a conceptual change moving towards the notion of a single system tonic had occurred is explicitly confirmed early in the medieval period, but it may have been well under way during the last centuries of the ancient period.

(c) References in general literature.

There are many references to music and musical instruments in Sanskrit, Pali and Prakrit (e.g. the *Vāsudevahindī*) literature (see Jain, 1977). On the whole they confirm the technical terminology and names and descriptions of instruments available from the treatises and iconography, but they also provide some further context and several entertaining anecdotes. Śrīvāstav (1967) located and discussed musical references in Sanskrit literature from the Vedas to the end of the 6th century, including references in Kālidāsa and other classical playwrights. For a wider sweep, of both literary and other early Indian sources, see Premalatha (1983). Many secondary studies and commentaries on classical works and authors have examined musical references among other cultural areas, but much remains to be discovered and systematically discussed. An important source for the music of southern India in the early centuries ce is the extensive section on music theory in the Tamil narrative work *Cilappatikāram*. It is even possible that some of the origins of later Sanskrit theory may be identifiable in this work and in the tradition it represents.

(ii) The medieval period.

(a) Treatises.

There are few musical treatises available between the *Sangīta-ratnākara* and the new theory that appeared in the later 16th century. Of those considered here the most influential are the two commentaries on the *Sangīta-ratnākara*. There are also two historically important works by Jain authors, a large-scale compendium of music theory of 1428 and a single enormous treatise from Rajasthan. The commentaries on the *Sangīta-ratnākara* are Simhabhūpāla's *Sudhākara* (c1330) and Kallinātha's *Kalānidhi* (c1450), both written in peninsular India. The earlier one quotes extensively from the first of the two Jain treatises, Pārśvadeva's *Sangīta-samaya-sāra*, which makes the latter nearly contemporaneous with the *Sangīta-ratnākara*, or possibly earlier. The later Jain treatise is the *Sangītopanisat-sāroddhāra* by Sudhākalaśa. It is from Gujarat and was completed in 1350. The *Sangīta-śiromani* (1428) was compiled at the behest of Sultan Malik Shah of Kāda (near present-day Allahabad) by a circle of scholars who used, and to some extent commented on, a large number of earlier Sanskrit works. The treatise from Rajasthan, which quotes from the *Sangīta-śiromani*, is the *Sangīta-rāja*, written under the direction of King Kumbhakarna of Mewar and dated 1453.

The Jain treatises may well represent a tradition of *śāstra* independent of the *Sangīta-ratnākara*. The *Sangīta-samaya-sāra* covers material similar to the *Sangīta-ratnākara*, but with many differences of detail. The great importance of the *Sangītopanisat-sāroddhāra* is as a link between ancient and modern phenomena. Firstly, in its chapter on tāla (time cycle), both the arrangement (by length of time cycle) and the association of a particular configurative drum pattern with each particular tāla point towards modern Hindustani usage. Secondly, the rāga chapter provides the oldest known set of verse iconographies for melody types. Six rāgas, each with five sub-types called *bhāsā*, are depicted as quasi-Tantric images, in several cases many-armed, holding various emblems, each with an associated animal

(*vāhana*). Nawab (1956) contains a set of paintings, a *rāga-mālā*, representing these melody type icons.

These are the only known *rāga* icons of this Tantric type, the various later traditions all having a basis in secular poetics. The historical significance of this material is heightened by the fact that most of the individual iconographies of the system in the *Sangītopanīsat-sāroddhāra* appear again in the *Sangīta-rāja*, but not as part of a symmetrical classification system. The *Sangīta-rāja* is on the whole simply an enormous collection of lore. It follows the categories of the *Sangīta-ratnākara* in principle and often paraphrases its descriptions. The iconographic *rāga* verses are simply attached where appropriate, usually with the observation 'according to some'. These are the most striking materials in the portions of the *Sangīta-rāja* so far published, but the very size of the work implies the inclusion of a number of miscellaneous details not available elsewhere.

Of the commentaries on the *Sangīta-ratnākara*, Kallinātha's *Kalānidhi* in particular is a tantalizing link between ancient and modern music. Kallinātha expanded considerably on the material in the *Sangīta-ratnākara*, in several places identifying 15th-century equivalents of its *rāgas* by names still in use, and he clarified the important section on improvisation. In one passage he confirmed and illustrated a fundamental contradiction (*virodha*) between ancient doctrines and practices he himself knew in 15th-century Vijayanagar (*Sangīta-ratnākara* ii, 114ff; see also Brhaspati, 1969, pp.20ff). Part of this passage speaks of 'the same formation being in all the *rāgas*' due to the 'immobility of the 5th', and of the scales of *rāgas* in the old system as 'done in the [modern] practice as though [all] beginnings were at the middle *sadja*', *sadja* being the degree that evidently had already become the single permanent system tonic that is now familiar. In another place, Kallinātha seems to have referred quite explicitly to a common tonic, saying 'Thus in regional [*rāgas*] those beginning with *nisāda* [degree 7] are fixed on the place of middle *sadja* [degree 1], and so then in all [*rāgas*] there is a common primary [degree]' (*Sangīta-ratnākara* iii, 298–9). He had introduced the matter as an explanation for Śārngadeva's mention of '[coming] from a common primacy', and thus implied that the system tonic was already prevalent in the early 13th century, at the end of the ancient period.

Simhabhūpāla's *Sudhākara* is less helpful as a guide to the transition which had been and was still taking place, but like Kallinātha he supplied much useful material from earlier sources.

(b) Traditions.

One of the major cultural consequences of the Muslim hegemony in the Indo-Gangetic plain and northern peninsular India was the introduction of the written chronicles of Muslim historians, with their regular use of dates, names and places. It is largely for this reason that medieval predecessors of the modern performing traditions seem somewhat more discernible for the Indo-Gangetic plain and Hindustani music than they are for Karnatak music. Most of the accounts, however, come from sources dating from the mid-16th century to the mid-18th, thus in some cases considerably later than the period in question.

In the decades before and after 1300 the outstanding Indo-Persian poet [Amir Khusrau](#) was at the court of the sultans of Delhi. Most of the stories about his connections with music are found in late sources, and many are apocryphal, but of his knowledge of and devotion to Indian music there can be no doubt. Whether or not he invented the devotional *qavvālī* singing of the Sufi orders and introduced the singing of *ghazal*, he certainly established and legitimized them as South Asian musical items. He was also a friend and disciple of the great Chishtī saint Nizām-ud-dīn Auliya, who successfully argued the propriety of using music for Sufi devotions, taking the case against the Muslim divines to the sultan in the early 1320s.

Timur's sack of Delhi in 1398 scattered the court establishment, and during the 15th century the effectively independent rulers of Bengal, Jaunpur, Gujarat and Gwalior were the chief patrons of music. Sultan Husain 'Sharqī' of Jaunpur, who reigned from 1458 until his principality was reabsorbed by the sultanate of Delhi in 1477, is often credited with the invention or revival both of a number of rāgas and of the musical form *khayāl*. The Hindu king of Gwalior, Man Singh Tomar (who reigned from 1486 to 1516), is lauded as a great patron, and the names of several of his musicians are recorded. Tānsen, the leading musician of Akbar's court and the paramount figure at the source of the most respected of the Hindustani music traditions, came from Gwalior and was first trained there.

The earliest Persian treatises on Indian music are largely dependent on Sanskrit sources. The *Ghunyāt-ul-munya* (1374–5) also contains, however, some interpretive comment on both theory and observed practice. The Delhi court itself became a musical centre once more during the reign of the Afghan king Sikandar Lodi (who reigned from 1489 to 1517). Later historians list the sultan's favourite rāgas. According to the earliest two accounts (1572), these were Kānadā, Kalyān, Gaud and the Western Asian *maqām* called Husainī, which is listed simply as a rāga in later 16th-century peninsular Sanskrit treatises. The *Lahjat-i-sikandar-shāhi*, dedicated to the sultan, follows the seven-chapter plan of the *Sangīta-ratnākara* without deviation, using the commentaries along with their citations from other sources such as the *Sangīta-samaya-sāra* and the *Brhad-deśī* (Delvoye, 'Indo-Persian Literature' (1994), pp.101–2; Lal, 1963, pp.242–3; Ahmad, 1954).

About professional musicians and their patrons in southern India there is less specific information, although devotional poems survive with their composers' names and sometimes also names of rāgas. An exceptional survival is the set of copper plates from Tirupati containing texts and rāga names for *kīrtanam* by the 15th-century Tāllapākam composers (Sambamoorthy, 1952–71, ii, p.367 and plates 21 and 22).

The fountain-head of modern Karnatak music was the Vijayanagar empire. Several passing anecdotal references in Muslim and Portuguese chronicles suggest that the fundamentals of musical practices in the Hindu Vijayanagar court and in the Muslim Bahmani court and its successors were not substantially different. In addition, Kallinātha's testimony (cited above) that the system had changed shows that in the Deccan some sort of syncretism of old and new practice had taken place that was as much a

departure from ancient lore as that occurring north of the Vindhyas in the same period.

[India, Subcontinent of, §II: History of classical music](#)

3. Music and theory after the 16th century.

The modern period of South Asian art music may be thought of in two main divisions, separated by the second half of the 18th century. For Hindustani music, the dominance of the Mughal musical establishment for nearly two centuries characterizes the first division. In 1562 the Emperor Akbar took personal control of his government and in the same year brought [Tānsen](#) from the court of Reva to his own court. The Mughal musical establishment endured, supplying and taking from smaller courts, until the period following the last years of Muhammad Shah (reigned 1719–48).

The second division begins in the years after Muhammad Shah, when many of the Delhi musicians dispersed to regional centres of semi-independent power, as their predecessors had done in the 15th century. The most important patronage outside Delhi was at Lucknow, the court of the nawabs of Avadh, but other princely states and the newly rich tax-farmers and businessmen in Calcutta also patronized musicians. Traditions from the mid-19th century onwards are then securely traceable up to Independence in 1947 and beyond.

In south India the modern period begins from the last years of Vijayanagar in the mid-16th century. During the next two centuries musical predominance became concentrated in the former Vijayanagar viceroyalty of Thanjavur, first under the rule of independent Nāyak viceroys until 1673. After 1675 Thanjavur was ruled by Maratha kings who maintained and enlarged the existing cultural traditions until the death of Tukoji II in 1736. Following his death the principality of Thanjavur was in turmoil for several decades. Patronage revived under Amar Singh, who reigned from 1787 to 1798. Śarabhoji Serfoji II (reigned 1798–1832) signed away his ruling prerogative to the British in 1799 in exchange for the preservation of his court and his royal dignity. He was then left free to devote himself to developing, among other luxuries, the musical establishment inherited from his predecessors. The three Brahman musician-devotees whom Karnatak musicians credit with the modern transformation of their heritage – [Tyāgarāja](#), [Muttusvāmi Dīksitar](#) and [Śyāma Śāstri](#) – also flourished during his reign.

In 1855 the royal succession in Thanjavur lapsed, but by then other south Indian courts and wealthy landed proprietors were supporting Thanjavur-trained musicians. In the second half of the 19th century a number of professional musicians learnt the *kīrtanam* compositions of Tyāgarāja from his immediate disciples and began singing and elaborating them as concert pieces. They were established by these musicians and those of the early 20th century as the nucleus of the present concert style. During this same period the support for musicians provided by the princes, wealthy landlords and temples began to be supplemented by *sangīta sabhā* ('music societies') in Madras and elsewhere, formed by Brahmans and others in business, government and the professions who had an interest in music.

(i) History of music theory in the modern period.

Beginning in 1550 a great many new treatises appeared, attempting to rationalize aspects of current practice and sometimes to reconcile it with inherited doctrine. In most cases these works come to terms with the *Sangīta-ratnākara*. As a rule, much of the old material is retained, often in the old seven-chapter format (see §2(i)(a) above). The novelties in the new works are largely confined to the general categories of tonal system, rāga (melody-type) and instruments. Many of the works in fact deal only with rāga, touching on the tonal system and on the *vīṇā* as an instrument of reference only to the extent necessary to elucidate their rāgas.

There are three diagnostic variables for the new theoretical works: first, whether they introduce a new tonal system based on the fretted stick zither (*vīṇā*) and try to reconcile it with the tonal material of the *Sangīta-ratnākara*, or merely reproduce it; second, whether the classifications of the rāgas are open-ended and based on scale-type, or closed and symmetrical and not based on any clearly discernible musical criteria; and third, whether individual rāgas are associated with iconographic verses describing people in poetic situations, or are discussed only as musical entities.

Looked at in this way, it can be said that treatises clearly associated both geographically and in terms of content with the modern Karnatak tradition introduce a new tonal system, classify rāgas by scale-type and treat them as purely musical entities: Rāmāmātya's *Svaramelakalānidhi* (c1550) belongs to this tradition. Treatises most closely connected with Hindustani music, above all Dāmodara's *Sangīta-darpana* (c1625), do not concern themselves with precise tonal relationships in practice but classify rāgas according to symmetrical schemes based on a fixed number of main rāgas (usually six), each with the same number and patterning of subordinate types, and attempt to correlate the classification with traditional poetic icons for each individual rāga.

There are also treatises that combine features of both groups: scale-type classifications with verse iconographies (Somanātha's *Rāga-vibodha* of 1609) and symmetrical rāga systems whose rāga scales are clearly described (Pundarīka Vitthala's *Rāga-mālā* in the late 16th century). These originated in north-west peninsular India or in western India. Finally, there is one main treatise, the *Sangīta-pārijāta* by Ahobala Pandita, in which a tonal system is uniquely described (by string divisions) but whose rāgas are merely listed, neither classified nor associated with poetic icons.

India, Subcontinent of, §II, 3: History of classical music, Music and theory after the 16th century.

(ii) South Indian sources for mela (scale-type).

The oldest surviving treatise of the modern period is Rāmāmātya's *Svaramelakalānidhi*, composed around 1550 in the court of Vijayanagar, 15 years before the capital was destroyed. This is the only independent theoretical work surviving from the Vijayanagar period and at the same time the first of the modern southern treatises. Its distinguishing theoretical feature is the description and grouping of rāgas according to the number of scale-types necessary to accommodate the varying intervallic structure of rāgas in current practice. This feature appears for the first time in the *Svaramelakalānidhi* and is still central to the purely southern group of treatises and to theory in Karnatak music. Scale-type description and classification could not have been newly invented by Rāmāmātya, however, and in the first of a series of later treatises from Thanjavur, the scale-type approach is credited to the sage Vidyāranya (the brother of the Vedic commentator Sāyana), who is traditionally associated with the foundation of Vijayanagar itself in the mid-14th century. This first Thanjavur treatise is Govinda Dīksitar's *Sangīta-sudhā*, produced in the early 17th century by the great chief minister of Raghunātha Nāyaka of Thanjavur. It follows the seven-chapter plan of the *Sangīta-ratnākara*, although the last three chapters are lost. It chiefly recasts the material of the *Sangīta-ratnākara* in a different metre, but in the last two-thirds of the rāga chapter new rāgas and scale-types are presented, the doctrine being attributed to Vidyāranya, and there are several passing criticisms of Rāmāmātya's *Svaramelakalānidhi*.

A treatise developing scale-types into a closed system is the *Caturdandī-prakāśikā* by Govinda Dīksitar's son Venkatamakhin, who showed how the semitonal scale of pitches produced by the *Vīnā* with fixed frets could be systematically permuted to produce 72 seven-degree scale-types with fixed tonic and 5th and five variable degrees. Included among these 72 were the 19 that Venkatamakhin recognized as necessary for the rāgas of his time. However, any rāgas with new scales that might develop in the future could readily find a scale-type available in the system.

The third of the 'Thanjavur treatises' is *Sangīta-sārāmṛta* composed under the direction of Tukoḷī II (reigned 1728–36). This work is based to some extent on its predecessors, yet its musical substance is quite recognizably a predecessor of the Karnatak music of today. After this, no significant new treatise on Karnatak music appeared in south India until the publication of Subbarāma Dīksitar's monumental Telugu work, *Sangīta-sampradāya-pradarśinī*, in 1904. This includes hundreds of *kīrtanam* and other compositions in letter notation (mostly from the Dīksitar family tradition), as well as biographical sketches of many important 18th- and 19th-century musicians; it is a basic historical source. Dīksitar also dealt seriously and fundamentally with the problem of notation and ornamentation in Karnatak music. In this he was influenced by his friend and adviser A.M. Chinnaswamy Mudaliar, compiler of *Oriental Music in Staff Notation* (Madras, 1892).

[India, Subcontinent of, §II, 3: History of classical music, Music and theory after the 16th century.](#)

(iii) 16th- and 17th-century rāga-rāginī treatises.

Until the appearance of V.N. Bhatkhande's work in the early 20th century, the traditional theoretical classifications for Hindustani rāgas (*rāg*) were symmetrical systems comprising a small number of rāgas (usually six), to each of which was assigned an equal number of what came to be called in Sanskrit *rāginī* and in Hindi *rāginī* (usually five for each rāga, making 36 in the whole system). In some systems a second sub-set of rāgas was added to each of the groups, and since rāgas and *rāginī* were mainly personified as lords and their ladies, the supplementary sub-sets were personified as *putra* ('sons').

Symmetrical rāga classifications are known from a large number of treatises. After 1600 they are generally accompanied by verse iconographies as well. Symmetrical rāga systems with iconographies also occur in the structured sets of miniature paintings called *rāga-mālā*. Curiously, there is no known musical treatise expounding the particular symmetrically structured set found in most painted *rāga-mālā*. For several centuries this 'painters' system' of rāgas and *rāginī* led a quite independent existence. (Individual rāgas with their iconographies, painted or versified, were in principle quite independent of classification systems. Not only do they wander from system to system but there are also important works giving iconographies that do not use a *rāga-rāginī* symmetrical classification at all, such as Somanātha's *Rāga-vibodha* of 1609.)

Apart from the unique mid-14th-century Tantric system of rāgas and *bhāsā* in the *Sangītopanīsat-sāroddhāra* by Sudhākalaśa, the oldest treatises in which symmetrical systems and verbal iconographies are found together are Pundarīka Vitthala's *Rāga-mālā* (1576) and Śubhankara's *Sangīta-dāmodara* (c1500) from eastern India. Pundarīka used a symmetrical six-rāga system with a pattern of its own. Śubhankara provided two sets of 36 rāga names (many in common), of which one is a symmetrical *rāga-rāginī* set without iconographies, the other an unordered list, but with an iconography for each rāga.

In the third part of the *Āīn-i akbarī* (1597), the chronicle of Akbar by Abul Fazl, there is a summary of Indian music theory as it was evidently understood in Delhi and Agra at that time. It follows the seven-chapter plan of the *Sangīta-ratnākara* but with important replacements of the contents in a number of places, the whole being set forth in an abridged form. The new material is in the sections on rāga (to which are added regional song types), instruments and various classes of performers. Rāga names are provided for three different symmetrical sets (including the 'painters' system'), but nothing is said of iconographies.

The *Sangīta-darpana* of Dāmodara (c1625) is the first source for the 'Hanūmān doctrine', a *rāga-rāginī* system of 36 which by 1800 had become standard. The *Sangīta-darpana* is in seven chapters, of which all but the chapter dealing with rāga are summaries of the corresponding chapters of the *Sangīta-ratnākara*. The chapter on rāga sets forth three *rāga-rāginī* schemes, two older ones and the *hanuman-mata* (the system of the Hanūmān doctrine), which is the only one exposed in detail. For each entity of the Hanūmān doctrine the scale degrees are given, specifying whether the scale has five, six or seven of them. The three modal functions (initial, medial and final) are also designated. The precise intervals, however,

cannot be determined, since only names of scales, taken over verbatim from the *Sangīta-ratnākara*, are given. Each rāga and *rāginī* of the Hanūmān doctrine is accompanied by an iconographic verse. Most of these verses are known from earlier sources, such as the *Sangīta-dāmodara* or *rāga-mālā* paintings.

India, Subcontinent of, §II, 3: History of classical music, Music and theory after the 16th century.

(iv) Deccani and western Indian treatises.

The characteristic feature of the north-west peninsular and western Indian group of treatises of the 16th and 17th centuries is classification by scale-type combined with an interest in the rāgas as individual visual icons.

Śrīkantha's *Rasa-kaumudī* was composed c1575 in Gujarat and comprises two five-chapter divisions, the first of which is devoted to music. Most of the musical material is taken directly from the *Sangīta-ratnākara*, but two extensive passages in the chapter on rāga are not. One of these passages is a description of the new forms of *vīnā* and an outline of the general tonal system based on its tuning and fretting. It is the tonal system described in Rāmāmātya's *Svaramelakalānidhi* and other southern treatises, yet it is actually taken over from a treatise by Pundarīka Vitthala, the *Sadrāgacandrodaya*. The other novel passage of the *Rasa-kaumudī* is the description of the rāgas, which are grouped according to a system of 11 *mela* (scale-types) in the southern fashion. To each, however, is added a verse iconography like those found with northern *rāga-rāginī* schemes, and not only the contents but also the wording are often like verses of the *Sangīta-dāmodara* and the *Sangīta-darpana*.

Even more curious than the mélange of lore from the *Sangīta-ratnākara*, the iconographic verses and the scale-types found in Śrīkantha's *Rasa-kaumudī* is the work of the author Pundarīka Vitthala, from whom the *vīnā* material in *Rasa-kaumudī* is largely borrowed. The rāgas in Pundarīka's *Sadrāgacandrodaya* are arranged entirely on the southern plan, by whatever scale-types were needed, with neither the symmetry of overall system nor the individual iconographic personifications characteristic of the northern works. Conversely, the *Rāga-mālā* (late 16th century) presents a symmetrical scheme of rāgas, *rāginī* and even *putra* ('sons', see §(iii) above), although unlike the characteristic northern treatises it does not blindly reproduce the interval and scale material of the *Sangīta-ratnākara*. Although the tonal system in the *Rāga-mālā* is not described according to *vīnā* fretting, Pundarīka did set up an interval description of his own that is precise enough to be interpreted. Evidently as Pundarīka wrote for his different patrons, he adapted his discussions to the local mode of theory. Taking his works as a whole, and notably the *Rāga-mālā* and *Sadrāgacandrodaya*, he is one of only two available theorists who dealt with all three new aspects of South Asian music theory from the 16th century to the 18th, writing on interval and *mela* (scale-type), *dhyāna* (iconographic verses) for melody types, and *rāga-rāginī* systems (symmetrical schemes of classification). The other such theorist is Locana, whose *Rāga-taranginī* (eastern Ganges valley, c1675) recounts *rāga-rāginī* material and sets forth a system of *mela*.

The most interesting of the Deccani works providing both precise scalar intervals and pictorial iconographies for the rāgas is Somanātha's *Rāga-vibodha* (1609). Somanātha was the only writer to provide a theoretical foundation for the association of rāgas and pictorial content. He proposed that each rāga has two forms: *nāda-rūpa* ('sound-form' or audible shape, which is variable according to performance) and *devatā-rūpa* ('icon-form' or contemplative or expressive shape, which is permanent and unchanging). His unique notations (each of which is only one among many possible manifestations of the *nāda-rūpa* of a rāga) are made as precise as possible in an effort to evoke in writing as much clarity of outline and vividness in colour for the mind's ear in the realm of sound as can be evoked for the mind's eye by a written evocation of the shape and colour of a visible entity or scene.

[India, Subcontinent of, §II, 3: History of classical music, Music and theory after the 16th century.](#)

(v) Eastern Indian treatises.

From eastern India a number of *sangīta* texts of the 16th, 17th and 18th centuries survive. Their purpose, apart from representing the *śāstric* theoretical tradition as such, seems to be to embrace the eastern (Bengali and Orissan) regional forms of music, especially devotional *kīrtana* -type compositional forms, within the main *śāstric* corpus. The *Sangīta-nārāyana*, probably a 17th-century work by Purusottama Miśra (though attributed to his royal patron Nārāyanadeva of Parlakimidi), quotes from a number of earlier eastern texts and contains some valuable information on local musical, especially compositional and metric-rhythmic, practice. It also offers additional *rāga-rāginī* material, with both classification systems and *dhyāna* verses.

[India, Subcontinent of, §II, 3: History of classical music, Music and theory after the 16th century.](#)

(vi) Treatises leading to modern Hindustani theory.

In one group of 17th-century works a new way of specifying intervals appears: numerical string-length measurements are specified for fixing the position of frets on the *vīnā*, leading to a directly measured general scale of 12 untempered semitones. Several of these treatises are described in Bhatkhande (1930). They include short works by Hrdaya-nārāyana and Bhāva Bhatta (an important source for *dhrupad* song texts (Delvoye, 'Dhrupad Songs' (1994), pp.407–8)), and the major work, the *Sangīta-pārijāta* by Ahobala Pandita, with its successor, Śrīnivāsa's *Rāga-tattva-vibodha*. Hrdaya-nārāyana was from the Jabalpur area of Central India, Bhāva Bhatta from Bikaner in western Rajasthan. The geographical origin of the *Sangīta-pārijāta* is unknown. The author's name is southern, and there is an important religious centre called Ahobilam in Andhra Pradesh. Furthermore, there are many passing references to rāga names and to musical forms that only a southern Indian pandit would have known. The work and its contents are distributed in the north, however, and the characteristic string division technique and its resulting scale (see §III, 1(ii)(d) below) have no connection with south Indian interval and scale systems or the tuning and fretting method used to derive them. The *Sangīta-pārijāta* was probably written in the north by someone from the

peninsula, in a similar way to the Deccani Pundarīka Vitthala, who wrote his *Rāga-mālā* on a *rāga-rāginī* basis for a northern patron. The *Sangīta-pārijāta* is an important source. It follows the overall divisions of the *Sangīta-ratnākara* (without the last chapter on dance), but the content of the chapters on *rāga* and on instruments is completely replaced, and there is other extensive new material throughout. The work was translated into Persian in 1724.

An important Persian source in its own right is Mīrzā Khān's *Tuhfat al-hind* (third quarter of the 17th century). The *Tuhfat al-hind* is an enormous compilation of what were held to be the chief Indian artistic sciences, those dealing with language, poetics, music and erotics. The section on music (book 5) is a compilation of the theoretical lore then current (including what was still being transmitted from the *Sangīta-ratnākara*) and stories about Hindustani music and its patrons in the medieval period. Several *rāga-rāginī* systems are described (including the Hanūmān doctrine), and there is a chapter on Persian *maqām* and their subdivisions. The work was read and quoted by Sir William Jones (1792; see §6 below). This and other Persian sources from the 17th and 18th centuries show some interest in the actual practice of music and its technical terminology as used by musicians as well as theoreticians. Valuable studies of these sources are N.P. Ahmad (1984) and Delvoye, 'Indo-Persian Literature' (1994).

At the end of the 18th century the maharaja of Jaipur, Pratāp Singh (reigned 1779–1804), had an enormous compilation called the *Sangīt-sār* written in Rajasthani. It is structurally an amalgam of the *Sangīta-ratnākara* and the *Sangīta-pārijāta*, but there is a great deal of important supplementary material giving extensive musical illustrations for both *rāga* and *tāla*, as well as names of modern instruments as equivalents for Sanskrit instrument names.

In 1813 in Patna the first north Indian classification system based on purely musical affinities was produced. The *Nāghmāt-i āsafī* of Muhammad Reza presents a closed *rāga-rāginī* system, but one in which there are genuine musical affinities (often as much melodic as scalar) between each *rāginī* and the main *rāga*. Vishnu Narayan Bhatkhande published the *rāga-rāginī* system from Reza's *Nāghmāt-i āsafī* in translation and paraphrase, with music examples.

Bhatkhande's *Hindustānī-sangīta-paddhati* appeared from 1910 to 1932 in Marathi. In the 1950s it was made available to a wider public through a Hindi translation; it is the product of decades of travel, repertory collection and research. Bhatkhande followed the principles of his predecessors in trying to reconcile theoretical sources with current practice. He found that written sources from the first part of the modern period (1550–1750), several of which he himself discovered and had published, were of both historical and theoretical relevance to current Hindustani practice, but that the traditional material carried on from the *Sangīta-ratnākara* and other ancient works was useless for his purposes. Without wishing to detract from either the historical value or the immense cultural prestige of the *Nātyaśāstra* and *Sangīta-ratnākara*, he dropped them forthwith as sources of musical theory for Hindustani music.

Bhatkhande went to south India in 1904 and met Subbarāma Dīksitar in Ettayapuram (near Madurai in Tamil Nadu). After studying the southern *mela* system as propounded in Dīksitar's manuscript of Venkatamakhin's *Caturdandī-prakāśikā* (see §(ii) above), and in the light of other southern rāga-systems based on scales, he set about devising a scale-type classification for Hindustani rāgas. He based his scheme on the settings of movable frets used by *Sitār* players for the different rāgas, called *thāt*. One scheme probably current in Bhatkhande's youth is a set of 12 *thāt* published in Safdar Husain Khān's *Qānūn-i sitār* (Delhi, 1870). Bhatkhande's own scheme comprised ten *thāt* named for ten important Hindustani rāgas. All other rāgas are assigned to one or another of the *thāt*, making use of accidentals where necessary. Aspects of Hindustani musical practice other than rāga are touched on rarely and in passing in Bhatkhande's writings on theory. However, between 1916 and 1937 he published, for pedagogical purposes, the multi-volume *Kramik pustak-mālikā* series, which included hundreds of vocal (many of them *dhrupad*) compositions arranged under rāga headings. Very many were collected by him from oral tradition, but unfortunately he gave no precise details concerning the exact provenance or the authenticity of transcription of the individual songs.

Bhatkhande's *thāt* classification theory and a number of his decisions about the designation of the predominant modal degrees for each rāga have been criticized as arbitrary and over-systematized. In fact, Bhatkhande was not dogmatic about his results, but there are grounds for concern about the inevitable over-simplifications resulting from their widespread use in elementary music education and in the analysis of rāgas. The most cogent criticisms are in [Omkarnath Thakur's *Sangītāñjali*](#) (1938–62). Thakur, one of the great singers and music educators of the 20th century, rejected the idea of scale-type classification altogether and preferred to deal with each rāga individually.

[India, Subcontinent of, §II: History of classical music](#)

4. Oral traditions after the 16th century.

South Asian classical music is regarded as pre-eminently vocal. Instrumental music, whether as an accompaniment to the voice, an imitation or extension of the voice, or a tradition parallel to the vocal tradition, is regarded as secondary. Hence the *paramparā* (succession) in *sampradāya* (performing traditions) is traced primarily through its most prestigious carriers, the poet-composers and singers of Karnatak music and Hindustani music; instrumental traditions are normally deemed ancillary.

[India, Subcontinent of, §II, 4: History of classical music, Oral traditions after the 16th century.](#)

(i) The Karnatak tradition.

Tamil is the mother tongue of most of the leading carriers of the modern Karnatak music tradition, and Madras is its cultural centre. However, many song texts and writings are in Telugu, because the existing tradition is to a

great extent an outgrowth of the musical life of the principality of Thanjavur in the Kaveri delta. Thanjavur was the heart of the Tamil empire of the Chola dynasty (from the 9th century to the 13th), but in the second quarter of the 16th century a Nāyak viceroy was appointed by the emperor at Vijayanagar, thus establishing a court whose language was Telugu.

After the destruction of Vijayanagar in 1565 the royal house was re-established farther south, but during the next century formerly tributary rulers (such as the Wodeyars of Mysore) and the direct imperial viceroys (the Nāyaks at Thanjavur, Madurai and other provincial capitals or forts) established themselves as rulers of independent states, although Thanjavur observed a nominal loyalty to the ruling house until well into the 17th century.

As a consequence of the Nāyak vicerealties and of further stimulation by the turmoil of the later 16th century, large numbers of Telugu-speaking functionaries and learned persons settled in Tamil Nadu, particularly in Thanjavur. Consequently the Telugu-speaking ruling group was culturally buttressed by a large educated class of Telugus, most of whom were *niyogī* Brahmans, that is administrators, scholars, poets etc.

During the time of Raghunātha Nāyak (reigned 1614–34) the principal vehicles for music were *yaksagāna* (originating from Vijayanagar) and other forms involving dance as well as song, such as the *padam*. The treatise *Sangīta-sudhā* dates from Raghunātha's reign. Ksētrayya, the composer of *padam*, visited the court under Vijayarāghava Nāyak (reigned 1634–73). After his reign Thanjavur came under the rule of Marathi kings, of whom Ekojī Bhonsle (brother of the Maratha leader Śivājī) was the first. The new dynasty fully supported and patronized the cultural patterns established during the Nāyak period, and alongside the growth of Marathi literary forms, Telugu and Sanskrit continued to be the languages of culture and learning respectively.

During the successive reigns of Ekojī's three sons the outlines of modern traditions became clearly discernible. Śahājī (reigned 1684–1712) was an enthusiastic patron of music and letters; among those whom he endowed with land was Śrīdhara Vēnkateśa (Ayyaval), who originated the tradition of devotional Krsna *bhajan* (song) followed to this day. Girirāja Kavi, a composer of devotional songs and *yaksagāna*, and the paternal grandfather of Tyāgarāja, was a court poet. Śahājī instructed his musical scholars to assemble a number of manuscripts in letter notation containing typical samples of the current methods for the vocal and instrumental elaboration of many rāgas, a few of which have been published. From these, taken in conjunction with the *Sangīta-sudhā*, one can see that the present rāgas and improvisatory techniques of Karnatak music reach back at least to 17th-century Thanjavur.

In the succeeding reigns of Śahājī's two younger brothers, Thanjavur continued as a musical centre. The treatise *Sangīta-sārāmṛta* is accredited to the youngest, Tulajā, or Tukoji (reigned 1728–36). In the third quarter of the 18th century the leading court musicians were Sonti Vēnkatasubbayya and Pachimiliam Ādiyappayya. The former was the teacher of Tyāgarāja's teacher, Sonti Vēnkataramanayya. Another of his disciples, Paidāla Gurumūrti Śāstri, was one of the first Karnatak musicians to settle in

Madras. Ādiyappayya was the composer of a *varnam* (an advanced study piece) in Bhairavī rāga beginning ‘Viriboni’, which every music student must still learn. He was also the teacher of several important musicians of the next generation, including Pallavi Gopālayya (several of whose compositions are still in the repertory), and Śyāma Śāstri was also his student for a time. Another Thanjavur court musician in the third quarter of the 18th century was the *vīnā* player Kalahastri Śāstri, believed to be Tyāgarāja’s maternal grandfather.

The three great names of Karnatak music – Śyāma Śāstri, Tyāgarāja and Muttusvāmi Dīksitar – were never directly patronized by the court establishment, but their teachers or forebears, or both, had been. Although the Indian ideal of a musician who sings for divinity instead of royalty is embodied in them, and particularly in Tyāgarāja, they are nonetheless part of the general musical tradition of the Thanjavur establishment. Śyāma Śāstri’s son and principal disciple Subbarāya Śāstri (1803–62) was one of the central figures of mid-19th-century Karnatak music. His compositions are widely sung, and his discipular line includes not only his adopted son but also Sundaramma, whose mother had been a Thanjavur court dancer and whose daughter was the great *vīnā* artist Veena Dhanam (1867–1938). Another student of Subbarāya Śāstri was the teacher of Taccūru Singarācāryulu (1834–92), whose *Gāyaka-locana* was the first printed book of Karnatak music in (letter) notation. Muttusvāmi Dīksitar’s most important disciple was his youngest brother Bālasvāmi Dīksitar (1786–1858), who was one of the first musicians to adapt the European violin to Karnatak music. He was the chief musician at the small court of Ettayapuram (near Madurai) and grandfather of Subbarāma Dīksitar (1839–1908), author of the *Sangīta-sampradāya-pradarśinī*.

Most prominent modern Karnatak musicians claim to be in some way part of Tyāgarāja’s *guru-śisya-paramparā* (‘master-disciple succession’). Tyāgarāja’s enormous prestige both as singer-composer and as saintly devotee make him the pivotal figure of the Karnatak tradition. Two outstanding musicians of the generation after him, Subbarāya Śāstri and Vīnā Kuppayyar, are said to have learnt from Tyāgarāja, but the transmission of most of Tyāgarāja’s compositions up to the late 20th century was not through them. Most of Tyāgarāja’s students were in fact devotees rather than active professional musicians, and the modern concert renderings of Tyāgarāja’s *Kṛiti* compositions originated from the professionals of the second generation after Tyāgarāja. For instance, both Mahāvaidyanātha Ayyar (1844–97) and Patnam Subrahmanya Ayyar (1845–1902) learnt Tyāgarāja’s compositions (from his disciple Mānambucāvadi Vēnkatasubbayya) as fully trained professional musicians. Mahāvaidyanātha Ayyar’s father and grandfather were musicians, and he and his elder brother were trained by a former Thanjavur court musician. Among the few people he and his brother taught were Sabheśa Ayyar (1872–1948), who was the great-grandson of the Thanjavur court *vīnā* player Pallavi Doraisvāmi Ayyar (1752–1816) and the principal teacher of several important 20th-century performers, among them Musiri Subrahmanya Ayyar (1899–1974). Patnam Subrahmanya Ayyar passed Tyāgarāja’s *kṛiti* on to Rāmnād Śrīnivāsa Ayyangār (1860–1919), the principal teacher of Ariyakudi Rāmānuja Ayyangār (1890–1967).

An artist of a still later era, Kumbhakonam 'Nayana' Pillai (1887–1934) learnt many of Tyāgarāja's compositions from the descendants of Tyāgarāja's disciples from Walajapet. One cannot now know for certain to what extent the later 19th- and 20th-century renderings of Tyāgarāja's *kṛiti* may reflect the need of professional musicians of two and more generations after Tyāgarāja to have compositions that reflect both the aura of sanctity and the complexity or bravura of concert performance. The underlying melodic configurations of pieces in known traditional rāgas and traditional rhythmic conformations, along with patterned transformations of simple text rhythms and the principle of *sangati* (increasingly varied melodic elaboration) for the simple melodic lines, are fundamental and must be Tyāgarāja's genuine and original contribution. But specific melodic variations of a given line, or the actual tunes of small pieces in rāgas hitherto and elsewhere unheard of, are probably not his.

The spread of the classical Karnatak style of Thanjavur to other parts of south India began in the latter part of the 18th century. During the unsettled period of the mid-18th century, culminating in the occupation of Thanjavur by the nawab of the Karnatak (1773–6) and Haidar Ali's second raid (1781), a number of Thanjavur musicians had found refuge in the state of Travancore (now southern Kerala). The chief minister of the ruler Svati Tirunal (reigned 1829–47) was from Thanjavur, and Thanjavur musicians were prominent at the court. The young ruler was himself an expert musician and is regarded in south India as one of the great composers. Among other important Thanjavur musicians in Trivandrum were a *vīṇā* player who was a grandson of Pachimiliam Ādiyappayya, and Vadivelu, one of the most important mid-19th-century musicians. Vadivelu was an expert in court dance, had been a disciple of Muttusvāmi Dīksitar and was another early exponent of the violin. Until modern times the Travancore royal family continued to be outstanding patrons of Karnatak music, and Trivandrum is still a major centre of Karnatak music, quite apart from the indigenous music of Kerala such as *kathakali* music and the drum ensembles of *tayambakam* and *pañcavādyam*.

The court of Mysore was also a centre for Karnatak music originally brought in from Thanjavur. After the defeat of Tipu Sultan in 1799 the family of the Wodeyar chiefs who had ruled Mysore in the 17th century was installed as a ruling dynasty by the British. During the minority of the first king, the former chief minister and regent Pūrnayya brought in Vīṇā Vēnkatasubbayya (*d* 1838) from Thanjavur as the prince's music teacher. Vēnkatasubbayya's grandson Subbanna (1855–1938) and grand-nephew Śēsanna (1852–1926) brought the (by now) Mysore tradition of *vīṇā* playing into the 20th century. The Tyāgarāja *paramparā* ('succession') was first represented in Mysore by Sadāśiva Rao (1802–82), who had studied with one of Tyāgarāja's Walajapet pupils. The *vīṇā* players Śēsanna and Subbanna in turn learnt compositions from Sadāśiva Rao.

Small princely states as well as large ones played a vital role in the spread of Karnatak music or in its preservation and transmission to the late 20th century. An example is the estate of Vizianagaram in north-east Andhra Pradesh. Around 1800 Guruvācāryulu, a *vīṇā* player from Thanjavur, was invited to the Vizianagaram court and began a tradition of *vīṇā* playing that was brought into the 20th century by his great-grandson, Vēṅkataramana

Das (1866–1948). Another estate in the same region was Bobbili, whose *vīnā* player, Sangameśvara Śāstri, was the teacher of the older brother and teacher of the violin virtuoso Dwaram Venkataswami Naidu (1900–64).

A very small estate that played a large role in Karnatak music was Ettayapuram, associated with the Dīksitar family. The ruling family of Telugu-speaking Nāyaks came south after the destruction of Vijayanagar and established itself as a subordinate house to the Nāyaks of Madurai. In the last years of the 18th century the *pālaiyakārar* ('poligar') of Ettayapuram made himself conspicuously useful to the British and in 1803 was permanently confirmed in his estate. From then on he and his successors cultivated the arts, particularly music.

[India, Subcontinent of, §II, 4: History of classical music, Oral traditions after the 16th century.](#)

(ii) Hindustani traditions from the 17th century to the mid-19th.

The contribution that Tyāgarāja made to Karnatak music was paralleled by that of [Tānsen](#) to Hindustani music. He was respected as the legendary supreme artist and the ultimate starting-point claimed for most highly esteemed master-disciple successions. Tānsen's musical roots are universally said to be in Gwalior under the reign of Man Singh Tomar (1486–1516) and his son (1516–26). The genre called *dhrupad* developed in Gwalior, and in the 17th century a manuscript collection of the *dhrupad* of the earlier Gwalior court musician Nāyak Bakhśū was made under the title *Sahas-ras* ('The thousand delights'). Tānsen was born about 1500 and was a professional musician. There is no evidence that he was a Brahman or that he ever became a Muslim, although some of his immediate family of the next generation did (by the end of the 17th century most Hindustani musicians were Muslims). When Tānsen was brought from Reva to Akbar's court musical establishment in 1562 he was probably already over 60. His fame as musician and poet (the *dhrupad* song texts were composed in literary forms of Braj-bhāsā) became legendary, and in written and oral traditions numerous songs are attributed to him (cf. Brhaspati, 1979; Delvoye, 'Dhrupad Songs' (1994)).

The contemporary source for music in Akbar's time is the court chronicle *Ā'in-i akbarī* (1597) of Abul Fazl. Between the section on music itself, which is based on the 'seven-chapter' form, and the list of the imperial musicians, it is possible to get a good impression of the classes and nationalities of musicians and of their repertoires. Most significantly, the vocal musicians are without exception South Asian. There are four Dhārhī with Muslim names and 15 musicians from Gwalior with wholly or partly Hindu names, Tānsen and one of his sons being among them; there is also a singer from Agra and the deposed usurper of Malwa, Bāz Bahādur. The instruments associated with the Gwalior singers are the *bīn* and the *surmandal*; one Dhārhī plays the *karnā*, a trumpet of the *naubat* (a processional band). Otherwise the instrumentalists (all Muslim) are either from outside Hindustan (Khorāsān or Central Asia) or are of unspecified origin.

After referring to dance as the seventh and last 'chapter', Abul Fazl describes about a dozen categories of musicians and entertainments, but only two – Dhārhī and Kalāvānt – can be connected with the list of court musicians. Dhārhī are specifically mentioned as singers of Punjabi songs in

praise of heroes, accompanying themselves on a small drum and on a two-string plucked instrument (smaller than a *bīn*). In the list of genres in his second 'chapter' Abul Fazl referred to heroic songs called *karkhā* and *sādrā*, in various languages. Imam wrote in 1857 that the Dhārhi were said to be the oldest of the musician communities, and that they were originally Rājput̄s who sang *karkhā*. In his list of entertainers Abul Fazl described the class called Kalāvānt as singers of *dhrupad*. In the second 'chapter' *dhrupad* is said to belong to the region including Gwalior, Agra and Bari. Between Abul Fazl's list of musicians and two of his music 'chapters', then, one can confirm a category, a locality and a repertory for two classes: Kalāvānt from Gwalior, including Tānsen, sang *dhrupad* (and some played the *bīn*); Dhārhi from the Punjab sang heroic songs to the accompaniment of a small drum and string instrument.

The third musician class of continuing significance that is mentioned in Abul Fazl's seventh music 'chapter' are the Qavvāl, who are said to be of the same class as the Dhārhi but to sing Delhi songs (and Persian songs in the same way). In the second music 'chapter' Delhi songs are identified as *qaūl* and *tarānā* and are said to have originated with Amir Khusrau. Amir Khusrau's *ghazal* (couplets) were sung both at the Sufi gatherings of Nizām-ud-dīn Auliya and at Sultan Alā-ud-dīn Khiljī's court. The characteristic semantic ambiguity of the *ghazal* (a secular love song to which an allegorically devotional interpretation can be given) made it 'an oblique cultural link between the Sufi hospice and the court' (Ahmad, 1969). The Qavvāl, then, were connected with but outside the range of purely court musicians, so that no Qavvāl appear on Abul Fazl's list of court singers. Nonetheless, it may be inferred from Abul Fazl that the Qavvāl were in some sort of close contact with the Dhārhi in the 16th century.

In later sources it is said that four *bānī* (styles) of *dhrupad* descended from four Kalāvānt musicians of Akbar's court. Of these, two are of particular interest, partly because of secondary associations with instruments. Firstly, a line of *bīn* players is believed to have begun from the marriage of Tānsen's daughter Saraswati to Misra Singh, the son of Tānsen's colleague, Sammokhan Singh. Historically the most important representative from this line was Niyāmat Khān (Sadārang), of the court of Muhammad Shah (reigned 1719–48). Secondly, Tānsen himself is supposed to have played the plucked *Rabāb*, and his son Vilās Khān founded a line of *rabābiyā*. The important 18th-century musician Masit Khan is believed by some to have been a descendant in this line; others have him in Sammokhan Singh's line.

Niyāmat Khān, known as *Sadārang*, and Masit Khan are traditionally said to have devised what are now the two most widespread representatives of Hindustani music: the vocal *khayāl* and the modern form and basic playing style of the Indian *Sitār*. The origins of *khayāl* have long been a matter of debate. It is reputed to have its roots in 15th-century Jaunpur or earlier, but the oldest examples in the repertory are Sadārang's compositions. The genre appears to have been in existence already in the 17th century, but it is particularly associated with the Kalāvānt *dhrupad* singer Sadārang and his family and their taking over certain special features from the Qavvāl musicians. Since their family heritage was *dhrupad*, Sadārang and his nephew Adārang perhaps did not themselves commonly perform *khayāl*,

but they could teach it to others, in particular to disciples who were not their own sons.

An illuminating source for the cultural life of Muhammad Shah's Delhi is the contemporary Persian account, *Muraqqa'-i Delhī*, of Dargah Quli Khān (b 1710), who resided in the capital between 1737 and 1740. He recorded a wide range of musical and artistic practices and genres, and described the apparently happy co-existence of different forms; Niyāmat Khān, he tells us (without mentioning the name Sadārang), was indeed a distinguished singer of *khayāl* as well as a *bīn* player (Blake, 1991, pp.156–7; Delvoye, 'Indo-Persian Literature' (1994), p.116; Lath, 1988, pp.9–10).

During the latter part of the 18th century the collapse of the Mughal Empire and the establishment or re-establishment of other centres of power resulted in the dispersal of Muhammad Shah's musicians and dancing girls. An early attraction was the court of Faizabad in Avadh, which had achieved a reputation for prosperity and patronage under the nawab Shuja-ud-Daula.

Many went to small courts in Rajasthan, to the west. As the Maratha Wars gradually drew to a close in the first two decades of the 19th century, other small states were reconstituted or devised under the Pax Britannica, and they developed court musical establishments. Among them were three musically important states, ruled by Maratha dynasties descended from soldiers of fortune: Indore, Baroda and the old state of Gwalior. The gradual drift of professional musicians to wealthy Bengali patrons, both landlord and merchant, in Calcutta also began in the early 19th century, and Varanasi has always supported musicians. The largest number of musicians, however, went to Lucknow, to the court of the nawabs of Avadh and to the employ of wealthy courtiers there, many of whom became accomplished and recognized artists in their own right, although on an amateur basis. For about 75 years Lucknow was the premier centre of art music of north India. Its hegemony ended only with the deposition of Nawab Wājid Alī Shāh in 1856 and the war of 1857. In these two years Hakīm Muhammad Karam Imam wrote his *Ma'danu'l-mūsīqī*, a vivid account of music at Lucknow and elsewhere in north India in the first half of the 19th century (Willard, 1834).

Courtesans (*tawāif*) are also known to have played an important role in the musical life of north Indian urban centres, especially Lucknow, from the late 18th century and into the 20th. There were women who were highly trained in *khayāl* and perhaps even *dhrupad* (as well as in the lighter, and increasingly popular, *thumrī* and *ghazal*), as represented for example in the Urdu novel *Umrāo jān adā* (1899) by Mirzā Muhammad Rusvā.

During the 260 years between the composition of Abul Fazl's *Ā'in-i akbarī* (1597) and Hakīm Imam's *Ma'danu'l-mūsīqī* (1857), Kalāvānt, Qavvāl and Dhārhi, the three chief categories of musician, continued to form the socio-musical basis of Hindustani music, but both status and repertory altered somewhat. Some Kalāvānt traditions now included *khayāl* as well as *dhrupad*, although the Qavvāl too were still important as *khayāliyā*. Between Kalāvānt and Qavvāl, however, there were substantial differences in the manner of rendition. Imam reported that

... the singing of *Khayāl* has been prevalent among Qavvals but they do not have *Ālāp* [introductory exposition of rāga without text, metre, or pulse]. Instead they begin with words of *Tarānā* that are in Persian and after exercising these words for some time they straight come to *Khayāl*, etc., and quickly create a highly colourful effect. So much so, that the people who practice *Ālāp* appear inferior before them. But to Kalavants, however, the primary thing is *Ālāp*.

Qavvāl also continued to sing Sufi devotional music such as *qaūl*, and they did not sing *dhrupad*.

All musician communities had lost status, but the Dhārhī community, regardless of where it had stood in the 16th century, had lost the most. The Dhārhī still accompanied with drum and a small string instrument, but most were now reduced to earning their living by accompanying dancing-girls. Indeed most, though not all, of the musicians identified by Imam as Dhārhī played the *Sārangī* (then and until modern times closely associated with courtesan singers *tawāif* or *bāī*) and the *Tablā*, both used to accompany *khayāl* as well as *thumrī* but not to accompany *dhrupad*.

For the whole of this period a hitherto little used historical resource is found in iconography and miniature painting (fig.3). The Mughal and provincial courts provided patronage for painters, who alongside portraiture and literary themes richly represented scenes of court life in their work, including many details of musical activity. From the numerous published collections and catalogues much may be learnt about musical life and its organization as well as the nature of musical instruments and their playing methods.

[India, Subcontinent of, §II, 4: History of classical music, Oral traditions after the 16th century.](#)

(iii) Hindustani traditions from the mid-19th century to the 20th.

The process of shifting repertoires and categories continued rapidly after 1857. The Dhārhī lost their group identity as professional musicians; their role as *sārangī* accompanists for singing-girls (and later for *khayāliyā*) was taken over by a formerly rural community called Mirāsī and by Kathaks. The Qavvāl continued to interact professionally and to intermarry with Kalāvānt until they were effectively absorbed by the latter in their secular professional capacities; Qavvāl today are only a category of specialists in *qavvālī* (Muslim devotional music). The Kalāvānt community meanwhile added *khayāl* to *dhrupad* in vocal music, and the sitar and later *sarod* (both plucked string instruments) to those that were already part of their heritage (the *bīn* and *rabāb*, and a now obsolete derivative of the latter called *sur-śrngār*). The term 'Kalāvānt' now usually has the sense of any professional vocalist (other than a singing-girl).

The *sampradāya* ('traditions') of Hindustani music were strongly family-orientated, and by the end of the 19th century Hindustani *sampradāya* were being called *gharānā* ('family'). In almost all circumstances non-family disciples could also associate themselves with a *gharānā*, but some musicians would reserve part of what they knew for their sons alone. The *gharānā* were named after the place of their origin.

(a) Discipular *gharānā*: Agra and Gwalior.

One of the two or three most admired musicians of modern times was [Faiyaz Khan](#), who was chief musician of the Gaekwar of Baroda from about 1915 until his death. Faiyaz Khan's paternal grandfather and father belonged to the so-called Sikandra (or Rangīle) *gharānā*, but because of the early death of his father, Faiyaz Khan was trained by his maternal grandfather, Ghulam Abbas Khan, a representative of the Agra *gharānā*. Ghulam Abbas Khan was the eldest son of Ghagge Khudā Bakhsh (c1800–c1855), who in turn was the youngest son of one Śyāmaranga, about whom little more is reported than that he was a descendant of Sujān Singh, said to have been a musician of Akbar's court. Ghagge Khudā Bakhsh, the founder of the Agra *gharānā*, learnt *dhrupad* from his father and uncle, but owing to his *ghigghu* ('choked-up') voice they gave him little encouragement. Hence he set out for Gwalior to learn *khayāl* from Nathan Khān and Pīr Bakhsh, hoping they would be able to clear up his vocal problem. They agreed to take him as a student, and in exchange, Ghagge Khudā Bakhsh taught them *dhrupad* belonging to his own family tradition. As a result of this contact both the Agra *gharānā* and the Gwalior *gharānā* have reflected something of an admixture of *dhrupad* improvisatory techniques in their rendition of *khayāl*.

Another important representative of the Agra *gharānā* was Vilāyat Husain Khān (1895–1962), whose *Sangīt-jñō samsmaran* (New Delhi, 1959) is a basic source for information on the family and discipular successions that formed modern Hindustani music.

The Gwalior *gharānā* is one of the oldest of the recognized modern *sampradāya* and the one most generally significant for Hindustani music in the 20th century. The first remembered names are two brothers who are said to have come from somewhere near Delhi in about 1800 and to have spent their entire careers in the service of the Scindia (Maratha) ruler of Gwalior. Beyond the fact that the brothers were only *khayāl* singers, nothing is known of their antecedents. The next generation was represented by Nathan Khān and Pīr Bakhsh. As mentioned above, they learnt *dhrupad* from Ghagge Khudā Bakhsh of Agra. The following generation was represented by Haddū Khān (d c1870) and Hassū Khān, who are considered the founders of the *gharānā*. The characteristic eclecticism of the Gwalior *gharānā* is illustrated by the way in which they absorbed yet another tradition. The Gwalior ruler Jhankojī II (reigned 1827–43) heard the great Qavvāl musician Muhammad Khān (d c1840), who was at the court of Reva. Jhankojī determined that his musicians Haddū and Hassū Khān should acquire Muhammad Khān's repertory and above all his style. Muhammad Khān was the son of Qavvāl Shakkār Khān and the grandson of the 18th-century Lucknow Qavvāl musician Ghulām Rasūl. In addition he had himself developed a brilliant new style of passage-work, which none so far had succeeded in imitating. Over a period of years the Gwalior ruler invited Muhammad Khān for long stays and frequent performances, during which Haddū and Hassū Khān, hiding behind a curtain, gradually picked up Muhammad Khān's repertory and worked out his technique.

The ways in which the earliest generations of the Gwalior *gharānā* built up their stock of compositions, styles and techniques (by inheritance from their own relatively obscure forebears, by barter with a Kalāvānt musician and by theft from a Qavvāl musician) indicate how music and musicianship were regarded as something to be treasured, as the private property of the family and the ultimate foundation of its prosperity. Haddū Khān and his brother, however, were as generous in sharing their musical wealth as they and their father and uncle had been zealous in acquiring it. The *gharānā* was represented by family descendants and disciples, but the enormous impact of the Gwalior *gharānā* on Hindustani music today has been through musicians from Maharashtra. The Gwalior ruling house being Maharashtrian, a number of Maharashtrians became resident there; among them was Joshi Bua (Vāsudeva Buvā Jośī), a senior disciple of Haddū Khān and a court musician. Balakrishna Bua (Bālakrsna Buvā; 1849–1926) came to Joshi Bua for musical studies from a small estate in Maharashtra called Ichalkaranji. Balakrishna Bua too became a distinguished disciple of the Gwalior *gharānā*, accepted as full colleague and equal by Haddū Khān’s sons Muhammad Khān and Rahīmat Khān (c1860–1922).

Balakrishna Bua’s disciple [Vishnu Digambar Paluskar](#) probably did more than any other single person to bring Hindustani classical music into the 20th century from the 19th-century world of princely courts, high artistic secrets and low social status. In 1897 he gave what was probably the first concert of Hindustani classical music where admission was by public ticket sale rather than private invitation. In 1901 in Lahore he opened the first public music school, the Gandharva Mahāvidyālaya. In later years his best disciples and their disciples opened branches in other cities. Vishnu Digambar was a convinced nationalist and linked Hindustani music (as an indigenous high art neither stifled nor adulterated by European rule) with the nationalist movement. He helped to make Hindustani music respectable by enabling students of middle-class families to perform publicly under the auspices of the music school. In a comparable stratagem of a purely musical sort, he took the beautiful and supple rāgas used for *thumrī*, with their associations with courtesans, and made tunes in them for the favourite devotional songs of the medieval Hindi poets, thus making those rāgas also respectable.

Vishnu Digambar’s own great musicianship and his popular appeal as a performer made his propaganda for classical music ultimately successful. However, in addition to training thousands of future supporters of music through the Gandharva Mahāvidyālaya, he trained his own professional disciples as rigorously as he had himself been trained, and more systematically. A senior disciple, Vinayak Rao Patwardhan, in turn taught Vishnu Digambar’s only son, D.V. Paluskar (1921–55).

Vishnu Digambar’s most successful disciple was [Omkarnath Thakur](#), who added a strong emotional element to what he received from the Gwalior tradition. After a brilliant public career of over 30 years, Omkarnath Thakur accepted an invitation to institute a college for music as part of Banaras Hindu University. For the degree courses he provided, with the assistance of two of his students, a six-volume textbook, *Sangītāñjalī*, which is the fullest existing source of Hindustani classical music in notation, providing

complete typical improvisatory elaborations as well as compositions. Two further volumes remain in manuscript.

(b) Court gharānā: Jaipur and Rampur.

The word *gharānā* is also sometimes applied solecistically to a particularly brilliant local assemblage of musicians, not necessarily otherwise connected by blood or training. During the latter part of the 19th century princely houses that had chosen the winning side in the 1857 war were in a position to build up their musical establishments rapidly if they so chose, and one that did was Jaipur. Two of the last generation of concert musicians identified as Qavvāl came there in 1870 from the state of Alwar, which had been put under a regency council by the British. One was the son of that Qavvāl Muhammad Khān from whom Haddū and Hassū Khān of Gwalior had stolen the secret of his passage-work. The other was his nephew, who was also the son-in-law of Haddū Khān. Also at Jaipur was the *sitāriyā* Imrat Sen (1813–93), who inherited the *masītkhānī sitār* tradition on both sides of his family. His father, Rahīm Sen, had been taught by his maternal grandfather, Dulhe Khān, and both were descendants of Masīt Khān. Yet another Jaipur line springs from the *dhrupadiyā* Bahrām Khān of the so-called Saharanpur *gharānā*. Through his brother's grandchildren Bahrām Khān was the musical progenitor of the musicians who now have the surname Dagar and who are the best-known of the few remaining representatives of *dhrupad* singing and Hindustani *bīn* playing (see §(c) below).

Another lineage at Jaipur is historically important for its connection with [Vishnu Narayan Bhatkhande](#). The ancestors of the Jaipur musicians Ishāq Alī Khān (d 1915) and his father Muhammad Alī Khān came from Faruqābād (where an important modern tradition of the *tablā* also originated). Around 1900 Ishāq Alī Khān, hard-pressed financially, agreed to teach *khayāl* to V.N. Bhatkhande for a few months on a monthly stipend. Because of his fluency in using his own (letter) notation Bhatkhande could collect not a few but a few hundred compositions, many of which were ultimately published in his *Kramik pustak-mālikā* (see §3(vi) above).

The musical establishment at the court of Rampur was Bhatkhande's other major source of repertory, and according to K.C.D. Brhaspati (1966), it was also a source of his notion of basing a *rāga* classification on ten scale-type *thāt*. The Rampur establishment was founded by Nawab Yūsuf Alī Khān (reigned 1840–64), who brought a number of musicians to Rampur from Lucknow after the last nawab of Avadh was deposed in 1856. The next nawab's younger brother Haidar Alī Khān (1846–c1905) was one of the enthusiastic noble amateurs not uncommon in princely India and the foremost disciple of two important musicians of the court. Haidar Alī Khān is said to have given one of these musicians 100,000 rupees for 307 compositions belonging to the Tānsen tradition. Haidar Alī Khān was himself the teacher of the *bīn* player Wazīr Khān (1863–1926). After the death of the latter's father he also taught his own son, known as Chamman Sahib (1879–1922). Chamman Sahib was in turn one of Bhatkhande's principal collaborators in his work at Rampur after 1917. The other, reluctantly, was Wazīr Khān. Bhatkhande made himself a formal disciple of the then reigning nawab, who thereupon required Wazīr Khān to teach the

repertory handed down in oral tradition from Tānsen, lest it be lost, and the Tānsen *dhrupad* published in the *Kramik pustak-mālikā* were thus obtained from Wazīr Khān.

Wazīr Khān also had distinguished disciples of a more traditional sort; one was the *sarod* player Hafiz Alī Khān (d 1972). Hafiz Alī Khān's great-grandfather, who played the (plucked) *rabāb*, came from Afghanistan and took service at the court of Reva, learning classical Hindustani music there. Hafiz Alī Khān's grandfather Ghulām Alī Khān went to Gwalior after 1857 and is supposed to have developed the modern *sarod* from the *rabāb*. After his father died Hafiz Alī Khān went to Rampur to learn from Wazīr Khān. Wazīr Khān's best-known disciple was [Allauddin Khan](#), who came to Rampur from what is now Bangladesh. Allauddin Khan's son [Ali Akbar Khan](#) and his son-in-law and disciple [Ravi Shankar](#) are now artists with international reputations.

(c) Other gharānā and the later 20th century.

Vastly improved communications and widened public patronage (see §5 below) have brought numerous performers, including those of the earlier days of broadcasting and performing, to popular and even international fame. Singers of the Gwalior and Agra *gharānā*, the Kirana *gharānā* ([Abdul Karim Khan](#), Hirabai Barodekar, Gangubai Hangal, [Bhimsen Joshi](#)), the Patiala *gharānā* ([Bade Ghulam Ali Khan](#)), the 'Alladiya Khan' or Jaipur *gharānā* (Mallikarjun Mansur, Kesarbai Kerkar, Mogubai Kurdikar, Kishori Amonkar), the Sahaswan/Rampur *gharānā* (Mushtaq Hussein Khan, Nisar Hussein Khan), the Mewar *gharānā* (Pandit Jasraj) and others like Kumar Gandharva and the Indore singer [Amir Khan](#), whose formative influences were more diverse, strengthened the position of *khayāl* as the leading classical Hindustani vocal genre of the century. Some (Abdul Karim Khan, Bade Ghulam Ali Khan and others) were also noted *thumrī* singers. *Thumrī* has also been prominently performed and recorded by specialist singers such as [Siddheswari Devi](#) and [Girija Devi](#) of Banāras (now Varanasi). The same widening of access and patronage has more recently come to reduce the emphasis on *gharānā* as such, while some singers (Bhimsen Joshi, Kishori Amonkar, and most notably Kumar Gandharva) extended their *gāyakī* (vocal styles) deliberately and experimentally. In the meantime *dhrupad*, which for much of the 20th century was in relative obscurity or decline, has in the last quarter of the century seen a revival of interest and patronage, first through the work (performing and teaching) of the vocalists and *bīn* players of the Dagar family and their pupils, and latterly at functions in north India arranged to revitalize the many lesser known regional and familial traditions (Widdess, 1994). Hindustani instrumental music has particularly flourished, enjoying as it does a greater independence from vocal music than in the Karnatak tradition, and here again, changing (including international) patronage has played a role. Certain instruments (*śahnāī*, *bānsurī*, *sārangī* etc.) have emerged as solo performers from a previously more subordinate function, while others (*sītār*, *sarod*) have longer histories as solo instruments. In the case of the *tablā* even a decline in solo demand is sometimes noted (Miner, 1993; Kippen, 1988, p.100).

[India, Subcontinent of, §II: History of classical music](#)

5. Classical music, the state and the middle class.

During the 19th century the source of patronage for Indian art music was the princely court (in south India the temple as well). By the mid-19th century older courts and newly established ones alike had come under British control. The British rulers themselves, controlling more than half the subcontinent directly, did nothing for music. Nor was this just a matter of deliberate non-interference in indigenous affairs, for they involved themselves in areas such as archaeology and philology. However, unlike the Mughals whom they succeeded, the British rulers were generally hostile to Indian art music, at best seeing it as the decadent legacy of a golden past. Only a few, outstanding among them Augustus Willard, seem to have been able to hear and come to understand it in its own terms (see §6 below).

The new clerical and professional middle class that founded the All-India National Congress in 1885 was also becoming a new source of patronage for musicians. The Gāyan Samāj was established in Pune in 1874, a branch was started in British Madras in 1883, and from 1895, many *sangīta sabhā* ('music societies') were established. In British Bengal the pioneering researches and creative achievements of [sourindro mohun Tagore](#) (who like the south Indian musicologist Chinnasvami Mudaliyar became centrally involved in the debate over the appropriateness of Bengali and Western notation to Indian music; cf Capwell, 1986, 1991; Farrell, 1997) and [rabindranath tagore](#) contributed to this growing awareness, as did the scholarly and artistic example and the promotional activities of V.N. Bhatkhande and Vishnu Digambar in British Bombay. When the Indian National Congress met in Madras in 1927–8, national independence was declared for the first time to be the goal of the movement, and it is symbolic that surplus funds from the congress were used to found the Madras Music Academy for the research, teaching and sponsorship of Indian classical music.

When independence came in 1947 it was the beginning of profound changes in the patronage of the performing arts. All-India Radio (AIR), established in British days, was made the medium for state patronage of classical music as a matter of deliberate policy by B.V. Keskar during his tenure as Minister for Information and Broadcasting. While some professional musicians subsist through teaching and concerts as well as broadcasts, for most AIR provides a reasonably steady income, depending on the connection and the status that the artist has. Both 'staff artists' in the regular employ of AIR and 'casual artists' who give occasional broadcasts are graded, and salaries or fees for broadcast performances are adjusted accordingly. A few top-ranking musicians are ungraded. Performing artists are among those who teach in schools and music colleges as well as taking private pupils. Classical music is commonly cultivated by the urban middle class as a worthwhile educational pursuit.

In 1916 the first All-India Music Conference was convened under the guidance of V.N. Bhatkhande and sponsored by the Gaekwar of Baroda. Both performers and scholars were invited. In subsequent decades the expression 'music conference' has come to mean a concert series. Such series constitute a principal venue for classical music in north India. In

south India the annual Music Academy conferences have been the model for other conferences, and the patronage of the numerous *sangīta-sabhā* continues, but with an ever-increasing proportion of non-musical events.

Important patronage has also been provided by commercial recording companies. Within the first decade of the 20th century the Gramophone Company (later called HMV) and its sister companies in Calcutta, Lahore, Varanasi and elsewhere had made a large number of recordings. Other companies came into being in the 1930s, and shortly after independence foreign companies began to record Indian artists, thus promoting interest in Indian music abroad. From the 1980s audio cassettes began to supplant vinyl discs, and in the 1990s CDs, though still a luxury in India, appeared in rising numbers there and abroad. The repertory recorded is vast and widening, and there are inevitable consequences in both the professional and the public perception of a music that was formerly largely dependent on single, unrepeated and open-ended performances. As a promoter of music, the power of recording is beyond dispute (see also §VIII, 2 below).

[India, Subcontinent of, §II: History of classical music](#)

6. Indian music and the West.

In the 20th century Indian classical music enjoyed some prestige outside the subcontinent itself. Hindustani practice and theory exerted considerable influence in the higher musical culture of Afghanistan, and Indian communities around the world have to varying degrees fostered their cultural traditions. The roots of Western awareness of Indian music (never extensive before the late years of British rule in India) may be found in the late 18th century. Until then, apart from some rather random observations (mainly of dancers) by travellers, there was little serious interest among Europeans. A few brief accounts or comments of greater value are exceptions, such as those by the 17th-century Italian Pietro della Valle (including a description of a string instrument, apparently a *vīnā*, and its player), Marin Mersenne in his *Harmonie universelle* of 1636–7 (also observations, some misunderstood, on instruments that had found their way into European collections), the German-born Danish missionary Bartholemaeus Ziegenbalg, whose *Malabarisches Heidenthum* of 1711 contained a substantial pioneering account of Indian musical theory and instruments, and the French traveller Pierre Sonnerat, whose *Voyages aux Indes Orientales et à la Chine*, published in 1782, again contained information on musical instruments.

In the 1780s a small group of prominent English women resident in Calcutta began to take an interest in Indian music and to employ musicians to play melodies which they then transcribed, sang and played on the harpsichord, and eventually published in part. The ‘Hindostannie Air’ was promoted especially by Sophia Plowden (wife of an East India Company employee), whose friends Margaret Fowke and her brother Francis supplied her with songs collected in Banāras (where Francis Fowke was Governor). Sophia Plowden was able herself to collect material from Lucknow. In 1789 a collection of ‘airs’ transcribed for harpsichord was published in Calcutta as *The Oriental Miscellany: being a Collection of the most Favourite Airs of Hindoostan* by the musician William Hamilton Bird. Around 1795 a further collection appeared, compiled by Charles Trinks,

and this was followed by others in London. An important further manuscript collection, also containing depictions of instruments, is in the Fitzwilliam Museum in Cambridge. The melodies, many of them apparently of 'light' musical forms in simple metres like *dādrā*, and many of which seem to have been considerably 'adapted' despite an aim to maintain authenticity, proved to be of some passing interest to composers in England in the early 19th century, who even based some compositions on them.

It appears to have been such collecting that first attracted the English Oriental scholar Sir William Jones (founder of the Asiatic Society of Bengal) to the study of Indian music. Together with the Governor-General Warren Hastings he helped Margaret Fowke in her collecting of songs, and in the first volume of the Society's *Asiatick Researches* (1788) he published a detailed letter on the *vīnā* by Francis Fowke. Through Fowke he was able to hear a *vīnā* player, probably Jivan Shah of Banāras, and in 1784 he wrote his treatise *On the Musical Modes of the Hindoos*, which he published in the third volume of the *Asiatick Researches* in 1792. Such interest as followed was largely due to Jones's impetus, though his pioneering essay was before long superseded. Captain N. Augustus Willard's remarkable 1834 *Treatise on the Music of Hindoostan* shows a more direct acquaintance with actual musical practice than Jones's work, which relied more on what he could determine of ancient theoretical precepts.

A valuable pictorial resource is the systematic portrayal of musical instruments and players made by the Flemish artist François Balthazar Solvyns (1760–1824) in the 1790s. He made a collection of drawings depicting many areas of life in Bengal, and in the second volume of the later edition (Paris, 1810) 35 plates of musicians and one of a *nautch* (dance) are introduced and accompanied by detailed notes. Some 19th-century works of universal and comparative musicology (William C. Stafford: *A History of Music*, 1830; François Joseph Fétis: *Histoire générale de la musique*, ii, 1869; J. Adrien de la Fage: *Histoire générale de la musique et de la danse*, 1844) and works by Carl Engel, Meadows Taylor, Alexander Ellis and others, show a gradual (if somewhat haphazard and often exoticist) increase of European interest in, and awareness of, Indian as well as other non-Western musics.

Fresh impetus came from S.M. Tagore, who corresponded and met with Western scholars, published many works on music himself (including a still useful anthology of writings by Jones, Willard, Fowke and others) and sent collections of Indian instruments, some of them fanciful hybrids, abroad to leading scholarly and musical institutions. These collections were studied by Western scholars including Curt Sachs and Joanny Grosset. Grosset's major article in the *Encyclopédie de la musique et dictionnaire du Conservatoire* (Paris, 1913) may be counted the beginning of modern interest in Indian music in the French-speaking world, as were, for the English, C.H. Day's *The Music and Musical Instruments of Southern India and the Deccan* (1891) and A.H. Fox Strangways's *The Music of Hindostan* (1914; see §X below). The emphasis on music as it was practised, rather than as reflecting classical theory, was a departure from much of the Western writing of the 19th century.

Hardly any performances of Indian classical music were heard in the West before the end of the 19th century, though there is some evidence of migrant Indians active in the late Victorian popular culture of London. Day refers to a Jaipur *bīn* player in London in 1886, and some other instrumentalists and dancers subsequently performed at international exhibitions in Britain and in Europe, affording composers like Debussy and Holst some limited contact with Asian music. Certainly Debussy met the musician and Sufi Hazrat Inayat Khan, who was on a European tour with a troupe of performers in 1912–14 and who enjoyed a somewhat more enthusiastic, though equally uninformed, response in France than in England. In Moscow, Inayat Khan impressed Sergei Tolstoy and others with his attempts to blend Eastern and Western music, and well into the 1920s, until his return to India, he continued to propagate Indian music and Eastern philosophy in England, Europe and America.

Inayat Khan's Western experience was partly a missionary venture, and the following he found among his audience combined religious and artistic interests. Rabindranath Tagore first visited England in 1880 and returned to the West many times, exerting some influence as a philosopher and educationist. His meeting with the Englishman Leonard Elmhirst in New York in 1921 resulted in the establishment of the school, college and theatre at Dartington Hall in Devonshire, England. Dartington developed as an important centre for Indian arts, where Indian music continued to be studied with Western and with visiting Indian artists and teachers up to the early 1990s.

The dancer [Uday Shankar](#) worked with the Russian ballerina Anna Pavlova (1881–1931) in London in the 1920s, and in collaboration they produced a number of dance productions that mixed Indian and Western forms. In the later 1930s Shankar, with a troupe of musicians, presented to American and European audiences concerts of Indian music somewhat tailored to Western requirements. Among those they presented for the first time in the West were the *sarod* player Allāuddin Khān (*d* 1972) and his pupil Ravi Shankar (*b* 1920), younger brother of Uday Shankar. From the 1950s Ravi Shankar, the *sarod* player Ali Akbar Khan and the *tablā* players Chatur Lal and Alla Rakha (1919–2000) became the best known and most influential of an increasing number of Hindustani instrumentalists touring the West. In the later 1960s a brief period of exoticism in Western popular music made some of the sounds of Hindustani music superficially familiar, but at the same time Ravi Shankar and others were also beginning to play to large audiences in concert halls and to record with major Western companies. Some syncretistic experiments followed as a result of encounters between Indian and Western composers and jazz musicians. It would be hard to claim that many of these have stood the test of time, but Indian music in its own right has increasingly prospered in the West. From the 1970s international interest became engaged with vocal and with Karnatak performances, and practical teaching and academic research (see §X below) in Indian music have gradually established a footing in European and American institutions.

[India, Subcontinent of](#)

III. Theory and practice of classical music.

This section addresses the styles and structures of Indian classical music as it is performed today and as it has been described over centuries in the theoretical works introduced in §II above. While practice has always moved ahead of theory, theory has articulated the underlying concepts and provided a technical vocabulary that is still used by musicians today. Study of the theoretical sources reveals how Indian music has constantly changed and developed while remaining faithful to certain underlying principles.

The science of music (*sangīta*) is traditionally divided into vocal music (*gīta*), instrumental music (*vādya*) and dance (*nrtya*). This sequence underlies the highly influential treatise *Sangīta-ratnākara* by the 13th-century writer Śārṅgadeva. Śārṅgadeva further divided his account of vocal music into (1) tonal systems; (2) rāga; (3) melodic elaboration and (vocal) ensembles; (4) compositions; (5) tāla (as articulated by rhythmic instruments); (6) instruments and instrumental music; (7) dance. This sequence is followed in the present section, except that the topic ‘Rhythm and tāla’ (§4 below), which applies to both vocal and instrumental music, precedes ‘Compositions, genres and performance of vocal music’ (§5 below).

1. Tonal systems.
2. Rāga.
3. Melodic elaboration.
4. Rhythm and tāla.
5. Compositions, genres and performance of vocal music.
6. Instrumental traditions.
7. Aesthetics.

India, Subcontinent of, §III, 1: Theory and practice of classical music.,
Tonal systems.

(i) Svara.

Svara can have two senses: an abstract pitch class, a scale degree; or a melodic element, a scale degree in a melodic context. The names of the seven *svara* and the syllables by which they are solmized in teaching and performance are set out in Table 1. The syllables can function as an oral and a written notation. Three octave registers (*sthāna* ‘position’ or *saptak* ‘group of 7’) called *mandra* (‘soft’, ‘low’), *madhya* (‘medium’) and *tāra* (‘carrying’, ‘high’) are associated with the chest, throat and head registers of the voice respectively. Additional lower and higher octaves (*atimandra*, *atitāra*) are encountered in instrumental music.

Since the 16th century the first scale degree, *sadja*, has functioned as a universal reference-pitch or tonic for all *rāgas* and is sustained or reiterated as a drone accompaniment (*kharaj*, *sur*, *śrutī*). The *svara* refer to relative pitches, not to a common pitch standard, since each soloist fixes the *sadja* at a pitch to suit his or her voice or instrument. The chosen pitch may be defined with reference to the keys of the harmonium: *kālī ek* ‘first black [key]’ (C \flat), *safed do* ‘second white’ (D) etc. In Western writings, and in this article, *sadja* is equated by convention with C. In most *rāgas*, either the perfect fourth or the perfect fifth degree, *madhyama* or *pañcama*, is also structurally important and is usually included in the drone. The functions and pitches of the remaining *svara* vary from *rāga* to *rāga*.

Svara can be construed as scale degrees, defined in terms of the 22 microtones (*śrutī*) of ancient theory or the 12 pitch positions (*svrasthāna*) of modern practice. In addition there are particular ways of treating each scale degree in specific musical contexts, referred to as *gamaka* (‘ornament’), *lāg* (‘way of taking’), *uccār* (‘pronunciation’) etc. Sometimes the way of treating a *svara* is designated by reference to a well-known *rāga*: Kānadā ga or Todī ga, Adānā ni or Bhairavī ni etc. A pitch becomes a *svara* by virtue of a particular mode of approach, prolongation and release (see §3(i) below).

Svara are also defined in terms of intervallic relationships. Theory from the *Nātyaśāstra* onwards identifies three such relationships: ‘consonant’ (*samvādī*), perfect 4ths and 5ths; ‘dissonant’ (*vivādī*), minor 2nds and major 7ths; and ‘assonant’ (*anuvādī*), all other intervals. Consonance (*samvāda*) is required between the predominant note of a *rāga* (called the *amśa* or *vādī*) and its companion a 4th or 5th distant, the *samvādī*. It also obtains between other notes, melodic motifs and registers (see §2(iii)–(iv) below). Therefore it is an important factor in the structure and evolution of scales, *rāgas* and melodies, especially in Hindustani music. Intervallic relationships are important not only between the successive pitches of a melody, but also between each individual *svara* and the ever-present drone.

[India, Subcontinent of, §III, 1: Theory and practice of classical music., Tonal systems.](#)

(ii) History of tonal systems.

The history of Indian tonal systems shows a gradual change, (1) from a microtonal to a semitonal division of the octave; (2) from a variable tonic system, where each *svara* can serve as the ground-note of scales and modes, to the use of *sa* as a universal system-tonic; and (3) from a system in which only three *svara* are of variable relative pitch to systems in which all are variable except *sa* and *pa*. The relationship of modern practice to older systems, and of each to Pythagorean and other tonal theories, has been the subject of intense debate among Western and Indian scholars. The theoretical primacy of heptatonic scales may reflect distant links with other Asian systems of antiquity, but hexatonic and especially pentatonic structures have been equally important. Scales with augmented 2nds appear in theory from the 16th century onwards and presumably reflect the arrival at Indian courts of musicians from Islamic Central Asia and Iran.

(a) Ancient Indian terms: *grāma*, *śruti*, *mūrcchanā*.

(b) The tonal system of the *Sangīta-ratnākara*.

(c) The development of the Karnatak general scale.

(d) The development of the Hindustani general scale.

India, Subcontinent of, §III, 1(ii): Theory and practice of classical music., Tonal systems., i) History of tonal systems.

(a) Ancient Indian terms: *grāma*, *śruti*, *mūrcchanā*.

In chapter 28 of the *Nāṭyaśāstra* the *svara* are arranged in two scales, or rather pitch-collections (*grāma*), named *sadja-grāma* and *madhyama-grāma* after their starting pitches. The *grāmas* are defined in terms of 22 equal microtonal intervals (*śruti*) and in terms of consonant intervals (*samvāda*) between specified *svara*. Each *svara* is considered to comprise both the pitch of the note itself and the interval of two, three or four *śrutis* separating the note from its lower neighbour (see [Table 2](#)). Representation in Western notation can only be approximate, because the *grāmas* included three sizes of scale-step, measuring two, three and four *śruti*. In practice the three *śruti* steps (*ri* and *dha* in *sadja-grāma*, *pa* and *ri* in *madhyama-grāma*) may have been rendered as undulating rather than as steady pitches, at least by singers and flute-players.

The consonant intervals are defined as measuring nine *śruti* (perfect 4th) and 13 *śruti* (perfect 5th); 4ths of ten or 5ths of twelve *śruti* were not considered consonant. Thus in the *sadja-grāma*, *pa* is consonant with *sa* but not with *ri*, but vice versa in the *madhyama-grāma*. Each *grāma* may be conceived of as chains of consonant 4ths or 5ths. In the *sadja-grāma*, these are *pa –sa –ma –ni –ga* plus *ri –dha*; in the *madhyama-grāma*, *sa –ma –ni –ga* and *pa –ri –dha*. However, the interval *ma –ni*, though measuring nine *śruti* in both *grāma*, is not listed as a consonance in the *Nāṭyaśāstra*, perhaps because these two *svara* are of unequal size (four

and two *śruti* respectively) and therefore occur in different melodic contexts.

In the *grāma* system only three *svara* (*ga*, *ni* and *pa*) were of variable pitch relative to the others. In all other instances the *śruti* between the *svara* were not recognized as scale degrees. *Ga* and *ni* could each be raised by two *śruti* to serve as sharpened leading-notes to *ma* and *sa*. The raised pitches are called *antara ga* and *kākalī ni*. The process of pitch alteration is called *svara-sādhāraṇa* ('overlapping of pitches').

Pa is consonant with *sa* in the *sadja-grāma* and *ri* in the *madhyama-grāma*. Consequently it is one *śruti* lower, relative to its neighbours, in the *madhyama-grāma* than it is in the *sadja-grāma*. This difference, as demonstrated in the *Nāṭyaśāstra* by a hypothetical experiment with the tuning of two *vīṇās* (here referring to harps), is the *pramāṇa-śruti* (the 'measuring' *śruti*), the unit of measurement by which all other intervals were theoretically defined.

A seven-string bow harp (*vīpañcī-vīṇā*) could be tuned in either *grāma* with any of the seven scale degrees as its lowest pitch. Each of the resulting scales, seven in each *grāma*, was called a *mūrcchanā* and was a specific scale-type. However, the ancient *mūrcchanā*, with their different ground-notes, have been replaced in modern theory by scales with a common ground-note (*melā* and *thāt*: see §(iv) below). A hexa- or pentatonic *mūrcchanā* was called a *tāna*; this term has survived in modern usage, but with different meanings. In Hindustani music *tān* means a phrase of a *rāga*, or rapid passage-work in *khayāl* (see §5(iii)(b) below). *Tānam* in Karnatak music refers to a pulsed but unmeasured improvisatory style (see §5(iv) below).

India, Subcontinent of, §III, 1(ii): Theory and practice of classical music., Tonal systems., i) History of tonal systems.

(b) The tonal system of the Sangīta-ratnākara.

By the 13th century the *grāma-śruti* system of the *Nāṭyaśāstra* was almost certainly defunct in practice, though still of fundamental importance to theory. One result was the re-interpretation of the system in metaphysical terms, another was the recognition of 'modified' (*vikṛta*) pitches in addition to the primary or 'pure' (*śuddha*) pitches of the *sadja-grāma*. The process begins in the *Bṛhad-deśī* of Matanga (perhaps 8th or 9th century), which restates the *grāma-śruti* system and discusses the nature and number of *śruti* and their ontological relationship to *svara*. It also presents theories of sound (*nāda*) based on Tantric metaphysics and physiology. In the *Sangīta-ratnākara* of Śārṅgadeva these two strands are combined, so that an existential reality is ascribed to the 22 *śruti*. When Desire brings the *nā* of Breath and the *da* of Fire together to form *nāda* (sound), that primordial *nāda* passes upwards through the body until it reaches the lowest *cakra* at which sound becomes material enough actually to be heard: the heart; this corresponds to the chest register of music. Here there are 22 channels from which the 22 *śruti* are produced. The 22 *śruti* in the two higher registers are produced in the throat and head. The reality of the 22 *śruti* is then supposedly demonstrated through the hypothetical tuning of two *vīṇā*, each with 22 strings.

Table 3a shows how Śārngadeva expanded the *grāma* system of the *Nāṭyaśāstra* by introducing 12 ‘modified’ (*vikṛta*) pitches. The impetus for this development may have been a trend in practice towards a 12-semitone scale. However, Śārngadeva's system provides additional pitch positions only in the regions *ga –ma* and *ni –sa*, where there were already the alternative notes *antara ga* and *kākalī ni* in the *Nāṭyaśāstra* system (Table 3c). In Śārngadeva's system, furthermore, wherever one *svara* is transformed by being on other than its own proper *śruti*, the *svara* immediately above it is also transformed, even if it has not moved, since it now no longer has the proper number of *śruti* below it. Table 3a, line (i), for instance, shows the reduction of *pa* by one *śruti* that produces the *madhyama-grāma*. *Pa* is now a *vikṛta svara* because it has been lowered, but *dha* is also *vikṛta* since it now has four *śruti* (‘*catuś-śruti*’) instead of its proper three *śruti*. The *sa* and *ma* in line (ii) are also *vikṛta* because they now have only two *śruti*, even though they are ‘not fallen’ (*acyuta*) from their proper positions.

Another curious feature of Śārngadeva's system (Table 3a, line (iii)) is the introduction of a 'fallen' (*cyuṭa*) *sa*, perhaps by analogy with the lowered *pa* of the *madhyama-grāma*, and similarly a 'fallen' *ma*. Unfortunately Śārngadeva does not explain the practical application of any of these new modified pitches. He gives only the *musica ficta*-like rules for using *antara ga* and *kākalī nī*, in direct or indirect returns to *ma* and *sa* respectively, and only these two *vikṛta* are mentioned in *rāga* definitions.

India, Subcontinent of, §III, 1(ii): Theory and practice of classical music., Tonal systems., i) History of tonal systems.

(c) The development of the Karnatak general scale.

Whether intentionally or not, Śārngadeva provided the first step towards theoretical recognition and definition of the 12-step general scale that is now the basis of Karnatak music. The process was completed in south India by Rāmāmātya, whose stated purpose in writing his treatise *Svaramelakalānidhi* (c1550) was to reconcile outdated theory with current practice. He did so by a radical reinterpretation of the *grāma* system as previously modified by Śārngadeva. The illusion of continuity was maintained by the retention of much of the traditional terminology. His system, which forms the basis of the modern Karnatak *rāga* classification, is represented in Table 3b. Four changes to Śārngadeva's tonal system were made. (1) The pitches *sa* and *pa* were fixed at *śruti* numbers 4 and 17 respectively, with no modifications allowed; these pitches were by this time provided with drone strings on the *vīṇā*, as they are on many string instruments today. (2) Śārngadeva's 'fallen' *sa* and *ma* are now treated as raised variants of *nī* and *ga* respectively, which consequently now have four pitch values each. Śārngadeva's names for all these pitch values are preserved. Similarly, the lowered *pa* of the *madhyama-grāma* is now considered a raised *ma*. (3) Rāmāmātya eliminates those four of Śārngadeva's modified *svara* that are at the same *śruti* positions as primary *svara*. (4) *Ri* and *dha* are each given two additional higher positions, called 'five-*śruti*' (*pañcaśruti*) and 'six-*śruti*' (*satśruti*). These coincide, however, with the two lowest positions of *ga* and *nī* respectively. They do not introduce any new pitch positions into the system but merely provide alternative names.

Thus far Rāmāmātya's changes appear relatively superficial. The scale still comprises 14 pitch positions, located at the same *śruti* as in Śārngadeva's system. However, he then proceeds to locate these pitch positions on the *vīṇā*, which was by this time no longer an arched harp as in the *Nāṭyaśāstra*, but a long-necked, fretted zither resembling the modern Hindustani *bīṇ* (see §6 below). This had four melody strings tuned to *sa – pa – sa – ma* (*C–G–c–f*). In doing so he reduces the 14 theoretical pitch positions to 12 by allocating a single fret to two of the positions of *nī* (*kākalī* and *cyuṭa-sadja*), and a single fret to two of the positions of *ga* (*antara* and *cyuṭa-madhyama*), on the grounds that the pitch differences thereby eliminated are negligible. Rāmāmātya's fretting yields a 12-semitone division of the octave as shown in Table 3c. With small changes of terminology this remains the general scale used in Karnatak music today (Table 3d).

Table 4a shows Rāmāmātya's placement of the frets on the *vīnā*. Rāmāmātya states emphatically that their positions are predetermined (*svayambhū*, 'self-existent'), not open to choice. He demonstrates how the frets are fixed by two sets of octave or unison equivalence, as shown in **Table 4b**. Fret 2 must be positioned so that the *pa* (*g*) on string IV at that fret is an octave above the open string II. Assuming that the frets are at right-angles to the strings, this also determines the pitches at the same fret on strings I to III. Of these, *śuddha ni* (*A* [□]) on string II fret 2 provides the pitch for fixing the octave higher on string IV fret 4. This in turn fixes *kākalī ni* (*B* [□]) (string II fret 4) from which the octave (string IV fret 6) can be positioned. A similar but descending sequence, beginning with open string III equals string II fret 5 (or IV open equals III fret 5), fixes the positions of the remaining frets (5, 3 and 1). The resulting pitches on fret 1 are out of tune with their namesakes at fret 6, but two of the latter were not used, being available on the next higher strings. *Cyuta-pañcama* (*f* [□]) on fret 1 is also out of tune with *kākalī ni* (*B/b* [□]) on frets 4 and 6. These discrepancies may not have been significant in practice.

As this system is presented by Rāmāmātya the original *grāma* system of the *Nāṭyaśāstra* appears to be intact: all the *svara* s of that system are still present and allocated to the same *śruti* positions. But in practice Rāmāmātya's system exhibits three fundamental differences: (1) the actual intervals of the scale now bear little relation to the theoretical *śruti* positions (compare **Table 3b** and **c**); (2) all scales and modes are now transposed to a common tonic, *sa*, which requires all other *svara* (apart from *pa*) to become movable; (3) Rāmāmātya's system makes it possible, for the first time in the Indian tradition, to express the interval of an augmented 2nd (e.g. between *śuddha ri* (*d* [□]) and *antara ga* (*e* [□])). Scales featuring this interval are prominent in his classification of *rāgas*, and it is possible that the influence of West or Central Asian musical systems played a part in this development.

India, Subcontinent of, §III, 1(ii): Theory and practice of classical music., Tonal systems., i) History of tonal systems.

(d) The development of the Hindustani general scale.

A different approach to reconciling the 22 *śruti* with the semitonal scale of the stick zither *vīnā* is followed in another group of treatises, of which the

Sangīta-pārijāta by Ahobala-pandīta is the most extensive, and probably the oldest. Like the *Svaramelakalānidhi*, it retains the traditional positions of the seven primary (*śuddha*) *svara* on the 22-*śruti* scale, at *śruti* nos.4, 7, 9, 13, 17, 20 and 22 ([Table 5a](#)). Thereafter it differs, first in that downward as well as upward alterations are proposed, second in that the designations for all the 'modified' (*vikṛta*) *svara* are new.

Sa and *pa* are unalterable, as in Rāmāmātya's system. Every other *svara* may be raised from its primary position to one or two higher positions on the *śruti* scale, up to and including the *śruti* where it becomes equivalent to the next higher primary *svara*, except that *sa* and *pa* have no equivalents. Every variable *svara* except *ma* may also be altered downwards along the *śruti* scale in the same way, and with the same avoidance of *sa* and *pa*. The terminology for higher and lower modified positions is the same for every *svara*: two *śrutis* lower is *pūrva* (first); one lower is *komala* (soft); the primary position is *śuddha* (pure); one *śruti* higher is *tīvra* (sharp); two higher is *tīvrata* (sharper); three higher is *tīvrata* (very sharp); four higher is *ati-tīvrata* (extremely sharp).

No single *svara* uses all these terms, but every term is used somewhere, as seen in Table 5a. Except for *ati-tīvrata ga*, the pattern is the same as in Table 3b and c. There is a general scale of 12 pitch positions, with an unalterable *sa* and *pa* and a natural and a raised *ma*. The *svara* pairs *ri – dha* and *ga – ni* have three varieties for each *svara*, in overlapping sets such that only the lowest *ri* and *dha* and the highest *ga* and *ni* do not have equivalents.

The *Sangīta-pārijāta*'s equation of *ati-tīvrata ga* with *śuddha ma* plays no role in either modern Indian tonal system. It was not merely a theoretical construction, however, but rather accounted for a still important feature of *rāgas* of the Sārang type. (What is now described as *śuddha ma* in both Hindustani and Karnatak Sārang *rāgas* was then called *ati-tīvrata ga*.)

The pitch positions in the *Sangīta-pārijāta* (like those in the *Svaramelakalānidhi*) are demonstrated instrumentally. Rather than by consonant cross-fretting, however, a monochord-like method is used, based on divisions of a single string of the *vīṇā*. The procedure is shown in Table 6. The basic principle is extremely simple. Every division must be made either in halves or in thirds, and of course the length to be divided must already be established. Dividing the whole string from bridge to mid-point establishes the system tonic (*sa*) and its upper octave. Half of that (a quarter of the whole) produces *śuddha ma* (*f*), and a third of the whole gives the immovable *pa* (*g*). The remaining intervals are determined by successively subdividing intervals already established (see Table 6). The *śuddha dha* (*a*) seems improbable (it is a quarter-tone higher than the harmonic major 6th, $\frac{5}{3}$, and an eighth-tone higher even than the Pythagorean major 6th). The *komala dha* also appears roughly a quarter-tone too high. But the approximation to natural intervals produced by this method is good in the lower half of the octave. Ahobala-pandīta adds that even if the division method were used at first, the resulting positions should then be adjusted by ear.

Here, as in the *Svaramelakalānidhi*, it is clear that a general scale of 12 semitones has been adopted and that its connection with the 22-*śruti* scale is tenuous. The *Sangīta-pārijāta*'s reconciliation works better on the whole. Even so, both diatonic semitones and diatonic tones can be reckoned as three-*śruti* intervals (see Table 5a), and there are other anomalies.

The transition from the tonal system of the *Sangīta-pārijāta* to the modern Hindustani terminology was a little more complex than the corresponding transition in south India, since further changes took place. Firstly, the alternative names for equivalent pitches disappeared altogether; secondly, there were shifts of usage in the designation of the five variable *svara*, particularly in the use of the term *śuddha* (see Table 5b).

In the treatise *Naghmāt-i āsafī*, whose author, Muhammad Reza, claimed he was associated with Lucknow musicians at the court of Nawab Āsaf-ud-daula (reigned 1775–97), only *sa*, *pa* and *ma* are regularly referred to as *śuddha* (Table 5b). The higher variety of *ga* is twice referred to in passing as *śuddha*, but normally the higher *ga* is called *tīvra*, and the lower variety *komal*. The *svara ri*, *dha* and *ni* are always called either *tīvra* or *komal* (*ri* is once called *ati-komal*), never *śuddha*. The higher *ma* is usually called *tīvratama*, as in the *Sangīta-pārijāta*. It is also included in lists of *tīvra svara*, and is once or twice called *tīvratara*. It is clear from the frequent use of the expression ‘both *ma*’ for rāgas such as Lalit, however, that the author was thinking in terms of only two pitch positions for *ma*. The lower *ma* is usually called *śuddha*, but it is also included in lists of *komal svara*. Only one of the *Sangīta-pārijāta*'s alternative names for equivalent pitches survives: [*ati*]-*tīvratama ga* is equated with *komal ma* in the description of the rāga Sārang.

The traditional distinction between a set of seven ‘pure’ (*śuddha*) *svara* and some number of ‘modified’ (*vikṛta*) *svara* has effectively disappeared in the *Nāghmāt-i āsafī*. The word *śuddha* is used mainly to designate the invariant system tonic *sa* and its unalterable 5th *pa*. Each of the remaining scale degrees has two equally valid pitch positions. This is more clearly shown in the terminology used for the music examples in the chapter on rāga of the Rajasthanī treatise *Sangīt-sār*, compiled by Pratāp Singh in about 1800. The fixed *sa* and *pa* are *asī* (a colloquial Perso-Arabic synonym for *śuddha*). Each of the five variable *svara* must be either *utarī* (‘lowered’) or *carhī* (‘raised’), a notion quite different from that of ‘pure’ as opposed to ‘modified’ (see ex.5b). There is no basic scale of seven from which others deviate; rather, there is a general scale of 12, from which seven are chosen with certain restrictions.

In modern times the notion of seven *śuddha svara* has been revived. However, the *śuddha svara* are now the degrees of the major scale; *vikṛta svara* are *komal re*, *ga*, *dha* and *ni*, and *tīvra ma* (Table 5b). The pre-modern opposition of *komal* and *tīvra* is still in occasional use, however, and there is no reason either in theory or in practice for the major scale to be considered more ‘pure’ (*śuddha*) than any other.

India, Subcontinent of, §III, 1: Theory and practice of classical music., Tonal systems.

(iii) Scale-types in modern theory.

Just as the *grāma* system of the *Nāṭyaśāstra* was the basis of the *mūrcchanās*, so the modern tonal systems generate a number of derived scale-types. Each scale-type is a selection of seven *svara* from the general scale of 12 pitch positions (*svrasthāna*). A given scale-type may be common to several rāgas, so scale-types are an aspect of the general tonal system.

The south Indian system of 72 scale-types (*melakarta* or *mela*) is produced by a systematic permutation of the variable *svara* positions shown in Table 3c. The invariable *sa* and *pa* are common to all 72. The octave is divided into two tetrachords, *sa – ma* and *pa – sa*. Within each tetrachord the variable *svara – ri* and *ga* or *dha* and *ni* – are systematically rotated through all possible combinations, as shown in Table 7. Scale-types 1–36

are formed by combining each of the six lower tetrachords, having *śuddha ma* (F) as the fourth degree, with each of the upper tetrachords in turn. By substituting *prati ma* (F \flat) for the natural fourth degree, a second, otherwise identical set of 36 scale-types is formed, nos.37–72. This system includes scale-types with augmented seconds and scale-types with consecutive semitones.

When Venkatamakhin outlined the scheme of 72 *melakarta* in the *Caturdandī-prakāśikā* he gave names only to those 19 scale-types that were needed for *rāgas* in use in 17th-century Thanjavur. He named each of these scale-types after the most prominent *rāga* belonging to it. Subsequently, the remaining scale-types have also been named, and there are now *rāgas* and compositions in every scale-type. Some have acquired important constituent *rāgas* as composers and performers have found musically effective ways of exploiting the scale. Nevertheless, there are still no more than a couple of dozen scale-types of real musical significance, having either a large number of constituent *rāgas* (such as scale-type 28) or one important *rāga* (such as Nāta *rāga* from scale-type 36).

The *melakarta* system has become endowed with a complex nomenclature intended to render it memorable. Each of the 12 lower tetrachords defines a set or ‘circle’ (*cakra*) of six scales, each consisting of combinations of the lower tetrachord with six different upper tetrachords. Each set has a name denoting its serial number in the system (thus ‘Moon’ is one, ‘Eye’ is two, ‘Veda’ is four etc.). Each individual scale-type also has a name, sometimes derived from that of a prominent *rāga* belonging to it. The name also bears a two-syllable prefix that encodes in reverse the serial number of the scale-type (thus scale-type 28 is Hari-kāmbhojī, where ‘ri’ is two and ‘ha’ is eight).

An alternative term for scale-type, *thāta*, first appears in the southern *Rāga-vibodha* of Somanātha (1609), but it has subsequently been adopted in place of *melakarta* in the Hindustani tradition. It was used in the 19th century by *sitār* players to denote the ‘setting’ or positioning of the movable frets on the neck of a *sitār* necessary to produce the intervals required by particular *rāgas*. Six *thāt* are listed by Day (1891), who states that they ‘have no names, but are usually known from the *rāgas* that are commonly played upon them’. Because the *sitār* has more than seven frets to the octave, each of these settings can be used to produce more than one heptatonic scale-type, or *rāgas* that require more than seven pitch positions. Subsequently the term *thāt* was adopted by V.N. Bhatkhande for his system of ten heptatonic scale-types, which he named after prominent Hindustani *rāgas* (Table 8). This system lacks the logical rigour of the Karnatak *melakarta* system, but it does not include any scale-types that are not in common use. As shown in Table 8, it is an interrupted sequence of six diatonic scales with progressively more ‘flats’ (nos.1–3 and 7–9), plus four scale-types with augmented seconds (nos.4–6 and 10). The ordering is based on what Bhatkhande deemed significant degree relationships: the natural second, third and sixth in 1–3, the flattened second with natural third and seventh in 4–6, the flattened third and seventh in 7–9, and *Todī thāt* in a class by itself.

Despite their pragmatic convenience for classifying rāgas, the *melakarta* and *thāt* systems suffer from a number of limitations, as Hindustani musicians in particular are wont to point out. Pentatonic or hexatonic rāgas can only be allocated to heptatonic scale-types on the sometimes arbitrary assumption that particular pitches are omitted. The scale-types make no allowances for variations in intonation of the *svara*, they separate into different categories rāgas that are closely related by melodic movement (see §2(iii) below), and they bring together rāgas that have no melodic features in common beyond their basic pitches.

[India, Subcontinent of, §III, 1: Theory and practice of classical music., Tonal systems.](#)

(iv) The 22 śruti in modern theory.

The 'microtonal scale' of Indian classical music has attracted much attention both in South Asia and internationally, particularly since the discovery and publication of chapter 28 of the *Nāṭyaśāstra*. It has been claimed that the *śruti* are evidence for the existence of complex mathematical acoustics in ancient India, or that they are evidence of nearly superhuman pitch discrimination and control on the part of performers. What can and cannot be inferred about the 22 *śruti* in the ancient period was made plain by Bhandarkar in 1912. The proposition of an unusually consistent microtonal control, advanced by Daniélou (1954) and others, has been experimentally refuted by Jairazbhoy (1963) and others. It is true that the numerous inflections of *svara* in musical contexts cannot be described fully in terms of a system of 12 pitch positions. But to say that particular shadings of pitch are essential in a particular musical context is not to say that those shadings are best described in terms of a microtonal scale.

Modern South Asian uses of the 22 *śruti* have usually built from the existing 12-position general scale and the system tonic. The fixed *svara sa* and *pa* provide two pitch positions and the five variable *svara*, each in two positions (*komal* and *tīvra*), provide ten more. Then the five *komal svara* are given five lower variants called *ati-komal*, the five *tīvra svara* five higher (*ati-tīvra*) variants. This generation of a scheme of 22 has nothing to do with either the *Nāṭyaśāstra* or *Sangīta-ratnākara*, but it is neat and suggestive.

Sometimes precise frequencies are proposed, based on a Pythagorean and a just intonation for each pitch position other than *sa* and *pa*. However, this supposed precision not only disregards the flexible realities of intonations but in seeking to explain ancient schemes in modern terms fails to account for them.

India, Subcontinent of, §III: Theory and practice of classical music.

2. Rāga.

- (i) The concept.
- (ii) Historical development of rāga systems.
- (iii) Rāga in Hindustani music.
- (iv) Rāga in Karnatak music.
- (v) Hindustani and Karnatak rāgas.

India, Subcontinent of, §III, 2: Theory and practice of classical music., Rāga.

(i) The concept.

(a) Rāga as melody type.

The central element of South Asian classical music is rāga. A rāga is not a tune, nor is it a 'modal' scale, but rather a continuum with scale and tune as its extremes (see [Mode, §V, 3](#)). Many rāgas can share the same intervallic structure, that is, the same scale-type (*mela, thāt*); at the same time, any number of compositions or improvisations can be in the same rāga.

A rāga can be described with emphasis on both 'scale' and 'tune' aspects. From the scale side, individual scale degrees may be assigned specific modal functions. The predominant degree was called *amśa* in traditional *śāstra*. It is called *vādī* in modern Hindustani music (along with its co-predominant *samvādī*; see §1(i) above), and in Karnatak music it is called *jīva-svara* ('life degree'). Initial and final degrees in traditional *śāstra* were called *graha* ('taking') and *nyāsa* ('settling'). These terms relate to a period when there was no system tonic, and the predominant and final of a rāga could be different *svara*. With the transposition of all rāgas to a common system tonic (*sa*: see §1(ii)(c) above) by the 16th century, the three functions of predominant, initial and final tended to become identified with the system tonic. In some modern texts (e.g. Thakur's *Sangītāñjali*) the terms *graha*, *nyāsa* and *amśa* have been revived to denote respectively phrase beginnings, phrase endings and the predominant degrees in the rāga as a whole.

A rāga can also be described by its melodic features, that is, in terms of successions of scale degrees. The nearest to a scalar description is the *āroh-avaroh*, the ascent–descent pattern. The *āroh-avaroh* of a rāga can show which scale degrees never appear and where any regularly occurring turns in the line occur. More elaborate descriptive samples of characteristic melodic configuration are called *calan* in Hindustani music and *sañcāra* in Karnatak music. In Karnatak music a motif especially characteristic for a rāga is called *rāga-chāya-sañcāra* ('rāga-image-phrase') or, in Tamil, *pitippu* ('catch'). In Hindustani music such a motif is called a *pakad* (also 'catch') for the rāga or, in a more Sanskritized fashion, its *mukhyānga* ('chief part') or the *rāgānga* ('part [that shows the] rāga').

The number of *rāgas* in practical use both in Hindustani and Karnatak music is of the order of a couple of hundred, so that every *rāga* is itself an element in a larger system. The recognizability of a *rāga* may turn on one or more of a number of heterogeneous factors of different orders of abstraction: these include intervallic structure (scale-type), prominent and transitory pitches, a particular way of ornamenting one or more scale degrees, characteristic motifs, characteristic tessitura or pace etc. Such factors in turn are perceived in terms of contrasting possibilities: two *rāgas* may have the same intervallic structure but different predominant notes or characteristic motifs; another two *rāgas* may share melodic configurations but differ in intervallic structure. Sometimes a whole group of *rāgas* shares some distinctive common melodic material, while at the same time each individual *rāga* has its own distinguishing features.

(b) Non-structural aspects.

The word *rāga* itself points to the importance of non-structural aspects of the concept. It derives from the Sanskrit root *rañj*, 'to be coloured, to redden', hence 'to be affected, moved, charmed, delighted'. As a noun, *rāga* is that quality of an object that arouses feeling or delight, and in early literature it refers in a non-technical sense to the beauty of a song, its 'passion'. Only from Matanga (8th–9th century) onwards is it used in a technical sense to denote a melodic construct or melody-type. The aesthetic impact of such a melody-type, its ability to delight the hearer, is attributed to the particular notes and melodic movements that render it distinct from all other melody-types. Thus the term implies the prime importance of aesthetic effect, but this is considered to be inseparable from melodic individuality.

Aesthetic and extra-musical aspects of *rāga* have been, and remain, profoundly important in Indian culture. They have included supernatural powers over the physical universe and associations with particular divinities, human characters, seasons and times of day. The earliest associations were with drama, since music played a central part in ancient Indian theatre. In the *Bṛhad-deśī* (see §II, 2(i)(a) above) certain *rāgas* were prescribed to introduce particular sections of a drama or particular characters, scenes, situations and *rasa* (aesthetic flavour; see §7 below). When the theory and practice of music became gradually divorced from drama, more esoteric associations were put forward. These included the association of each *rāga* with a presiding deity (13th century, *Saṅgīta-ratnākara*), leading to its further identification as a deity, male or female (14th century, *Kalpasūtra*). Consequently, many *rāgas* bear the names of deities and are still sometimes believed to present themselves as spirits or *jinnns* to the musician when correctly performed. From the 16th century, however, a secularization of this concept occurred, especially at the Mughal and Rājput courts, whereby *rāgas* were associated with the literary typology of erotic heroes and heroines (*nāyaka* and *nāyikā*) rather than with deities. Male *rāgas* and female *rāginī* were accordingly depicted as persons or tableaux in Sanskrit verses (*rāga-dhyāna*) and sets of miniature paintings (*rāga-mālā*; see §II, 3(iii) above).

The belief that *rāgas* can exercise power over the physical world, as well as or instead of the aesthetic one, is perhaps an extension of their earlier

identification as divinities. The power of rāga Dīpak to produce fire and of Malhār to produce rain, for example, are recurrent themes in the mythology of Indian music. Some musicians attribute therapeutic properties to rāgas, each being beneficial for specific physiological or mental ailments. In the absence of any universally recognized, authoritative definition of the rāgas, the ability to produce magical or therapeutic effects is sometimes claimed by or attributed to musicians as a means of confirming the validity of their tradition.

The association of rāgas with particular times of day or seasons of the year is still particularly strong in Hindustani music. Each rāga is attributed to one of the eight *pahar* or divisions of the day and night, and/or to one of the six seasons (*rtu*), and will normally be performed at or near its proper time and in the correct sequence relative to other rāgas. This association may derive from temple music, where rāgas are sung to accompany the cycle of daily rituals and seasonal festivals.

While it is often assumed that the aesthetic and other associations attributed to rāgas are dependent on the structural characteristics by which the rāgas are defined, the link between the two realms remains elusive. A number of inconclusive attempts have been made to verify traditional rāga associations experimentally, for instance by playing samples of various rāgas to subjects and eliciting verbal responses (e.g. Deva, 1981). Bhatkhande had some success in linking the performance times of Hindustani rāgas with their scale-types and the position of the *vādī*, but anomalies remain. The fact that many rāgas have changed in structure over the centuries but have retained earlier time-associations suggests that structural and non-structural aspects are not directly interdependent. Rather, each rāga has aesthetic and extra-musical associations that are triggered in the knowledgeable listener's mind by its correct rendition according to the current concept of its structure.

(c) Origins, number and change.

Rāgas are traditionally considered to be *apaurusa*, 'non-human', in origin. Mythology attributes them, for example, to the five heads of Śiva, the patron deity of music, and his consort Pārvatī, or to the songs sung in praise of Kṛṣṇa by his 16,000 milkmaid consorts (*gopī*). Sources from the *Bṛhad-deśī* onwards attribute the origin of the rāgas to the earlier system of *jāti* (themselves created by Brahma) by processes of variation and mixture. However, the names of many early rāgas imply an origin in regional (*deśī*) musics, including the musics of 'tribal' peoples (e.g. Todī, Śabarī) and foreign invaders (e.g. Śaka, Turuska-('Turkish-')gauda). Many rāga names still suggest regional or ethnic origins, even (since the Muslim period) in areas outside India (e.g. Yaman, Hijāz).

The number of rāgas in existence cannot be defined exactly. A traditional number is 36, deriving from the medieval *rāga-rāginī* systems, but the actual number has probably always been greater. As an example, 260 were classified by the 13th-century theorist Śārṅgadeva. For Hindustani music, Bhatkhande gives 186 in his *Kramik pustak-mālikā* (1953–5), but in that tradition a performing musician will have a working repertory of approximately 40 or 50 rāgas. Kaufmann lists some 2000 Karnatak rāgas

(1976), compiled from various sources, but again the working repertory of an individual musician would be considerably less than this.

Uncertainty as to the total number of rāgas is due partly to the absence of any single authoritative source, written or oral, and partly to changes in the repertory as new rāgas are introduced and old ones forgotten. The ideology of rāga exercises a check on the creation of new rāgas, however, since they are considered to be of divine rather than human origin and, according to some, all viable rāgas exist already. The invention (or discovery) of certain rāgas is attributed to or claimed by particular musicians, and in the south, rāgas have been created to exploit all the 72 scalar possibilities of the *melakarta* system (of which only 19 were in use in the 17th century). But many 'new' rāgas are in fact combinations of elements from existing ones. Another method of introducing novelty without presuming on divine prerogative is to import Karnatak rāgas or scale-types into Hindustani music, or vice versa (see §(v) below). In the north, each *gharānā* has a number of 'secret' (*acchop*) rāgas that, although claimed to be old, are in effect new when first revealed in public (Neuman, 1980).

Out of respect for the divine origins of rāga, many musicians also hold that individual rāgas are not susceptible to change but are still performed (by those who know them correctly) in their original forms. Documentary evidence shows that although some significant continuities can still be traced between modern and earlier rāga forms, profound changes have occurred. Many rāgas have changed their scale-type or have generated variants in different scale-types, as the difference in scale-type between many similarly named Hindustani and Karnatak rāgas suggests. Such changes have been attributed in part to the combination of attributes from different rāgas (Powers, 1970) and in part to the inherent asymmetry of musical scales, which may have induced musicians to make compensatory adjustments in scale-type, melodic movement, intonation, ornamentation etc. (Jairazbhoy, 1971).

India, Subcontinent of, §III, 2: Theory and practice of classical music., Rāga.

(ii) Historical development of rāga systems.

The term *rāga* occurs in the *Nāṭyaśāstra* only in its non-technical sense of 'passion'. The term for melody-type or modal category in that source is *jāti*, 'class'. A *jāti* was distinguished from the *grāma* pitch-collections and the *mūrcchanā* scales on which it was based (see §1(ii)(a) above) by the attribution of special functions to particular *svara*. These functions included *graha*, the initial note; *amśa*, the predominant note; *nyāsa*, the final note; and *apanyāsa*, a note or notes on which intermediate cadences might fall. In addition, particular *svara* might be frequent (*bahutva*) or infrequent (*alpatva*), and melodic movements between certain *svara* were specified. The primary or 'pure' (*śuddha*) form of each *jāti* was heptatonic, and the same *svara* served as both predominant and final. However, each *jāti* also admitted a number of variants (*vikṛta*), in which specified *svara* other than the final could serve as predominant, and one or two specified *svara* might be omitted. The *jāti* was thus a modal category under which a number of related melody-types, not individually named or identified, might be classified.

Some clue as to the origins of the *jāti*, and their relationship with later modal systems, may be provided by their names. The seven ‘note-born’ (*svara-jā*) *jāti*, considered to form a primary set, are each named after the *svara* that is their final (e.g. Sādījī, with *sadja* as final). They form a sub-system in which scale-type, as defined by the final, is the primary criterion of classification. The remaining 11 ‘mixed’ (*samsargajā*) *jāti* are explained as combinations of two or more primary *jāti*. Since several of the mixed *jāti* have the same final, scale-type is no longer the sole criterion of classification, and these *jāti* begin to resemble melody-types. Some of their names hint at regional origin (thus Sadjodīcyavā, ‘northern Sadja’ etc.).

A number of sources from the middle of the first millennium ce, including a passage in the Chinese *Sui History* referring to the late 6th century and the Kudumiyāmalai inscription in south India dating from the 7th or 8th century, refer to a different set of seven melody-types, to which the term *grāma-rāga* became attached. By the time of Matanga (8th–9th century) these formed the basis of an extended repertory of 32 *grāma-rāga* together with numerous variants called ‘dialects’ (*bhāsā*). These early *rāgas* are defined using terms borrowed from the *jāti* system (*amśa*, *nyāsa* etc.), but the alternatives inherent in the *jāti* are not allowed. Each *rāga* comprises a specific and unique combination of structural characteristics, to which its unique aesthetic effect is attributed. A number of the *grāma-rāga* bear names suggesting an origin in northern regions of the subcontinent, while the *bhāsā* include names referring to peoples and places from both the north and the south (Widdess, 1993). The basis of classification was now performance style (*gīti*); as with the mixed *jāti*, scale-type was not a criterion.

By the 12th century the old *grāma-rāga* were no longer used in concert music, though they continued to be described and illustrated with notated examples in theoretical works. The current repertory became known as the *deśī* (‘provincial’) *rāgas*, of which some were based on earlier *grāma-rāga* or *bhāsā*, some were hybrid forms, and some originated in local traditions. The *Sangīta-ratnākara* (13th century) classifies *rāgas* according to their place in a quasi-genealogical paradigm: *grāma* giving rise to *jāti*, giving rise to *grāma-rāga*, giving rise to *bhāsā* and *deśī-rāga*. But the earlier generations of this paradigm were abandoned by most later authors, since they had long ceased to be relevant in practice. The *Sangīta-makaranda* (attributed to Nārada, ?14th century) classifies the *rāgas* according to various criteria: performance time (morning, midday or night), number of pitches (five, six or seven), threefold gender (male, female or neuter), twofold gender (eight male *rāgas* with three ‘wives’ each) and degree of ornamentation (much, moderate or none, a throw-back to the *gīti* classification of *grāma-rāga*). Note that scale-type is not treated as a basis for *rāga* classification at this period.

Various male-female *rāga* systems (*mata*) were current in different regions of north India during the 16th to 18th centuries, and some were popular with painters of *rāga-mālā* (see §II, 3(iii) above). A common pattern comprised six male *rāgas* each with five female *rāginī*, totalling 36, to which sons (*putra*) could be added. There is little evidence that these systems were based on any scalar similarity between a *rāga* and its dependants.

Scale-type as an aspect of rāga definition and classification was introduced by Rāmāmātya (c1550) and became the standard method of classification in the south. However, Rāmāmātya also classified rāgas according to their potential for melodic development in *ālāpa* and *prabandha* compositions. The *Caturdandī-prakāśikā* of Venkatamakhin (17th century) expanded the number of theoretical scale-types to 72, but only 19 were required for classifying the rāgas then current. In later Karnatak music scale-type has become the overriding criterion of classification, such that the principal rāga in each scale-type is called the 'parent' (*janaka*) and the others its 'children' (*janya*), and rāgas have been developed in all the 72 scale-types of Venkatamakhin's system.

From the 16th century onwards some Hindustani treatises advocated scalar definition and classification on the model of the southern scale-type system, while others clung to *rāga-rāginī* typology (see §II, 3(iv) above). The latter is now obsolete, but Hindustani musicians vary in their attitude to scalar classification, some accepting Bhatkhande's *thāt* system, others not. An alternative northern approach to typology associates rāgas in groups or 'rāga-families' (*rāg-kul*), where each group comprises variant or related rāgas characterized by shared melodic features but not necessarily a shared scale. The continuing importance of motivic relationships between rāgas has been discussed in historical and contemporary contexts by Powers (1970).

India, Subcontinent of, §III, 2: Theory and practice of classical music., Rāga.

(iii) Rāga in Hindustani music.

(a) Development of rāga theory.

Theoretical writing on rāga in Hindustani music has addressed both the identification and analysis of the characteristic features of individual rāgas and the elucidation of structural principles that underlie the rāga system as a whole. The latter endeavour tends to take scalar structure as its starting-point, while the former is more concerned with melodic motifs and emphases, registers, ornamentation and 'intonation' in the broadest sense.

The most influential formulation of contemporary Hindustani rāga theory is that of V.N. Bhatkhande. He postulated a number of structural characteristics that he claimed were common to most Hindustani rāgas: each rāga employs at least five of the seven *svara*; the *svara ma* or *pa* is always present, in addition to the system tonic *sa*; two pitch positions of the same *svara*, e.g. *śuddha* and *tivra ma*, may not occur consecutively; the *vādī* is the most important *svara* of the rāga, supported by a secondary important *svara*, the *samvādī*, normally a consonant 4th or 5th distant; the *vādī* is located in the upper tetrachord (*uttarāṅg*) in morning rāgas, the lower tetrachord (*pūrvāṅg*) in evening rāgas.

There are exceptions to all these 'rules', some of which Bhatkhande acknowledged. In particular, the identification of one *svara* in each rāga as *vādī* is controversial. In many rāgas there are more notes than one that could be regarded as *vādī*, and it follows that the connection between the performance time of a rāga and the position of *vādī*, though it often holds good, is also open to question. Bhatkhande's concept of *vādī* in fact fuses

two concepts from ancient theory, consonance (*samvāda*) and predominant function (*amśa*).

Bhatkhande reduced the scalar structures of Hindustani rāgas to ten *thāt* (see §1(iii) above) and proceeded on this basis to classify and describe the individual rāgas. His verbal descriptions are brief and limited to a few salient features: the *thāt*, the number of degrees taken in ascent and descent (for which he revived the ancient term *jāti* in a new sense), the *vādī* and *samvādī*, characteristic ornaments or pitch sequences, the appropriate time of performance, the aesthetic ethos (*rasa*) etc. These and similar definitions by other authors have become the stock-in-trade of institutional musical pedagogy. However, Bhatkhande was careful to acknowledge variant interpretations that he had encountered in oral tradition. His definitions are furthermore extensively illustrated with examples in notation. He himself composed simple outlines showing the ascending and descending lines within an octave (*āroh-avaroh*), more elaborate sequences of phrases (*svar-vistār*) such as might be performed in an *ālāp*, and short didactic compositions intended to embody the essential features of the rāga (*laksan-gīt*). Bhatkhande also presented numerous vocal compositions in each rāga, representing the genres *dhrupad*, *dhamār*, *khayāl*, *thumrī*, *tarānā* etc. (see §5(iii) below). These compositions, which fill the pages of his six-volume compilation *Kramik pustak-mālikā* (1953–5), were taken down from a number of eminent musicians representing different branches of the oral tradition. Although the source of individual compositions is not given, differences in detail can be seen between the compositions in some rāgas that reflect the diversity of the oral tradition and the absence of any single authoritative version. This anthology, as a record of the vocal repertory current in the first half of the 20th century and as material for analysis of the Hindustani rāga system, is an unparalleled achievement.

Drawing on Bhatkhande's pioneering work, N.A. Jairazbhoy (1971, 1972) developed a holistic analysis of the relationship between the surface characteristics of individual rāgas and the underlying structure of the scales that they employ. He analysed the tonal relationships within each basic scale in terms of consonance or dissonance with the drone, and parallel interval-sets in disjunct and conjunct tetrachords (ascending *sa –ma, pa –sa* and descending *sa –pa, pa –re* respectively). The melodic characteristics of individual rāgas and groups of rāgas, including alternative notes, staggered scales, oblique melodic movement, the position of *vādī* and *samvādī*, compass and exceptional intonation, were interpreted as strategies for exploiting and concealing the symmetries and asymmetries of their underlying scales. The same hypothesis has been used to explain changes in the scale structure of rāgas since the 16th century, but the focus of Jairazbhoy's work is on system-wide musical and historical processes rather than individual rāgas.

One of Bhatkhande's principal critics, the singer and educationist Omkarnath Thakur, drew attention to inconsistencies and arbitrariness in Bhatkhande's *thāt* system, which Thakur regarded as unnecessary and misleading. He favoured a classification of rāgas into groups based on melodic characteristics rather than scales, and sought to link these groups with the *jāti* system of the *Nāṭyaśāstra*. But the main achievement of his

six-volume textbook *Sangītāñjali* was his unprecedentedly detailed analysis of performance practice in individual rāgas, and of the subtle but crucial distinctions to be observed between rāgas.

Thakur's exceptional insight into rāga relationships provided a basis for several of H.S. Powers's publications, in which rāga is treated as a melodic form (*svarūp*) rather than as a scale-based construct. Like Jairazbhoy, Powers (1970) advances historical evidence for his hypothesis, arguing that similarly named rāgas in Hindustani and Karnatak music differ in scale owing to historical divergence but embody similar melodic features, such as emphasized pitches, characteristic progressions, motifs, formulae, registers and ornaments. He also analysed the structural meanings invested in melodic formulae that identify particular rāgas or groups of rāgas, drawing on linguistic theory as well as Thakur's concept of rāga relationships (1976). A comparative evaluation of Bhatkhande's and Thakur's approaches to rāga theory was published in 1992.

(b) Hindustani rāgas in practice.

The rāga Darbārī Kānadā illustrates many of the features of Hindustani rāga theory and practice. Its importance in the current repertory, its especially clear surface features and underlying structure and its close links with other rāgas make it a classic case. The underlying scale is one in which intervallic parallelism exists between the conjunct descending tetrachords $c-b-a-g$ and $g-f-e-d$ (the tonic is represented by convention as c).

While this structure is common to several rāgas, the parallelism is particularly emphasized in Darbārī Kānadā. It is reflected, for example, in Bhatkhande's identification of d and g , at the bases of the parallel tetrachords, as *vādī* and *samvādī* respectively. Others regard a and e , which are also important in the rāga, as *vādī* and *samvādī*. Both these notes are treated with a wide, slow oscillation that is distinctive for the rāga, but they can also both be omitted in certain contexts. The reason for the oscillation may be both structural and aesthetic. A is conspicuously not consonant with the prominent pitch d , and Jairazbhoy (1971) suggests that the wide oscillation implies an a or compensates for its absence. At the same time the gravity of these oscillations contributes to the serious (*gambhīra*) ethos of the rāga, which is also reflected in a slow pace and a concentration on the lower registers.

Fig.4 shows in outline the principal routes by which melodies in this rāga may ascend and descend from the lower tonic to the upper octave and back (the tonic, sa , is notated by convention as c). First, the simplest possible octave ascent-descent (*āroh-avaroh*) is shown and the underlying scalar parallelism indicated. The ascent and descent are then set out separately and in more detail. The ascending line divides into parallel segments, a_1 and a_2 . The first ascends directly from the tonic to f , from which point it can return to d (skipping the e), or continue upwards to g . In the upper segment (a_2) the melody ascends in like manner from f to c' (or g). The oscillation on e is echoed by that on a . There is also a lesser oscillation on b and a tendency to sharpen this note when it functions as a

leading-note to the upper tonic. This sharpening may also be applied to the corresponding degree in the lower segment, *f*, when it leads to *g*.

In contrast to the relatively direct ascent, the descending line is highly convoluted (*vakra*). Again there are two parallel segments, indicated as d_1 and d_2 . D_1 features the oblique movement $c'-a-b-g$ with the characteristic Darbārī oscillation again on a ; the parallel movement in the lower segment is $g-e-f-d$. An alternative in this segment is shown at d_3 (in fig.4b), where the movement $e-f$ is replaced by the corresponding interval of the upper tetrachord, $a-b$; transposed into the octave below (*mandra*). The beginning of the descent in d_1 is often embellished as shown at y_1 . However, the resulting line $b-c'-d'-a$ cannot be reproduced exactly in the lower segment without introducing an a that is foreign to the rāga (thus $f-g-a-e$). Instead, the configuration in y_2 is $f-g-b-e$; omitting the a altogether. A tendency to omit this note and its counterpart e is also reflected in the alternative ascending configurations shown at a_3 and a_4 .

The octave ascent-descent pattern of a rāga constitutes a basic model that is realized in melody in an infinite variety of ways. Ex.1 shows the beginning of a vocal *ālāp* (see §3 (ii)(a) and (b) below) in rāga Darbārī Kānadā. It shows a first unfolding of the rāga, which in accordance with the serious ethos of this rāga takes place in the lowest octave of the vocal range (*mandra*), working downwards from the middle to the lower tonic. The descending configurations are therefore heard first in this example. Ascending phrases then follow, returning to the starting-point. The identity of Darbārī Kānadā is established by the phrase y_1 , and confirmed shortly afterwards by d_1 . The remaining descending and ascending configurations set out in fig.4 appear in due course. In both descent and ascent the arrival at the fifth (*pa*, *g*) is an important resting-point, marking the division between segments d_1 and d_2 , a_1 and a_2 . In the descending phase this resting-point is delayed by returning from a to *c* several times. Similarly the conclusion of the ascending phase at the end of the example is extended by repeated delays of the final return to the tonic. The exposition of any rāga in the same style and register could follow a similar course.

Ex.2 shows the same rāga rendered as a slow *khayāl* (see §5(iii) below) in the 12-beat time-cycle Ektāl. As in all compositions, the rāga is articulated in two contrasting registers, lower and higher, in the two sections of the melody, *sthāyī* and *antarā* respectively. Appropriately for this rāga, the tessitura of the first section is very low, emphasizing the strong pitch *d* and its consonant *G* in the lower (*mandra*) register, as well as the tonic and the characteristically oscillated *a*. At the end of this section the oscillated *e* is introduced for the first time. The second section emphasizes the same material an octave higher, rising to the upper tonic and peaking on *d* above that. It covers the whole of the middle octave in descent and ascent before returning to the low register of the *sthāyī*. The characteristic Darbārī flavour is at its richest in the passages ‘rī māī’ in the *sthāyī* (cf fig.4, y_1/d_1) and ‘tāke rośana’ in the *antarā* (y_2/d_2), where the distinctive pitch-sequences of the rāga are enhanced by the introductory flourish (*tān*) using heavy

shakes (*gamak*), the slow oscillation of $e_{\underline{1}}$ and $a_{\underline{2}}$; and the sliding fall $b_{\underline{3}}$ – g or f – d . The final return to the register of the *sthāyī* at ‘aura’ (d_1, d_2) epitomizes the descending line of the rāga. The alternative form of ascent, in which $e_{\underline{1}}$ and $a_{\underline{2}}$ are omitted (a_3, a_4), appears in the low register at ‘pīra mero’ of the *sthāyī*, where it prepares a high point at the introduction of $e_{\underline{1}}$ at ‘saco’. The same ascent in the *antarā* register at ‘cahu’ prepares the subsequent fall back to $a_{\underline{2}}$ and $e_{\underline{1}}$ in ‘aura’. A simpler example of the same *sthāyī*–*antarā* structure in this rāga is shown in [ex.3a](#).

Darbārī is related to a number of other rāgas belonging to the Kānadā group. Adānā is almost identical to Darbārī in terms of its pitch material, except that a₁ is more often omitted. What chiefly distinguishes it, as can be seen in [ex.4a](#), is its rapid tempo and predominantly high register, as opposed to the slow tempo and low register of Darbārī. Other members of the same group differ in tonal material, differences that are interpreted by Jairazbhoy in terms of the underlying scale ([fig.5](#)). The substitution of a₁ in Darbārī and Adānā for a₂ in Sughrāī and Śahānā eliminates a tritone relationship between *a* and e₂; which is addressed in Sūhā and Śahānā by oblique movement and in Nāyakī Kānadā by omitting *a* altogether. A tendency to omit both *a* and *e* may be noted in all these rāgas. Powers's analysis of the same group (1981) stresses the motivic similarities that

establish their relationship. Thus the phrase $e\bar{f}-d$ is common to all and is the Kānadā *ang* (see below) of the Kānadā group of rāgas (see [Mode, §V, 3, ex.37](#)). The descending intervals $b\bar{f}-g$ and $f-d$ are also common to all and are shared with another group of rāgas, the pentatonic Sārangs; hence it is said that the Kānadās have the tinge or 'reflection' (*chāyā*) of Sārang.

Like the Kānadās, the Sārang family includes rāgas with different scale-types ([fig.6](#)), but all are pentatonic (1 2 4 5 7), all are midday rāgas, and all have the characteristic descending motif $f-d-(c-d)-B-c$. The use of both sevenths and both fourths can be understood in the light of leading-note functions and tetrachordal balance. Thus the tendency in all Sārangs to sharpen $b\bar{f}$ in ascent to c' is transferred in Śuddh Sārang to f in parallel contexts.

A rāga can be viewed in terms of individual pitches and scale-type or in terms of melodic motifs and other sequences of pitch. The term *ang* ('limb') is used in both senses. It can mean a tetra- or pentachordal segment of a scale, as in Bhatkhande's usage, or a melodic phrase, as in *mukhyānga* or *rāgānga* (the identifying phrase of a rāga). Similarly *pūrvāng* and *uttarāng* (literally 'prior', and 'consequent' or 'higher' *ang*) can mean the tetrachords *sa - ma* and *pa - sa* respectively, or they can refer to more loosely defined, overlapping pitch-areas within which the characteristic phrases of the rāga evolve. The concept of *pūrvāng* and *uttarāng* in the latter sense is illustrated in [exx.3-5](#).

In the Pūriyā compositions (exx.3*b*, 4*b* and 5) the opening phrase of the *sthāyī* establishes the characteristic thematic configurations based on the motifs $f_{\square}e-d_{\square}c$ and $B-d_{\square}c$, in the *pūrvāṅ* range $B-f_{\square}$ (extended to the next available note in each direction, *a*), and emphasizing the *vādī-samvādī* pair *B* and *e*. In ex.2 the continuation of the *sthāyī* expands one degree upwards to *b*. In exx.3*b* and 4*b* the extension is downwards one degree to f_{\square} . The interval $f_{\square}a$ functions as a single degree step because Pūriyā has no *g*. Thematically the *pūrvāṅ* also includes the motifs $B-d_{\square}e$ and its usual variant $B-d_{\square}f_{\square}e$; $f_{\square}a-e-f_{\square}e$; and at its highest and lowest points $e-f_{\square}a-b$ and $f_{\square}a-b$. In the extension to the upper d_{\square} at the end of the third measure of ex.4(*b*), the upper *c'* is scrupulously avoided (although *c* is an important note in Pūriyā); this is so that *uttarāṅ* material is not anticipated.

The *antarā* sections of the Pūriyā examples establish the *uttarāṅ* material: the rising $f_{\square}a-b-c'$ (the strong upper *c'* is part of the *rāga* as well as a

requirement of the *uttarāṅg* in this case); the descending $b-d \text{---} b-(a)-f \text{---} a-e$; and again the *vādī* -*samvādī* pair b and e are established as principal degrees. The *antarā* all conclude by turning back towards *pūrvāṅg* material in order to return smoothly to the beginning of the *sthāyī*. (For further discussion and examples see [Mode, §V, 2\(ii\)](#), exx.33 and 34.)

[India, Subcontinent of, §III, 2: Theory and practice of classical music., Rāga.](#)

(iv) Rāga in Karnatak music.

The features of Hindustani rāgas discussed above are also found in Karnatak rāgas, but they are often less obvious, either in analysis or to the ear. South Indian theory provides relatively little in the way of analytical terminology and categories for rāga, and close description is not really needed for teaching south Indian rāgas. In Hindustani music, fixed compositions play a relatively small role in concert performing practice, and detailed analysis and description of the rules and procedures of a rāga are extremely helpful to a student. In Karnatak music, conversely, compositions play a major role in the concert repertory, and a practising musician will be able to sing many compositions in each of the major rāgas. The materials of a rāga are informally induced from the repertory of pieces. Little need be given in the way of formal description beyond the *ārohana* -*avarohana* and a few characteristic phrases, with such descriptions acting as a reminder of what is already known from the compositions. Scale theory has monopolized the attention of south Indian musicians from the mid-19th century onwards, and musicians have been much more interested in working out and naming as rāgas the scale degree sequences used in Tyāgarāja's *kīrtanam* compositions, and in creating new ('*apūrva* ') rāgas, than in concentrating on the foundations of those that are traditionally important.

In addition, the underlying patterns within individual rāgas are often covered by the south Indian system of ornaments. More often than not the configuration of an ornamented degree in performance is a function of the place of the pitch class in the scale-type rather than of the *svara* in the rāga melodic type. For example, in both Hindustani and Karnatak Todī rāgas the principal degrees are $e \text{---} a$. Generally in Karnatak music a prolonged e in the region of f is sung as a wide shake from above ($f-e$). A prolonged a in the region of g is sung as a narrow shake from below ($g-a$). Although these two scale degrees occur in any number of parallel configurations in Karnatak Todī, their differences on the surface, because of their contrasting ornamentation, obscure those parallels. In Hindustani Todī, the pitches of both e and a are clearly intoned in their contexts, and their relationship is more audibly apparent.

Exx.6–9 are based on transcriptions from recordings of compositions in three south Indian rāgas all using the same scale-type, *mela* no.28 ($c d e f g a b$). Only the basic melodies are shown; ex.6 in particular has a long succession of variations on the first line, which have been omitted here. (For the ornament signs see §3(i)(b) below and ex.10.)

Exx.6 and 7 are both in rāga Nāta-kurañjī. Much of the basic *pūrvāṅg* material of the rāga is heard in the opening sections of the compositions,

called *pallavi* (corresponding to the *sthāyī* of Hindustani compositions). The syllables ‘manasu-visaya nata-vidulak’ o-’ in ex.6 and ‘sura-vinutam candra-tārā sutam bu-’ in ex.7 are set to virtually the same music. Descent in the *pūrvāṅ* is illustrated in ‘ō-manasa’ in ex.6 and ‘budham āśrayāmi’ in ex.7. *Uttarāṅ* material establishing the upper tonic occurs in the two *anupallavi* (contrasting sections corresponding to Hindustani *antarā*), set to the words ‘(tana talup’) okar’intiki nīgi’ in ex.6 and ‘(budha) janair veditam/bhūsurair moditam’ in ex.7. A descent confined entirely within the *uttarāṅ* is illustrated in ‘tā gukkalu dōlu’ in ex.6. Full returning descent through *uttarāṅ* and *pūrvāṅ* together is seen in its simplest form (c–b–a–f–e–c) in ‘mahanīya sampa(dam)’ in ex.7; this is the form in which the Nāta-kurañjī *avarohana* (descent) is usually given.

The more complex and slower-paced form of descent is seen in ‘galgun’ ō manasa’ and ‘rītigād’ā?’ in ex.6. In these two phrases of the example the ‘actual’ performed configuration of the unit *f–e–f–d–c* is written out. Unlike most ornamentation, this phrase is characteristic for Nāta-kurañjī, and it also concretely illustrates several general features of south Indian rāgas. The unit *f–e–f–d–c* is often construed as *e–f–g–e–d–c*, because of its realization in performance with a heavy emphasis on the pitches *pa* and *ga*

to the near suppression of *ma*; thus ‘ō manasa’ could be construed *f–e–d–e–f–g–e–d–c* instead of *f–e–d–e–f–e–f–d–c*. Such a construction, however, obscures the parallelism of the unit *f–e–f–d* with the unit *b₊a–b₊g* of the *uttarāṅga*, where the structural degrees and the realized sound are much more alike. The parallelism is further obscured by the fact that *f–e–f–d* normally goes down to *c*, while *b₊a–b₊g*, conversely, never descends to *f* but always leads to *a*; the setting of ‘o-sāṅgitē’ shown in ex.6, where the parallel is really proved, occurs only at this transition into the next line.

Hence the parallelism of the units *f–e–f–d* and *b₊a–b₊g*, apparent in a reduced transcription, is by no means obvious to the ear in performance. In turn, these two units may be heard as extensions of the couples *b₊a* and *f–e* of the simple descent form, as in ‘mahanīya sampa(dam)’ in ex.7. Much of the more complex structure of Nāṭa-kurañjī is ultimately reducible to elaborations on the obvious parallelism of *b₊a* and *f–e*.

A similar instance may be seen in the *pallavi* and *anupallavi* of ex.8a: ‘gītārthamu san ...’ and ‘sītā-pati cara ...’. Although superficially their contours are quite different, especially in the rhyming syllables ‘gītā’ and ‘sītā’, the reduction shows that the underlying configurations are parallel, based on the descents *f–e–d–(c)* and *b₊a–g–(f)* followed by the ascents *d–f–g* and *g–b₊c* respectively. The parallel descents *f–e–d* and *b₊a–g* are particularly characteristic for Sūratī rāga, and may be even more obviously seen in ‘hari-hara’ beginning the *caranam* (ex.8b) and in ‘gītānandamu’ concluding the first line of the *pallavi*.

The rāga Sūrātī is one of the few whose scale pattern is shared by another important Karnatak rāga. Both Sūrātī (ex.8) and Kedāragaula (ex.9) are *audava* (pentatonic) in ascent: neither may proceed $d-e-f-g$ and $g-a-b-c'$, but only $d-f-g$ and $g-b-c'$ (in Sūrātī $g-b-a-b$ is also possible). Likewise, both are *sampūrna* (full) in the descent. Nonetheless, Sūrātī and Kedāragaula are impossible to confuse; each has striking features in complete contrast with the other.

The *jīva-svara* ('life *svara* ') of Sūrātī is b ; characteristically approached from below, dwelt upon with gentle shakes, surrounded by turns, and returned downwards to g , as in 'vātātmajuniki' and 'vara tyāgarāja' of the concluding lines of *anupallavi* and *caranam* in ex.8. Descents move stepwise (structurally) between b and d , as in 'gītānandamu' (*pallavi*) and 'hari-hara bhāskara' (*caranam*). The rāga does not rise often into the upper octave, and it should not go below b . The notes a and e are not only absent in ascent but weak in descent, especially the e .

Kedāragaula has a much more bravura character than Sūrātī. It rises often into the high register and stays there: 'vēnul' ella' in the *anupallavi* of ex.9 is the characteristic phrase, establishing the *jīva-svara ri*, just as 'vātātmajuniki' establishes b in Sūrātī (in ex.8). The d is elaborated by heavy shakes from e , and e in Kedāragaula is frequently brought out strongly (almost always as upper neighbour to d), as in 'vēnul' ella drsti tsutti' and 'gāvalan'ē' of ex.9; in Sūrātī the pitch e is normally nearly inaudible. Kedāragaula has parallel phrases in the descent, as in 'vēyutsu

mrōkutsu rāga', but they are broader in range than those in Sūrātī, and executed not with small and gentle tremolos but with sparkling *odigimpu* (for a written-out version of the *anupallavi* of [ex.9](#), see [ex.10\(iv\)\(b\)](#)).

India, Subcontinent of, §III, 2: Theory and practice of classical music.,
Rāga.

(v) Hindustani and Karnatak rāgas.

Despite differences in repertory, theoretical concepts, performing practice, tonal production and general style, there are many kinds of relationship between individual rāgas in Hindustani and Karnatak music. Comparisons are usually made between rāgas with common scale-types – Karnatak Todī with Hindustani Bhairavī, Karnatak Bhairavī with Hindustani Āsāvarī (Jaunpurī) – rather than between rāgas with common names – Karnatak and Hindustani Todī, Karnatak and Hindustani Bhairavī. Certainly scale and name sometimes go together, as in the case of Hindustani Kalyān and Karnatak Kalyānī. A statistical study of these two is included in Chaitanya Deva's 'Rāga rūpa' (1967). Rāgas with the same name in both systems usually use different scale-types. However, although less obvious relationships between such rāgas can almost always be found, they differ from case to case and raise questions about parallel and divergent historical evolution.

Borrowings between the two musics have also taken place since they reached their modern forms. Muttusvāmi Dīksitar spent five years in Banāras, and a few of his *kīrtanam* compositions are set in Hindustani

rāgas, although they are mostly sung in the Karnatak style. Later in the 19th century several rāgas used in *thumrī*, notably Hindustani Bhairavī, Kāfī and Khamāj, were taken up for 'light' music in south India and are sung in a conscious imitation of Hindustani musical style.

In the 20th century there was some borrowing in the other direction. Most of the importations from Karnatak music into Hindustani music were of rāgas characterized by scalar configurations not otherwise known in the Hindustani tradition, such as the popular pentatonic rāga Hamsadhvani (c d e g b c'), or the *melakarta* scale no.57, Simhendramadhyama (c d e f g a b c'). See also Mode, §V, 3.

India, Subcontinent of, §III: Theory and practice of classical music.

3. Melodic elaboration.

(i) Ornamentation.

(ii) Improvisation.

India, Subcontinent of, §III, 3: Theory and practice of classical music., Melodic elaboration.

(i) Ornamentation.

The word *gamaka*, used as a generic term, is usually rendered 'ornament', but the implication that something merely decorative has been added to something more basic is in part misleading. *Gamaka*, particularly in south India, is a general category covering all aspects of a *svara* in context, other than its theoretical pitch-position in the general scale. In Hindustani music the word *uccār* ('pronunciation') is very often used in the same sense. Either term designates aspects of attack, prolongation and release. The word *gamaka* is also used in a narrower and more specific sense to refer to a shake (see below).

The term *alamkāra* (lit. 'that which makes sufficient') means 'ornament' in all senses (jewellery, literary device etc.), but in music it has the specific meaning of a decorative motif that can be repeated sequentially up and down the scale, and hence a type of exercise. *Alamkāra* in this sense is an ingredient in the formation of *tān* in *khayāl* (see §5(iii)(b) below).

(a) Gamaka in the treatises.

The *Nāṭyaśāstra* does not distinguish between *alamkāra* and *gamaka* in the above senses but treats the latter as a case of the former. In the *Sangīta-ratnākara* (13th century) they have become fully distinct, with *alamkāra* defined as a sequence of *svara*, *gamaka* as 'the shaking of a *svara* that is pleasing to the listener' (chapter 3, pp.87–97). Śārngadeva classifies *gamaka* according to the speed of the shake (six varieties from fast to slow, plus one of variable speed), voice quality (three varieties), number of pitches the shake is applied to (one or many) and application in ascent or descent. A final 'mixed' category makes 15 varieties of *gamaka* in total. Other kinds of melodic embellishment, falling into neither the *alamkāra* nor the *gamaka* categories, are included in a now obsolete category *sthāya*, under which the *Sangīta-ratnākara* lists 96 terms referring to all aspects and styles of the production of sound in music.

Among the 16th- and 17th-century treatises, both the *Sangīta-pārijāta* (Ahobala Pandita) and *Rāga-vibodha* (Somanātha) offer new *gamaka* systems. Like their scalar constructions, their descriptions of ornaments are based on the fretted *vīnā*, but the brief passage describing 19 instrumental *gamaka* in the *Sangīta-pārijāta* is of little interest compared with the extraordinary and original work of Somanātha in 1609. The fifth chapter of his *Rāga-vibodha* is meant to present the closest possible written equivalents for the pictorial representations of *rāgas* so fashionable in his time (see §II, 3(iii) above). To evoke the *devatā-rūpa* ('icon form'), Somanātha had only to write a descriptive verse. To match the *nāda-rūpa* ('sound form'), however, he had to write a notation that could really evoke musical sounds. From the endless varieties of *gamaka* and *sthāya* he selected 20, for which he devised notational symbols he called *sanketa* ('agreement' or 'intimation'), to be appended to the *svara* letters; three more symbols indicated upper octave, lower octave and conclusions. He described the techniques for producing these *vādana-bheda* ('playing varieties') on the *vīnā*, and with their help the lengthy specimens of *rāga* configurations that he gave can be read.

(b) Gamaka in Karnatak music.

The *Sangīta-ratnākara*'s 15 *gamaka* were vocal. Modern south Indian *gamaka*, conversely, are conceived instrumentally, like those of the *Sangīta-pārijāta* and *Rāga-vibodha*. Vocal *gamaka* are as far as possible described and illustrated in terms of the plucked and fretted *vīnā* as instrument of reference. In the Thanjavur *vīnā* tradition of Muttusvāmi Dīksitar, 'ten kinds of *gamaka*' are mentioned, and two published treatises from around 1800 confirm the ten: the *Sangīta-sāra-sangrahamu* and *Vīnā-laksana*. In the *Sangīta-sampradāya-pradarśinī* (1904) Subbarāma Dīksitar ingeniously incorporated the ten *gamaka* of this south Indian oral tradition into the 15 of the *Sangīta-ratnākara* and superimposed on them both a threefold classification of his own. Ex.10(i)–(iii) illustrates eight of the ten, written with symbols derived from Subbarāma Dīksitar's own and transcribed in an approximation of their sound.

Dīksitar's three main categories were based on means of production or musical function, or both. For consistency, his classification is slightly modified in ex.10. The first category comprises shakes called *kampita*, produced by holding the playing wire behind the fret and deflecting it out of line across the fret. The musical function of this class is prolongation. In Karnatak music six of the 12 *svrasthāna* may never be sustained without being shaken, and of the remaining six all but the invariant tonic and 5th (*sa* and *pa*) are shaken in many contexts.

The characteristic of the second category is stress; all of its members involve fingering on the frets. The third class is the slides, the principal member of which is *jāru*. Dīksitar included two articulation ornaments in his third class, neither of which, however, is normally produced by sliding. The *orika* is made by deflection, and *odigimpu* may be fingered or deflected. These last two *gamaka* (ex.10(ii)(d) and (e)), and the various forms of *kampita* (ex.10(i)(a)), are what give Karnatak music the quality of being always in motion even at the very slowest tempo. When *gamaka* is used as a specific rather than a generic term, it means *kampita*.

(c) Gamaka in Hindustani music.

Whereas Karnatak music hardly ever prolongs a *svara* without a shake, Hindustani music emphasizes steady and sustained tone. The heavily oscillating *āndolan*, corresponding to the south Indian *kampita*, is used only in very special circumstances, such as on the sixth degree of rāga Hamīr (the rāga being thereby identified), on the third and sixth degrees of rāga Darbārī Kānadā (see exx.1 and 2 *passim*), or the third degree of raga Mīyā kī Mallār. Hindustani music is especially characterized, however, by the

mīnd, a slow portamento from one degree to another, like the Karnatak *jāru*. In an *ālāp* or slow *khayāl* in a serious rāga such as Darbārī Kānadā, virtually every *svara* is approached or left with *mīnd*. On an instrument such as the *sītār*, *mīnd* is made by *ultā mīnd* (deflection) or *paltā mīnd* (release of a deflected string). The fingerboard is especially wide for just this purpose, and slow *mīnd* of half an octave or more can be made. The same effect is achieved on unfretted instruments such as the *sārangī* by sliding along the string (*sūt*).

The smooth glissando of *mīnd* and *sūt* contrasts with the rapid articulation of discrete pitches in *krintan* (a fingered turn) and *ghasīt* (the finger slides rapidly along the *sītār* string touching all the intermediate frets; see §6 below).

The general term in Hindustani music for a single appoggiatura or acciaccatura is *kan-svara*. The general class of turns is called *murkī*. A chain of mordents on successive *svara* is called *zamzamā*.

Hindustani musicians generally use such terms as *uccār* ('pronunciation') rather than *gamak* to denote how a *svara* is treated in context. *Gamak* as a specific ornament in Hindustani music is a fast and heavy shake from each of a number of degrees in passage-work, in which the pitches of the degrees themselves may become ambiguous. Instrumentally the Hindustani *gamak* is particularly effective on fretless string instruments such as *sarod* or *sārangī*, where the sliding left hand can be jerked vigorously from position to position along the wire or string.

Ornamentation is particularly important in Hindustani music as an indicator of stylistic identity. The major vocal genres and their instrumental equivalents are distinguished by their ornamentation (as well as by rhythm and other characteristics). *Mīnd*, *āndolan* and *gamak* are the principal ornaments in *dhrupad*; *gamak* and *kan-svara* are applied with rapid throat movement in *khayāl*; *murkī* is the hallmark of *thumrī*, and *zamzamā* of *tappā*. Similarly, the *bānī* of *dhrupad* and the schools (*gharānā*) of vocal and instrumental music define their musical identities partly in terms of specific ornaments and other techniques. Thus the *sītār/sarod* school of Alauddin Khan cultivates both fingered and pulled or sliding ornaments (*krintan* and *mīnd*), whereas the school of Vilayat Khan (the Imdād Khān *gharānā*) has developed pulled/sliding techniques to the virtual exclusion of fingered ornaments.

India, Subcontinent of, §III, 3: Theory and practice of classical music., Melodic elaboration.

(ii) Improvisation.

- (a) Principles.
- (b) Historical background.
- (c) The exposition of a Hindustani rāga.
- (d) The exposition of a Karnatak rāga.

India, Subcontinent of, §III, 3(ii): Theory and practice of classical music., Melodic elaboration., i) Improvisation.

(a) Principles.

Improvisation with the elements of a rāga and within its structural framework plays the major role in performance, although in Karnatak music the rendering of compositions has been taking an ever larger share of total performance time. Improvisation, of course, does not mean assembling individual degrees in random order: even in its most free form it entails combining and elaborating motifs and phrases. Melodic elaboration can take the form of varying and extending a particular phrase, through stretching and compressing of motivic elements and through prefixing, suffixing or inserting motivic elements from within the same phrase or from other phrases. It also entails the combination of different phrase types within a particular register (*pūrvāṅg*, *uttarāṅg* etc.) and their extension into adjacent registers.

There is no single general term for improvisation. Melodic elaboration, whether improvised or not, may be referred to by such terms as 'discourse' (*ālāpa*), 'expansion' (*vistār*, *barhat*), 'invention, fancy' (*upaj*) and by more specific terms for particular techniques. The fundamental principle by which different types of elaboration are distinguished in theory and organized in performance is rhythm: rhythm with or without clear pulse, with or without metre (*tāla*), and at different tempos and levels of rhythmic density (see §4(i) below). In performance, unpulsed rhythm leads to pulsed, unmetred to metred and slow to fast (or less dense to more dense). At different stages of the performance different ornaments, vocal or instrumental techniques and types of melodic and rhythmic improvisation become appropriate. The consequent richness of stylistic variety enables the musician to elaborate a single rāga for an hour or more.

Table 9 summarizes the principal improvisatory styles in relation to their rhythmic organization. The theoretical terms *nibaddha* and *anibaddha* respectively denote music that is 'constrained' or 'unconstrained' by song-text and/or tāla. They correspond to two major categories of improvisation, that which occurs during the rendition of a metrical composition, and that which is independent of both composition and metre. *Nibaddha* improvisation styles will be discussed in more detail below (see §5(ii)–(iv)). Table 9 not only classifies the repertory of improvisatory styles but also maps their sequential organization in performance. Most genres proceed down the first column (non-metrical improvisation, first without and then with clear pulse) then, after introducing a metrical composition, down the second column. The Hindustani *khayāl*, though the dominant vocal style in north India, represents an exception in that little attention is normally paid to the first column. The performance usually begins with the composition or with only a short, unpulsed *ālāp*.

India, Subcontinent of, §III, 3(ii): Theory and practice of classical music., Melodic elaboration., i) Improvisation.

(b) Historical background.

The term *ālāpa*, meaning a genre of melody designed to exhibit the modal characteristics of a *rāga* in a systematic manner, and notated *ālāpa* melodies demonstrating different *rāgas*, appear in historical sources almost as early as the term *rāga* (see §II above). *Rāga* and *ālāpa* are closely related concepts, for it is through *ālāpa* (in which there are no metrical or textual constraints on the free flow of melody) that the fine distinctions between different *rāgas*, and the individual character of each, can be most clearly demonstrated. Notated examples suggest that in early (pre-13th-century) *ālāpa*, the melodic material of the *rāga* was expressed as an elaborate octave ascent and descent. This pattern, with some extension in the upper register, could be repeated with different melodic elaborations and in different rhythmic styles.

Although it is stated that the purpose of the *ālāpa* is to demonstrate all the features of *rāga*, there is no theoretical discussion of the method of doing so until the *Sangīta-ratnākara* (13th century), where the related term *ālapti* denotes melodic elaboration in general. It is defined as ‘making clear or manifest, unfolding [the *rāga*]’ (*prakatīkarana*), and it can be applied to the *rāga* alone (*rāgālapti*), or to a composition (*rūpakālapti*; see §5(ii) below). According to *Sangīta-ratnākara*’s description, *rāgālapti* comprised four stages, in which four successively higher pitch areas within the octave were developed in turn. Each stage departed from and returned to the tonic (*sthāyī*). The opening phrase of the first stage was called *mukha-cāla*, where *cāla* denotes a movement (of pitch) and *mukha* means ‘face’ (perhaps implying that part of the *rāga* by which the whole is recognized). The development of each pitch area focussed on a particular important degree of the *rāga*: in succession, a note in the lower half of the scale, the fourth or fifth, a note in the upper half of the scale, and the upper tonic. A number of brief examples are given in the *Sangīta-ratnākara*, and it is stated that the same procedure was applied to all *rāgas* (ex.11). In principle, the note-by-note expansion of melodic range within a central octave remains a fundamental process in Hindustani *dhrupad*, *khyāl* and instrumental *ālāp*. Śārṅgadeva’s comment on the role of ornamentation and of pitch hierarchy in such improvisation applies equally to modern Hindustani and Karnatak music: ‘The establishment of the *rāga* should be effected by means of very gradual, clear, circuitous figurations (*sthāya*), pervaded by the vital notes (*jīva-svara*) of the *rāga*’ (chapter 3, p.196).

India, Subcontinent of, §III, 3(ii): Theory and practice of classical music., Melodic elaboration., i) Improvisation.

(c) The exposition of a Hindustani rāga.

Improvised exposition of the rāga ungoverned by a time cycle can be pulsed or unpulsed in both modern traditions. In performance styles other than the Hindustani slow *khayāl*, the *ālāp* is rendered without tāla. With Hindustani *dhrupad* (and usually with *khayāl* of the Agra *gharānā*), with the best known Hindustani instrumental styles and with south Indian *pallavi* exposition an *ālāp* always comes first; the rendering of *kīrtanam* compositions in south Indian concerts is also often preceded by an *ālāpana* of the composition's rāga. In Hindustani *dhrupad* and plucked instrument items a second, pulsed exposition of the rāga follows the *ālāp*, called *nom-tom* or *jor* respectively. The south Indian equivalent before a *pallavi* exposition is *tānam*. In Hindustani instrumental music *jor* is usually followed by *jhālā*, rhythmic patterns arising from rapidly striking the playing string and side strings in various patterns.

The *Sangīta-ratnākara*'s description of *rāgālapiti* corresponds very closely in principle with the Hindustani *ālāp*; this is also true of *ālāp* in slow *khayāl*, with the proviso that returns are made to the *mukhrā* of a composition and aimed at an arrival point whose timing is controlled by a long time cycle. Given whatever restrictions may ensue in one rāga as opposed to another, the *ālāp* proceeds as the *Sangīta-ratnākara* says: it is built upwards registrally in sections, returning at the end of each section to the *pūrvāṅg*, which is marked each time by the *mukhrā*, a short pulsed cadential tag, *sam dikhāne* ('for showing the *sam*'). In principle each registrally determined section reaches one *svara* higher than the previous section. Ex.12 comprises the main part of an *ālāp* of rāga Pūriyā, along with fragments of *jor* and *jhālā* (see below), taken from demonstration samples in a modern *sītār* manual. (To see the structural relationship of this *ālāp* of Pūriyā to the abstracted configurations of the rāga, see *Mode*, §V, 3.) Owing to the didactic origins of ex.12, the melodic development is somewhat mechanical, and details of rhythm, articulation and ornamentation are missing.

The first four sections of ex.12(a) correspond to the first three sections of the *Sangīta-ratnākara*'s description, with section 1 equivalent to *mukha-cāla*; sections 5 and 6 of ex.12(a) correspond to the *Sangīta-ratnākara*'s section 4. There is a return to the lower tonic at the end of each section, making the *ālāp* an instance of the 'back to the beginning' principle of cyclic organization. Section 4 is particularly interesting in respect to the specific rāga structure and the general procedure of *ālāp*. It is the section establishing *a*, in due ascending order of degrees after the *vādī* degree *e* (section 2) and *ṛi* (section 3). Taken by itself and out of context, much of section 4, with its emphasis on *a*, could suggest the rāga Mārvā (see *Mode*, §V, 3); only in the last three units, as it approaches its cadence, does the *bhāva* ('feeling') and *chāyā* ('image') of Pūriyā reappear. Two things, however, make this merely a neutral passage in which Pūriyā is temporarily *tirobhāv* ('hidden'), rather than a destructive passage making rāga Mārvā 'manifest' (*āvīrbhāv*). Firstly, although one of Mārvā's principal *svara* (*a*) is brought forth, Mārvā's characteristically strong *d* is very weak

here. The $ḍ$ comes briefly at exposed initial positions but only in the middle of sets of progressively expanding approaches to a , from below (units 1 to 5 in section 4), and from above (units 6 to 8; for a comparison see [Mode, §V, 3](#)). Secondly, the $chāyā$ and $bhāva$ of Pūriyā has already been fully established in the preceding stages of the $ālāp$ in ex. 12, especially in section 2; and the one degree of the scale not used as an emphasized degree in the succession of upwardly extending sections is $ḍ$; the characteristic degree for Mārvā.

It should also be noted that no section leading to a final b is included in the sample. Although b is the second most important degree in Pūriyā (after e), it is not usually an important phrase-final; its significance, rather, is as a phrase-initial, as an upper or lower sustained mid-phrase focus, and as a registral boundary.

Ex. 12a demonstrates the two larger divisions of a typical $ālāp$; sections 1 to 4 establish the $pūrvāṅg$ of the $rāga$, sections 5 to 6 the $uttarāṅg$. These larger divisions are often termed $sthāyī$ and $antarā$ respectively, after the sections of a composition, which are similarly distinguished by register (see §5(i) below). Ex. 12a continues with a further section, not shown here, exploring the register below the system tonic ($mandra$), but in practice this register is normally developed at the beginning of the $sthāyī$.

Pulsed $rāga$ exposition is illustrated in ex. 12b and c. The jor is the type called $ladī$ ('chain' or 'string'), the basic variety, and is always presented first. It is made by building back from an ending; in the section shown here e , $f̣+e$ and $e-f̣+e$ build to a motif characteristic for the $rāga$. $E-f̣+e$ then ends each unit until the final, cadential unit brings the line down. The second section follows the same procedure: c , $B-c$, $B-ḍ+c$ sets up a characteristic motif that can then conclude an ever-lengthening sequence of phrases building towards it. A second jor variety is $guthāv$ ('intertwining'), in which a small group of $svara$ adjacent in the $rāga$ (usually three) is permuted in all kinds of combinations; still another variety combines the principles of $ladī$ and $guthāv$.

Ex. 12c shows two fragments of $jhālā$, which follows jor in the succession of instrumental improvisations without time cycle. It is played with single plucks on the playing string ($bāj$) followed by one, two or three strokes at the side drone strings ($cikārī$). The alternation establishes a simple, recurring rhythmic pattern called a $chand$, as indicated by the syllables (bol) designating the two kinds of stroke: $dā-rā-rā-rā/dā-rā-rā-rā$ for a simple 4 + 4 pattern, $dā-rā-rā/dā-rā-rā/dā-rā$ for 3 + 3 + 2, these being the two most common $chand$. Any combination of twos, threes and fours may be used, however, and modern players make some very complex patterns. The $chand$ may be freely combined, changed and interrupted, there being no larger time cycle controlling them when $jhālā$ follows immediately upon jor . When used to provide a thrilling conclusion to a gat improvisation, $jhālā$ conforms to the 16-beat Tīntāl, which is accelerated to the maximum possible speed.

The vocal equivalent of jor is $nom-tom$, sung in $dhrupad ālāp$: the pulsed units are sung with a small number of conventional meaningless syllables ($tī$, ta , $rī$, ra , na , $nā$, nom and tom), and the music is similar in style to jor ,

which was probably modelled on *nom-tom*. The last stage of *nom-tom*, equivalent to and probably modelled on the instrumental *jhālā*, is sung with the syllables *ta-na-na-na ra-na-na-na* and the like, making fast combinations like an instrumental *chand*, but with repeated notes. From time to time wide swoops in pitch of the order of an octave, made with closed or nearly closed lips, break the flow; they are onomatopoeically called *hun-kāra* (an old *gamaka* name coming from the 15 in the *Sangīta-ratnākara*). Other ornaments important in *nom-tom* include *gamaka*, *lahak*, *hudak* etc.

India, Subcontinent of, §III, 3(ii): Theory and practice of classical music., Melodic elaboration., i) Improvisation.

(d) The exposition of a Karnatak rāga.

The differences in style between Karnatak and Hindustani music are nowhere more exposed than in *ālāpana* and *ālāp*. The stately Hindustani *ālāp* exhibits individual scale degrees often approached by slow *mīnd* and, in certain rāgas, sustained with oscillations. The Karnatak *ālāpana* alternates occasional sustained pitches with other scale degrees prolonged in wide shakes, often preceded by a few short semi-detached notes, the whole interspersed with short bursts of melodic flourish even in slow-paced portions.

A full rāga *ālāpana* in Karnatak music is also structured somewhat differently in performance from the Hindustani *ālāp*, although the same basic principles are involved. The early 17th-century Thanjavur treatise *Sangīta-sudhā* described a procedure not quite like that of the *Sangīta-ratnākara*. The samples in the Shahjī manuscripts of the later 17th century confirm the procedures described, and the modern practice is very much the same.

The typical Karnatak *ālāpana* opens with an *āksiptikā* ('throwing out', the vernacular is *āyittam*), in which a brief overview of several of the basic configurations of *uttarāṅg* as well as *pūrvāṅg* is given. In the second stage – *rāgavardhanī* ('rāga expansion') in the *Sangīta-sudhā* – phrases of the *pūrvāṅg* are first developed as fully as possible as melodic units, expanded, and contracted internally and combined together through rising and falling patterns externally. The second part of this stage moves to the *uttarāṅg* and establishes the upper octave of the system tonic, building and developing *uttarāṅg* phrases.

Following the rāga expansion based on melodic elaboration and concatenation comes a second exposition based on approaches to endings, sometimes called *vinyāsa-sañcāra* ('end-[marked-]passages'). *Vinyāsa-sañcāra* is based on the return principle. A short motif is sung, and the approaches to it are progressively lengthened. *Vinyāsa-sañcāra* is used as the principal area for virtuoso display and comprises three elements: the goal motif; the nearest available sustainable pitch; and ever-longer, ever-wider chains of *brikka* or *phirukka* (Hindustani *phirnā* 'whirl'), melismatic patterns. These may also appear elsewhere but are characteristically developed in this way. Two or three *vinyāsa-sañcāra* sections are sung in a full Karnatak *ālāpana*, with particular emphasis on one that allows the nuclear steady pitch to be at the upper tonic or, where the rāga allows it, higher still.

The last section of the *ālāpana* brings the pitch and intensity level gradually downwards, through melodic motifs of the *uttarāṅg* and *pūrvāṅg*, and concludes normally with a few phrases in the *mandra* (below the system tonic) before coming to rest on the tonic.

Such an *ālāpana* will normally appear once or twice in a concert. It may precede a *kṛitī* composition that is going to be treated as a major item. Traditionally, however, the full *ālāpana* of a major *rāga* was presented in connection with the concert item designated *rāgam-tānam-pallavi*, in which case it would be followed by the pulsed *rāga* improvisation called *tānam*. In principle, *rāgam-tānam-pallavi* is the major item in a programme of Karnatak music, although in modern practice it is often given a lesser role, some *kṛitī* earlier in the programme having been given a full complement of prior *ālāpana*, and adjunct *niraval* and *kalpana svara*. The *tānam*, however, is usually done only in *rāgam-tānam-pallavi* (see §5(iv) below for discussion of this genre).

South Indian *tānam* is close to Hindustani *nom-tom*, given the differences in style; the syllables are *tā nam*, *ta ka nam*, *ā nan dam* etc. Separate sections of *tānam* are built in successively higher registral levels, each is concluded with a short unpulsed passage of *ālāpana* before the next is begun. The whole *tānam* concludes with the threefold sequence of a *tānam* phrase at successively lower pitch levels (usually built around upper tonic, 5th and lower tonic), followed by a few last phrases of unpulsed *ālāpana*.

India, Subcontinent of, §III: Theory and practice of classical music.

4. Rhythm and tāla.

- (i) Terms for rhythm and metre.
- (ii) Historical development of tāla systems.
- (iii) Tāla in Karnatak music.
- (iv) Tāla in Hindustani music.

India, Subcontinent of, §III, 4: Theory and practice of classical music., Rhythm and tāla.

(i) Terms for rhythm and metre.

Rhythmic organization is at least as important as melody in characterizing the many styles of Indian classical music. The Hindustani and Karnatak styles are distinguished partly by their rhythmic characteristics, as are the vocal genres of Hindustani music (*dhrupad*, *khayāl*, *thumrī* etc.) and their instrumental counterparts. An extended performance of a *rāga* is likely to comprise a sequence of rhythmically differentiated sections, moving from unmetred rhythm to fixed metre (tāla) and from slow tempo to fast.

Fundamental to the discussion of rhythm in Indian musical discourse is the concept of measuring time, usually on the basis of a regular pulse, called *mātrā* ('unit of measurement') in Hindustani music or *aksara* ('syllable') in Karnatak music. These terms are often rendered in English as 'beat' (though this word can be confused with the hand-gestures of tāla) or 'count', since the *mātrā/aksara* can usually be counted on the fingers during teaching or performance (with some exceptions in very fast or very slow tempo). In general, however, the *mātrā/aksara* corresponds most closely to the concept of a 'beat' in Western music.

The closest Indian equivalent for the modern Western term 'rhythm' is *laya*. The basic meaning of *laya* is 'tempo', with three basic levels: slow (*vilambit[a]*), medium (*madhya*) and fast (*drut[a]*). A secondary meaning is 'rhythmic density', the subdivision of each beat into two or more equal parts, giving the impression of faster tempos. In Hindustani music the tempo of the beat (*mātrā*) is termed *barābar laya*, and the beat may be subdivided into two (*dugun laya*), three (*tigun*), four (*caugun*), six (*chegun*) or eight (*āthgun*). Other *laya* such as 5:1, 7:1, 4:3 etc. are encountered mostly in instrumental solos. In Karnatak music the terms *gati* and *natai* similarly denote levels of *laya*. The normal subdivision of the beat into two or four is called *caturaśra* ('four-cornered') *gati/natai*, while alternative subdivisions are three or six (*tiśra*), five (*khanda*) and seven (*miśra gati/natai*).

Gati (or *gata*) means 'pace' or 'movement' and occurs in other senses too. In Hindustani instrumental music a *gat* is a composition characterized by its 'movement', a rhythmic plucking-pattern on the *sitār* or *sarod*, or a configuration of rhythmic densities on the *tablā*. Another term for rhythmic 'movement' is *cāl*, 'gait', as in *hāthī kā cāl*, 'elephant's gait' (the slow rhythm of a *dhrupad* in *Cautāl*). Closer to Western 'metre' are *chand*, the term for metre in poetry, which in music denotes a small repeated surface-rhythm pattern (e.g. 3 + 2 + 2), and *tāla*, a cyclically repeating fixed time cycle.

Most performances begin with an unmetred introduction, even if only consisting of one or two phrases to introduce the *rāga* (see §3(ii)(c) above). In Hindustani vocal (*dhrupad*) and instrumental *ālāp*, and in Karnatak *rāgam-tānam-pallavī*, this introduction is extended to give a complete exposition of the *rāga* in several rhythmically differentiated sections. The rhythm of the opening slow *ālāp* or *rāgam* appears to be unregulated by a consistent pulse, except in the periodic *mohrā* formula of *ālāp*, where an explicit pulsation temporarily resolves the rhythmic ambiguity of the surrounding improvisation. The performer may, however, have a more or less regular pulse in mind throughout. A pulse becomes explicit (and faster) in the medium-tempo *ālāp* (*jur*) or Karnatak *tānam*, where irregular groupings of two, three, four etc. pulses maintain metrical ambiguity and rhythmic interest. Hindustani fast *ālāp*, which plucked string instruments play in the *jhālā* style (see ex. 12), accelerates the pulse to the maximum technically possible. The grouping of pulses here may again be irregular, but groups of four predominate, and rhythmic patterning (*chand*) in threes, fives, sevens etc. may be introduced for variety. There is no Karnatak equivalent of fast *ālāp*.

The *ālāp(ana)* is usually followed by a composition and further improvisations set to a particular *tāla*. *Tāla*, from Sanskrit *tala* ('flat surface, palm'), means a clap or slap and hence the measurement of musical time with the aid of claps and other cheironomic gestures (*kriyā*). Each particular *tāla* comprises a number of pulse-beats (*mātrā*) grouped into a 'cycle' (Hindustani *āvart*, Karnatak *āvartanam*), defined by an emphasized beat (*sam*) at the beginning. Audible claps (Hindustani *tālī*) and silent waves (Hindustani *khālī*) are used to mark the first and selected other pulses during the cycle, in a set pattern, as an aid to keeping time in teaching and in the performance of certain genres. The disposition of claps at unequal

intervals helps to maintain a sense of position within the cycle. In some genres the hand-gestures are replaced in performance by instruments: by small cymbals (appropriately named *tālam*) in the Karnatak *nāgasvaram* (oboe) ensemble and in many non-classical religious music genres, and by the Hindustani *tablā*, which plays a set pattern of strokes (*thekā*, literally 'support') based on the theoretical clap-pattern. In *khayāl* and *thumrī* the role of the *tablā* is restricted to playing decorated variants of this *thekā*, and hand-gestures are therefore unnecessary. In *dhrupad* the *pakhāvaj* drum improvises freely, returning to the *thekā* only occasionally. In this genre, and even more so in Karnatak practice where there is no *thekā* at all, the hand-gestures are an essential means of articulating the metrical structure and are performed by solo vocalists and/or by members of the audience.

India, Subcontinent of, §III, 4: Theory and practice of classical music., Rhythm and tāla.

(ii) Historical development of tāla systems.

As with melody, there is an inherited body of rhythmic theory that no longer describes practice but is a source of rhythmic concepts and terminology. Again as with modal theory, the system of 'canonical' (*mārga*) tālas described in the earliest treatises (*Nāṭyaśāstra*, *Dattilam*) is distinctively different from that of the 'provincial' (*deśī*) tālas recorded in later texts such as the *Sangīta-ratnākara*. The *deśī-tāla* provide the basis for the modern tāla systems.

In both historical systems, hand-gestures and/or cymbal strokes, arranged in asymmetrical patterns, were used to articulate rhythmic periods. In the *mārga* system, an elaborate cheironomic code, using claps (*samnipāta*) and four different silent gestures, was employed to mark the progress of the *saptagītaka*, a repertory of sacred song used in the introduction to drama. The complexity of this code may have been necessitated by the extended and complex temporal structures of the *saptagītaka*, which do not seem to have been organized according to simple metrical cycles or strophic forms.

The *mārga-tāla* system also included five simple patterns that may have been cyclically repeated in less complex genres such as the *dhruvā* stage songs. The later *deśī-tāla* system consisted entirely of such cyclical patterns – the *Sangīta-ratnākara* lists 120 – and the complex cheironomy of the *saptagītaka* was therefore no longer required.

Both *mārga* and *deśī* systems defined the spacing of hand-claps or cymbal strokes using values and terminology derived from poetics. The basic values were *laghu* ('light'), *guru* ('heavy', two *laghus*) and *pluta* ('protracted', three *laghus*). In the *deśī* system two shorter values were added, *druta* ('fast', half *laghu*) and *anudruta* ('very fast', quarter *laghu*). These shorter values, and the *virāma* ('rest') that extended the previous value by a fraction, enabled the expression of a greater variety of rhythmic proportions than was possible with the three basic values of the *mārga* system.

Although these prosodic values could be used to express ternary rhythm, the metrical structure of the *mārga* system was, at another level, exclusively binary. The basic pulse or *mātrā*, defined as about one second

in length, was grouped into metrical units (*kalā*) comprising two, four or eight pulses. These units could be combined into larger periods (*anga*, 'limb'), described as *catuśra* ('four-cornered') if there were 4, 8, 16 or 32 units, or *tryaśra* ('three-cornered') if there were 6, 12 or 24. Claps and silent hand-gestures were then assigned to specific metrical units according to a variety of patterns. Each pattern could be expanded to double or quadruple length by inserting extra units between those of the original pattern; silent hand-gestures denoted these extra units.

Additive or 'mixed' (*miśra*, *sankīrna*) metres comprising five, seven, nine etc. metrical units were not employed in the sacred hymns and stage songs described by the *Nāṭyaśāstra*, though they were acknowledged to exist. Such metres are prominent in the *deśī tāla* system, where the binary *kalā* is replaced by metrical units of different lengths, expressed by the prosodic values *laghu*, *druta*, *anudruta* etc. Theorists delighted in cataloguing (and no doubt also inventing) dozens of tālas formed from combinations of these units, some of which must have been ephemeral while others have remained in the repertory more permanently. Even some of the more *recherché* patterns can still be heard as an occasional tour de force in Hindustani percussion solos or Karnatak *rāgam-tānam-pallavi* performances.

A limitation of the *deśī* system was that its basic units still expressed only binary proportions (apart from the rarely used longest unit, the *pluta*). Units of three, five etc. could only be expressed by combinations of binary units with or without *virāma*. In the modern Karnatak tāla system (see below), this limitation has been resolved by making the *laghu* a variable unit, comprising three, four, five, seven or nine beats (the *druta* and *anudruta* remaining fixed at two beats and one respectively). In the north, the prosodic terminology has been abandoned altogether; metrical units (*vibhāg*) of two, three, four and five beats are employed without terminological distinction.

Two further aspects of tāla that are important in the modern traditions can be traced in texts dealing with the *deśī-tāla*. From the *Sangīta-ratnākara* onwards certain composition types (*prabandha*, see §5(i) below) were associated with particular tālas, often sharing the same name, as in the modern *dhamār* and *dādrā* (see §(iv) below). In later texts, tālas began to be associated with particular configurations of drum syllables, though the concept of *thekā* emerges fully only in modern Hindustani practice (see below). Despite these theory–practice connections, however, the number of tālas in practical use today, and probably also in earlier times, in any one tradition is very small compared with the innumerable patterns available in theory. A group of seven tālas called *sāлага-sūda* or *sūlādi* (named after the *sāлага-sūda prabandha* in which they were used) has had particular importance since the *Sangīta-ratnākara*, surviving in different forms today in the Karnatak 'formal' system (see below) and the Newar *caryā* tradition of [Nepal](#). A similar set of ten tālas was used for singing *dhrupad* at the Mughal court in the 16th century or early 17th, according to the song collection *Sahasras*. While the modern Karnatak *sūlādi* system comprises 35 basic tālas, the 'informal' system predominantly used in practice comprises at most ten (see below). These provide fast and slow varieties of binary, ternary, quintuple and septuple metre. The Hindustani tālas in

common use also represent these four metrical types but with more varieties (distinguished by clap-pattern and/or by drum-pattern, *thekā*), numbering about 20 altogether.

India, Subcontinent of, §III, 4: Theory and practice of classical music., Rhythm and tāla.

(iii) Tāla in Karnatak music.

In modern Karnatak music there are, in effect, two systems of tāla. What might be called the formal system is of considerable antiquity and forms the basis of the early stages of formal music instruction said to have been laid down by the Kanada devotional singer Purandara Dās (1480–1564). In concert performing practice, tālas appertaining only to the formal system are represented in a few restricted and largely rather learned contexts. The informal system may be seen as a simplification and reformulation of elements of the formal system. It is the basis of the great bulk of the current repertory, including Ksetrayya's *padam* and Tyāgarāja's *kīrtanam*.

(a) The formal system.

The formal system is shown in Table 10. It comprises the seven *sūlādi* tālas, each of which is defined by a clap-pattern comprising one or more segments (*anga*), expressed with the values *anudruta* (one beat), *druta* (two beats) and *laghu*. The *laghu* is a variable quantity, comprising three beats (*tisra*), four beats (*caturaśra*), five beats (*khanda*), seven beats (*miśra*) or nine beats (*sankīrna*). In counting time each segment is marked by an audible clap (*tattu*) on the first beat. The remaining beats of a *laghu* are counted by touching fingers to thumb or palm, while the second beat of a *druta* is indicated by a silent gesture with palm upturned (*vīccu*).

Each *sūlādi* tāla has five variants, distinguished by the value of the *laghu*. However, in each case there is one principal variant (boxed in Table 10), which may be denoted by the simple tāla name without any further qualification. Four of these principal varieties are *caturaśra*, with one representative each of the *tisra*, *khanda* and *miśra* types. The remaining

variants are rarities, with the exception of *caturaśra* Tripuṭa, known as 'Ādi tāla' ('first tāla'), which plays an extremely important role in the 'informal' system.

Other tāla varieties of the formal system are represented only in special circumstances. Ata tāla (in its principal *khanda* variety) has one very prominent role in the Karnatak tradition: it is one of two tālas used for the *tāna varnam* (see §5(iv) below), the other being Ādi. Ex.7 in Jhampā tāla belongs to a set composed by Muttusvāmi Dīksitar on the shrines of the nine planets in the Thiruvārur temple. The first seven of this set are on the planets that correspond with the seven days of the week and are set successively in each of the seven *sūlādi* tālas (ex.7 is for the planet Mercury, corresponding to Wednesday). Certain compositions in *khanda* Jhampā tāla (5 + 1 + 2) and *khanda* Tripuṭa tāla (5 + 2 + 2) are widely known, and *pallavi* are often rendered in rare varieties of the *sūlādi* tālas.

(b) The informal system.

What is here called the 'informal' tāla system comprises selected tālas of the 'formal' system plus two fast tālas called Cāpu. Table 11 shows how these together provide a system of binary, ternary, quintuple and septuple metres in slow and fast forms. The Cāpu tālas (*khanda* Cāpu, five beats, and *miśra* Cāpu, seven beats) function as fast varieties of Jhampā and Tripuṭa respectively; *khanda* Cāpu is colloquially called *ara Jhampā* ('half Jhampā'). They are not analysed in terms of *laghu*, *druta* and *anudruta* units as are the *sūlādi* tālas, but they are clapped as follows: *khanda* Cāpu 2 + 1 + 2, *miśra* Cāpu (3) + 2 + 2 with a wave rather than a clap on the first beat. The binary tāla Ādi is the most important and most frequently used tāla of Karnatak music (exx.6 and 8 are both in slow Ādi tāla).

It is a fundamental principle of tāla that while the pattern of irregularly spaced audible claps marks the rotation of the cycle, it does not necessarily indicate the rhythmic organization of musical events within the time-span so measured. Not only is there an almost infinite variety of possible rhythmic configurations within any tāla cycle, but a tāla may even be characterized by an internal rhythm different from that implied by the clap-pattern. Thus the Karnatak Jhampā tāla, in its most common *miśra* variety, is structured by claps as 7 + 1 + 2, but the characteristic rhythm of melodies in this tāla is (2 + 3) + (2 + 3), as seen in ex.7. Similar internal

rhythms operate to a greater or lesser extent in many other tālas of both the Karnatak and Hindustani systems.

For two of the asymmetric tālas the syllabic quantities in compositions normally fit the pulse and the beats of the tālas. The quintal patterning of ex.7 in the slow Jhampā tāla is pointed out above. Ex.9 shows similar conformities for long–short syllable distributions in the fast triple Rūpaka tāla. Note in *Vēnugānalōluni* that the metrical position of the first syllable (*etuppu*) comes after the first beat, and that this conventional delay endows ‘back to the beginning’ returns, such as the *kalpana svāra* in ex.13, with a much greater forward momentum into the composition than they would have if it began on the first beat itself, following the syllabic quantities literally.

Similar rhythmic improvements afforded to a composition by deferral in the slow quadratic Ādi tāla are discussed in §5(iv) below, with reference to ‘*Gītārthamu*’ (ex.8). The rhythms of this piece, and many like it, such as ex.6, are essentially based on long–short syllabic quantity, like pieces in Rūpaka or Jhampā tāla, albeit with more scope for transformations. But Ādi tāla compositions on the whole show a much greater variety of rhythmic treatment within the basically square quadratic framework than do many pieces in any of the asymmetrical tālas.

The most common pattern for fast Ādi tāla compositions is illustrated in [Table 12a](#). Unlike those in other fast tālas, this rhythm is not tightly tied to syllabic quantity. The basic rhythm is of half-beats grouped 2 + 3 + 3. This basic rhythm is shown on the centre line of Table 12a and is taken twice in one cycle. The *etuppu* (initial time-point) is the second half of the second beat of the tāla and the *arudi* (point of arrival) the fifth beat, at the first *druta*. In terms of the rhythm there is a strong downbeat on the *arudi* preceded by an anacrusis of five half-beats. The anacrusis itself concludes with a fixed long plus short (time value and syllabic quantity), which in turn is set up with one, two or three syllables fitted into two pulses. The second 2 + 3 + 3 is structured in the same way, but with less weight at the point of arrival and as a whole. All the variants indicated in Table 12a occur, and in many combinations. The musical rhythm, in short, exists prior to the composition of the text. Apart from the long–short conclusion of the upbeat phrase, syllabic quantity as such is not important; the text is conformable to free combinations of the prosody of popular Telugu poetry. There are hundreds of compositions of Karnatak music in this variety of Ādi tāla, and it is one of the most widely known and best-loved of all south Indian musical types. It is called Deśādi tāla.

Just as characteristic of south Indian music is the faster variety of the 'mixed' tāla of 3 + 4, whose most common rhythmic combinations are shown in Table 12*b*. This *miśra* Cāpu tāla is not quite as sprightly as the Deśādi of Table 12*a*, but rather more lyrical and flowing. As may be seen in Table 12*b* there is a somewhat greater flexibility in the rhythmic patterning than there is in Deśādi; within each separate vertical segment undivided horizontally, any alternative shown is possible. Beyond this, there are two different possibilities as to *arudi* (point of arrival). An *arudi* may come firmly and be sustained at the downbeat of the third *āvartanam*, as shown in the bottom part of the table, so that the second phrase has less weight than the first; however, as shown in the top part of the table, there may be no real point of arrival at all. The music can fit easily and comfortably into an evenly balanced two-phrase format without driving towards one rhythmic goal more than another. This graceful tāla accounts for well over half Ksetrayya's *padam* compositions and for some of Tyāgarāja's best-known *kīrtanam* compositions.

India, Subcontinent of, §III, 4: Theory and practice of classical music.,
Rhythm and tāla.

(iv) Tāla in Hindustani music.

The tālas of Hindustani music are not codified according to any consistent system, but rather comprise a number of overlapping repertoires associated with different genres and ensembles. [Table 13](#) gives an overview in which the tālas are arranged by metrical type: binary (8 or 16 *mātrā*), ternary (6 or 12), quintuple (5 or 10), septuple (7 or 14) and others (9, 11, 15 etc.). For each tāla the genres and tempos in which it is used are indicated. Thus Tīntāl is used in all tempos and in almost all genres except *dhrupad*, Cautāl is used in all tempos, mainly in *dhrupad*, and so on.

The division of each tāla into segments (*vibhāg*), indicated in practice either by hand-gestures or by an accompanying drum-pattern (*thekā*), is shown numerically in Table 13. Thus the 16-beat Tīntāl, which is by far the most common Hindustani tāla, is divided into four segments of four beats each, shown as 4 + 4 + (4) + 4. Each segment except the third begins with a clap (*tālī*), and the third segment (bracketed) is indicated by a wave (*khālī*); for the accompanying drum-patterns see Table 14. In written notation the clapped segments are numbered, with X (in place of 1) to mark the first clap (*sam*) and 0 to denote *khālī*; the notation for Tīntāl is therefore X 2 0 3. Note that it is the claps that are enumerated, not the pulse-beats or segments, hence the name Tīntāl, ‘three[-clap] tāla’ (compared with Cautāl, ‘four[-clap] tāla’, which has 12 pulse-beats).

The tendency to organize musical rhythm within the cycle into an evenly balanced two-phrase format, which was noted in the case of Karnatak Jhampā, Deśādī and *miśra* Cāpu tālas (though not reflected in their clap-patterns), has become an important principle of tāla construction in Hindustani music and is manifested more or less overtly in the clap-patterns. Thus in each metrical category of Table 13, except the last, there are one or more tālas whose clap-pattern resembles Tīntāl, clap-clap-wave-clap (X 2 0 3), with the *khālī* wave marking the division of the cycle into two halves of equal length. The segment lengths in these tālas are usually the same in each half, thus [4 + 4] + [(4) + 4] (Tīntāl), [2 + 3] + [(2) + 3] (Jhaptāl), and [3 + 4] + [(3) + 4] (Dīpcandī, Jhūmrā). There are also two short tālas, used in light genres, with a simpler symmetry: 4 + (4) (Kaharvā) and 3 + (3) (Dādrā). The *khālī* in all these tālas does not mark a ‘weak beat’, as is sometimes claimed, but the second of two balancing components, of which the first (marked by *sam*) is the stronger. This symmetry is reflected in compositions such as the *sitār gat* in ex.3. Although a pervasive feature of Hindustani rhythm, the function of the mid-way *khālī* is quite different from that of the similar hand-gesture in Karnatak time-beating and is unprecedented in the historical tāla systems. It is a relatively recent development in Hindustani music, being mentioned in written sources only from the late 19th century.

In addition to these balanced tālas, associated particularly with the tablā and the genres that it accompanies, there are others constructed less symmetrically, in which the *khālī* is either absent (Tīvra), functions as the *sam* (Rūpak), or serves to subdivide segments of four or five *mātrā* into shorter units (Sūltāl, Ādā-cautāl, Savārī tāl, Brahma tāl etc.). Thus in Cautāl, of 12 beats, the claps articulate a pattern of 4 + 4 + 2 + 2. Each of the four-beat segments is subdivided by *khālī* to give 2 + (2) + 2 + (2) + 2 + 2. One result of this subdivision, however, is that the second *khālī* falls at the beginning of the second half of the cycle and thus implies an alternative, balanced structure of two equal (if differently structured) halves: [2 + (2) + 2] + [(2) + 2 + 2]. Similarly for the 14-beat tāla Dhamār, the most common of several alternative clap-patterns is [5 + 2] + [(3) + 4], where the *khālī* again marks the division of the cycle into two halves of equal length but different internal division. In both Cautāl and Dhamār the typical rhythm of vocal compositions is different from the tāla segmentation but coincides with it at the *sam* and the mid-way *khālī*: [3 + 3] + [3 + 3] in Cautāl, [3 + 4] + [3 + 4] in Dhamār. In both tālas the mid-way *khālī* is an important landmark for singers when improvising rhythmic variations (*laykārī*: see §5 below).

The only tālas, therefore, that exhibit no balanced structure at all within the cycle are those that are very fast (Sūltāl, Tīvrā) or not divisible by two (tālas of 7, 9, 11 etc. *mātrā*). Even taken together these tālas account for a very small proportion of performances.

The major vocal genres of *dhrupad*, *khayāl* and *thumrī*, and the instrumental styles based on them, use different (if overlapping) sets of tālas (see Table 13). They also adopt different approaches to time-keeping, to rhythmic accompaniment and to rhythmic style in composition and improvisation. In *dhrupad*, the tāla gestures are executed by the singer himself and knowledgeable members of the audience, as in Karnatak concert-music. The *pakhāvaj* accompanist is thus freed from the necessity of playing a simple *thekā* and may improvise an elaborate and rhythmically dense accompaniment. The *dhrupad* singer's approach to rhythm is essentially 'syllabic'. In the composition each syllable of text is set to one or two beats' duration (sometimes on the basis of metrical quantity), and these durations are respected in performance, with some slight anticipations and delays for expressive effect. In *laykārī* variations, whether fixed or improvised, the syllables of text (like the strokes of the *pakhāvaj*, also conceived as syllables) are set to precise subdivisions of the *mātrā* according to the different levels of *laya* (see §(i) above). There is little room in this style for *rubato*.

By contrast, the rhythm of *khayāl* can be extremely flexible, depending on the tempo and the *gharānā*. The rotation of the tāla is marked by the *thekā* of the *tablā*, which frees the singer to indulge in a 'melismatic' rhythmic style, especially in the very slow tempos and extended tālas (Ektāl, Tilvādā, Jhūmrā) of *barā khayāl*. That is, syllables of text may be rather freely distributed across the beats of the cycle or extended into sustained pitches or florid melismas. Syllables and other rhythmic events do not necessarily fall on the beat, except at the first beat (*sam*). Such flexibility may be assisted by a tempo as slow as eight seconds per beat, a relatively recent development achieved by having the *tablā* player play the *thekā* at half the previous minimal tempo. As the tempo quickens, however, the rhythm becomes more 'syllabic', especially in *sargam tān* (solfège passages). In *thumrī* the retardation of tempo and melismatic freedom of the vocal rhythm have progressed so far that the *mātrā* can become irregular. Sometimes it is impossible to distinguish whether a 14- or a 16-beat tāla is being used, and some *thumrī* tālas (Dīpcandī, Cacar) can be played and counted either way.

Instrumentalists typically employ a combination of 'syllabic' and 'melismatic' rhythmic styles. The latter tends to predominate in slow-tempo, *khayāl* - style performances in Tīntāl or Ektāl, the former in medium- or fast-tempo, *dhrupad* -style *gat* played in tālas such as Rūpak or Jhaptāl.

The importance of the *thekā* in most genres of Hindustani music is such that the tālas tend now to be defined and identified in terms of their *thekā*, rather than by the Karnatak practice emphasizing clap-patterns. Basic *thekā* for the principal tālas of Hindustani music are set out in Table 14. The sonorities are encoded in the notation syllables (*bol*). For the purposes of defining a *thekā*, the most important contrast of sonority is between 'heavy' (*bhārī*) and 'empty' (*khālī*) strokes. 'Heavy' strokes comprise an

undamped resonant stroke on the lower-pitched, left-hand drum (*bāya*), either alone or simultaneously with any stroke on the right hand. 'Light' strokes comprise all strokes that lack this left-hand resonant sound. In *tablā* notation all heavy strokes begin with a voiced consonant (usually also aspirated): *dhā*, *dhin*, *dhī* etc. (both hands), *ghe* (or *ge*) (left hand alone). Empty strokes by contrast begin with an unvoiced, unaspirated consonant: *tā*, *tin*, *tī*, *tū*, *tete* etc. (right hand), *ka*, *kat* (left hand).

The *thekā* relate to the theoretical structure of the *tālas* in a variety of ways. In some cases the *thekā* could be said to be a drummed version of the clap-pattern. Heavy strokes are used for those segments of the *tāla* (*vibhāg*) denoted by claps (*tālī*), light strokes for the segment(s) denoted by a wave (*khālī*). An exemplar of this principle is Jhaptāl: the first, second and fourth segments are marked by claps and by the 'heavy' stroke *dhī*, while the third segment (commencing the balancing second half of the *tāla*) is marked by a wave and by the corresponding 'light' stroke *tī*. The same clap-pattern and similar *thekā* are found also in the 14-beat *tālas* Dīpcandī and Jhūmrā, and in the 16-beat Tilvādā and Cacār. The 16-beat Cacār and its 14-beat relative Dīpcandī both show a one-beat anticipation of the *khālī*, with 'light' strokes appearing at the last beat of the first half of the *tāla*.

The correspondence between clap-pattern and *thekā* is not always so direct, however. In Tīntāl, of 16 beats, the *thekā* is similar to that of Jhaptāl in terms of the selection and arrangement of strokes, but there is a displacement of the 'heavy' and 'light' segments of the *thekā* by one beat in

relation to the clap-pattern. The 'light' strokes begin at beat 10, one beat after the wave in the clap-pattern, and 'heavy' strokes re-enter at beat 13, one beat after the clap on beat 12. This displacement gives a strong upbeat character to the whole *thekā*. Its basic formula is *dhin dhin dhā / dhā*, leading to and resolving on the first beat of the next segment, not *dhā dhin dhin dhā /* beginning and ending with the segment boundaries. (This sense of anacrusis is also characteristic of many Tīntāl melodies, for example the instrumental *Masītkhānī gat* (see ex.3), where, however, the anacrusis is of five rather than three beats.) The resulting coincidence of a 'heavy' *tablā* stroke with the *khālī* wave on beat 9 belies the assumption that the *khālī* of the clap-pattern represents a 'negative' or 'unemphasized' beat. Both it and the immediately following change of *tablā* sonority signal the start of the second half of the tāla.

The basic correspondence of 'heavy' and 'light' *tablā* strokes with claps and waves respectively applies to all the variants of Tīntāl *thekā* and to many of the shorter tālas in varying degrees. The same correspondence also applies in some degree to the *pakhāvaj thekā* for tālas used in *dhrupad*. The *thekā* for Dhamār, a tāla notorious for its intricacy, is treated as two seven-beat segments, the first 'heavy' and the second 'light', with a one-beat displacement against the clap-pattern such that a 'light' stroke appears on the *sam* and a 'heavy' stroke on the *khālī*. This is even more anomalous than the well-known tāla Rūpak, which resembles the Karnatak *miśra Cāpu* in having a wave (and a light stroke) on the *sam*.

There remains a small number of tālas in which the clap-pattern and *thekā* bear essentially no relation to each other. Two tālas used for *khayāl*, Ektāl and Ādā-cautāl, derive their clap-patterns from Cautāl. However, the *thekā* for these tālas, though related to each other, are not derived from Cautāl *thekā* and show no consistent correspondence of 'heavy' and 'light' strokes with the clap-patterns. It seems likely in such cases that clap-patterns borrowed from *dhrupad* tālas were superimposed for theoretical purposes on to independently evolved *tablā* rhythms.

In summary, the Hindustani tālas are differentiated not only by length measured in beats, but by the internal organization of the constituent beats, so that ten beats (for example) can be articulated as (2 + 3) + (2 + 3) (Jhaptāl) or 2 + (2) + 2 + 2 + (2) (Sūltāl). Where two tālas have the same number of beats and the same clap-pattern, it is the *thekā* that distinguishes them. The same clap-pattern, on the other hand, can articulate tālas with different numbers of beats, and a sequence of drum-strokes can similarly be adapted to provide *thekā* for tālas of different lengths. When we bear in mind that factors such as characteristic rhythmic inflections, the sounds of particular *tablā* strokes, tempo and vocal or instrumental style and genre can also be strongly associated with particular tālas, the concept of tāla in north India emerges as a complex musical identity that cannot be completely defined in terms of *mātrā* (beats) and *vibhāg* (segments).

5. Compositions, genres and performance of vocal music.

(i) Compositions.

(ii) Improvisation on compositions.

(iii) Genres and performance: Hindustani music.

(iv) Genres and performance: Karnatak music.

India, Subcontinent of, §III, 5: Theory and practice of classical music.,
Compositions, genres and performance of vocal music.

(i) Compositions.

Each item of a vocal performance of South Asian classical music is based on a composed song with poetic text, set to a particular rāga and tāla. The song (Hindustani *bandīś*, *cīz*; Karnatak *prabandha*) may be of minimal length compared to the extensive improvisation that precedes and/or follows it. The contribution of the performer in its rendition is of crucial importance, and the act of composition and the role of the composer do not have the status that has accrued to them in the Western musical world.

The art of the poet-composer (*vāg-geya-kāra*, 'maker of words and melody') is nevertheless a respected one, and compositions attributed to important figures such as Tyāgarāja or Tānsen, and identified by the poet's signature or *chāp* in the final line, are highly valued. The number and kind of compositions that a musician knows can be very important elements in his professional standing. Compositions can be treasured family property and, traditionally, could be sold, pawned or included in dowries.

Compositions are further important because they determine many aspects of the performance in which they are embedded: not only the rāga and tāla, but also the style of rendition and techniques of ornamentation and improvisation that may be applied.

The theoretical discrimination of composition-types began as early as the *Nāṭyaśāstra*. The *gītaka* or sacred hymns performed during the ritual dramatic prelude (*pūrva-ranga*) were defined in terms of tāla structure (see §4(ii) above), whereas the *dhruvā* stage-songs were classified according to their poetic metres. Later texts such as the *Sangīta-ratnākara* discuss composition-types (*prabandha*) from different regions of South Asia, from which many current types (classical and non-classical) may be descended. The *prabandha* are defined according to a variety of features, including text elements (words, epithets, non-lexical syllables and solmization or drum-syllables), metre, language, subject-matter, rāga, tāla etc. Some *prabandha* were also dance forms. Central concerns of *prabandha* theory are the relationship of melody (*dhatu*) to text (*mātu*) and of musical tāla to poetic metre.

Most *prabandha* comprised a number of musical sections corresponding to text lines or verses, often including a refrain (*dhruvā*). Refrain-forms permeated Indian vernacular song from the 7th century onwards, owing to the spread of devotional religious movements, in which responsorial singing is a central feature of ritual. The definition of a particular composition-type called *dhruvā-prabandha* ('refrain-song') in the *Sangīta-ratnākara* records for the first time a complex of four features that are common to major Hindustani and Karnatak vocal forms today: the arrangement of four melodic sections in the pattern ABCB'; repetition of part of section A as a refrain; a higher register in B and B' than in A and C; and inclusion of the name of the dedicatee (and/or of the composer) in the text of the final section (B').

Examples of Karnatak *kīrtanam* and Hindustani *dhrupad* compositions are set out in parallel in [ex.13](#), showing how far they conform to this structure. They differ in all other respects (rāga, tāla, language, style, genre etc.), suggesting that the common structure is a deeply embedded, historically rooted and geographically widespread unifying factor. In the *kīrtanam* and *dhrupad* compositions, the four melodic sections correspond to four text lines (t1–t4), as shown in [fig.7](#). Section A sets the first words of the text, which often encapsulate the theme of the poem and identify the song. This section is termed *pallavi* (the ‘germ’, ‘shoot’ of the song) or *sthāyī* (‘fixed’, i.e. refrain) in Karnatak and Hindustani music respectively. Melodically it stresses the lower tonic and lower register of the rāga, though it may range as far as the upper tonic or even beyond. In performance, this section, or a part of it, can itself be cyclically repeated, and it is the point of repeated departure and return.

The *B* section is termed *anupallavi* (Karnatak: 'after the *pallavi* ') or *antarā* (Hindustani: 'intervening') and is melodically more constrained than the *A* section. It begins with an ascent from the mid-range to the upper tonic, which is then stressed (see (1) in ex.13). Subsequent phrases develop the upper regions of the *rāga*, carrying the melody to its highest point so far (usually a strong note of the *rāga* in the lower tetrachord of the upper octave (see (2) in ex.13)). The final phrases of the section may return to the lower register and often echo the end of the *A* section in order to effect a smooth transition back to the beginning of the song ((3) in ex.13).

Hindustani *khayāl*, instrumental *gat* and many *dhrupad* compositions have only the *A* and *B* sections, and therefore conclude with this return to *A*. In longer *dhrupad* and most *kīrtanam* compositions, the *C* section develops the same register as *A* but usually stresses the fifth or fourth degree (depending on the *rāga*). The final section, *B'*, which follows immediately without any intervening reprise of *A*, returns to the upper pitch-areas as in *B*, to which it may be melodically similar or identical. In *dhrupad* these two last sections are regarded as separate units, called *sañcāri* and *ābhog* respectively. In *kīrtanam* they are considered to form a single section termed *carana*. The end of *B'*, like that of *B*, leads into a reprise of *A*, or its first phrase, with which performance of the composition ends.

This basic structure also exists in expanded and contracted forms. Karnatak *kīrtanam* or *kṛiti* compositions may include additional *carana*, usually set to the same melody as the first. Occasional *khayāl* and *thumrī* compositions, and many Hindustani devotional songs (*bhajan*), have one or more additional *antarā*, sung to the *B* melody. By contrast, shorter *dhrupad* compositions, most *khayāl* and *thumrī* compositions and instrumental *gat* compositions comprise *A* and *B* sections only, and sometimes no more than the *A* section is actually performed (or the *B* section may be improvised). Some Karnatak *kīrtanam* comprise a *pallavi* followed by multiple *carana*, to the same or different melodies, while in *rāgam-tānam-pallavī* the composition comprises a *pallavi* only (see §(iv) below).

All these structures are intrinsically cyclic, with the first phrase of the *A* section as the point of departure and return. In Hindustani music this first phrase (*sthāyī-mukhrā*) can itself be cyclically repeated as many times as desired. Both *B* and *B'* sections lead at their conclusion into a reprise of this phrase, and it will be returned to many times during any improvisation that follows the composition. The whole performance will end with this phrase. The opening phrase of the *B* section (*antarā-mukhrā*) may also be used as a refrain for part of the improvisation, if the performer wishes to improvise on the words or melody of that section, but the *sthāyī-mukhrā* normally returns. In Karnatak music there is greater variety in the choice of phrases for repetition as the basis for improvisation, but the *pallavi* remains the essential point of conclusion in all forms except the *varnam* (see below).

Individual segments of the composition may be immediately repeated, with or without variation, if the singer (or dancer) wishes to stress or improvise on the words and/or melody of that segment. A repeatable segment or phrase normally comprises one cycle of the *tāla* in slow tempo, two or four cycles at faster speeds. Repetition of individual phrases is an important

feature of Karnatak music, where the majority of concert *kṛiti* compositions (as opposed to more devotional *kīrtanam*) are learnt with fixed and memorized variations called *sangati*. It is believed that phrase-repetition with elaborate *sangati* was instituted by Tyāgarāja (1767–1847). Since his time it has become standard practice, and many compositions by others (such as Muttusvāmi Dīksitar) have also been adorned, by later musicians, with *sangati* variations that are now considered indispensable.

Another type of repetition with pre-composed variation is where a complete section of a composition is repeated at faster or (less commonly) slower speeds against the *tāla*, through augmentation or diminution. The words, melody and rhythmic proportions remain intact. This device may be employed in the performance of Karnatak *rāgam-tānam-pallavi* and Hindustani *dhrupad* (see below).

Vocal compositions in Indian music and their realization in performance can thus be seen to embody several fundamental musical processes: cyclical returns to the beginning; change of melodic register in different sections of the composition, exploiting the various registral and thematic elements of the *rāga*; repetition of individual phrases with variations increasing in melodic complexity and rhythmic density; and changes in metrical relationship between melody and *tāla*. These processes can be further elaborated through improvisation.

[India, Subcontinent of, §III, 5: Theory and practice of classical music., Compositions, genres and performance of vocal music.](#)

(ii) Improvisation on compositions.

Not only the underlying form of vocal compositions but also the basic types of *nibaddha* ('constrained') improvisation are prefigured in the *Sangīta-ratnākara*. The elaboration of a metrical composition (*rūpakālapati*) is said by Śārngadeva to comprise either of two processes: *pratigrahanikā* ('reprising') *rūpakālapati*, where after a phrase of *rāga* elaboration one returns to a phrase of the composition; or *bhañjanī* ('breaking up') *rūpakālapati*, where the text of the composition is sung many times, in part or whole, keeping the original rhythmic setting of the words but with ever new melodic phrases. Similar processes are still current in modern practice; in particular, the alternation of improvised episodes with periodic reprises of a phrase of the composition, usually the first, is a ubiquitous practice.

Śārngadeva's discussion of *rāgālapati* (see §3(ii)(b) above) and *rūpakālapati* in the *Sangīta-ratnākara* provides us with the first analysis of the processes of improvisation in South Asian music. There is also an indication of how these processes related to performance as a whole, in the description of a courtly dance-form, the *Gaundalī* ('Gond woman's dance'). According to this description the performance of this dance began with the singing of the tonic (*sthāyī*) and the fourfold development of *rāgālapati*. A vocal composition (*dhruvā-prabandha*, see above) was then sung and danced in *tāla* with drum accompaniment. New melodic material (*sthāya*) was then introduced, interspersed with reprises of the refrain of the composition (*dhruvā-khanda*). The reprise was marked by vigorous drum playing and a sudden 'freeze' by the dancer at the crucial moment of return, a process familiar from modern *kathak* dance performances. This sequence of events

– *rāgālap̄ti*, composition, and (*pratigrahanikā*) *rūpakālap̄ti* punctuated by returns to the refrain – underlies the major genres of *rāga* performance in both Karnatak and Hindustani music today.

(a) Returns to a given motif (*pratigrahanikā*).

Here a particular phrase of the composition, often the first, is repeated in alternation with passages of improvised melodic and/or rhythmic development. This process is used in all the styles in the ‘*nibaddha*’ column of Table 9 above. It underlies the *bol-bat* of *dhrupad*, the *ālāp* and *tāns* of *khayāl*, the *bol banāo* of *thumrī*, the *torā* of *sitār* / *sarod* playing and the *kalpana svara* of Karnatak music. Whatever the style and techniques employed, musical interest lies both in the melodic and rhythmic excursions of the improvisation and in the ingenuity with which the performer returns to the composition. The Hindi term for the motif to which the return is made is *mukhrā* (‘little face’); it is normally the first phrase of the *sthāyī*. In ex.3 above, for instance, ‘sapane-mē ā-’ is the *mukhrā*; it has two parts, comprising the point of arrival at ‘ā’ and the phrase leading up to that point, which is, properly speaking, the *mukhrā*. The point of arrival is called *sam* (‘together’), where both melodic and rhythmic elements finally coalesce at a single point. In ex.2 above the *mukhrā* is ‘hajarata’, and the *sam* is on ‘to’. As is illustrated here, in Hindustani vocal music, and especially in slow *khayāl*, a precisely measured-out duration is not always essential to the *mukhrā*, the musical function of which is as a lead-in or lead-back. In rendering the slow *khayāl* in *rāga* *Darbārī Kānadā*, for instance, phrases of unpulsed improvised *ālāp* would fill most of each long time cycle (transcribed here as 12 whole-note values); the singer will slip into a pulsed phrase as he comes back to ‘hajarata’, making sure only to catch it far enough ahead of the *sam* to allow time for an elegantly shaped approach to and arrival at ‘to’.

The *tān* of Hindustani fast *khayāl* are free bravura passages sung on an open vowel. In *tān* singing, some flexibility as to the amount of the *mukhrā* actually used or the point at which it begins, or both, is again possible; the *tān* must conclude and some rhythmically elegant *mukhrā* should be heard, but the only irreducible metric requirement is that the *sam* be reached with the first count of the time cycle. Sometimes *tān* may lead right to the *sam*, dispensing with the *mukhrā* altogether. The *mukhra* can be treated with similar flexibility in *dhrupad* (and especially *dhamār*) *laykārī* improvisation (see below).

In Hindustani instrumental music the principal type of free passage between returns of the *mukhrā* is called *torā* (‘break’, also ‘bracelet, necklace’). A *torā* is a plucking pattern for the right hand combined with pitch-changing movements of the left hand. A *torā* differs from a *tān* in that it has some sort of definite rhythmic shape, whereas a *tān* is passage-work in fast but equal note values. A *torā* often concludes with a culminating cadential passage repeated three times in sequence, called *tihāī* (‘threefold’). The *tihāī* must be timed in such a way that it concludes on the beat before the *mukhrā*, or at the beginning of the *mukhrā*, or the *sam* itself. *Tihāī* can also be used in *dhrupad* and is an important feature of dance performance.

The flexibility of beginning point and emphasis on arrival point in the Hindustani *mukhrā* is reversed in Karnatak music. A line of the composition (not necessarily the first) is chosen, and free improvisation is required to lead directly, naturally, but also precisely to the first part of the phrase, which then may or may not proceed to a strong arrival point (*arudi*). Ex.14 illustrates one of the characteristic specialities of Karnatak music. It shows sample phrases of *kalpana svara* ('improvised *svara*') attached to the first line of the composition partly transcribed in ex.9, *Vēnugānalōluni*, rāga Kedāragaula (see §2(iv) above). The firmly fixed point is the actual beginning of the line of the composition, 'Vēnu-gāna-', which is called its *etuppu* ('taking up'). The *etuppu* is a specific *svara* of the rāga, falling at a specific point in the tāla; here it is the second degree (*d*) in rāga Kedāragaula, coming on the second half of the first beat in fast-tempo of Rūpaka tāla. There are only a few ways this point can be approached in Kedāragaula; in fact, the last three degrees of a *kalpana svara* passage could lead to this motif beginning at *d* only by going *e-d-c-e* (as in ex.14), *g-f-e-d* or *f-e-c-d* (following *g* or *d*). The time-point for the *etuppu* here, just after the first count, is the norm for fast Rūpaka tāla; the final approach to the *etuppu* with an odd number of attacks (five in this and most cases) is the norm for all tālas. The low initial pitch and immediate upward continuation of the composition's opening demand a basically descending line in each final approach. The requirements of the rāga Kedāragaula (see §2(iv) above) determine the specific possibilities of melodic configuration in the *kalpana svara* throughout.

Two general techniques of *pratigrahanikā* improvisation are illustrated in ex.14. First of all, a fixed formula at the end is preceded by an ever longer and more elaborate build-up. Also characteristic is the use of the threefold cadential rhythmic sequence at the ends of longer passages, called *morā* in Karnatak music. In the transcription's semiquaver durations, the third of the sample *kalpana svāra* ends sequentially with unit durations of 4 + 4 + 5 pulses. The fourth passage ends 6 + 6 + 5, with a rhythm that is one of many possible rhythms for a standard *mrdangam* cadential formula (*tadinginatam*, see §6 below). The drummer would probably be expecting this formula and would certainly join in in time for the second and third members of the sequence. (Hindustani musicians sometimes improvise with *svāra* syllables and with other non-textual syllables (*bol*) in compositions that use them, but seldom with tight linkage to a precise time-point or the control of rhythmic pattern that is essential to the modern south Indian technique.)

(b) Repetition with variation (bhañjanī).

Here a particular phrase or section of the composition is repeated one or more times. The words and rhythm of the segment remain intact, but the melody is varied. This process has resulted, in the Karnatak *kṛitī*, in

variations (*sangati*) that have become fixed and are transmitted and performed as part of the composition itself. A related Karnatak technique, but improvised, is *niraval* ('filling up'). A single line of text from the composition – occupying one cycle of a slow *tāla*, two or four in a fast one – is sung repeatedly, quite closely following the original rhythmic distribution of text syllables but with melodic phrases appropriate to the *rāga* supplied by the performer. In practice the effect is much like that of *kalpana svara*: the improvisation of *niraval* must lead back to the beginning of the original setting at the proper time-point and *svara* position, and it proceeds at two speeds, first with several cycles at the basic pulse, then a number of cycles at double time. The rendering of compositions in south Indian music is frequently embellished by *niraval* followed by *kalpana svara* attached to the same line of the composition, or by one or the other. The first line of a composition is rarely chosen for *niraval* but often for *kalpana svara* alone.

The *bhañjanī* type of variation does not occur as such in Hindustani music. In slow *khayāl* the unpulsed *ālāp* is often done using the words of the *khayāl* composition rather than the open vowel, in which case it is called *bol-ālāp*, but the rhythm is very flexible within the *tāla*. The singing of *tān* on *bol* (the words of the composition) rather than on the open vowel is called *bol-tān*, and is the nearest equivalent to south Indian *niraval*, although in most *khayāl* styles it is again very flexible rhythmically. The term *bol-tān* is sometimes confused with the very similar *bol-bat* (partition or distribution of the words); *bol-bat* belongs to the *dhrupad* style, but is also used in some *khayāl* styles. Like *bol-tān* it uses words from the composition to carry improvised phrases of the *rāga*, but the text and music phrases are syllabic, not melismatic, and the emphasis is on interesting rhythmic combination.

The *laya-bat* of *dhrupad* and the *anuloma-pratiloma* of *rāgam-tānam-pallavi* maintain the melody and rhythmic proportions of the composition, but they change the rhythmic relationship of the melody and text-syllables to the *tāla* through diminution and augmentation. This type of manipulation of the composition is not improvised.

[India, Subcontinent of, §III, 5: Theory and practice of classical music., Compositions, genres and performance of vocal music.](#)

(iii) Genres and performance: Hindustani music.

To a greater extent than in the south, north Indian vocalists distinguish a number of genres each with its proper composition-type, vocal style, techniques of improvisation, aesthetic objectives and other features. The principal genres are *dhrupad*, *khayāl* and *thumrī*, though there are a number of related genres or sub-genres. Most vocalists take at least some training in all three principal genres but specialize in one or two. *Khayāl* singers often sing *thumrī* as an encore, but it is unusual for a *dhrupad* singer to sing *khayāl* or vice versa, because of the very different vocal techniques required.

(a) Dhrupad.

Dhrupad compositions are believed to be the oldest part of the Hindustani repertory, with some attributed to Tānsen and other historical figures (see

§II, above) still in circulation. Likewise the associated performance practice is regarded as older than that of *khayāl* and *thumrī*, which developed in the 18th and 19th centuries respectively. Consequently *dhrupad* is valued by its proponents for its authenticity of structure (correct rendering of intonation, *rāga* and *tāla* and complete and accurate rendering of the composition), stylistic purity (full-throated voice production, restriction of ornamentation and improvisation to a limited number of techniques) and elevated purpose (addressed to the Divine and to connoisseurs, not compromising with popular taste). Having never enjoyed widespread popularity or understanding since its heyday in Mughal times, *dhrupad* became all but extinct in the mid-20th century. Its revival in the latter part of the century was a surprisingly vigorous phenomenon.

A *dhrupad* poem is usually in the Braj dialect of Hindi (used for devotional hymnody) and comprises two or four rhyming lines, set to two or four melodic sections (described above). Although in earlier times almost any subject, sacred or secular, could be treated in *dhrupad*, it has come to be associated particularly with devotional or philosophical subjects, including both Hindu and Islamic themes. Consequently *dhrupad* is regarded by its exponents as a more sacred art than other Hindustani genres. *Dhrupad* compositions are found in almost all *rāgas*, but only in certain *tālas* (see Table 13). Of these, *Cautāl* is the most common, but sub-genres exist using *Dhamār* (for *dhamār* compositions describing the *Holī* spring festival as celebrated by *Kṛṣṇa*), *Jhaptāl* (especially for Sufi mystical songs called *sādrā*), and *Sūltāl* and *Tivra* (for fast-tempo songs usually in praise of deities). The accompaniment for *dhrupad* is properly provided by the barrel-drum *pakhāvaj* rather than the *tablā*. Other accompanying instruments include the *tambūrā* drone lute and, optionally, a bowed lute *sārangī* and/or harmonium (avoided by some performers).

The vocal style of *dhrupad* is based on voice production from the diaphragm, smooth glissandi and other pitch-inflections, and avoidance of any rapid *fioritura* that requires constriction of the throat. *Dhrupad* singers need voices able to compete with the powerful resonance of the accompanying *pakhāvaj* – one reason, perhaps, why *dhrupad* singers are usually male and often perform in pairs.

A *dhrupad* performance in concert context usually begins with an extended *nom-tom ālāp* (see §3(ii)(c) above), which may last 30 minutes or more and demonstrates the artist's insight into the structure and aesthetic of the *rāga*. The composition is then presented in a dignified rhythmic style (see §4(iv) above). If it is in slow tempo, it may be followed by one or more further compositions in different *tālas* and faster tempo.

Elaboration of the composition in *dhrupad* is termed *bat* ('division'), *upaj* ('invention'), or *laya-kārī* ('making (different) rhythmic densities'). The performer's options are considerably more restricted than in *khayāl* (see below), since he must always use the words of the composition, and only two basic procedures are permitted, sometimes termed *laya-bat* and *bol-bat*. In *laya-bat*, a section of the composition is sung with its time values systematically reduced to a half, a third or a quarter of their original length; that is to say, it is sung as *dugun*, *tigun* or *caugun laya* (see §4(i) above). No other material change and no element of improvisation is involved.

More complex proportional diminutions are referred to in literature but never heard in practice.

According to some authorities, these calculated rhythmic manipulations of the composition were all the variation that was originally allowed in the performance of Cautāl *dhrupad* compositions. In *dhamār*, the lighter sub-genre sung by *dhrupad* musicians, a freer style of variation is considered appropriate. The musicians can improvise new rhythmic and melodic settings of the syllables of the poem, repeating phrases, words and even syllables as desired, at any level of *laya*, provided only that the structures of *rāga* and *tāla* are respected. This reflects the frolicsome character of the spring Saturnalia described in *dhamār* texts. This free *upaj* or *bol-bat* is now also often performed in Cautāl and other *dhrupad* sub-genres, reflecting the strong preference for improvised variation that is a hallmark of contemporary Hindustani musical culture. So strong a preference is it that the fixed *laya-bat* is often omitted altogether.

In *bol-bat* the essential requirement is for the vocalist and *pakhāvaj* accompanist (who improvises simultaneously with the vocalist) to return to the beginning of the composition, arriving together at the *sam*, the first beat of the *tāla* cycle. If the composition begins with *mukhrā* leading to *sam*, this must be worked into the final moments of each improvisation, though it may be expanded or compressed rhythmically if required. Thus the cyclicity inherent in both the *tāla* and the composition is further reflected in the *pratigrahanikā*-type improvisation.

(b) *Khayāl*.

The second main genre of Hindustani music, *khayāl*, had almost completely eclipsed *dhrupad* by the mid-20th century. The ethos of *khayāl* is one of stylistic variety and freedom of improvisation (*khayāl* means 'imagination, fantasy') as opposed to the strictness of *dhrupad*. Nevertheless, many features of *dhrupad* have been taken into *khayāl* performance. Depending on the *gharānā*, *khayāl* performance may resemble *dhrupad* quite closely (especially in the Agra *gharānā*) or diverge from it more or less radically. *Khayāl* texts are normally in Hindi and comprise only two rhyming, unmetred lines, corresponding to the musical *sthāyī* and *antarā* sections (see §(i) above). They range over a wide variety of love themes, often expressed in a feminine persona and including the amorous adventures of Kṛṣṇa or those of the emperor, and devotion to a lover or to a Muslim holy man. There are three varieties of *khayāl* distinguished by tempo: slow (*vilambit*), also known as 'big' (*barā*) *khayāl*, medium (*madhya*) *khayāl* and fast (*drut*) or 'small' (*chotā*) *khayāl*. A slow *khayāl* is always followed by a fast *khayāl*, but a medium-tempo or a fast *khayāl* may be sung alone as an independent item. Only the more serious *rāgas* are employed in *khayāl*, since light *rāgas* will be sung in *thumrī* style. The typical *tālas* are different from those employed in *dhrupad* and include Ektāl, Jhūmrā, Tilvādā and Tīntāl for slow compositions, Ektāl, Tīntāl, Jhaptāl, Rūpak and Ādā-cautāl in medium and fast compositions. *Khayāl* is accompanied by *tablā*, *tambūrā* and often *sārangī* and/or harmonium.

The vocal style of *khayāl* is characterized by a type of *fioritura* called *tān*, in which a rapid sequence of pitches, or repetitions of the same pitch, is sung to a single text syllable or to the vowel 'ā'. This technique, and other

ornaments involving rapid movement used in *khayāl*, require a greater tension of the throat muscles than is permitted in *dhrupad*. The style is reproduced on the *sitār* by rapid deflections of the string with the stopping finger, so that an elaborate sequence of pitches is produced from one stroke (see §6 below).

A *khayāl* performance usually dispenses with the opening *nom-tom ālāp* of *dhrupad*; a few phrases may be sufficient to introduce the *rāga* before the composition is commenced. The composition may be sung in its entirety at this point, or the second section (*antarā*) may be postponed until later. The *tāla* is indicated by the *tablā*, which plays a more or less embellished form of the cyclically repeated basic drum-pattern (*thekā*) for the *tāla* in question. If the tempo is slow, the singer's rhythm may be very free, necessarily coinciding with the drum only at the first beat (*sam*) of the *tāla*. At medium and fast tempo the rhythmic style is less melismatic (see §4(iv) above).

Improvisation on the composition involves departing from and repeatedly returning to the first phrase of the composition, the *mukhrā*, which includes beat 1 of the first complete cycle of the composition but often starts with an anacrusis. The tempo gradually increases, and different styles and techniques of melodic and rhythmic improvisation are introduced at appropriate tempos. In slow *khayāl* the first stage of improvisation is normally that called *ālāp* or *barhat* ('expansion'). This closely resembles the slow *ālāp* of *dhrupad* in its gradual unfolding of the *rāga* phrases and the quasi-unpulsed rhythm of the vocalist. However, here the *tablā* maintains the *tāla* throughout, using the *thekā*, and the singer uses syllables from the composition and/or vocalization to 'ā' rather than the *nom-tom* syllables of *dhrupad ālāp*. Where in *dhrupad ālāp* the singer makes periodic returns to the *mohrā* of the *rāga*, here he returns to the *mukhrā* of the composition. In both cases this re-establishes rhythmic congruence after a period of ambiguity. At the climax of the *ālāp* where the upper tonic is reached, the *antarā* of the composition may be introduced (or reintroduced), since this section of the composition always begins with an ascent to the upper tonic.

The quasi-free rhythm of the *ālāp* may be followed by more rhythmic improvisation using the words of the composition, in a style more or less close to the *bol-bat* of *dhrupad*. Other options include *sargam*, where each of a sequence of pitches is sung to its appropriate solmization syllable (*sa*, *re*, *ga* etc.; see Table 1 above). Finally, improvised passages of *tān* are introduced. These bravura passages may be sung either with or (in slow *khayāl*) without clear reference to the underlying pulse. Many kinds of *tān* are distinguished by separate names, such as *sapāt tān* ('smooth', i.e. straight, scalar passages), *phirat tān* ('returning', i.e. involuted passages), *gamak tān* (passages sung with a heavy shake on each degree) and so on. *Tān* may be sung to 'ā' (*ākār tān*) or with syllables of the song-text (*bol-tān*). As before, each *tān* passage must return to the *mukhrā* of the composition, leading to beat 1 of the *tāla*.

If the tempo was initially slow, the fast-tempo 'small' *khayāl* will be introduced at this point, to be followed with more *tān* and other fast-tempo improvisation. The development of this composition is much shorter than that of the 'big' *khayāl*. A medium-tempo *khayāl* may be elaborated with all

the stages of improvisation and without any following fast-tempo composition.

Of the several other types of composition performed by *khayāl* singers, the most distinctive is the *tarānā*. The texts employ a special set of non-lexical syllables, such as ‘tom ta na na, u dāna dīm, dere na, dira dira’ and ‘yalālī yalā’. Sometimes drum syllables or dance syllables are incorporated. The various syllable combinations lend themselves to rhythmic improvisatory permutations at very fast speeds. Sometimes a *tarānā* includes a line or two of Persian text, and it seems more than probable that the present genre originated from ecstatic Sufi songs using cryptic expressions in Persian such as ‘tū dānī’ (‘thou knowest’) and Shī’a cries like ‘yā alī’ (‘O Ali’). *Ma’danu’l-mūsīqī* alludes to *tarānā* as an item performed before *khayāl* (rather than *ālāp*) by members of the Qavvāl community, although in current practice it is sung as a medium- or fast-tempo *khayāl* by classical singers. The word *tarānā* itself is merely Persian for ‘song’. *Tarānā* is one of the Hindustani genres that has been enthusiastically adopted in south India, where it is called *tillānā*. *Tillānā* compositions are used both in concerts and in dance recitals, as light items for the last portions of a programme.

(c) *Thumrī*.

The third main style of Hindustani classical music is embodied in the compositions called *thumrī*, developed in Lucknow in the 18th and 19th centuries, and later in Banāras (see also §IV, 1 below). The texts are extremely short and characterized by the *mādhurya bhāva* (‘sweet sentiment’) of erotic love. *Thumrī* has *sthāyī* and *antarā* divisions like *khayāl* but is rendered in a much more elaborately florid and perhaps rather sentimental manner. The main tempo is slow, but towards the end there is a section in a fast time cycle in which the singer repeats the first line indefinitely to keep the time while the *tablā* player plays virtuoso solo passages called *laggī*; the conclusion is again at the slow tempo. *Thumrī* has its own slow time cycles (see Tables 13 and 14) and its own rather small number of *rāgas*, which are found in *dhrupad* but hardly ever used in *khayāl*. The chief *thumrī* *rāgas* are Pīlū Khamāj, Kāfī, Jogiyā and, above all, Bhairavī. Whatever the *rāga*, phrases and elements from other *rāgas* are often mixed in (hence designations like *miśra* [‘mixed’] Khamāj and *miśra* Kāfī), sometimes to the extent that only the refrain belongs to the same *rāga* throughout. *Dādrā* compositions in the fast *dādrā* tāla also use *thumrī* *rāgas*.

Renditions of *thumrī* *rāgas* in *thumrī* style are now used as concluding items in most concert programmes, both instrumental and vocal. Furthermore, *bhajan* (popular devotional poetry) is now often sung in some of the very popular *thumrī* *rāgas* by musicians who like these *rāgas* but do not handle the *thumrī* style easily, or who prefer not to sing the somewhat erotic *thumrī* texts; this practice was begun by Vishnu Digambar Paluskar (1872–1931).

India, Subcontinent of, §III, 5: Theory and practice of classical music.,
Compositions, genres and performance of vocal music.

(iv) Genres and performance: Karnatak music.

Compositions play a much more central role in concerts of Karnatak music than they do in Hindustani music. The oldest south Indian compositions that probably retain some of their original musical settings are the *padam* compositions of Ksetrayya, used for the south Indian classical temple dance now called *bharata-nāṭyam*. They are devotional texts, mostly in the *mādhurya* ('erotic') mode, and sung in a rather slow tempo that gives the dancer ample time to illustrate and elaborate the text with the stylized gestures of *abhinaya*. A few Karnatak rāgas are considered too vigorous for *padam* – they are called *ghana* ('heavy') and are especially suitable for *tānam* improvisation (see §3(ii)(d) above) – but most of the well-known rāgas are used in *padam*. Some of the smaller and more melodious rāgas particularly good for *padam* are called *rakti* ('emotional') rāgas. *Jāvalī*, a small-scale and lightly erotic genre sung in rather fast tempos, also uses *rakti* rāgas.

In the mid-18th century probably the most important compositional form was the *varnam*, which unlike other genres has two completely independent sections. The opening *pallavi* is followed by a rhyming *anupallavi*, the two being related to one another as are the *sthāyī* and *antarā* of Hindustani music (see §(i) above). Following the *anupallavi* comes a passage sung first with its *svara* syllables and then with a *sāhitya* (text), followed by a return to the *pallavi*. Then a *caranam* (stanza) is sung; the *caranam* itself serves as a refrain for several passages of *svara-sāhitya* like that following the *anupallavi*, and the *varnam* concludes with the last return to the *caranam*. Uniquely in the *varnam*, there is never a final return to the opening section, the *pallavi*.

Varnam compositions are of two kinds; *pada varnam* is for dance and is the major item of a *bharata-nāṭyam* recital; *tāna varnam* is for singing (or playing), and the extra passages following the *anupallavi* and *caranam* are sung with *svara* syllables only. Traditionally a *varnam* is sung as the first item of every concert; otherwise, they are regarded as advanced study pieces, from which many important rāga configurations are learnt. The verbal texts of *tāna varnam* are short and floridly set; the individual *svara* in the pulsed melismas are sung in a distinctly emphatic and separated fashion unique to the *tāna varnam*.

The most important modern south Indian type of composition is the *kīrtanam*. A *kīrtanam* used as a concert piece and endowed with composed variations (*sangati*, *cittasvara*) is often called a *kṛiti*. In essence a *kīrtanam* is a simple devotional song for group singing, comprising a short refrain, the *pallavi*, sung by the whole group, and a number of stanzas, the *caranam*, for the leader or for individual members of the group. The *pallavi* is sung in a low register and the *caranam* in the upper register. *Kīrtanam* like this, including many composed and used by Tyāgarāja for his own devotions, are still sung as *bhajana* (devotional songs).

Even the simplest *kīrtanam*, however, usually have besides *pallavi* and multiple *caranam* an *anupallavi*, following and rhyming with the *pallavi*, set to a contrasting melody in the upper register. Many simple devotional *kīrtanam* have *anupallavi* and *caranam* in the same tune. In a more complex *kīrtanam* the full ABCB' structure of *kṛiti* and *dhrupad* is observed (see §(i) above). In the typical design of the small concert *kṛiti*, the *pallavi*

and *anupallavi* have one line each, while each *caranam* has two lines (sometimes four). A larger *kṛiti* normally has two lines in the *pallavi*, two lines in the *anupallavi* and four or more lines in the *caranam*; normally only one *caranam* is used for a large *kṛiti*.

Ex.8 above shows the basic melodies of the whole of Tyāgarāja's '*Gītārthamu*', a song of 2 + 2 + 4 lines (= tāla cycles) treated as a moderately substantial concert piece. As mentioned above, any individual line of a composition may be enlarged with a succession of memorized variations called *sangati*. Omitted from ex.8 are whole sets of *sangati* for the first half-line ('gītārthamu sangitānandamu' etc.), and for both lines of the *anupallavi*; only the returns to the *pallavi* are indicated, to show the overall shape and continuity in performance. As is common, the first two lines of the *caranam* revert to the register of the *pallavi*, but with a different melody focussing on the 5th scale degree, while the last two lines (from 'hari vara rūpudu') have the same tune as the *anupallavi*.

Also contributing to the expansion of many *kīrtanam* compositions into elaborate concert *kṛiti* is the use of a tempo slower than the brisk pace appropriate to a devotional group song. The slow tempo permits the stylish transformation of a square text rhythm into a gracefully varied and elegant musical rhythm. The underlying rhythmic unit of '*Gītārthamu*' at slow speed is represented in ex.8 as a quaver, making four beats to a minim count, eight counts in the time cycle. The long and short quantities in the text syllables can be regarded as doubled in value, the proportion being thought of as 4:2 rather than 2:1, which allows plenty of room for subtle rhythmic shifts of attack position. One sees that a value of 4 in a long syllable of the text can be replaced in the music by values of anything from 2 (in 'dzūda') to 6 (in 'sam'); the duration of the short syllables can be reckoned on the same scale as being either 2 or 1. Among the rhythmic niceties made possible by this process is the reduction of the two longs of 'gītā' and 'sītā' and the four shorts of 'hari-hara' and 'hari vara' to a series of hemiolas, by squeezing them from two counts into one and a half. The *etuppu* (the time-point of each line beginning) is thereby shifted forward to the third beat of the first count, which in turn means that the ending of each line is carried across the first count before the next line is begun. The increased momentum thus given to line repetitions and variations, to continuations and to returns to the opening, contributes greatly to the unity of the composition as well as to its surface effect.

Ex.7 above, the *pallavi* and *anupallavi* of a *kīrtanam* by Muttusvāmi Dīksitar, illustrates a rhythmic technique of a different kind, intrinsic to the basic structure of the composition rather than superimposed upon it. The musical rhythms are precisely based on the syllabic quantities of the text, but two tempos are used. The basic tempo is represented by 'budham āśrayāmi satatam', while 'sura-vinutam candra-tārā sutam' goes at twice the speed. In the *anupallavi* the passage 'madhura ... sampadam' is also at double time, called *madhyama-kāla* ('medium speed'). *Madhyama-kāla* conclusions to sections are a constant feature of Dīksitar's compositions, and in some cases very complex text-music devices are employed in their construction.

A programme of Karnatak music will normally comprise a sequence of compositions in different *rāgas* and different forms: mainly *kṛiti* or *kīrtanam*, with perhaps a *varnam* to begin and a *tillānā* or *bhajan* to end. The extent of improvised elaboration will vary, some compositions being rendered with no more variation than the fixed *sangati*. Usually one item, often a large *kṛiti*, is elaborately developed, beginning with an extended *ālāpanam*. Some improvised *niraval* and/or *svara-kalpana* may be included during the rendition of the composition, and more may follow. The variety of improvisation techniques used and the extent of elaboration applied is limited, however, by the perception that the music is at root devotional, and the expression of the words should be enhanced, not overshadowed, by purely musical development. Full scope for abstract musical development is allowed only in the genre *rāgam-tānam-pallavī*, which may be performed as the centrepiece of a recital if time permits.

The performance of *rāgam-tānam-pallavī*, or *pallavi* for short, developed at the 18th- and 19th-century courts, beginning with the mid-18th-century Thanjavur musician Pachimiliam Ādiyappayya. It was and is the supreme test of a musician's skill in improvisation. The composed element is reduced to a single short section, the *pallavi*; there are no *anupallavi* or *caranam* as in other forms. The *pallavi* itself has a special structure, comprising two phrases separated by a short rest; the first phrase is repeated to conclude the melody. Usually the *pallavi* incorporates a technical challenge. It may be composed in an unusual *rāga* or *tāla*, or the two phrases may move at different speeds against the *tāla*. Two examples of *pallavi* melody are given in [ex. 15](#). The first is composed in an otherwise unknown *tāla* comprising successively shorter *anga*; in the second, set to *miśra* Cāpu *tāla*, the pattern of the *tāla* is presented in the first phrase at double speed, resulting in a highly syncopated rhythm. Such melodies were invented and proffered as challenges to court musicians by their patrons or rivals. The challenge was not only to repeat the *pallavi* immediately but also then to perform a complete *rāgam-tānam-pallavī* improvisation on it, lasting perhaps an hour (Catlin, 1985).

The elaboration of a *pallavi* begins with an extended unmetred *ālāpanam*, called *rāgam* in this context, in which the motivic material of the *rāga* is developed in all registers (see §3(ii)(d) above). When the soloist has completed this development, the violin accompanist is usually given an opportunity to play an *ālāpanam* independently. Then follows the *tānam*, where, as in the medium-tempo *ālāp* of *dhrupad* or the *jur* of a *sitār* solo, the *rāga* is unfolded against a steady but unmetred pulse (often articulated as a lightly pulsed drone by the violin). The *pallavi* melody is then introduced, and the percussion accompanist(s) (playing the barrel-drum *mrdangam* and optional instruments such as the pot drum *ghatam*) participate from this point on. Extended and elaborate *niraval* and *svarakalpana* improvisations, by the soloist and the violin accompanist alternately, may also include the augmentation-diminution procedures known as *anuloma* and *pratiloma*, where the *tāla* is kept constant, and the

composition is sung at faster or slower speeds (cf the *lay-bat* of *dhrupad*), or the composition is sung at a constant tempo and the *tāla* clapped at different speeds against it. A sequence of three or more progressive augmentations or diminutions may be termed *trikāla* ('three time-reckonings'). Other variation procedures include a *korappu*, dialogue between the soloist and accompanists, in which the latter imitate immediately each phrase improvised by the former; and *korvai*, a pre-composed episode of complex rhythm played by all performers in unison. The performance ends with a final reprise of the *pallavi*, but this is normally preceded by *tāni āvartanam*, an extended percussion solo (or dialogue if there is more than one percussionist) in a number of episodes leading to a climax. The soloist must keep time for the percussionists by showing the *tāla* with the hand and must reintroduce the *pallavi* melody at exactly the right moment. Thus the underlying principle of *pratigrahanikā*-type improvisation, the return to the composition after improvised episodes, here becomes the final challenge of the *pallavi* performance.

India, Subcontinent of, §III: Theory and practice of classical music.

6. Instrumental traditions.

South Asian instruments are classically arranged into four groups: *tata* ('stretched') are chordophones; *susira* ('tubular') are aerophones; *avanaddha* ('covered') are membranophones; and *ghana* ('solid') are idiophones. This section discusses the instrumental repertoires of Hindustani and Karnatak music; organological information is found under each instrument's individual entry. It should be noted that many of the instruments below are also used in local, devotional and popular traditions.

(i) Chordophones.

(ii) Aerophones.

(iii) Membranophones.

(iv) Idiophones.

(v) Ensembles.

India, Subcontinent of, §III, 6: Theory and practice of classical music., Instrumental traditions.

(i) Chordophones.

The general term for a chordophone in Sanskrit music literature has been *vīnā* (see *Vīnā*, §§1–2). Today this term designates the Karnatak *vīnā* (a plucked, fretted lute sometimes called *Sarasvatī-vīnā*), while *bīn* refers to the Hindustani *vīnā* (a plucked, fretted stick zither) associated with the *dhrupad* tradition (Table 15). Both of these instruments have a fretless counterpart, the *gottuvādyam* and *vicitrā vīnā* respectively, the string being stopped with a sliding block. The plucked lutes of Hindustani music are the fretted *sītār* (and its larger counterpart, the *sūrbahār*), the fretless *sarod* (and its forerunner the *rabāb*) and the drone lute *tambūrā* (also used in Karnatak music).

Bowed lutes in south Asia, the fretless *sārangī* and violin and (uncommonly) the fretted *dīlrubā* and *esrāj*, were traditionally accompanying instruments. The violin was predominant in the south and the *sārangī* in the north; both now appear on concert platforms as solo instruments. The *santūr*, a struck box zither, was until recently restricted to the *sūfiāna mūsīqī* of Kashmir but is now being used to perform Hindustani

music. Hindustani and Karnatak musicians have also adopted instruments originating from outside south Asia. In addition to the violin mentioned above, there are notable performers on the guitar and the mandolin.

(a) Vīnā and bīn.

A south Indian *vīnā* performance consists of several discrete musical items varying in duration from five minutes to an hour or more. Each musical item starts with *ālāpana*, during which no *tāla* operates and there is no percussion accompaniment; the *tāla* strings are struck for occasional timbral contrast with the melody strings. In longer musical items, *ālāpana* is followed by *tāna*, in which rhythmic patterns are built up by alternating strokes on the *tāla* and melody strings. In the compositions and subsequent improvisations that follow *tāna*, a *tāla* operates and the *mrdangam* (barrel drum) provides a percussion accompaniment. In this context, the *tāla* strings are struck to mark the main beats of the *tāla* only (for example in *Ādi tāla* – comprising 8 beats – they are struck on 1, 5 and 7). In the Mysore *vīnā* tradition this is strictly adhered to, though elsewhere, because of the influence of Hindustani *sītār* technique, innovators may tend to mark every beat of the *tāla*.

The bulk of the repertory comprises *Kṛitī*. The right-hand strokes (on the melody strings) of the *vīnā* represent the consonants of the song text. When a *kṛitī* is performed, lines of the song text are repeated (from four to 16 or more times) with progressive melodic development. Two consistent features of such development are the gradual increase in rhythmic density and the extension of the range of pitch movement, which build up excitement and tension in the listener. On the *vīnā*, this involves the left arm moving faster and farther up and down the neck. Towards the end of such developments the tension is released by alternating this material with a contrasting line of melody/song text, followed by a return to the first rendering of the original line. Spontaneous improvisation may occur within this, and wholly improvised items of repertory (*pallavi*) follow the same cyclical form.

The northern *vīnā*, or *bīn* (fig.8), is played by performers of *Dhrupad*, particularly in *ālāp*. Many of the techniques of portamento and the use of the *cikāri* (punctuating) strings used in the performance of *ālāp*, *jor* and *jhālā* (see below) originated in *bīn* technique. The *bīn* is also played in metric compositions with the *pakhāvaj* (barrel drum), but the subordination of instrumental to vocal style has resulted in an absence of distinctively instrumental compositional styles.

(b) Sītār and sarod.

The two main classical *Sītār* repertoires, or *bāj*, comprising styles of metric composition (*gāt*) and associated performing practices, were established during the 18th century. The Delhi *bāj* is based on a style attributed to *Masit Khan* of the 18th century Mughal capital. His descendants later moved to Rajasthani courts, and the style is also called ‘western’ (*pachāo*, *pachva*), or *masītkhānī*. The *masītkhānī* performing style was *dhrupad* - influenced, with *rabāb* - and *bīn* - derived *ālāp* (introductory section), *jor*, *thak* and *jhālā* metric variational practices, including melodic or rhythmic transformation of the *gat* (*sīdhī-ārī*) and augmentation-diminution (*thā-dūn*), similar to *dhrupad bāt* (the *tablā thekā* for slow *tīntāl* in 19th-century Bengali sources is markedly like that of the *pakhāvaj*).

The ‘eastern’ (*pūrab*) or *razākhānī bāj* is attributed to *Ghulam Raza Khan* of Lucknow. The *razākhānī* style is probably closer to the *sītār tanbūr* than the *dhrupad* tradition: the ‘light’ *rāgas* that form part of it (such as *Kāfi*, *Pīlū*,

Khamāj and Bhairavī) are melodically similar to Central Asian tunes. Performing practice included augmentation-diminution (*thā-dūn*), cross-string plucking (*cher*) and short stretches of melodic passage work (*khucrā tān* or *upaj*) derived from *khayāl* song and often improvised.

The terms *masītkhānī* and *razākhānī*, applied to *gat*, denote skeletal rhythmic plucking structures (slow and fast respectively) rather than specific melodic compositions by Masit Khan and Raza Khan. The most common *razākhānī* type begins on the 7th beat; some such compositions predate Raza Khan and are attributed in tradition (especially those in *rāga Kāfī*) to Amir Khusrau and may relate to *sūfiāna rang*. They were extended by 18th-century *sītār* players such as the brothers Lād Khān and Pyār Khān. There is a greater underlying similarity in the plucking rhythm of the first lines of the two *gat* types than is apparent today, when the tempo difference may be 8:1 or more; traditional *sītār* players, however, still refer to the two as *dhīmā* ('moderate') and *dūnī* ('double'). Older *gat* from this period are often in two lines, corresponding to the *sthāyī* and *mañjhā*, not *sthāyī* and *antarā*, of the modern style. The *mañjhā* line is created in *masītkhānī gat* by triple repetition of the first sub-bar, comparable to the *gat-dohrā* ('theme and doubling') of Delhi *tablā*; the *antarā* is probably a later development influenced by vocal forms and created here by rhythmic imitation of the first two lines into the upper octave. *Razākhānī gat* shows more variety. The emerging classical *gat* repertory of the 18th century represents different stylizations of common material. This shows some affinity with the instrumental 'teahouse' music of north Afghanistan and Central Asia.

Table 16 represents the forms played in the modern *sītār* repertory. It displays the two movements (*ālāp* and *gat-torā*), principal sections (*ālāp*, slow and fast *gat*) and subordinate sections (*jor* and *jhālā*). Some optional procedures are grouped beneath each section. Full performances include all sections (1–6); shorter ones omit some (especially 2, 3 and 6). The introductory *ālāp* sometimes occurs alone, but normally elements of both *ālāp* and *gat-torā* are included; the order of sections is always maintained. Change to a related *rāga* sometimes occurs, while *rāga-mālā* ('garland of *rāgas*') with extemporized changes of mode is quite popular. A *prastārikā* ('medley') of *gat* in several *tāla* is now rare. The usual term for the complete performance is *rāg*, though the term *gat* was formerly used in this sense.

The first section (*ālāp*) is devoted to the exposition of the mode through various techniques primarily derived from vocal music, above all portamento (*miir*), which is achieved through string deflection. *Ālāp* is without metre (*tāla*) or drum accompaniment and is always *molto cantando*. *Āocār ālāp* (1(a); *uccār*: ‘pronouncement’) is a brief announcement of the rāga through a few characteristic phrases, such as the *pakar* (Hindi: ‘catch’), and may lead directly to *gat* (4 or 5). Phrasal *ālāp* of various kinds (1(c); Hindi *bandhān*: ‘bound’; Urdu *qāid*: ‘strict’) comprises more extended development of such phrases centring on strong tones of the mode – the tonic (*sa*), melodic centre (*vādī*), secondary centre (*samvādī*) and often also the 5th (*pa*) or 4th (*ma*) degree of the scale. In 1(b), *vistār* or *bistār* (‘extended’) *ālāp*, these features of the rāga are elaborated in slow, rigorous developments through low, middle and upper octaves. In the middle octave, each note is introduced in turn in ascending scale order, and the development of each note is concluded by a rhythmic cadence (*muhrā*: ‘coming forward’). This form reflects the *bīn–sūrbahār* repertoires; a generation ago a *sitāriyā* (*sitār* player) could play *vistār* of a rāga on the *sūrbahār* and then its *gat-torā* on the *sitār* tuned a 4th or a 5th higher. *Ālāp*-type development may also occur in *gat* sections (4, 5). In slow *gat* (4), *vistār*-type extension called *barhat* (‘increase’) or *ālāpī* is performed in free tempo against slow *tablā* metre. This feature is again relatively modern and derived from *khayāl*; in both *khayāl* and *sitār* performance it would follow an introductory *āocār ālāp*. Short phrasal *ālāp* occurring in *gat* sections is *bahlāvā* (‘divertissement’).

In *gor* (2; ‘joining’) and *jhālā* (3), there are various combinations of techniques that may derive partly from vocal *nom-tom ālāp* (which may itself derive from instruments), developing rāga through pulse and tempo. Rhythmic groupings are set up through tonal patterns and play made with departure and return to the beat; later stages concentrate on intensified patterns – *larī* and complex cross-rhythmic *bol* and *thonk* (‘hammering’).

Jhālā (‘a shower’), which cannot be earlier than mid-19th century on the *sitār* (when the *cikāri* strings were added), contrasts accelerated patterns

on the melody strings and the *cikāri*, with accent either on the latter (*ulat*: ‘reversed’) at the end of *ālāp* (3) or on the former (*sulat*: ‘straightforward’) to conclude fast *gat* (6; some sources reverse these terms). The *ulat* with added complex *bol* is *thonk jhālā*. A former technique derived from *sarod* and *rabāb*, *jhārā* (also ‘shower’) played patterns similar to *jhālā*, but all on the main string. The *sitār* and *bīn* equivalent of the time was *cher* (‘excitation’), which contrasted melody string notes with fast patterns on open or fretted drones.

The metric *gat* compositions (4, 5) remain the heart of *sitār* repertory as models for the student and the nucleus of performing practice. In the mid-19th century these were quite separate traditions; in standard modern performing practice, both types of *gat* follow in succession. Tīntāl (a 16-beat rhythmic cycle) is the base for both *bāj*. In the 19th century, 12-beat Ektāl was the other main tāla for *sitār* (being symmetrical it was also good for *thā-dūn*; see below); today, *gat* in many tāla have been developed, notably by *sitār* players of the Allaudin Khan school.

There are many types of improvisational practice that occur as *torā* (‘breaks’) in *gat* playing. In *gat-vistār*, for example, the plucking pattern of the *masītkhānī gat* is kept up by the right hand, while the left hand moves elsewhere to provide different melodic elaborations. The older truly variational ones (*sīdhī-ārī*, *thā-dūn*) are less common today, but *āmad* (variation of the cadence) is still important. *Chand*, *boltān* and *tārparan* stress right-hand plucking and are similar to *jor-jhālā* techniques. *Tān*, mainly melodic bravura passages, have seen a great development following that of *khayāl*. Very rapid right-hand plucking has always been a feature of *sitār* playing, but with the left hand moving much more slowly, so that many small sets of repeated notes are heard. Concert virtuosos now often move the left hand as fast as the right. Cross-rhythmic work (*ārā-kuārī*: ‘cross-crooked’) and the triple rhythmic cadence (*tihāī*, *tīyā*) serving as a closing cue probably derive from drums and dance (*kathak*). Modern *savāl-javāb* (‘question-answer’) is antiphonal phrasing from *sitār* to *tablā*, leading to a climactic *sāth-sangat* (‘simultaneous [improvised] accompaniment’); more traditionally this denotes thematic imitation of *sitār* and *tablā* ‘breaks’.

As with the *sitār*, the historical centre of the **Sarod** repertory is composed of *gat* with variational and extensional ‘breaks’ (*torā*), primarily in Tīntāl. Medium-tempo *gat* were common in the traditional repertory, but today the *sarod* also plays slow *masītkhānī* and fast *razākhānī gat* types, like the *sitār*, and also in various tālas. Much of its performing practice is the same as that of the *sitār*, though the nomenclature may vary, and the *sarod* now performs the full form of *ālāp*, *jor*, slow *gat*, fast *gat* and *jhālā*. The *jor* and *jhālā* repertory in particular owes much to the *rabāb-sarod* tradition. Although in the past the number of *sarod gharānā* was small, the instrument now enjoys great popularity.

(c) **Sārangī and violin.**

The **Sārangī** is traditionally used to accompany vocal music (essentially imitating what the singer has just sung), especially *khayāl* and *thumrī* (see §5(iii) above), and to play the time-keeping melody for *tablā* solos and *kathak* dance. The *sārangī* is also used, though less frequently, as a solo

instrument. In this case the central repertory may be described as 'instrumental *Khayāl*': *ālāp* followed by slow then fast compositions. The most famous player of modern times, [Ram Narayan](#), has incorporated elements from the *dhrupad* vocal tradition and has developed his own individual playing style. He is also the only outstanding player to restrict his performances to solos. Other great exponents of recent times, among them [Bundu Khan](#) and Gopal Misra, continued the tradition of accompanying vocal music, in addition to giving solo recitals.

The European violin was introduced into south Indian music in about 1800. Balasvāmi Dīksitar (Muttusvāmi's youngest brother) and the Thanjavur musician Vadivelu who settled in Trivandrum were its first exponents. By the end of the 19th century it had become the standard accompanying instrument for concerts of Karnatak music, and it is now also widely used as a solo instrument. It is tuned in 4ths and 5ths (or 5ths and 4ths) sounding *sa* and *pa*. The original fingering was a two-finger technique modelled on the *vīṇā*, sliding up with the middle finger and down with the index finger. Many aspects of European technique have been adopted and refashioned to the purposes of Karnatak music. No general vibrato is used, but the instrument lends itself admirably to the *gamaka* of the south Indian style. It is held with the body against the upper chest and the scroll wedged firmly against the ankle, fully stabilized so that the left hand is free to slide along the fingerboard. The violin is now also used as a solo instrument in Hindustani music.

[India, Subcontinent of, §III, 6: Theory and practice of classical music., Instrumental traditions.](#)

(ii) Aerophones.

Aerophones have played special and limited roles in South Asian music. The flute (*vamśa*) is one of only two instruments for which *rāgas* are listed in the *Sangīta-ratnākara*; it was also an important instrument in the ancient theatre orchestra. It did not play any role in classical music of modern times until the 20th century, during which time it became a concert instrument for both Karnatak (*venu*, Tamil *pullānkulal*) and Hindustani music (*basrī*, *basurī*). In Karnatak music flautists play the standard vocal repertory, and the flute is now heard in the *cinna melam* that accompanies *bharata-nāṭyam*. In Hindustani music flautists play in an 'instrumental *khayāl*' style: *ālāp*, followed by slow *khayāl* accompanied by *thekā* on *tablā*, then fast *khayāl* with *tān*.

The south Indian double-reed [Nāgasvaram](#), the sound of which is valued as auspicious, is the leading instrument in the temple *periyā melam*, with the *tavil* and the drone oboe *ottu*; it also appears on the concert stage. Part of the repertory of the *nāgasvaram* is derived from the Karnatak tradition, largely vocal compositions. Additionally a body of instrumental compositions without any text (*mallārī*) is performed solely on the *nāgasvaram*. A composition in slow tempo is varied through performance at double, quadruple and octuple tempos. Different tempos may be mixed together, and a composition may be performed in triplet patterns as well.

The [Śahnāī](#) is the double-reed instrument of north India. It is linked with the *naubat* ensemble and is played in many different contexts: on the concert stage, at mausoleums, mosques and in temple compounds. Like the

basurī, the *śahnāī* follows the pattern of *khayāl* performances when played on the concert platform (see also §(v) below).

India, Subcontinent of, §III, 6: Theory and practice of classical music., Instrumental traditions.

(iii) Membranophones.

The major barrel drums of South Asian classical traditions are the south Indian *Mrdangam* and *tavil* and the north Indian *pakhāvaj*; the *tablā* is a pair of asymmetrical kettledrums; and the south Indian *Kaṅjīrā* is a frame drum (fig.9). The *mrdangam*, *pakhāvaj* and *tablā* are discussed below. The *tavil* accompanies the *nāgasvaram* in the *periyā melam*, both within the temple precinct and in processions. The *tavil* accompaniment is distinctive, often playing short solos during the unmetred *ālāpana* (perhaps to give a rest to the *nāgasvaram* players); the drum also accompanies classical song-based metred compositions. The *kaṅjīrā* is often used to accompany Karnatak vocal music, along with the *mrdangam* and *ghatam* (percussion vessel).

(a) *Mrdangam* and *pakhāvaj*.

(b) *Tablā*.

India, Subcontinent of, §III, 6(iii): Theory and practice of classical music., Instrumental traditions., ii) Membranophones.

(a) *Mrdangam* and *pakhāvaj*.

As with the *vīnā*, the name *mrdanga(m)* refers to both a northern (also known as *pakhāvaj*) and southern Indian instrument. Both can be traced back to the *mardala*, a barrel drum whose technique is discussed in depth in the medieval *Sangīta-ratnākara* (13th century). The *mardala* patterns are still very much in evidence in the modern *mrdanga(m)* traditions.

There were and are two different kinds of drum strokes and patterns: a primordial set of four and a certain number used for filling in between them. The *Sangīta-ratnākara* gives *ta dhi thom tem* for the primal set, called *śrama-vāhanī* ('carrying the burden'); this is still the basis for the first sequence learnt in both Hindustani and Karnatak *mrdangam* traditions. It also gives the sequence in repeating pairs, triplets and quadruplets – *ta-ta dhi-dhi ... ta-ta-ta dhi-dhi-dhi ...* etc. – as they are still given in the first lessons. The last syllable now is usually *nam* (another of seven basic *mardala* strokes in the *Sangīta-ratnākara*) but may also be *jhem* or *jhom* in the Karnatak traditions.

The second class of strokes in the *Sangīta-ratnākara* is called *eka-sara-tākanī* ('single-flowing-*tākanī*'), exemplified by combinations of *taka* and *dhikata* said to amount to eight, which are meant to 'break' the sequences of *ta dhi thom tem* and provide a 'flow' of drumming. Many examples of the elaboration of the *ta dhi tom nam* succession by means of secondary 'flowing' formulae combined with repetition and recurrence of the four main strokes are given in the 14th-century *Sangītopanīsat-sāroddhāra* (Sudhākalaśa). Very interesting historically is the association of each variant with a *tāla*, as though for a *thekā* of Hindustani music. Although they are mostly not absolutely identical with existing traditional patterns, some of these patterns are very close, and all are playable. The first quoted below is for *Ādī tāla*: 'tad dhi thau draim'. Others are 'tat-taki/tat-

ta/dhi-dhik-ki/dhid-dhi'; 'tat-ta/dhid-dhi/thau-thau/dhi draim'; 'karagada naragada/tad-dhi-dhik kada-daragada dhid-dhi kat-thau/dhik-kat-thau draim'.

A longer specimen of *ta dhi thau draim* plus the filler formula *daragada*, unconnected with a specific *tāla*, is given in the chapter on instruments, as an instance of combination for the *mardala*: 'tak-kada daragada/dhik-kada daragada tā-dhik-kada/dā-dhik-kada/daragada dhid-dhik-kada/tā-tak-kada/daragada tak-kada/dā-dhik-kada/daragada dhik-kada daragada daragada tā dhit thau draim'.

Comparing these patterns with the first lessons in south Indian *mrdangam* traditions shows the continuity in the principle of combining the main strokes with filler patterns (*jāti*), e.g. *tā–kitataka dhī–kitataka tom–kitataka nam–kitataka/tā tā kita dhī dhī kita tom tom kita nam nam kita*. Other and longer formulae of filler syllables are combined with *kitataka*, such as *tarikita, takadina, takadimi, janutaka* and so on: *tak-kita kitataka takatarikitataka/dhik-kita kitataka takatarikitataka* etc. Other single strokes or short groups can take the places of *ta dhi tom nam*: *tak-kum kitataka ... talāngutom kitataka ...* and so on.

South Indian mrdangam. In their early training, modern students of the south Indian *mrdangam* learn to play different *jātis* in relation to different *tālas*. There are no fixed relationships between particular *jātis* and particular *tālas*. The player's rhythmic sense and motor skills are developed through increasingly varied and complex relations between the two: *jātis* comprising odd numbers of strokes played in *tālas* comprising even numbers of beats, and vice versa; doubling, halving and trebling the tempos of the *jātis* while the *tāla* remains constant; and starting the *jātis* on different beats of the *tāla*.

Playing in terms of improvising *jātis* in relation to a fixed *tāla* is called *konugolu*. This is contrasted with the *tathākāra* approach used when accompanying melody instruments. South Indian *mrdangam* players do not keep time in the same way as *tablā* players do (see §(b) below) but supply a rhythmic counterpoint to the repeated pattern of accents provided by the melody instrument or voice, along with rolls and flourishes.

During the *kalpana svara* passages that follow improvised *pallavi* (and may follow fixed compositions, called *kṛitī*), the melody instrument improvises increasingly long and rhythmically complex sequences, each terminating on the same strong accent of a refrain passage. In *kalpana svara* the melody instrument usually 'challenges' the *mrdangam* player to repeat immediately the complex rhythmic sequence just played. During such 'contests', the *mrdangam* player may occasionally replicate a melodic sequence by skilful left-hand strokes.

The solo performance recital traditionally occupies anything from 15 minutes to an hour or more towards the end of a concert, following the main *rāga* of the concert. This is the longest item, comprising *rāga, tānam, pallavi* improvisation (or, increasingly nowadays, a *kṛitī*) and improvised *kalpana svara*. These last two sections are set to a single *tāla* of fixed tempo. Immediately after *kalpana svara* the *mrdangam* continues alone into the solo recital, improvising with as many different *jātis* and *jāti*

sequences as possible within the framework of the fixed tāla. The player does not mark the strong beats of the tāla with regular drumstrokes; throughout the *mrdangam* solo the principal performer of the ensemble marks the strong beats with movements of the right hand. In this way the complex and varying relationships between the rhythmic accents of the *jāti* sequences and the strong beats of the tāla are made accessible to the spectators. Towards the end of the solo the rhythmic density increases to herald the approach of the climax, which lasts for a minute or two and in which relationships between rhythm and metre display maximum complexity and variability. The solo concludes with three repeats of a pre-arranged terminal *jāti*, which concludes precisely on the starting note of the *pallavi* refrain played once by the whole ensemble to terminate the musical item.

Of the tālas used, Ādī (4+2+2) is the most common. However, other tālas such as Rūpaka (2+4), Triputa (3+2+2), Eka (4), Khanda chāpu (2+3) and Miśra chāpu (3+4) are frequently heard, and many popular compositions are set to these tālas. Occasionally, compositions in Dhruva (4+2+4+4), Mathya (4+2+4), Jhampa (7+1+2) and Ata (5+5+2+2) are found, usually in the context of improvised *pallavi*. Ādī tāla has three tempos, arrived at by doubling and quadrupling the number of beats in the measure. The other tālas have a single tempo (although this is variable within limits). Rūpaka, Triputa and Khanda chāpu are fast tempo tālas; Eka and Miśra chāpu are medium tempo; and Dhruva, Mathya, Jhampa and Ata are slow. The slow tempo tālas are associated with older compositions. *Mrdangam* players often experiment with theoretically derived tālas, but these rarely result in public performances.

Pakhāvaj. The vocal and instrumental forms of *dhrupad*, accompanied by *pakhāvaj*, are rhythmically organized in tāla. The drum is silent during the *ālāp*; with the commencement of the vocal or instrumental composition the drum begins to play. The general style of *pakhāvaj* accompaniment is characterized as 'simultaneous-variational' (*sāth sangat*), which distinguishes it from the alternating variation of the *tablā* in the newer Indo-Muslim style.

The *dhrupad* tāla system has been characterized as additive, in that the common metres are made up mostly of sub-bars of different lengths, thus: Cautāl (Cārtāl, Dhruvadtāl), 12 beats (4+4+2+2); Sūltāl, 10 beats (4+2+4); Tīvrātāl, 7 beats (3+2+2); Dhamār, 14 beats (5+2+3+4); Ārā ('crooked') Cautāl, 14 beats (2+4+4+4). The tāla itself has the function of a time signature, a conceptual framework between the musicians. The *pakhāvaj*, unlike the *tablā*, does not make much use of a base-rhythm pattern in performance, though it does have illustrative patterns. These are sometimes called *thapiyā* ('mark, signature'), or *thekā* ('support'), following the *tablā* terminology.

The most important aspect of *pakhāvaj* (as of the vocal) variations is tempo manipulation, for which the general term is *bat* ('division'). In general, these 'mask' rather than 'mark' the tāla structure, driving at their conclusion towards the main, first beat of the metre (*sam*) to coincide with the singer. The structure of a typical *pakhāvaj dhrupad* accompaniment may be discussed principally in terms of tempo (*laya*): in the first verse (*sthāyī*) the

drum plays *tukrā prastār* or *peškār* variations in base-tempo, usually medium; in the second (*antarā*) it plays double-tempo *prastār* and *tukrā*; in *sañcāri* it plays triple- and in *ābhog*, quadruple-tempo variations; in subsequent returns to the *sthāyī*, more complex tempos develop (five or seven against four, for example). This format applies to solo playing, but more adventurous tempos (three-quarters, one-and-a-quarter etc.) also occur. Sharma talks of 32 tempo patterns in all. The doubling of tempo within a piece is called *dupallī* ('two-fold'), and successive doublings *tīnpallī*, *caupallī* etc.

Within this are several different types of variational structure organized by tone-colour, repetition and recurrence, and so on. *Tukrā* ('piece') is a short variation from a few beats to two or three cycles in length, usually with varying strokes and rhythms, and with or without a closing *tihāī* or triple cadential formula. The term *paran* (for *pūran*: 'filler'; though it has also a more general connotation) is usually reserved for longer structures with manipulation of strokes (*bol*), tempo and timbre. This often takes the form of theme and *tihāī*, the latter usually a compound one (*cakradār*: 'three times three'). An additional and important principle of variation is that of additive extension (*prastār*), where a particular *bol* -phrase is taken (*ghinanaka* is a favourite one for this) and increasingly varied and complex *bol* are added before it (e.g. *dhā-kita ghinanaka*, *dhumakita ghinanaka*, *dhā-kita dhumakita ghinanaka ghinanaka*, *dhā-kita dhumakita takadhuma ghinanaka*). A piece that further emphasizes the permutation of *bol* (as in *dhumakita takadhuma* above) is called *peškār* (this has more in common with the *qāidā* than the *peškār* of the *tablā*). The *relā* ('torrent') of the *pakhāvaj* may derive from imitation of the *tārparan* and *jhālā* patterns of such string instruments as the *bīn* and *rabāb* (which the *pakhāvaj* used to accompany) and are fast streams of predominantly closed, rolling *bol*, given in quadruple groupings which are mostly in 12-beat *Cautāl* and 16-beat *Tritāl* (the favourite instrumental *tālas*). The *parār* is a longer *relā* (around six cycles in length) with a closing *tihāī*. Patterns in one *tāla* may here be fitted into another. The *pakhāvaj* also plays with the *kathak* dance, where in addition to the rhythmic procedures sketched above, its *bol* can include lexical words or syllables; this occurs also in religious formulae (*stuti*), where the *bol* corresponds prosodically to, and also symbolizes, the words of the text.

India, Subcontinent of, §III, 6(iii): Theory and practice of classical music., Instrumental traditions., ii) Membranophones.

(b) *Tablā*.

The *Tablā* has a rich and diverse repertory. They are used to accompany *kathak* dance, 'big' and 'small' *khayāl* and *tarānā* (see §5(iii)(b) above), 'light' song forms such as *tappā*, *dādrā* and *ghazal* (see §IV below), and the instrumental *gat torā*; they are also used to perform solo compositions. A *tablā* composition is bound by the number of *mātrā* ('measure', 'count') of the particular *tāla* in which it is performed, the tempo (*laya*) and the individual peculiarities of the compositional type. Some are cyclical (e.g. *qāida*), reflecting the cyclical nature of *tāla* structure and its mechanisms, such as the *bhārā* ('heavy') and *khālī* ('empty') portions of the time-cycle, which are marked by voiced and unvoiced syllables respectively; others, though metrically governed by the *tāla*, do not necessarily adhere to its

internal principles. Most *thekā* (see below) adhere to the internal structure of their respective *tālas*, such as *vibhāg* ('breakdown', i.e. division) and its *tālī* ('clapped') and *khālī* ('empty') adjuncts. Compositions such as *tukrā* ('piece') ignore these, exploring other metrical intricacies such as the *tihāī* (triple cadential formula). Most compositions eventually return to the *thekā* by means of a *tihāī*, with the last syllable on the *sam* (the first beat of a given time-cycle) of the ensuing cycle. The *thekā* establishes the *laya* and marks the *āvarta* ('cycle') by referring to the *sam* and the *vibhāg* marked by *tālī* and *khālī*. A function of *thekā* is to accompany instruments and/or the voice, compositions being introduced when the soloist takes a rest from improvisation. The *tablā* may also be performed solo (*lahrā*: 'tune'), usually to the accompaniment of an instrument such as the *sārangī*, playing a circular tune (*naghma*) and marking time. The choosing of a composition is governed by the type of performance and the music being accompanied, together with the tempo in which it is being performed. Compositions may be said to fall into two distinct categories: those that are fixed (e.g. *tukrā*; see below) and those that are variable, such as the *qā'ida*.

The *qā'ida* ('formula') has a fixed cell composition establishing a set of syllables (*bol*) used as a basis for variations through permutations of the phrases. A variation (*paltā*) may not use syllables other than those contained within the main cell composition. The permutations are not so much of individual syllables as of phrases. There are two distinct approaches to the *qā'ida*: the Delhi *gharānā* and the *pūrab* ('eastern', e.g. Lucknow, Varanasi). The *qā'ida* is a special feature of the *tablā* and is said to have originated in the Delhi style (*bāj*). It follows the principles of *tablā* - orientated *thekā* such as *Tīntāl* (16 *mātrā*) and *Jhaptāl* (10 *mātrā*), both of which are divisible into two equal halves, the first *bhārī* and the second *khālī*. Both these *tālas*, as with other *tablā* *tālas*, have the characteristic *tālī*, *tālī*, *khālī*, *tālī* breakdown. The *qā'ida* follows a similar pattern with the first two *tālī* forming the *bhārī* and the second half, *khālī* and *tālī*, collectively representing the *khālī*. Even where there is an asymmetrical *tāla* such as *Rūpak* (which has seven *mātrā*, divided into *khālī* (3), *tālī* (2), *tālī* (2)) a similar process is used by multiplying the original composition by two or four, and so evening out any odd numbers of pulses. The *khālī* and *tālī* of *Rūpak* are not reflected on the expounding of the *qā'ida*, which adheres to its symmetrical form. The Delhi *qā'ida* reflect the *vibhāg* more clearly than do some of the *pūrab qā'ida*, which tend to be more convoluted and intricate. A characteristic of the Delhi *bāj* is the *dohrā* ('doubling'), which gives the first half of the main *qā'ida* in its *bhārī* form, twice, and then the main *qā'ida* with its second half tailing into *khālī* by becoming unvoiced. The first half is then repeated twice in its unvoiced form, followed by the main *qā'ida*, both halves played voiced. The *dohrā* thus suggests four parts, equivalent to *tālī*, *tālī*, *khālī* and *tālī*. The *paltā* ('permutations') are introduced in a similar format, substituting the first quarter of the *dohrā*, and are repeated in the third section as *khālī* by being unvoiced. The *qā'ida* is thus performed in duple tempo to the original established by the main composition, which in turn is dictated by the tempo provided by the *thekā*. The *qā'ida* returns to the *thekā* by means of a *tihāī*. *Qā'ida* are played in all three basic tempos: *vilambīt-laya* ('slow tempo'), *madhya-laya* ('medium tempo') and *drut* ('fast tempo'). 'Light' (*laggī*) *qā'ida*, with lighter syllabic patterns, are used in accompanying 'semi/light-classical' forms such as *thumri*, as well as in traditional and film tunes and songs.

Other types of variable composition are similarly expanded by means of *paltā*. The *relā* ('rushing') is a *qā'ida*-type composition having a main *bol* from which the *dohrā* and *paltā* are derived, eventually returning to *thekā* by means of a *tihāī*. It is played at a fast tempo, producing a rapid overall rolling effect by employing suitable phraseology (e.g. *terekete* and *dhere dhere* as in the *relā*: '(dhā terekite dhere dhere dhere ghire naghe) × 2; dhā terekite dhā terekite dhā terekite dhere dhere dhere ghire naghe' (Tīntāl)). The *peškār* ('introduction') and the *uthān* ('arising') also expand by means of the *paltā*. In some *pūrab gharānā* (e.g. Farukhabad) the *peškār*, as practised by Delhi, is known as the *uthān*. The *peškār* is seen as a composition with a marked gait, being expanded through similar principles to the *qā'ida*. The *uthān*, on the other hand, is developed through less rigid principles, leaving room for comparatively free improvisations within certain conventions laid out by root compositions. Both these compositions are played in *vilambīt-laya* and are normally used to introduce solo or accompanying performance.

The *qā'ida* expansion principles are also evident in other compositions, such as the *calan* ('movement') and the *gat* ('measure', 'tune'). There are many forms of *gat*, some resembling the *qā'ida* while others, because of the nature of their intricacies, are expanded only by using pre-composed variations. An example of this second type is the *mañjhadhār gat* ('holding the centre'), in which the normal duple pulse is found in the centre of the composition. Most *mañjhadhār gat* are given variations only in forming *tihāī* and/or *cakradār* ('forming circles'), a triple cadential formula often thought of as a composition in itself. *Gat*, therefore, may be divided into two categories: those that are variable, such as *gat qā'ida*, and those that are set.

The most important of the set compositions is the *tukrā* ('piece'), a fixed composition ending in a *tihāī*. Another form of *tukrā* is the *paran* borrowed from the *pakhāvaj*. The *paran* of the *tablā* is similar to the *tukrā* but dominated by *pakhāvaj* stroke-syllabic structures. These compositions are performed usually in *drut* (fast tempo) and are used in solo and in dance accompaniments. The *mukhrā* ('face') is a short composition introducing *sam*, its maximum length being one *āvarta*.

A distinctive feature of *tablā* performance (and an innovation in South Asian art music) is the alternation between a base-pattern (*thekā*: 'framework', 'prop', 'support') and variation forms. The *thekā* and variational breaks are employed for basic training, solo playing, accompaniment of dance, 'small' *khayāl* and *tarānā*, and instrumental *gat*. Following the dancer's base-pattern of footwork (*tatkār*) in Tīntāl (the quadruple metre fundamental to this style) – based on alternate steps of the right (R) and left (L) feet – the *tablā thekā* is founded on an alternation of the two principal resonant right-hand strokes *ta* and *tin* (on a base-relationship of two strokes to one step), itself made binary by the presence or absence of the resonant left-hand stroke *ghe* (Table 17). Similar structures evolved for other *tablā* -accompanied tāla, such as Dādrā, Jhap and Rūpak; in the case of the two that involve an up-beat and are thus asymmetrical (Rūpak overall, Jhap internally), the upbeat stroke *tin* is played on the main accents. An older *thekā* for Rūpak, for example, in origin probably an Afghan dance motor-rhythm (it is also known as Pašto tāla), has been

transformed in the modern *thekā* to conform to the metronomic and qualitative pattern of the *kathak* dance style (Table 18). In dance the ‘support’ given by the *thekā* is one of maintaining flow, tempo and metre between dance pieces; to this end it has evolved as a polyrhythmic (but even) pattern, in which every beat has an accent, without much use of dynamic variety. This has been adopted in ‘fast’ *khayāl* and *tarānā* and in instrumental *gat*, to accompany the variations of the lead musician.

In slow *khayāl* and the ‘light’ song-forms, *thekā* of a different nature have evolved, mostly using agogic organization and signal strokes to maintain the tāla; in modern slow *khayāl* this can consist of individual beats lasting up to six seconds, given in cycles of from 10 to 16 beats. The slow *masītkhānī* and *seniyā gat* of the *sītār* were clearly designed to be accompanied by *pakhāvaj*, and the influence of that drum's style is seen in some 19th century *thekā* (Table 19); now they are accompanied exclusively by the *tablā*.

The repertory of the *razākhānī*, or Lucknow, *sītār* is more closely allied to the typical fast *khayāl* dance and *tablā* framework. The *sarod* (and, more recently, other melody instruments) progressively adopted a performance structure and *tablā* accompaniment pattern derived from that of the *sītār*. The performance structure for *tablā* solo (*tablā lahrā*; ‘*tablā* and fiddle-tune’, showing the old association with the *sārangī*, though the melody may now be played on harmonium, *sītār* etc.) derived naturally from the daily practice and creation of new material over the centuries by the *tablā* player, and it uses the *thekā* pattern to maintain flow between variations.

India, Subcontinent of, §III, 6: Theory and practice of classical music., Instrumental traditions.

(iv) Idiophones.

Cymbals (*tālam*) and flat gongs have played, and in some contexts still do play, an essential part in marking out the divisions of a *tāla*. In some contexts they may be used to play rhythmic patterns, in a similar manner to the drums described above. The *cennalam* (small flat gong) and *ilatalam* (cymbals) of the *kathakali* ensemble often play patterns distinct from time-keeping.

The *nattuvanār* of the *cinna melam* changes from time-keeping with the *nattuva tālam* (a pair of cymbals, one of bronze and one of steel) to playing the rhythm whenever reciting choreographic syllables for the dancer, reverting to time-keeping when the song is resumed.

The South Indian *gatam* is a clay pot used as a struck idiophone. It is often present as a member of the Karnatak concert ensemble and plays rhythmic patterns along with, and alternating with, the *mrdangam*. Also occasionally present in the Karnatak ensemble as a rhythmic accompanying instrument is the *mursing* (jews harp).

India, Subcontinent of, §III, 6: Theory and practice of classical music., Instrumental traditions.

(v) Ensembles.

An ensemble for South Asian art music is best understood in terms of the musical functions: melody governed by *rāga*, rhythm comprising pattern and tempo (*laya*), and the two brought together under a time cycle (*tāla*). Two supplementary elements in an ensemble are an instrumental drone, reinforcing the system tonic, and a melodic accompaniment. Table 20 shows the main parts of ensembles in the two art musics today, grouped according to musical role.

TABLE 20: Roles in South Asian art music ensembles

	<i>Karnatak</i>	<i>Hindustani</i>
	voice	voice (khayāl, thumrī, dhrupad)
<i>soloist</i>	vīnā; more recently violin, flute etc	bīn, sitār, sarod; more recently violin, flute, sārangī etc
	nāgasvaram (temple processions, now also concerts)	sahnāī (temple and ceremonial, now also concerts)
	violin	harmonium, sārangī (khayāl,

<i>accompaniment</i>	[2nd vīnā; violin]	thumrī)
	[2nd nāgasvaram]	[bīn formerly accompanied dhrupad]
<i>drum</i>	mrdangam (sometimes joined by ghatam and/or kañjīrā)	tablā (khayāl, thumrī, sitār) and other instruments)
	tāvīl (with nāgasvaram)	pakhāvaj (dhrupad, dhamār; bīn)
	tāvīl (with nāgasvaram)	khurdhāk/duggī (with shahnāī)
	tambūrā/śruti-box [side strings (vīnā)] ottu (with nāgasvaram)	tambūrā [side strings (bīn, sitar)] [3rd shahnāī]
<i>tāla</i>	[hand (vocalist)]	[hand (dhrupad singer)]
	tālam (with nāgasvaram) [side strings (with vīnā)]	tablā (thekā)

Hardly any separate performers are listed for the vital function of regulating the tāla. In some circumstances sections of the tāla are marked by idiophones of one kind or another, as in the processional ensembles of south Indian temples (see below). In concert styles, however, the divisions of the tāla are marked either by the principal performer with his hand or by a string player on side strings, or are not marked at all. In Hindustani instrumental music, on the other hand, and even more in the vocal genres

khayāl and *thumrī*, the time cycles are marked out by the *tablā* playing *thekā* (see §(iii)(b) above). Insofar as this practice dispenses not only with a separate reckoning of the *talā* by hand or idiophone but also with the very need for such a reckoning, it is a deviation (however widespread and familiar now) from an ancient and indigenous principle that separates rhythmic drumming from time-keeping.

(a) The concert ensemble.

The principal concert soloist is the vocalist. Plucked string instruments, such as south Indian *vīṇā* and Hindustani *bīṇ* and *sītār*, have also long had solo standing. Many more instruments now take solo roles in concerts, including the bowed string instruments, violin and *sārangī*, which were traditionally confined to melodic accompaniment. The melodic accompanist may double the soloist in compositions; in improvisation he may support the soloist by echoing his phrases while they are in progress, and he may alternate antiphonally with the soloist.

The rhythmic patterns of the drum in the ensemble are in principle independent of those in any composition or improvisation being performed by the melodic soloist. When playing simultaneously the two are bound together only in the large, that is, by the framework of the time cycle, although they almost always share the atomic pulse as well (except in the slow *khayāl*, where the soloist sings without pulse and the *tablā* drum controls the time cycle).

The *Nāṭyaśāstra* mentions three kinds of relationship between a vocal soloist and accompanying flute, strings and drums, each of which has its modern analogue. In the most basic, *tattva* ('element'), the accompanist simply doubles the singer's melody or rhythm, or both (this is the only relationship suggested for the flute). In the relationship of *anugata* ('accompaniment'), the general melodic or rhythmic configuration of the composition is preserved by a string accompanist or drummer but very much elaborated, and virtuoso display can be introduced when the singer sustains a long note or pauses between sections. Finally there is *ogha* ('flood' or 'multitude'), which for a string player means antiphonal alternation and for a drummer fast and free virtuoso display.

The background drone in concert ensembles is usually provided by the plucked open wires of a *Tambūrā* (large long-necked lute) played by a student or sometimes by the soloist (female vocalists in particular). The adjoining side wires of some plucked string instruments can provide a harmonic background of tonic, sometimes 5th, and upper tonic as they are struck to mark divisions of a time cycle or in alternation with the playing wire. Strumming (or simultaneously bowing) open strings tuned to tonic and 5th also provides drone, as does the tuned right-hand head of a concert drum.

(b) Ceremonial ensembles.

Besides the indoor concert ensembles there are ensembles originally connected with temple or court ceremonial, in which the three basic musical functions of classical music are sometimes quite distinctly separated.

Periya melam. This Tamil term means 'great ensemble', and it denotes a band that usually includes two *nāgasvaram*, an *ottu* (a drone oboe), *tavil* and *tālam*. A *śankh* (conch), which plays the *jāti* (rhythmic patterns), is sometimes added to the ensemble. It is associated with temples in south India and plays the ceremonial and processional music that accompanies the image of the deity. Extensive *ālāpana* is played by the *nāgasvaram*, which may alternate between two or more players. Rhythmic solos are played between sections of the *ālāpana* by the *tavil*; during these the rhythmic cycles are marked by the *tālam*. For several years such ensembles (comprising a leading and secondary *nāgasvaram*, each accompanied by a *tavil*, an *ottu* and/or a *śruti-box* and *tālam*) have been giving recitals of Karnatak music.

Cinna melam. This ensemble (*cinna* is Tamil for 'lesser', 'small') accompanies recitals of *bharata-nāṭyam* dance. It is lead by the *nattuvanār*, who beats the *tālam* with a pair of *nattuva tālam* (cymbals) and recites the *jāti* for the dancers. In addition to the dancers, who wear *gejjai* (ankle bells), the ensemble includes a principal singer, a melodic accompaniment, a drone and a *mrdangam*. The melodic accompaniment was formerly provided by a *mukhavīnā* (small oboe) and more recently by a clarinet, and the drone by a *śruti upanga* (bagpipe). These instruments are now usually replaced by a transverse flute (*venu* or *kulal*), a violin and/or a *vīnā* and a *śruti-box*. The ensemble is also known as *nāc*.

Śahnāī ensembles. The *śahnāī* arrived in South Asia as part of the Muslim ceremonial *naubat* ensemble (see [Naqqārakhāna](#)). The ensemble's role was to play several times daily at the gates of palaces and at some shrines of Muslim *pīr* (holy men). The *naubat* is now very rare, although a few musicians are still employed at the shrine of Mu'inuddin in Ajmer, Rajasthan. Their music is now based on Hindustani rāgas.

The *śahnāī* also functions as a temple instrument in many places in the north, most notably in Varanasi, where it is accompanied by the drums *khurdāk* and *duggi*. It was from this background that the *śahnāī* moved to playing Hindustani music on the concert platform.

[India, Subcontinent of, §III: Theory and practice of classical music.](#)

7. Aesthetics.

Artistic creativity in Indian classical music depends on a performer's mastery of learned structures and idioms, but with each performance being in principle ephemeral and unrepeatable. Theoretical and aesthetic attention has therefore tended to give priority to underlying musical principles rather than the final product of a 'composition' or performance. However, the study of Indian musical aesthetics has ranged over many formal, functional and psychological aspects of the art, including both the evaluation of practice and a more philosophical interest in the basic structures. Both of these broad concerns have their precedents in *śāstra* (see §II, 1 above), an aim of which was the comprehensive definition and description of music, its origins and its correct procedures. In the description of instrumental and vocal procedure and of melodic shape and 'finish', texts such as the *Sangīta-ratnākara* and *Sangīta-samaya-sāra* (see

§II, 1(ii)(a) above) and their derivatives show some influence from the language and critical discourse of real musical practice. For example, these texts' classified lists of *sthāya* (the numerous different melodic inflectional patterns that are used in the passage from one note, *svara*, to the next) can be seen as attempts to provide effective practical markers of melodic style. The *sthāya*, comprehensively listed by Śārngadeva (*Sangīta-raknākara*, iii, 97–188), were apparently used and named by practising musicians of his time. They are precisely those intonational contours that both distinguish the peculiarly Indian approach to melodic line in general and separate the various styles one from another within the Indian field (Lath, 1987). Although many of the melodic features that they describe must have continued in practice, the theoretical category later fell out of use. Parallels for some of the *sthāya* may be seen in the technical language and practice of present-day musicians.

Śāstra aimed to order and schematize such material, and in so doing it was influenced by other disciplines such as phonetics, metrics, dramaturgy and poetics. Thus in the third chapter of the *Sangīta-ratnākara*, in outlining the technical characteristics of the song-composer (*vāg-geya-kāra*), the singer (*gāyaka*), the singer's natural vocal ability (*śārīra*) and voice quality itself (*śabda*), a schematic system of merits (*guna*) and faults (*dosa*) is used, and these are graded in accordance with common *śāstric* method. In the absence of an indisputably unbroken oral tradition, it is hard to interpret many of the detailed descriptive and evaluative terms we find here, but some cultural preferences do seem to emerge. For example, equal facility in all parts of a wide vocal range, strength of tone and the ability to inspire pathos in the listener are praised, while frailty, hoarseness and inflexibility are condemned. The lists also suggest that musicians could be highly rated for a variety of reasons, and individuality does not seem to be ruled out. This kind of aesthetic evaluation was conceptually connected with the method of the *alamkāra* school of poetics, which concentrated on varieties of verbal expression in defining poetic style and genre. The point of departure was the *Nāṭyaśāstra*, which brought poetics and music theory close together in the single context of Sanskrit dramaturgy. Literary theory long continued to influence musical aesthetics. The influence is also to be found in the analysis of song types (*prabandha*) in the *Bṛhad-deśī* and its successors, where style and compositional type are classified not only according to poetic text metre and the *rāga* and *tāla*, but also in terms of regional character reminiscent of linguistic and literary idiom (Rowell, 1992, 286–7, 312–13).

As Indian classical, particularly Hindustani, music is characterized more by improvisation within strict parameters than by a repertory of 'works' (a Western category for which there is no real Indian equivalent), performance is seen as a representation of one or more underlying structures (*rāga*, *tāla* and compositional form), and evaluation is on the basis of how properly and effectively this is done. On the part of the enculturated listener, the musical experience centrally involves recognition and re-experience as well as the response to new material (Powers, 1976). A possible exception may be found in the *kṛitī* and other pre-determined elements of the Karnatak repertory (see §5(iv) above). However, there is an essential fluidity in the realization and rendering of these pieces, so that the performer may be regarded as having a considerable stake in the eventual structure of the

musical 'text'. Great prestige is still commonly accorded to the particularly open-ended renderings of *kṛiti* and *pallavi*, and a musician will be found deficient if the performance suggests excessive pre-composition (Catlin, 1985). Furthermore, a *kṛiti* will still be appraised partly on how well it represents one or more characteristics of its *rāga*. The same criterion is often applied by musicians to a well-formed *bandīś* ('song') in *khayāl*. Innovation is in principle circumscribed in such a way that the perceived integrity of the *rāga*, *tāla* and compositional form are not violated, unless for special effect. Śārngadeva briefly states how novelty is achieved and in what it consists, that is, what distinguishes one performance from another. A new song composition, he tells us, employs a new (i.e. different) *rāga*, *tāla* and verbal text; a *rāga* may be 'newly' executed with new [combinations of] *sthāya*, the verbal text is new by virtue of its varied subject-matter and affective power, and so on.

The classical Indian 'musica speculativa' was particularly concerned with the genesis and evolution of sound, both physical (e.g. the production of sound in the human body, as expounded in yogic and physiological terms by Śārngadeva at the start of the *Saṅgīta-ratnākara*) and metaphysical (the arising of audible sound from the primordial creative principle of *nāda*, already expounded in the first chapter of the *Brhad-deśī*). Musical sound is explained as an evolution, differentiation, refinement and meaningful organization of the raw sonic material. Again, the theory of language was a strong influence (Rowell, 1992, chaps. 3, 7 and 8; Sharma, 1995; Lath, 1995). In the *Brhad-deśī* several alternative philosophical models are offered to explain the relation of *svara* to *śruti* (see §1(ii) above), and in the standard model of many texts the *rāgas* are presented as generated derivatives of more basic melodic systems or structures (*grāma*, *mūrcchanā*). The 'evolutionary' account of *rāga* as derived from scale and mode may be seen as a forerunner of the classificatory and pedagogical orderings of more recent systems.

Conceptually, *rāga* (see §2(i) above) has maintained a considerable continuity from early texts to the present day: both the distinctness of the different *rāgas* and the individuality of ethos of each of them have always been stressed; each performance 'reveals' and enhances for the listener an already known (i.e. learned) structural and aesthetic entity that persists, as an abstract, behind all its exemplars and can only be represented through them. In the *rāga-mālā* systems of painting, which flourished in the north and central Indian courts especially from the 16th to the early 19th centuries (see §II, 3(iii) above), and in the poetic evocations (*dhyāna-śloka*) often accompanying them, the notion of individuality and distinctness of the *rāgas* was given a visual and emotive analogue. However, writers on music stress the aesthetic autonomy of music itself; the ethos of the *rāga*, to be understood, has to be experienced in sound rather than simply described. Nānyadeva's, Śārngadeva's and Somanātha's notated musical examples in their treatises are included in order to impart this understanding.

The affective character of melody was expounded first in relation to its use in the dramatic context. In the *Brhad-deśī* the many *rāgas* are distinguished from one another not only by their individual tonal features but by their conventional association with particular scenes or situations or character types in Sanskrit drama; thus they are characterized by their aesthetic

function in supporting particular atmospheres and moods. Here may be at least one of the origins of the conventional linking of rāgas in Hindustani music with times of day and seasons of the year, a notion of appropriate time evoked or enhanced by the melodic ethos. In these associations it is also possible that ideas of appropriateness and auspiciousness were inherited from traditions of religious music, in which ritual exactness of performance was crucially important.

In the *Brhad-deśī* the important connection was also made between rāga and *rasa*, the central and most potent idea in traditional Indian aesthetics. *Rasa* is aesthetic 'flavour' or 'relish', produced out of the various kinds of represented emotion (*bhāva*) that are found in the situations and events depicted on stage. Originally occurring in the *Nāṭyaśāstra* as a theory of aesthetic response to drama, the *rasa* principle was extended to non-dramatic literature and eventually came to be regarded as relevant to aesthetic experience in general. The theory of *rasa* was discussed and variously elaborated by successive writers on poetics, but essentially it held that there is a limited number of specific *rasa* corresponding to a similarly fixed series of 'basic' or 'permanent' emotions. *Rasa* can be aroused, in a sensitive spectator or connoisseur (*rasika* or *sahrdaya*), through his 'tasting' the emotion represented in the work of art. Much discussion has been devoted to the *rasa* theory and its applicability to music (as opposed to the verbal and representational arts alone), and conclusions have ranged from total rejection to enthusiastic adaptations of the idea. As a general theory of aesthetics it does suggest a particular model of interaction between the creative act and the 'receiver' of art who recognizes and responds to the structural entities underlying a performance or artefact. It must, however, be admitted that in the case of rāga, in addition to the stable notion of the identity of particular melodic substructures, there will be a range of moods, evoking many levels of response, in the course of any actual performance.

IV. Semi-classical genres.

Thumrī and *ghazal* are two of the most popular urban forms of song in north India. Both genres are referred to as ‘light’ or ‘light-classical’ because of their emphasis on the melodic elaboration of lyrics, rather than on displays of virtuosity or scrupulously correct rendition of *rāga*, and because of their use of modes and metres resembling those of regional folk musics, that is, regionally distinct, non-élite traditional musics lacking bases in theoretical treatises. Until the mid 20th century, both genres were also associated with courtesan dance. While the lyric content of both genres is predominantly amatory, *thumrī* is usually composed in the Braj Bhāsā dialect of Hindi and reflects the influence of the devotional Hindu movement, *bhakti*. *Ghazal* is usually composed in Urdu and is strongly influenced by the Sufi mystic movement of Islam.

1. *Thumrī*, *dādrā* and *tappā*.

Although the origin of *thumrī* has commonly been ascribed to the Lucknow court of Wajid Ali Shah (ruler of Avadh, 1847–56), *thumrī* considerably predates this era. Precedents can be found in related genres such as *pānika*, *nādavatī*, *carcarī* and *caccarī* (*catuspadī*), dating from the first millennium ce, in which female dancers would choreographically interpret erotic and/or devotional texts. Numerous references to *ćarćarī* in subsequent centuries suggest strong affinities with modern *thumrī* in the association with Krsna-worship, the use of the Braj Bhāsā dialect, and performance by courtesans. Extant references to *thumrī* proper date from the 1660s and 70s, and by the early 1800s the genre had emerged as a light song-type accompanying amatory courtesan dance. In subsequent decades, as patronage shifted from the declining Mughal elite to Lucknow-based landlords and courtiers, *thumrī* evolved rapidly, and male as well as female classical musicians came to cultivate it as a musical genre in its own right. The prevailing contemporary style was the *bandīś* (‘composition’) *thumrī*, which featured lively textual-melodic variations (*bol bānt*) on a composition generally set in Tīntāl, often in conjunction with *kathak* dance.

In the first half of the 20th century, the modern style of *thumrī* coalesced, predominantly in Varanasi, emphasizing a more sentimental style of melodic-textual elaboration (*bol banāo*), typically set to 14- or 16-beat cycles variously called Dīpcandī, cāñcar or Jat. Despite the evident derivation of these metres from folk musics and the use of a fast, folk-influenced concluding or intermittent *laggī* section also influenced by local traditions, the modern *thumrī* acquired a semi-classical sophistication that enabled it to adapt well to the transition from feudal to bourgeois patronage and from the courtesan salon to the modern concert hall. In the mid-20th century, Punjabi vocalists popularized a somewhat lighter style of *thumrī*, featuring more lavish ornamentation and greater usage of the six-beat *Dādrā* and eight-beat *Kaharvā tālas*.

The text of *thumrī* is not restricted to any precise rules of versification and, in some instances, even takes the form of a prose-poem. The subject-matter of these songs is often based on the legends of Krsna, an incarnation of the Hindu deity Visnu, particularly those that concern his

relationship with Rādhā and the other *gopī* (milkmaids). In the songs, it is generally Rādhā or an unnamed woman who is expressing her feelings, either directly to her beloved or to a friend. In spite of this, *thumrī* may be rendered by either a male or female singer. The songs have specific topics, such as description and praise of the beloved, the lover lamenting the absence or anticipating the arrival of the beloved, and the pangs of separation. The dominant ethos (*rasa*) of these songs is amorous (*śrngāra*) and pathetic (*karuna*). In connection with *bhakti*, however, these themes are thought to be allegorical, God being the beloved; they represent man's search for union with God.

Thumrī generally employs a specific set of *rāgas* and *tālas* that are unique to light-classical music and that bear affinities to those used in north Indian folk musics. As in other north Indian vocal forms, a *thumrī* has two composed sections, *sthāyī* and *antarā*, each consisting of one or two lines of poetry. These two sections are based on different registers of the *rāga* in which the *thumrī* is composed, the *antarā* generally being the higher.

There are several features that distinguish *thumrī* from other north Indian vocal forms such as *khayāl*. The ornaments used in *thumrī* are generally quicker and lighter in character, and there is greater freedom in the use of alternative notes, some of which would not be acceptable in the performance of a *khayāl*. Moreover, it is not unusual for a *thumrī* singer to introduce a temporary change of *rāga*. *Thumrī* and *khayāl* are both largely improvised, but the type of improvisation in *thumrī* is mainly *bol banāo*, which may take the form of overt word-painting or, more typically, affective lyric elaboration via repeated melismatic variation of a fragment of text. [Ex.16](#) illustrates *bol banāo* in *thumrī*.

The *thumrī* begins virtually without a prelude (*ālāp*). The text lines are repeated as often as the singer wishes, each time with a different melodic interpretation. Typically, at the conclusion of the song the singer returns to the first line, repeating it while the player of the *tablā*, who has until this moment been marking time, improvises at a considerably faster tempo. This section, called *laggī*, is generally in a cycle of eight beats (Kaharvā) or 16 beats (Tintāl) even though the *thumrī* itself may have been sung in a different time measure. At the end of the *tablā* improvisation the musicians revert to the original tempo and time measure, at which point the song may be concluded or repeated in its entirety with new improvisations.

Vocal *thumrī* is accompanied by *tablā*, *tanpūrā* (*tambūrā*) and a melodic instrument, traditionally the *sārangī* or, more commonly today, the harmonium. Although *thumrī* is primarily a vocal form it can often be heard as an instrumental piece, the voice being replaced by one of the solo instruments used in Hindustani music such as the *sītār*, *sarod*, *śahnāī* or *basurī*. While instrumental *thumrī* cannot incorporate *bol banāo*, it employs the ornamentation, phrasing and raga and tāla repertory of the vocal *thumrī* style.

The term *dādrā*, aside from referring to a common six-beat cycle, also denotes a semi-classical vocal genre, closely related to *thumrī* but having a somewhat lighter character. In *dādrā* the singer generally employs Dādrā or Kaharvā tāla and maintains a more lively rhythmic lilt; *dādrā* lyrics are

exclusively amatory and often include verses in Urdu as well as Braj-bhāṣā.

Tappā represents a quite distinct genre of semi-classical music. Its origin is generally attributed to Shori Mian, believed to be the pen-name of Ghulam Nabi, a singer in the Lucknow court of Asaf-ud-daulā, nawab of Avadh (1776–97). In *tappā*, the vocalist sings an incessant series of frenetic fast runs (*tāna*) characterized by circular, zigzag melodic motion (*zamzamā*), generally set to the 16-beat Sitārkhāni tāla. Both improvisations as well as the compositions themselves are rendered in this style, which is said to have been inspired originally by the rapid ornamentation found in Punjabi music. *Tappā* survived until the mid-20th century as a demanding and difficult genre, cultivated especially by Varanasi-based courtesan singers; it is now seldom heard.

2. Ghazal.

Ghazal is a form of Urdu poetry that was introduced into India by the conquering Muslims as part of their Persian cultural heritage. The word *ghazal* is derived from the Arabic root that denotes ‘to talk amorously with women’, and thus the poetry is, superficially, sensual and erotic. However, it is much influenced by the mystic ideas of Sufism, where the beloved is really God and the poet yearns for union with Him. One of the great attractions of this poetic form is its appeal on different levels: the erotic, the mystical and the philosophical. Modern poems in the genre occasionally contain social and political comment.

The formal occasion for the recitation of this poetry was the *muṣāirā* (‘poetic symposium’), where poets were invited to recite their poems to a critical audience, a practice that still continues. Urdu poetry developed under court patronage, as did much north Indian classical music, but the two appear to have had little influence on each other. It is generally stated that Amir Khusrau introduced the musical form of the *ghazal* at the end of the 13th century. The singing of *ghazal*, however, only gained prominence in the 18th and 19th centuries at the courts of the rulers of Delhi, Lucknow and Rampur, where it was the preserve of the court dancing-girls and courtesans. Thus there was, until modern times, a social stigma associated with the singing of *ghazal*, which was also a reflection of the censure of music by the orthodox Muslim community.

The *ghazal* consists of an indeterminate number of couplets (*śer*), which are thematically independent and united only by the metre and rhyme-scheme. In order to achieve epigrammatic condensation of expression, couplets generally rely on a stock set of conventional metaphors, imagery and topics – especially unrequited love – most of which derive from the Persian poetic tradition. Both couplets of the first lines rhyme; in the succeeding couplets the original rhyme scheme is maintained in the second line. The rhyme scheme is thus *aa*, *ba*, *ca* etc. This pattern is generally reflected in the melody, the line with rhyme *a* being sung to one tune, the other lines (*b*, *c* etc.) being sung to a second related tune generally in a higher register. Typically, each verse is followed by an instrumental interlude, which in the light-classical style would take the form of *laggī*. The most common metres used are variants of the eight-beat Kaharvā, the six-beat Dādrā, and, less often, the seven-beat Rūpak tālas.

Given its versatility and its suitability to musical rendering, *ghazal* has thrived as a musical genre in various forms. Hindi-language poems in a loose *ghazal* form have been widely sung in Hindu devotional contexts. The Urdu *ghazal*, however, is more extensively cultivated, both as a musical and literary genre. In the *musāīrā* the *ghazal* is either recited or chanted in a style called *tarannum* (see §V, 1 below), probably introduced in the 19th century. There are many similarities between this style of chanting and *ghazal* song as described above, the main difference being that the *tarannum* is not in a fixed time measure and follows the metre of the poem more closely than does the song. Also, the *tarannum* is chanted without instrumental accompaniment. The courtesan tradition of *ghazal* singing is gradually dying out, but may still be heard in private homes, small concerts and, occasionally, on the radio. The singing of *ghazal* is also practised by Qavvāls (professional Muslim religious singers); this tradition appears to be thriving. A typical Qavvāl group consists of three or four singers accompanied by *dholak*, harmonium and *bulbultarang* (a plucked board zither). A considerable element of spontaneity is provided by the interpolation or improvisation of new verses. At the end of each verse the singers often introduce purely melodic vocalizations, while the audience assimilates the verse content. These improvisations are generally classical in style and often involve a change of *rāga*.

While knowledge of Urdu-based styles practised in the 19th century is limited, it is clear that *ghazal* flourished as a related genre to *thumrī*, performed, especially in Lucknow, primarily by courtesans and often accompanying interpretive mimetic dance. Early 20th-century phonograph recordings of *ghazal* reveal a somewhat classical orientation in the usage of virtuoso *tāna* (fast melodic run) techniques. In subsequent generations, singers such as Begum Akhtar (d 1974) cultivated a more distinctively light-classical style, which resembled *thumrī* in its emphasis on *bol banāo* (rendered on the non-rhyming lines) and the use of a standard accompaniment of *tablā*, *tanpūrā* and *sārangī* and/or harmonium. In its greater emphasis on the text and its correspondingly lesser scope for abstract melodic elaboration, *ghazal* has been regarded as 'lighter' than *thumrī*. As such, it has generally been performed not by classical singers but by specialists in light music, whose ranks, since the mid-20th century, are no longer dominated by courtesans.

With the advent of sound film in 1931 *ghazal* became an important component of north Indian film music, and distinctive styles of film *ghazal* soon emerged. Since the emergence of a mainstream film music style in the 1940s, film *ghazal* came to be distinguished by the absence of improvisation, the use of more accessible tunes and diction, the replacement of the *laggī* interlude with a pre-composed instrumental passage and the use of an extensive accompanying ensemble typically containing both Western and Indian instruments. Accordingly, the film *ghazal*, unlike its connoisseur-orientated counterpart, came to enjoy mass popularity. By the 1970s, however, *ghazal* became less common in film music, perhaps due to the incompatibility of its romantic character with the popularity of action-orientated films and disco-influenced soundtracks.

Nevertheless, during this decade a new style of *ghazal*-singing was popularized by Pakistani singers Mehdi Hasan and Ghulam Ali, combining

the leisurely pace and improvisatory approach of the light-classical style with, to some extent, the accessibility of film music. The new 'pop' *ghazal* emerged in association both with cassette technology, which enabled it to bypass the film industry, and with the emergence of a more extensive and self-aware north Indian bourgeoisie (Manuel, 1993). The new *ghazal* is performed and listened to widely by Hindi and Urdu-speaking Hindus as well as Muslims throughout the subcontinent.

V. Chant

The word as sound is a concept basic to all domains of South Asian culture. Accordingly, a wide range of poetry is chanted in a variety of languages and in contexts ranging from entertainment to religious practice. Generally termed recitation, such poetry covers traditional epics such as the *Hir ranjha* chanted for Punjabi village audiences, Urdu poets presenting their works at *mushā'iras* (formal assemblies of literary élites) and poetic texts in all major Indian religions, from the scriptural chanting of religious specialists to congregational litanies. Some chant melodies are widely known, such as the *Rām dhun* used to chant the Rāmāyana, or the *masnavi* tune linked to the Sufi verses of Rumi. In all Indian music the relationship between music and poetry is of some importance, but in poetic chant this relationship is particularly significant.

Since in chant the word is of primary importance, it is necessary to approach chanted poetry through the word rather than through its musical realization. Performing style, form and, especially, rhythm are likely to be the principal musical means of conveying features of poetic structure and meaning as well as of recitational context. Rhythm, by governing the duration of pitch in time, further extends the influence of these poetic features to the melody. The tonal range and melodic motifs of chant melody are, however, subject to influence from widely disseminated popular and art music as well as regional traditional genres, all of which contribute to a common musical milieu.

Tarannum, the chanting of Urdu poetry, and Hindu Vedic chant (see §2 below) illustrate certain general principles underlying musical recitation, where features of musical style are determined by the characteristics of spoken language and poetic structure as well as by the context and meaning of the text.

1. *Tarannum*.

Urdu is the national language of Pakistan and one of India's 18 official languages. Its main centres are the cities of Pakistan and northern and western India, and Hyderabad in the south. As the literary language and lingua franca developed by the Muslims in India, it continues to represent South Asian Muslim culture. Urdu poetry, a highly formalized art, has a distinctly Persian flavour, since its symbolism and imagery as well as the poetic forms, metres and scansion rules are derived from Persian and Arabic models. The predominant form is the *ghazal* (see §IV, 2 above), a lyrical and philosophical love-poem, structured in couplets that are independent in content but linked by a common theme and a recurring rhyme pattern. As a favourite form of cultivated entertainment and self-expression this poetry is chanted in *tarannum* style both formally by poets at the *mushā'ira* (symposium) and informally by other Urdu speakers.

Tarannum is categorized as recitation, not singing or music, and it is appreciated only in terms of the poetry it supports. Accordingly it appertains to the respected sphere of the poet and not to the socially inferior realm of the professional musician. This strict separation of chanting from singing exempts *tarannum* from the Islamic religious censure of singing and instrumental music; hence it is the only form of secular 'music' widely practised by South Asian Muslims.

The music of *tarannum* is dominated by the text. The style of performance emphasizes aspects of verbal communication: words are pronounced as in spoken declamation and even consonants are enunciated according to their natural duration in speech. The rhythm and tempo of speech are generally maintained. The smallest formal unit, the poetic line, is normally free from interruption and internal repetition, but complete lines are repeated and pauses are introduced as part of the spontaneous interaction between reciter and audience. Voice production is highly idiosyncratic, reflecting the reciter's speaking voice rather than a standard vocal model, such as exists in singing. To some extent the vocal quality of *tarannum* is determined by the predominance of long vowels in the poetic vocabulary and of long syllables in the metric structure.

Tarannum is strictly strophic in formal structure. Each couplet contains two contrasting tunes that correspond to the *sthāyī-antarā* principle of north Indian art music. The first, non-rhyming line of the couplet is generally set to an *antarā* -like tune with a high tessitura (the upper tetrachord of the octave); the second, rhyming line is set to a *sthāyī*-like tune with a low tessitura (the lower tetrachord, with tonic emphasis). The melodic cadences of both tunes often correspond.

The rhythm of *tarannum* is derived from the poetic metre (exx.17 and 18). The complex metric system of Urdu poetry, rooted in Arabic prosody, is based on a variety of long–short patterns. In the musical realization of the poetic metre the long and short syllables form the basis for long and short durational units. Both the duration and the mutual relationship of these units are highly variable, which accounts for the rhythmic diversity of *tarannum*. This variability may express semantic as well as structural factors in the text. The relationship between long and short durational units may also be consistent, resulting in rhythmic regularity and a tendency to replace length with stress (see ex.18).

Melodically, *tarannum* belongs in the context of north Indian semi-classical music and is subject to the influence of the current musical environment, including popular recorded music. The melodic content extends from motifs with a narrow tonal range to *rāga*-types. Chant tunes are characterized by their portability (a tune can be ‘carried’ from one poem to another) and potential for variation. The same tune may be adapted to poems which differ widely in length and metrical scheme (exx.17 and 18). Conversely, the same poem may be chanted to more than one tune. There thus exists a repertory of reciting tunes that performers modify in accordance with the poem and their own personal style. Poets also create new tunes of their own, thereby enriching the repertory. Specific melodic and rhythmic settings may thus become attached to particular poems and associated with the personal reciting style and vocal profile that poets cultivate as part of their creative personality. Another facet of performance is declamatory freedom to interrupt and repeat verse lines within a poem as part of a reciter’s interaction with the audience.

Tarannum recitation has also been extended to *kavisammelan*, assemblies for the recitation of Hindi poetry that follows Sanskrit-derived formal principles. Today *tarannum* is internationally disseminated by touring poets

who recite at *mushā'iras* held in South Asian communities in North America, Britain and the Gulf States.

2. Sāmavedic chant.

The *sāmavedic* chant is commonly supposed to represent the earliest surviving form of Indian music; it has been traditionally regarded by theorists as the source of all Indian art music. This claim must be treated cautiously, however, since there must have existed numerous other musical elements and influences in religious, secular and ceremonial practice from very early times.

The four Vedas (*veda* primarily means 'knowledge') are collections of early Sanskrit hymns and ritual texts originating in the religious beliefs and practices of the early Aryan settlers in South Asia. The hymns of the *Sāmaveda* – the Veda of 'chants' or 'melodies' (*sāman*) – are for the most part also contained in the primary hymn collection of the *Rgveda*. However, in the *Sāmaveda* they are rearranged in two series of verses (*ārcika*), the first according to the deities they address and the poetic metres used, the second according to the ritual and liturgical contexts in which the verses are recited. There are no musical directions, but special song-manuals (*gāna*) of more recent origin give melodies in notation, as well as the modifications to the basic text – lengthened and additional syllables etc. – which are employed in the sung versions of the hymns.

In earlier and ancient sources many *sāmavedic* 'schools' (*śākhā*) are said to have existed. The transmission of the melodies and their performance procedures was sustained by strict training within each school, and strict and orthodox accuracy within each of them was crucial for the efficacy of religious ritual. Three such schools survive today, called the Jaiminīya or Talavakāra, the Kauthuma and the Rānāyanīya. The *gānas*, and other later practical handbooks of performance attached to the different schools, appear to have been compiled as mnemonic aids to a primarily oral tradition. The other handbooks include works on timing, metres, pitch varieties and ritual uses of the chants and the magical and apotropaic lore related to them. In some of these Vedic 'ancillary' Sanskrit texts can be found a tendency to relate some features of *sāmavedic* recitation and music, and its notation, to the later post-Vedic pitch systems. Research over the last century has increasingly supported the view that textual study and present-day field observation can illuminate each other, and pioneering studies by J.F. Staal (1961) and Wayne Howard (1977 and 1988) have thrown much light on the relation of practice and theory.

The *sāman* verses can be performed in private recitation or in a more open ritual context of the sacrifice. At the more elaborate of the great public (*śrauta*) sacrifices the priests sing a number of *stotra*s, laudatory compositions formed of complexes of verses from the Vedic hymns. The portions (*bhakti*) of each of the composite stanzas (*stotrīya*) are performed by one or more of a trio of specialist *sāmavedic* priests called the *prastotr* (introductory singer), *udgātr* (principal singer) and *pratihartr* (responsorial singer). The verbal text is modified in various ways to fit the prescribed melodic form in a melismatic style; it is possible that the melodies existed already and the verses had to be 'set' to them. On the basis of the texts and the practical manuals, up to eight different methods of 'alteration' have

been identified, and the different recensions of the *sāmavedic śākhā*, and different traditions even within each of these, show a variety of ways of adapting the texts within the essential rules of practice. In the Kauthuma manuscripts the Sanskrit text is accompanied by an interlinear numerical notation of five figures, and in the Rānāyanīya by a syllabic notation, in which the symbols are used to indicate musical phrases. Ancient sources name seven ‘tones’ (*svara s*, not to be confused with those of post-Vedic musical systems), and it seems that the figures and letters refer to items in a repertory of phrases or motives. The *gāna* texts use the figures also as mnemonic indications of gestures (*mudrā*) made with the thumb and fingers of the right hand, these being themselves partly a mnemonic means to assist in the learning and transmission of the *sāman* melodies.

VI. Religious musics

South Asian religious practices range from the localized worship of village goddesses to such trans-national religions as Islam and Christianity. Buddhism, Sikhism, Jainism and the religious complexes that make up Hinduism all have their origins in South Asia. These overlapping and competing webs of religious belief and ritual are expressed by an equally varied set of musics. (For the history and musical practices of Buddhism in South Asia see [Buddhist music](#) and [Tibetan music](#), §2(ii); for South Asian Jewish traditions see [Jewish music](#), §III, 8(v).)

India, Subcontinent of, §VI: Religious musics

1. Hindu.

Bhajan (from Sanskrit: *bhajana*) is the generic term identifying popular Hindu religious songs associated with *bhakti*, an approach to union with God. The *bhajan* literature is extensive, comprising many thousands of songs in many languages, including Sanskrit. *Bhajan* also denotes a genre of religious ritual exercised in all parts of India. The rites are usually congregational, ranging in number of participants from three or four to many thousands. The Sanskrit words *bhajana* and *bhakti* are both derived from the root word *bhaj* ('to share' or 'to give of') and are connected with an approach to God in which the relationship of the worshipper to the deity is based on attitudes of love.

*Bhakta*s (devotees) see God as personalized, an image that is not a single idealization, but one that reflects the infinite variety of the universe. All Hindu deities are seen as representing aspects of the one supreme Godhead, and icons are seen as containing within them the essence of God. In ritual the deity is treated as a royal guest and tended lovingly by the *bhakta*s. The God is garlanded with flowers, bathed, clothed in new garments, offered refreshments and praised in song and dance. The ceremony, in its entirety, is a mystical expression of adoration of the deity by the worshippers. The concept of approaching God through love can be traced down through the Upanishads and the Epics (especially the *Bhagavad gītā*) to the medieval Purāna. In the *Bhāgavata purāna* the doctrine of *bhakti* is crystallized into a set of attitudes and acts, the performance of which would aid the worshipper in his aim of union with God. Various attitudes of love may be expressed allegorically in song texts that depict God, the only true male, in the love relationship with the woman who symbolizes mankind. Two additional tenets of *bhakti* doctrine are the efficacies of listening to the praises of God and the singing of holy names. The themes used in *bhajan* texts are based on various kinds and levels of love, praises and repetition of God's names.

Bhakti as a dominant force in Hinduism began to develop as a theistic reaction against heretical (atheistic) Buddhism and Jainism in southern India in about the 6th century ce. The movement was divided into two sects: one, worshippers of the God Śiva, called Nāyanar, the other, devotees of Visnu, called Ālvār. They disseminated their religious doctrines through songs of devotion composed in the vernacular. Groups of worshippers advocating surrender to God moved about the countryside from temple to temple led by zealous poet-singers, singing, dancing and engaging in heated debates. Deified poet-singers of both sexes and from all social strata kindled a revival of Hinduism through *bhakti* that eventually engulfed all of India. The revival also generated the *ācārya*s (teachers), religious leaders who reinterpreted the ancient scriptures to meet the needs of their own times, and who in the process laid the philosophical foundations for future *bhakti* developments. The most influential were Śankara (d c820 ce), Rāmānuja (d 1137) and Madhva (d 1278). They were

followed by Nimbārka (fl 12th century), Rāmānanda (fl 14th century), Vallabha (d 1531) and Chaitānya (d 1533). In addition to their general religious influences they aroused generations of poet-singers who carried their spiritual messages in song. Jayadeva (fl 12th century), the composer of the *Gīta-govinda*, belongs with this group because of the vast influence this work has had on the course of *bhakti* up to modern times.

The revival initiated by the Nāyanar and Ālvār was continued by the Vīraśaiva (Lingāyat) and Haridāsa of Karnataka, and from there spread to the north, where the tradition of singing poet-saints reached its culmination with Tukaram (d 1649). Eventually every vernacular region produced its own poet-singers: Raidās, Mīrābāī, Dadu, Tulasī Dās, Sūr Dās, Vidyāpati, Candi Dās, Rāmprasād and Śankardeva in the north; in the south Purandara Dās, Arunagirinathar, Nārāyana Tīrtha, Bhadrācala Rāma Dāsa, [Tyāgarāja](#), the most venerated southern composer, and the three Tāllapākam composers whose activities were centred on Tirupati (south-eastern Andhra Pradesh) at the Venkateśa temple. It was they, a family of three generations of poet-singers, who during the 16th century established the southern ritual form, as well as important classical forms. They also introduced dancing into the *bhajan* ritual.

Islamic domination of India, which began in the 12th century, was most powerful in the 17th century. During this time the *bhakti* movement continued to spread and develop, inspired by waves of fervent singing poet-saints and spurred by Muslim religious oppression. At the same time religious acculturation occurred through the blending of Sufi (Muslim mystic) and Hindu concepts. The iconoclast Kabīr (d 1550) is representative of this infusion, as is Guru Nānak (d 1539), founder of Sikhism, a religion that combines Hindu and Muslim concepts.

Ritual environments are not specified in Hinduism; *bhajan* s may be performed anywhere, inside or outside, alone or collectively. Sometimes buildings or other enclosed structures are built or used exclusively for *bhajan* rituals. The traditional public focus for worship is the temple and its surroundings. Various sects have established *matha* s (monasteries), which often house resident monks and in which worship is performed daily. The *mandal* ('association') often comprises members of regional enclaves or worshippers of regional deities. The traditional Hindu home contains an area or room set aside for family and friends to worship in.

There is wide variation in both the location and the length of a *bhajan* performance. It may range from an hour or two up to many days if special rites are being observed. Some rituals take place during the day, others at night; most are carried out weekly, commencing at dusk, requiring two to four hours for completion. Attendance is often open to people of varying social strata; there may be from three or four to over 50 people, either of one sex only or mixed. The ritual sequence also differs regionally and from one group to another. It is composed primarily of *bhajan* songs performed in an ordered series, beginning and ending with formulae, that is, auspicious mantras or songs. The main body of songs accompanies worshipful acts such as the offering of food and flowers, the waving of lights, and symbolic dances. Rituals vary greatly in format from complex structures to the singing of a single phrase, repeated continuously.

The prosody of *bhajan* texts either conforms to or is influenced by traditional Sanskrit forms such as *pada* and *śloka*. Forms in which the names or praises of a deity are expressed can be arranged under the general heading *jāpa* ('repetition') and are as follows: the text of the *nāmāvali* ('row of names') consists of names, praises or supplications directed to the deity; *sahasranāma* ('1000 names') consists of a catalogue of 1000 names of a deity symbolizing the deity's attributes as being infinite. *Nāma parāyana* refers to the repetition of a single name such as Rāma or Śiva; a short phrase consisting of deities' names, called, in some regions, *pundarikam*, is used in group ritual. Usually a *mukhrā* (signature), the composer's name or pseudonym, is incorporated into the last stanza of a text. All textual themes are based on the attitudes of love and are augmented by the use of names, praises and supplications, including philosophical and didactic elements.

The musical elements in *bhajan* are intended to convey the all-important words. The rhythms used are comparatively uncomplicated, usually employing a *tāla* (time cycle) consisting of four beats. Melodies, especially those sung congregationally, are simple, direct and generally lack the complexities found in classical music. *Bhajan* songs are composed in *rāgas* that are limited to a few identifiable characteristics and are therefore easily recognized by the general public. *Bhajan* songs generally include either refrain-type or *jāpa* forms; the number of lines in refrains and stanzas and the numbers of repetitions of refrains vary with each performance. The *jāpa* forms vary in musical characteristics from the intoning of a single name to *sahasranāma*, which uses a range of a few pitches, and *nāmāvali*, responsorial songs employing ranges equal to refrain-type songs. The *pundarikam*, which is also responsorial, uses only two pitches. It is a formula song that announces the topic to follow or the deity to be addressed in the subsequent song. The *śloka* and comparable vernacular forms are performed solo and unaccompanied and are often associated with meditative sections of the ritual.

Musical instruments are used to accompany most *bhajan* songs and rituals. Although drums and cymbals are most common, any instruments may be employed by worshippers. Regional origins are reflected in the sizes and shapes of instruments and in other factors, including performance techniques. Drums, in particular, are drawn from both classical and folk traditions. Pairs of brass cymbals (*tāl*, *tālam*), generally ranging from 2 to 15 cm in diameter and varying greatly in shape and gauge, are struck together by singing devotees. Wooden or metal clappers (*kartāl*) of varying size with jingles or tiny bells mounted on them are also played by worshippers. The harmonium, a keyboard instrument originally brought to India by Christian missionaries, is a highly valued instrument. It is used as a melodic guide and general accompaniment while also providing the drone. The *tambūrā* (a long-necked fretless lute) and *śruti*-box (either an electronic drone or a small harmonium with a limited number of reeds) are also widely used drone instruments. Drum and harmonium players usually have some musical training and may be classed as amateurs or part-time professionals. Some instrumentalists and a few singers are paid for performing in *bhajan* rituals, but the motivation for all, including professionals, is worship.

India, Subcontinent of, §VI: Religious musics

2. Muslim.

Religious music is the main musical expression of the South Asian Muslim community. It has a viable and varied tradition and embodies regional Indian as well as supra-regional Islamic cultural elements.

South Asian Muslim religious music falls into two broad categories that from both a religious and a musical point of view are distinctly separate. One may be termed scriptural or liturgical or, according to Islamic theological tradition, *talhīn* (cantillation), the other non-scriptural or non-liturgical vocal performance or, in Arabic, *inshād* (plural *nashā'id*, invocations). Both are central to the active religious life of Muslims throughout the Indian subcontinent. The urban areas of past and present Muslim domination are the centres of Muslim religious music. The fact that this musical tradition cuts across geographical boundaries is directly related to the strongly supra-regional aspect of Islam, which is particularly notable in South Asian Muslim culture.

Islamic theology proscribes secular music as unlawful and dangerous; hence, Muslim religious music is not conceived of as music but falls into the permitted category of recitation or chant, where musical features are subordinated to religious text and function (see §V, 1 above). Since the use of musical instruments is identified with secular music, they are not used in chant (except for the unorthodox tradition of *qavvālī*; see below). South Asian Muslim religious music is generically related to other Islamic chant forms.

South Asian Muslim scriptural music is collectively called *qir'at* and includes all Qur'anic and liturgical texts in Arabic, including the call to prayer (*āzān*), the prayer ritual (*namāz*) and salutations (*salām*). *Qir'at* is chanted universally, by religious functionaries and laymen, in public and private settings. As the chanting of sacred texts, this tradition adheres closely to the established Arabic model imparted at theological schools. The layman's *qir'at* is generally modified towards an Indian tonal idiom.

Non-liturgical vocal performance falls into three categories identified by their respective contexts: the Shī'a *majlis*, the Sufi *qavvālī* and the Sunni *mīlād*. All three categories have their roots in Iran and indirectly in Arabia, and they share a set of basic traits. The primary context for all non-liturgical music is the religious assembly of a devotional or commemorative character focussing on principal religious figures of Islam. At each of these assemblies a variety of hymns and chants is performed in a standard order by more or less trained performers with limited audience participation. All texts are in vernacular poetry, principally in Urdu, the chief South Asian Muslim language. Other languages used regionally to some extent are Hindi, Punjabi, Sindhi, Pashto, Kashmiri, Gujarati and Bengali, in addition to classical Persian, which was formerly prevalent. The music itself represents a combination of characteristics derived from the text and a generally north Indian musical idiom. In the musical form, the *sthāyī-antarā* principle of north Indian song is adapted to the formal schemes of the poetry with extensions and improvisations. The rhythm is based on the metric structure of the poem. Different musical realizations of its long-short

patterns result in several rhythmic styles. Melodically, non-liturgical music is related to north Indian art and semi-classical music, ranging from complex rāga structures through traditional and popular melodies to rudimentary reciting tunes. The performance style, directly linked to the function of communicating religious poetry and conveying religious emotion, is characterized by emphasis on declamation as well as on beauty of vocal expression.

(i) **Majlis.**

The *majlis* ('assembly') encompasses all musical expression of the South Asian Muslim Shī'a community, a minority that gained cultural prominence through several Shī'a dynasties on the subcontinent. Shī'a religious practice is characterized by its emphasis on the mourning for the martyrdom of the imam Husayn, grandson of the Prophet Muhammad. As an assembly for the chanting of elegiac and commemorative poetry the *majlis* is the heart of Shī'a religious observance and may be private or public. *Majlis* are attended by all Shī'as during the Muslim month of Muharram, but may also be held throughout the year.

The five invocational forms of the *majlis* are *sōz*, *salām* (ex.19), *marsiyā*, *nauha* and *mātam* (ex.20), each stylistically and musically different. *Sōz*, *salām* and *marsiyā* derive from classical song, using specific rāgas and even substituting a vocal drone (*ās*) for the instrumental drone of classical song. The performers are usually trained professionals (*Sōzkhwān*, *Marsyākhwān*), but they may also be semi-professionals. *Nauha* and *mātam* reflect traditional or popular song and are performed by semi-professionals and amateurs, especially local chanting societies (*anjuman*). Here too a substitute for an instrument is used in the form of rhythmic chest beating, which provides *mātam* invocations with a regular pulsation. All five invocational forms represent versions of two rhythmic styles. Both are based on the long–short succession of the poetic metre and group the poetic feet in a variety of ways. One is an irregular rhythmic style, recitative-like and declamatory (ex.19), the other a regular rhythmic style with an underlying pulse and patterned into musical metres (ex.20).

Among linguistically/regionally defined traditions are the Ismaili *ginan*. These are a poetic repertory of Shi'a chant in Gujarati. They are central to the religious assemblies of Ismaili communities in both India and Pakistan. In Bangladesh the prominent genre of Shi'a vernacular music is *jarigan*, set to Bengali poetry.

(ii) Qavvālī.

Sufism, a major force in South Asian Muslim history and well-established throughout South Asian Islam, has developed its own poetry and music as an essential means for devotional expression and the attainment of religious ecstasy (*hāl*). *Qavvālī* or *mahfil-i samā* ' (gathering for listening') is the musical assembly held by Sufis throughout the year, but principally on the anniversary (*'urs*) of the numerous Sufi saints at their shrines or wherever their devotees may gather. The term *qavvālī* denotes the Sufi song itself, and only by implication the occasion of its performance.

The most authentic performers (*Qavvāl*) are hereditary professionals tracing their origin and performing tradition to the 13th-century poet and musician Amir Khusrau, who was linked with the Chishtī order of Sufism. *Qavvālī* is also performed by many other professionals in a less traditional style and by devotees at various shrines. The poetry in Urdu and Persian emphasizes either mystical love through the *ghazal* poetic form (see §IV, 2 above) or the praise of God, the Prophet and saints or imams through the hymn forms of *hamd*, *na't* and *manqabat*. Hymns based on poetry of both types constitute the main part of a *qavvālī* assembly; they are flanked traditionally by two hymns attributed to Amir Khusrau: *qawl* and *rang*. *Qavvālī* normally combines group and solo singing and is accompanied by drum, harmonium and hand-clapping. Percussion has traditionally been exempt from religious prohibition by Sufis because it articulates the heart beat and provides an essential stimulus to religious ecstasy.

Musically *qavvālī* is linked with the north Indian *khayāl* tradition of singing. The formal scheme combines metric group refrains and rhythmically free solo improvisations, including rapid melismatic passages. There is an incessant repetition of salient text phrases that build towards or maintain the state of ecstasy, and different verses and tunes are freely added within any one song. *Qavvālī* rhythm is dominated throughout by the poetic metre, which is realized either in a declamatory style of improvisation

superimposed on the continuing drum pattern or in a regular style where the pattern of the poetic metre fits into the drum pattern, generally four-beat time (*Qavvālī tāla*) or six-beat time (*Dādrā tāla*). *Qavvālī* melody derives from several sources: classical *rāgas*, *rāga*-like structures peculiar to the *qavvālī* tradition and traditional melodies are used within any one song to form several short tunes, with their many variations and melodic improvisations. In performance, emphatic enunciation and extremely rhythmic declamation are the most prominent features. *Qavvālī* is now freely performed outside the religious context and adapted accordingly, using a variety of instruments, texts with a popular appeal, and a more regularized form.

(iii) Mīlād.

Mīlād (from Arabic *mawlid*: 'birthday'), the assembly celebrating the birthday of the Prophet Muhammad, is widespread among the Sunni majority, particularly among women, and is therefore the most widespread form of South Asian Muslim non-liturgical music. *Mīlād* mainly consists of hymns of devotion and praise to God and the Prophet (*hamd*, *na't* and *munājāt*), usually performed by one or more semi-professionals alternately with appropriate narration or a sermon, some of which is chanted. The congregation joins in the standard closing hymn of salutation to the Prophet (*salām*) and sometimes in the simple chant of praise (*durūd*) interspersed with the hymns.

Of the three categories of non-liturgical music, *mīlād* has the most orthodox environment and lacks a tradition of professional performance, hence it is musically the least sophisticated. Its relatively large standard repertory of hymns is characterized by a preference for poetic metres with a regular pattern and by tunes with a limited tonal range and certain typical motivic formulae.

Outside the context of the three major religious assemblies described above, non-liturgical chant can be heard in a variety of other settings, including school and home as well as staged events for professionally performed *qavvālī*. In a religious community so strongly marked by gender separation, women hold separate and more frequent gatherings of *mīlād* and *majlis* than men, but *qavvālī* remains essentially a male domain.

(iv) Modern trends.

Recording and broadcasting technology have had a considerable impact on repertory and dissemination beyond religiously sanctioned contexts and has turned *qavvālī* performers such as the Sabari brothers and Nusrat Fateh Ali into stars of a genre that represents nation as well as religion. This has propelled *qavvālī* into the world music soundscape. Conversely, the proliferation of cassette recordings displays the sectarian as well as linguistic and regional diversity of religious hymns. Recordings have also brought Arabic musical influence, less to vernacular genres than to Qur'anic recitation.

In general the enormous spread and prestige of recorded and transmitted sound has led to Muslim religious music being adapted and standardized but also to it being preserved and enhanced, particularly in Pakistan with its

strongly Islamic cultural climate. In India, minority Muslim communities tend to preserve traditional chanting practices but, as in Pakistan, *qavvālī* has become modified into a popular trend and much recorded genre.

India, Subcontinent of, §VI: Religious musics

3. Christian.

The approximately 30 million Christians in India constitute a diverse set of communities differentiated variously in terms of race, language, region and caste. Migrations, conquests and colonizations over the centuries have shaped their history, and the resulting interactions between local traditions and external ones, especially those of the Middle East and Europe, have generated a wide spectrum of Christian musical styles, from the predominantly European to the more distinctively indigenous.

(i) The Syrian churches.

The liturgical and non-liturgical songs of the Christians in south India refer to the mission and martyrdom of St Thomas the Apostle, who, according to traditional belief, established Christian communities in the region now known as Kerala in the 1st century ce. The St Thomas Christians, as they are known, celebrate the life of the saint in songs and dances such as *mārgam kali* ('dance of the Christian way'). Persian Christians, who started migrating to Kerala in the 4th century, introduced the Chaldean liturgy in Syriac. Owing to hierarchical relations between the Indian and the Chaldean churches (from at least the middle of the 5th century) and to the use of the Syriac liturgy, ecclesiastical documents name the St Thomas Christians also as Syrians.

As a result of a series of divisions that took place among the St Thomas Christians from 1653 to 1908, there are five independent churches in Kerala: the Syro-Malabar Church, the Church of the East (Nestorian Church), the Syrian Orthodox Church, the Syro-Malankara Church and the Marthoma Church. The first two of these churches follow the Chaldean liturgy, originally in East Syriac; the others use the Antiochian (also known as Jacobite) liturgy, originally in West Syriac. During the process of vernacularizing the liturgies in the 1960s, translators took special care to adjust the texts in Malayalam to the metre and melody of the original Syriac chants. For instance, Syro-Malabar congregations sing the melody transcribed in [ex.21](#), which is designated by the first two words of the Syriac text, *kambel māran* ('receive O! Lord'), in the Office for the Dead with Malayalam translation of the text.

It is probable that a number of melodies that were once part of the common repertory of the Syrian churches in the Middle East and India are now extant only in Kerala. However, the existing melodies appear to have been indigenized somewhat over the course of time by incorporating musical elements such as the Karnatak seven-beat *Miśracāpu* and six-beat *Rūpakam tālas*.

While maintaining different melodic repertoires, the musics of the Chaldean and Antiochean liturgies in Malayalam share many common features: unaccompanied antiphonal singing of monophonic hymns; use of modal melodies as a compositional device; textual and melodic incipits; syllabic setting of text; neumatic or melismatic ornamentation of either the ultimate or the penultimate syllable of a text line or strophic unit; limited melodic range (in most cases of a minor 3rd to a perfect 5th); rhythmically free cadences at the ends of phrases; and the use of more than one metre in the same strophic melody. A number of these features are apparent also in the music of other performance genres of the St Thomas Christians, for example in wedding songs and the songs of *mārgam kali* (fig.10).

See also [Syrian church music](#).

(ii) The Catholic church.

Portuguese missionaries introduced the Latin rite to south and central India in the early 16th century. The Western music tradition established by the missionaries continues today in the churches of Goa and other metropolitan cities, where choirs sing Western-style hymns in harmony and counterpoint to the accompaniment of instruments such as violin, guitar and keyboard. In spite of initial ecclesiastical disapproval, Catholics in some regions actively participated in local music genres and contributed their own syncretic secular musics, such as the Konkani-language [Mandó](#), *dekni* and *dulpod* of Goa and Mangalore.

Since the 1960s the more tolerant attitude ushered in by the Second Vatican Council (1962–5) towards ‘non-Christian’ religions and their parent cultures facilitated the adaptation of indigenous dance and musical styles into liturgical and social celebrations. Throughout South Asia Christian *bhajan* s flourish in forms stylistically similar to their Hindu counterparts

(see §1 above). The numerous Ādivāsī converts to Catholicism in north India often recycle their traditional melodies with Christian texts and perform them to the accompaniment of dance. Gujarati Catholics dance the *rās* and *garba* (local dances otherwise associated with the Hindu *navarātra* festival) during Christian feasts, with song texts based on biblical themes. A number of Catholic cultural institutions in the north and south train students in *bharata-nāṭyam*, a south Indian classical dance performed with Christian lyrics.

(iii) The Protestant churches.

From the early 18th century, various Protestant missions from Europe and America evangelized in the east and north-east. The missionaries translated German chorales and Anglican hymns into South Asian languages (keeping the original melodies) for the new converts, who came mostly from the lower castes. The proselytization policies of the missionary groups have impacted variously in different regions. For instance, a general antipathy towards indigenous cultures together with the exclusive promotion of Western-style hymn-singing appears to have led to a marked decline of indigenous traditional music in the north-eastern states of Meghalaya, Nagaland, Manipur and Mizoram. In the south, however, the pioneering Lutheran missionaries, in particular, encouraged local musicians to compose songs in indigenous styles. Thus, there are two stylistically different music traditions among Protestant churches in south India popularly distinguished as ‘hymns’ and ‘lyrics’. German and English hymns and their translations in local languages are referred to as ‘hymns’, and indigenous compositions, such as *kīrtanam*, as ‘lyrics’.

The initiative to adopt south Indian art music to express Christian faith came mostly from singer-poets who converted to Protestant Christianity in the 18th and 19th centuries. Vedanayagam Sastryar (1774–1864) in Tamil Nadu, Purushothama Chaudhari (1803–90) in Andhra Pradesh, and Mosavalsalam Sastriikal (1847–1916) in Kerala, to name but a few, created a vast corpus of Christian poetic literature in their native languages. They composed poems following the *kīrtanam* of Karnatak classical music, using the tripartite structure of *pallavi*, *anupallavi* and *caranam*. These poems remain an integral part of worship, even though congregations do not always adhere strictly to the *rāga* and *tāla* prescribed by the composers.

India, Subcontinent of, §VI: Religious musics

4. Sikh.

Sikhism was founded in the Punjab in the latter half of the 15th century by the Guru Nānak (1469–1539). The Sikhs follow the teachings of ten *guru*s (‘teachers’) and the scriptures of their holy book, the Guru Granth Sāhib, written predominantly in Punjabi and compiled by 1604. Sikhs regard performing or listening to religious music as the primary form of worship; thus music plays a significant role in Sikh life. Their aim is for union with God and to break the cycle of reincarnation (*moksa*) by conquering the vices of *kām* (lust), *krodh* (anger), *lobh* (greed), *moh* (worldly attachment) and *ahankār* (pride). The *guru*s maintained that performing or listening to religious music was the ideal way to achieve this.

Sikh religious music, or *śabd kīrtan*, consists of hymns known as *śabd s* (mostly from the Guru Granth Sāhib), containing the teachings of six of the ten Sikh *gurus*, Hindu and Sufi saints and court singers (*bhatts*). The orally transmitted repertory developed over a period from the 15th to the 18th century (the time of the tenth *guru*). The term *kīrtan* was adopted from the Hindu *bhakti* movement and today may refer to either a collection of *śabd* or the performance of the hymns (*kīrtan* is thought of as being performed only for worship, not for a secular event). The texts of the *śabds* conform to Indian poetic forms of the time, often from local traditions (e.g. *salok*, *pauri*, *chant*, *sohilā* and *var*).

The melodies of the *śabds* are based either on Hindustani *rāgas* (except *rāga Mānjh*, which is particular to the Punjab) or Punjabi traditional melodies (*dhuni s*). *Śabds* following *rāgas* use little ornamentation and are in *sthāyī-antarā* form. The Guru Granth Sāhib contains *śabds* in 31 different *rāgas* in a given order (see Table 21). The largest number of *śabds* are in *rāga Gaurī*; *rāgas Srī*, *Āsā* and *Rāmkali* are also popular. The settings of texts draw on the *ras* of each *rāga* to help convey specific themes (Guru Rāmdas, the fourth *guru* (1534–81), is particularly noted for this). Strict adherence to the melodic characteristics of the *rāga* was considered less important than whether a given melody expressed the text well, and sometimes *rāgas* were adapted and varied, often by including elements of another. The *śabds* that are in a *rāga* follow Hindustani *tālas*, those in *dhuni*, traditional Punjabi rhythmic cycles.

TABLE 21: Śabds in the Guru Granth Sāhib

Order	Rāga name	Order	Rāga name
1.	Śrī	17.	Gaund
2.	Mānjh	18.	Rāmkali
3.	Gāuri	19.	Nat
4.	Āsā	20.	Māligāura
5.	Gujari	21.	Māru
6.	Devchandhāri	22.	Tukhāri
7.	Bihāgrā	23.	Kedārā
8.	Vadhans	24.	Bhairo
9.	Sorath	25.	Basant
10.	Dhanāsari	26.	Sārang
11.	Janitsari	27.	Malhār
12.	Tōdī	28.	Kānadā
13.	Bairāri	29.	Kalyān
14.	Tilang	30.	Prabhāti
15.	Suhi	31.	Jaijavanti*
16.	Bilāval		

*Added later.

Many instruments have been used in the past to accompany *kīrtan*, including *pakhāvaj*, *sāriṅdā*, *rabāb*, *sārangī*, *sītār*, *tāmbūra*, *taoos*, *kartāl*, *dholak* and *dhādh*. Today the most commonly used instruments are the harmonium and *tablā*.

There are three types of *kīrtan* performers (*kīrtaniyas*): *rabābis*, *rāgīs* and *dhādhīs*. *Rabābis* (for example, Guru Nānak's accompanist Mardana) were professional Muslim Mīrāsīs, whose lineage is almost extinct today. *Rāgīs* are often itinerant and non-professional musicians and the most common singers in *gurdvāras* (Sikh temples). The *kīrtan* ensemble usually consists of three *rāgīs*: two harmonium players (one of whom may also play a stringed instrument or cymbals) who sing, and a *tablā* or *jor* ('pair' of drums, identical or similar to the *tablā*) player who usually does not. These musicians may be men or, less commonly, women. Members of the congregation may volunteer to perform *śadb kīrtan*, in which case women more often sing and play harmonium while men more often play *tablā*. The *dhādhīs* are itinerant musicians who sing about social and political history.

Kīrtan may be sung in a traditional (based on Punjabi *dhunis*) or classical style. Guru Nānak based his singing style on *dhrupad*; when *khayāl* became popular it was adopted by the tenth *guru* (Guru Gobind Singh, 1666–1708). However, the main injunction is that *kīrtaniyas* should sing clearly to emphasize the text. Ideally, *kīrtan* should be performed with the *sangat* (congregation) present. Although the Guru Granth Sāhib mentions the importance of listening to the word of God (*bānī*), it emphasizes the recitation of *bānī* and the name of God by the *sangat* (*sadh sangat*). At times there is antiphonal repetition of lines between the *rāgī* and the *sangat*.

The performance practice of *kīrtan* has undergone many changes since the compilation of the Guru Granth Sāhib. Over the years some Sikh communities have simplified the *rāga* melodies and have based *kīrtan* on popular *dhunis* and film songs (though the latter are unapproved) to secure public accessibility and to facilitate group singing. While some *rāgīs* still sing in a classical style (i.e. those officially appointed at *gurdvāras*), others sing in a semi-classical style, using *tālas* such as *Dādrā*, *Kaharvā* and *Tintāl*. Today there is a large population of Anglo-American Sikhs, some of whom have introduced string arrangements of *kīrtan*.

[India, Subcontinent of, §VI: Religious musics](#)

5. Jain.

Jain worship is virtually always accompanied by music: hymn-singing in daily worship at home or in a temple; chorus singing of liturgy; auspicious music marking processions or temple dedications (often played by marching bands); informal group singing at festivals; and songs of praise sung to welcome mendicants or to celebrate the completion of strenuous austerities. Since mendicants are not permitted by doctrine to perform many of the rituals performed by the laity, singing becomes a locus of mendicant devotional practice, especially among Jain nuns. Even the simplest form of worship, *darśan*, is usually accompanied by a hymn.

In spite of this ubiquity of music, Jains do not articulate a truly separate musical tradition; for the most part Jain music shares its musicality with the traditional musics of each group of Jains. Gujarati Jains share most of the melodies, timbre, ornamentation, etc. with Gujarati traditional music for weddings or *garbā* music associated with the Hindu Navrātri festival. Rajasthani Jains use Rajasthani Manganiyār and Dagar musics in their performance styles and melodic repertoires.

There are few attributes that mark Jain music as clearly distinct from the local traditions, but there is often a difference in character. Jain music is virtually always performed in a tone of restraint and precision that reflects the dominant Jain religious values of restraint and control. Almost all Jain music seems to strive for the sentiment of peacefulness even in celebration. Another unique feature of Jain music is the use of a seated dance (an adaptation of *rās-garbā* dances, two facing seated rows of singers clashing short sticks, or *dandiya*) as percussion to mark time in the performances.

Historical and mythological records are equivocal. Jain mythology credits Rsbhanāth, the founding saint (*jina*) of this era, with the creation of music. The mythological source for Jain devotional hymns is the *Śakra stava*, which Śakra (Indra), the king of the Gods, recites to celebrate the birth of each *jina*. There are a variety of devotional genres called hymns (*stotra*, *stavan* and *bhāvnā gīt*), distinguished from each other by performance context and lyrics. The liturgical texts – *pūjā* texts, *devvandan*, *pratikraman* – include the musical forms (*dohā*, *dhol* and *chand*) associated with the Gujarati and Rajasthani genres (beginning in the medieval period) called *rāso* and *dholā* respectively. In the 13th century the rise of temple-dwelling monks led to performances by female dancers and of music in the temples, much like those in the contemporary Hindu temples. This music may well have been related to the classical music of the era and may be a source for some of the *rāga* designations that one can still find in *stavan* books. While there are classical *rāga* designations assigned as melody names for many liturgical texts, they are usually paired with a melody name from a well-known traditional song or the increasingly common Hindi film song melodies.

Despite textual injunctions against women dancing, clapping and leather in temples, Jain music includes all of these today. In the devotional textual tradition one finds references to a few instruments, the most common being bells, especially large brass temple bells, and drums. In contemporary temple practice one usually finds either unaccompanied vocal music or voice accompanied by a double-headed barrel drum (*dholak*) or a single-sided barrel drum, along with a combination of bells, hand cymbals and tambourines, and the *dandiya* used in the seated dance described above. It is increasingly common at festivals or major celebrations to find an amplified chorus accompanied by harmonium, *bānjo* (or *bulbultarang*), synthesizer and/or *tablā* replacing the more traditional *śahnāī* and kettle drum ensemble. The marching band, comprised variously of clarinets, trumpets, drums, *śahnāī* and portable electric organ, accompany most Jain parades for mendicant initiations, marriages, temple image processions and the procession of those who have completed extensive fasts.

India, Subcontinent of

VII. Local traditions

Indian society is complex: the constitution recognizes 18 languages, most of which have their own script, and there are many others both written and spoken (see §I, 1 above). The major linguistic divide is between the north (languages such as Hindi, Bengali and Marathi) and the south (Kannada, Malayalam, Tamil and Telugu). India's geography – the Himalayas in the north, the fertile Gangetic alluvial plain, desert in western Rajasthan, the scrub or forest of the Deccan plateau and tropical coasts – suggests that there would be distinctive regional adaptations, and there are. Although some 80% of the population is classified as Hindu, there is much diversity in local religions. Roughly 11% of the population is Muslim, and there are millions of Sikhs, Christians and Jains, among others. Nearly 8% of the

population are Ādivāsīs ('indigenous' or 'tribal' peoples), and there are over 2000 castes (named, ranked, endogamous social categories usually associated with an occupation). There are great differences between rural and urban culture as well.

Through this cultural diversity run unifying threads. The importance of devotional religion (*bhakti*) in India is one, and the importance of music in devotional religion is another (see §VI, 1 above). Also having an important bearing on local traditions is a national literacy rate of 52%. (State literacy rates vary widely.) Because many do not read and write, oral tradition remains important as a source of ideology. Some 74% of India's population is classified as rural, and rural areas tend to have lower literacy rates. Only about 40% of women are literate. This reflects another important pattern, the different worlds of Indian men and women.

1. North India.
2. South India.
3. Ādivāsī music.
4. Local traditions and classical music.
5. Music and cultural change.

India, Subcontinent of, §VII, 1: Local traditions, North India.

(i) Non-professional musicians.

(a) Women's music.

Indian women sing group songs that men do not sing, and vice versa. Women, moreover, sing more than men. Men and women are somewhat segregated in their daily routines, and in rural north India purdah (customs resulting in the seclusion of women from public life) continues, although in a less than stringent form. Indian women learn, through the songs they sing, the stories of important deities such as Kṛṣṇa and Śiva and the powers of deities such as mother goddesses. Their songs also concern kinship relationships and associated feelings, for example the anguish of separation from their husbands and the conflict between a woman and her husband's mother, who is co-resident in the joint family. The joint family (two or more related couples sharing a hearth) is still the ideal in much of rural India, although it is probably attained in no more than 30% of families.

Women sing for the most important rites of passage, in particular at childbirth, marriage and death. The songs transmit fundamental religious beliefs and social sentiments, and they are sung and heard by hundreds of millions of people. Women's song, as well as other music, is considered to be *mangal* ('auspicious'), regardless of the content: the songs are believed to assist in attaining the goals of the rites in which they are performed.

[Ex.22](#) was recorded in 1995, sung by three different groups of non-specialist upper-caste women (Srotriyā Brahman, Bhumiḥār Brahman and Kāyasth castes) in three different wedding rites in Muzaffarpur and

Madhubani in Bihar. With its use of the word *sube* (related to the Hindi *śubh*, 'auspicious') in each line, the song is even more explicitly auspicious.

Be it all auspicious, auspicious oh auspicious. [repeated]
Let it be auspicious for the groom's father's older brother's wife, let it be auspicious for the groom's father's older brother.
Be it all auspicious, auspicious oh auspicious. [repeated]
Let it be auspicious for the groom's father's sister, let it be auspicious for the groom's father's sister's husband.
Be it all auspicious, auspicious oh auspicious. [repeated]
Let it be auspicious for the groom's mother's sister, let it be auspicious for the groom's mother's sister's husband etc.

Like all women's group songs this is repetitious. It is strophic, but like many women's songs each line of text is only a variation on one line of poetry with a change in a single term, in this case the term for the relative being blessed. The inclusion of many relatives beyond the nuclear family clearly reflects the importance of such kin and honours them.

Women in northern Bihar do not accompany their songs with a drum, but in many regions, including Uttar Pradesh and south-western Bihar, it is not unusual for one of the women of the group to play the *dholak*. Although women play it with bare hands, some professionals tie small sticks to two fingers of their right hand to give the right hand strokes an even sharper sound. It is the most common drum and possibly the most common musical instrument in north India.

Women's music is monodic with varying amounts of ornamentation. The amount of ornamentation is the outcome of conflicting tendencies. Given the ability and the creative urge, even non-specialist singers will decorate the melody. However, this is opposed by the necessity of singing in union, which is aided by simplicity. The melody of ex.22 is typical of women's song melodies in that it comprises two strains, with the second having a greater range, going higher and having tones not found in the first strain. This kind of melodic structure is shared not only with many other kinds of traditional music but also with Hindustani music (see §III, 5(i) above).

Ex.23 is a women's milling song that deals with the difficult mother/daughter-in-law relationship. It was sung by Brahman women in Ballia District, eastern Uttar Pradesh. In north India residence after

marriage is traditionally patrilocal, that is the wife moves in with her husband in or very near his natal home. Village exogamy is also practised, so the young woman moves from her natal home into a family and village of strangers. Many women's songs speak of the difficulties a woman has in her husband's family. Here the mother-in-law curses the daughter-in-law's family in response to her accidental lapse of modesty. The daughter-in-law can bear the tyranny of the mother-in-law no longer.

With a golden broom, oh Rāma, she sweeps out the courtyard.

She goes out of the courtyard, oh Rāma; her sari falls open
Sitting on a stool, oh Rāma, the honourable mother-in-law says,

'I will kill your brother, the wife of your elder brother, and your brother's daughter'.

The mother-in-law gives, oh Rāma, the golden pitcher

The daughter-in-law takes in her hand, oh Rāma, the silken draw-rope

To fill the pitcher, to fill the pitcher at the bank.

She drowns herself, oh Rāma, she sinks in the Yamuna river.

Women's ritual songs were once considered imperative for weddings and other rites of passage. This requirement is weakening as more and more recorded music is used in rituals. Women also sing songs that are primarily recreational, either as an end in itself or as an accompaniment to repetitive work such as rice-transplanting or milling grain. Two other common traditions in women's singing are the singing of a type of teasing, often obscene song (*gāṭī*) by family-centred groups of women to their visiting in-laws and other visitors, particularly at weddings; and on the death of a family member, a solemn genre that is between crying and singing (Hindi: *vilāp*). In these songs women improvise on themes ranging from how they will miss the departed person to a grievance the singer has with a person of higher status. In eastern Uttar Pradesh these songs are performed with just a few tones.

(b) Men's music.

Of non-specialist men's music the most common genre is that of group devotional singing (fig.11). Two words in India commonly used for devotional songs are *bhajan* and *kīrtan* (see §IV, 1 above). The two categories refer to many different types of song. In western north India *kīrtan* refers most commonly to repetitious hymns sung by groups of non-specialist males. One member of the group plays the *dholak*, and others accompany with clapping or with small cymbals called *mañjīrā*, *jārī*, or *jhāñj* (slightly larger); often one man plays the harmonium, introduced by French

missionaries. The music is intended to generate ecstasy, and its strategy is for the initially moderate volume and tempo to increase slowly to a more intense level. This pattern is repeated a number of times during the course of a session. The texts of devotional songs express devotion to deities that vary according to region. Khandoba is worshipped in the western Deccan plateau, Rāma, Hanumān and Kṛṣṇa are popular in Uttar Pradesh, and Durgā and Kālī are popular in Bihar, Bengal and Assam.

[Ex.24](#) is a *nām-kīrtan* recorded in Varanasi (locally called Banāras). In *nām-kīrtan* the text of the song consists only of the alternation of the name(s) of the deity. Here, the names of Rāma and his wife, Sītā, are repeated throughout the song. Rāma is the hero of the Rāmāyana, one of the two most important epics in Hinduism, and in the Varanasi region Rāma is identified with *Bhagwān* ('God'). The name of the deity 'surpasses the level of symbol. The vibrations of its utterance are considered to be one form of the absolute' (Slawek, 1986, p.111). Here again we see the melody in two parts with slightly different scales. The fervid, percussive quality of the music is typical of non-professional men's devotional music.

(c) Specialist repertoires.

This third category is subdivided into two groups: first, the self-conscious, urbanized singer, singing either folk songs garnered in the field or new compositions, and secondly, the non-professional but adept performer. A young man recorded in Madhubani, Bihar, in 1995, exemplifies the category of urban folk singer. He was one of three men who were recorded in different locations in northern Bihar who sang a song well known by speakers of the Maithili language, *Kakhan harab dukh mor*. This song, clearly a part of the oral tradition, is attributed to the 14th–15th-century Maithili poet, Vidyapati. His songs are one of the distinguishing cultural features of the Maithili region. The song is often sung as a *parāti* or *prabhāti*, a devotional genre sung solo and unaccompanied in the very early hours of morning as an offering ([ex.25](#) was recorded in a session in Madhubani convened for documentation purposes). The song gently admonishes the deity Śiva, here called Bholā Nāth.

Hey, Bholā Nāth, when will you take away my sorrow?
I was born in sorrow; I grew up in sorrow.
Even in my dreams there was no happiness.
Rice and sandalwood on a wood apple leaf and incense I

offer you.

So sings Vidyapati: hey Bholā Nāth, when will you take away my sorrow?

The singer, Prasanna Mani Jha, sings in cultural programmes and at civic functions. Classical tendencies are evident in his performance, which differed from the other two versions of the song collected, in his long sustaining of some tones and elaborate melody. The opening melodic formula found in this song and the long convex curvature of the melody are common stylistic traits of traditional songs, especially the women's songs, of northern and western Bihar and eastern Uttar Pradesh.

A herder in eastern Uttar Pradesh who performs a musical 'holler' (a song intended to be heard over a long distance) also serves to illustrate this category of 'non-professional specialist' (ex.26). The song is called *kharī birahā* and is performed by members of two castes associated with herding, the sheep-herding Gareriyā caste and the much more numerous cow-herding caste called Yādav or Ahir. The herder spends much of his time at a distance from other people, and the *kharī birahā* allows him to communicate with them. A man also may sing it simply for his own enjoyment or when he is with a group of his caste members, in which case they will join in on the last word of a line of poetry, usually a verb.

In its most common form the singer chants the first two lines of text primarily on the tonic. In the remaining two or three lines the singer lifts the melody up a substantial interval into a range in which he can sing at his highest volume – the *kharī birahā* can be heard for a mile or more across the flat countryside – and then slowly lowers it back to its starting point. The pitch-collection of the *kharī birahā* is unique in the music of this region.

Devotional (primarily Vaisnava but also including *nirgun*, the formless divine) and philosophical topics predominate in the *kharī birahās* heard today, although some are concerned with heterosexual attraction and love. The text of the *kharī birahā* presented here refers to an episode in that period of Kṛṣṇa's mythical life when he was involved with Rādhā, a *gopī* or 'cow-maiden'. Her love for Kṛṣṇa and passionate yearning to be united with him is taken as a model for *bhakti* devotion. The song states that she was so entranced by the sound of Kṛṣṇa's flute that she could not even pick a ripe plum from the bowed branch. Most *kharī birahā* texts are similarly able to stand on their own as an image, vignette or devotional assertion.

The *kharī birahā* is an emblem of the herding castes, the Yādavs in particular. The *kharī birahā* singer is an unpaid specialist who knows songs most others do not know and who has developed a distinctive performance style that requires ability, time and effort to master. His recompense is his own gratification and the respect and admiration of his neighbours and members of his caste.

[India, Subcontinent of, §VII, 1: Local traditions, North India.](#)

(ii) Professional musicians.

These musicians perform for a fee, for entertainment or to fulfil a religious objective of the patron. They may use distinctive instruments, and they perform distinctive items as well as some common ones. (The category need not be confined to hereditary musicians.) In the north-western state of Rajasthan, where inherited relations between patrons and professional music castes were common until the mid-20th century, musicians of this category included the Dholis, Jogīs, Manganiyārs, Langās and *bhopā* s. All

of these performers, as is generally true of professional traditional singers, are at the lower end of the social hierarchy.

The social system that gave rise to Rajasthan's musical specialists and those of many other states is a system of inherited patron-client relationships called *jajmānī*. Before 1947 Rajasthan was comprised largely of kingdoms. Most rulers, and some of their landowners, had courts that employed musicians. All families of means, however, inherited relationships with certain families whose members provided goods or services (such as priests, washermen and musicians) and who were compensated by shares of the harvest or cash payments. The head of the family for whom the services were provided was the *jajmān*. The *jajmānī* system is in a state of continuing decline today.

According to Kothari (1944, p.210), the musical caste most commonly patronized by Rajasthani ruling castes was the Raj Damami, a sub-group of the Dholi caste. Traditionally musician families in these castes received small amounts of cash for services such as performing at weddings, and a certain weight of foodgrains per field at harvest time. Patrons might also contribute towards the service caste's wedding and other expenses. When the courts were abolished in 1947 many such musicians lost their base of support. Some found employment in brass bands, but many had to take jobs unrelated to music. Musicians who served non-aristocratic patrons continued to receive patronage, and thus survived. One such group is the Manganiyārs.

(a) Manganiyārs.

Professional musicians.

(a) Manganiyārs.

The Manganiyārs are a Muslim caste living in the Jaisalmer, Barmer and Jodhpur districts of Rajasthan, whose numbers are estimated at around 3000–5000. They provide music primarily to Rājput̄s but also to lower castes. Their special instrument is the *kamaicā*, a bowed lute. Manganiyārs are also known for their virtuoso playing of *khartāl*, a pair of wood clappers. Their onomatopoeic term for the instrument is *rāigidgidī*.

Like many other professionals in Rajasthan, the Manganiyārs traditionally played mostly at the rites of passage of their patrons, especially at weddings. They play ritual songs whose performance is simply imperative, as well as entertainment songs in a special session called *kacerī*, where they play for an audience that listens and evaluates their performance. The Manganiyārs play four types of song: songs in praise of patrons, devotional Hindu songs, romantic ballads and songs derived from women's songs (Jairazbhoy, 1984, p.23). An example of this last category, called *ambāvārī*, concerns the wedding and is played during the ceremony (ex.27). Its text is typical of a class of wedding songs listing things to be made or procured. This one mentions festoons of the auspicious mango leaves, the wedding canopy, special fabric, bangles, shawls etc. Such songs may serve as a device to help participants remember what needs to

be done. The notation of the song shows many florid passages and ornamentation similar to that of Hindustani classical music, sung at a rapid tempo. Many scholars have discussed the connection between the musical styles of professionals like the Manganiyārs and the Hindustani classical tradition.

India, Subcontinent of, §VII, 1(ii): Local traditions, North India., i)
Professional musicians.

(b) Bhopās.

The *bhopās* perform various martial epics, the most common of these being the story of Pābujī. Some of the *bhopās* are from an Ādivāsī group (the Bhils), but most are of a caste called Nāyak. Although today many perform for tourists, traditionally they sang mostly for families of the Raika herding caste. The context calling for a *bhopā*'s performance is traditionally a religious one, common for professional musicians across India. Smith (1991) notes that the performance is both entertainment and ritual, but Kothari (1994) states that the performance itself is the most important objective, not its enjoyment. A family sponsors a performance to fulfil a vow made to a deity or spirit to gain assistance in dealing with a problem such as barrenness of women or animals, or a series of illnesses or deaths. A family might also sponsor a performance to gain religious merit. This often involves performance of another Indian musical institution, the all-night wake (*jāgaran*), which is held to mark marriages, births, deaths and the completion of vows.

Before the *bhopā* begins his recitation he erects the *par* (a scroll painting on a cloth around 1.5 m high and 5 to 6 m long, crowded with painted scenes from the epic) and performs *ārātī* ('fire sacrifice') to Pābujī. As well as being the epic hero, Pābujī is worshipped at his own shrines by the Raika herding caste and others. Most *bhopā*s play a bowed lute called *Rāvanhatthā*. In addition to the jingles attached to the bow, the *bhopā* also ties bells to his ankles that sound as he dances. Other *bhopā*s use instruments such as the stick zither with sound-amplifying gourds at each end called *jantar*. The *bhopā* of the permanent shrine plays a large clay pot with parchment stretched over the opening.

The essential story of Pābujī is as follows: Pābujī, the son of a Rājput and a celestial nymph, promises to give camels to the daughter of his half-brother as a wedding gift. On returning from Lanka with the camels he has stolen, he is seen by the princess Phulvanti, who falls in love with him. In the middle of their wedding a little bird tells him his relative's cattle are being stolen, and he goes to the rescue with his half-brother and their men. All are ultimately killed, and Pābujī ascends to heaven in a palanquin. His half-brother's wife, Gahlotan, sees the battle in a dream and tells Pābujī's would-be wife. They commit *satī*. However, Gahlotan is pregnant, and before entering the flames she cuts open her belly and extracts the infant male. He grows up and one day discovers his origin. He vows revenge on and eventually murders Pābujī's killer; he then becomes a renunciant.

The *bhopā* sings this complex tale alternately with his wife or a caste brother (ex.28), who holds a lamp by the scroll painting and declaims the story while one of them points out scenes on the cloth. Although they know about 12 hours of text, they never perform it in its entirety. They sing it to multiple melodies, and the styles of these vary substantially from performer to performer. Smith (1991) observed that one tune was used most commonly for the first stanza of each section; one tune seemed to be an extended version of another; one tune is restricted to a certain bit of the story; and three of the tunes are for the *bhopā*'s dances. Why alternate tunes are used for different parts of the story is unclear. The dances are rhythmic, and the melodic contrast may serve to maintain the interest of the

audience. The variation may also help the performers to remember the text.

It is likely that the epic of Pābujī is an elaborated story of a *bhomiyā* god (Kothari, 1989). This is the generic name in Rajasthan and Gujarat for a warrior who died in pursuit of cattle thieves. Pābujī is referred to numerous times in the epic as a *bhomiyā*, and the memorial pillars in his shrines are similar to those of the other *bhomiyās*. Villagers establish a shrine for the dead warrior and worship him as a minor deity. In certain cases the spirit is manifest through a medium, usually a *bhopā*. His singing of the hero's story at Pābujī shrines induces his own possession by the spirit. (It should also be noted that the epic and its performance serve to enhance the reputation of the spirit and shrine.) The medium then begins to help the local people by divination and magical healing, and the shrine becomes popular, sometimes drawing people from a large area.

It has been noted that the story of Pābujī manifests a pattern (violation, death, deification and revenge) found in the epics of local, sub-regional and regional hero or spirit cults throughout India. Epics such as these embody the belief system, particularly the origin and nature of the god, on which particular caste and shrine rituals are based. In Blackburn's comparative study of Indian epics (1989) it is argued that this pattern is true of those epics that are used in ritual worship, not the ones of transregional distribution sung purely for entertainment, such as the Ālhā and Dholi. The performance context (caste- or shrine-sponsored ritual in this case) is one element determining the content of the epic.

[India, Subcontinent of, §VII, 1\(ii\): Local traditions, North India., i\)](#)
[Professional musicians.](#)

(c) Mendicants.

Both Hinduism and Islam emphasize the importance of charity and its bearing on salvation. Known to some outside India is a type of musical mendicant called Baul, of West Bengal and Bangladesh (see [Bengali music](#)). A group of Bauls associated with the singer Purna Das Baul has performed in the West since the 1960s. Most Bauls now play more often for religious fairs, but the role was traditionally that of itinerant mendicant. They accompany their melismatic songs (some of which convey Krishna cult doctrine and some tantric and other religio-philosophical systems) with a plucked lute (*dotāra*, 'two strings') that has four or five strings, a variable tension chordophone called *khamak* and other instruments. The *khamak* is an inverted single-head drum with a string that passes up through the hollow chamber and is tied to a knob. The player holds the inverted drum under his left arm and the knob in his left hand. He plucks the string with a plectrum or finger of his right hand while changing the pitch by increasing or decreasing the tension of the string with the knob in his left hand. Other similar instruments used by Bauls are the *gopīyantra* and the *ānandalaharī* (see [Variable tension chordophone](#)).

The kind of sound produced by these instruments, a tone of changing pitch in a lower range (its ascending form suggested by 'bu-ump' spoken with rising inflection), is very characteristic of Indian music. It is heard in the *bhapang* of eastern Rajasthan, in the sound of the left-hand head of the *dholak* and *mrdangam*, and in a family of hourglass drums with variable tension heads, including the *huruk* (north India), the *udukku* (south India),

whose similar names evidence their common origin, and the *damarū*, found throughout India.

Similar to the Bauls are the so-called *jogīs* of Uttar Pradesh and Bihar. They accompany themselves with the *Sārangī*, the bowed lute used in Hindustani classical music. Often only two strings are present, and one of these will provide the drone. The *dotāra* mentioned above has one or more drone strings. The bowed lutes usually have one or more, and many mendicants all over India play a single string plucked lute (*ektāra*, *tuntune*). The *jogīs* sing (for donations of grain, old cloth or cash) a variety of religious and philosophical songs, including some called *nirgun bhajans*, whose content is similar to some of the Bauls' songs. These songs promote the ideas of non-attachment to the mundane world and devotion that need not be externally visible, to a formless (*nirgun*) deity (a deity without attributes). They lambast official priests and religion. Sung throughout India, songs of this heterodox type combine ideas from Buddhist mysticism, Advaita Vedanta, Tantrism, Yoga, the Nāth cults and Sufism.

Nirgun bhajans are also sung by the blind mendicants called Surdas, after the blind 16th-century Vaishnava poet-saint. In 1990 mendicants of this type (who come from no particular caste) were still to be seen plying their trade in eastern Uttar Pradesh (fig.12). The young man whose song is notated in [ex.29](#), Rajendra Gaur, was recorded on the train that travels daily from Varanasi to Mau in eastern Uttar Pradesh. His song preaches that death is inevitable and the body lives only 'four days', i.e. the four *āśhram* or stages of a devout man's life in times past (student, householder, forest hermit, renunciant). Salvation requires wisdom and non-attachment, and one should think about donations to the poor. Kabīr was a medieval poet-saint of this region, and many of the *nirgun bhajan s* are self-attributed to him.

So, brother, the wise man hits with knowledge, the hunter hits
with an arrow,
From not subduing the senses, the body dies
But arrogant egoism never dies, as was said by Kabīr.
People, why is there the treacherous bandit?
This body is but a visitor of four days.
Don't be proud; one day you will go for sure.
For your going a bamboo conveyance is made.
This body is but a visitor of four days.
You will make thousands, millions of rupees; you won't take
even a cowrie with you.
No matter how much you earn, it will all stay here.
Now there is made a red shroud for you to wear.
This body is but a visitor of four days.
Keep the thought in your mind, keep the thought in your mind.
Think about donations to the poor.
Then this is wisdom for you to think about.
This body is but a visitor of four days.
Four bearers will lift the palanquin and carry you to the
burning ghat.
This body is but a visitor of four days.

So Kabīr has sung and gone to heaven.
On this earth your mark has gone, a symbol of your good
work.
This body is but a visitor of four days.
People, why is there this treacherous thief?
This body of yours is made of dirt.

The tunes of *nirgun bhajans* are of no single type. Any tune, including those of film songs, may be put to a *bhajan* text. The unknown composer of this song set the text to a *qavvālī* tune. Orthodox *qavvālī* is sung in leader-chorus format at Sufi Muslim assemblies, especially at the anniversaries of Sufi saints. This religious form evolved into popular *qavvālī* (see §VI, 2(ii) above). In the popular form non-Muslim texts are sung to the same musical style: solos in free rhythm alternate with heavily rhythmic and repetitious refrains sung by a chorus with the same intensity of feeling as the men's devotional singing. In this *nirgun bhajan* the choral portion is absent and the entire song is in free rhythm.

India, Subcontinent of, §VII, 1(ii): Local traditions, North India., i)
Professional musicians.

(d) Processional bands.

Contrasting with the sacred public music of the mendicants is the mostly secular public music of processional bands. These bands play in civic festival parades such as the anniversary parade of the city of Jaisalmer and the *Śiva Rātra* parade in Varanasi, as well as in processions that are part of familial rites of passage. Their most common job is to lead the groom's wedding party to the bride's home or rented hall where the wedding is held (a *bārāt* procession). As weddings abound (especially during the astrologically appropriate seasons), processional bands are frequently encountered in public life in India.

The kind of processional bands preferred by their employers has changed with time. Royal families and chieftains used to employ, at the bare minimum, pairs of large kettledrums (*nagārā*). Poorer families in and around Varanasi even today hire a small group of percussionists, usually playing a frame drum (*daphalā*), a gong and a pair of kettledrums, for this kind of function. These *daphalā* groups come from the Camar caste, whose traditional job was removing animal carcasses and processing the skins. The association of untouchable castes like the Camars with drumming and drum-making is, or was, pan-Indian.

Families with more to spend use the next oldest kind of group, the *śahnāī* ensemble. The sound of the *Śahnāī* or similar instrument is considered especially auspicious and therefore appropriate for weddings. The *śahnāī* is a double-reed aerophone introduced in India by Muslims around the end of the 1st millennium ce. The holes in its body are covered by fingers rather than key pads. The *śahnāī* ensemble consists of a lead *śahnāī* player, one or more support players who play in unison and fill in when the soloist takes a break, one or more players of drone *śahnāīs*, and a drummer who plays a pair of small kettledrums called *duggī* and *khurdāk* (fig.13). Like the brass bands they play mainly film music but also the occasional folk tune. In northern Bihar the double-reed aerophone ensemble is that of the *pipāhī*, a shorter version of the *śahnāī*, with a cylindrical rather than a conical bore and an integrated bell. A similar double-reed aerophone, the *surnāī*, is used in Rajasthan.

Families of relatively more means who want the procession to appear modern or fashionable prefer the brass band (in some places called *angrezī* or 'English' band), which has been in India for at least two centuries. Its players, in brightly coloured Western-style uniforms, use Western band instruments, now in some cases bolstered by amplified keyboards and Hawaiian-type guitars. Trumpets or clarinets (sometimes saxophones) usually play the lead roles, and euphoniums (baritones) play the adumbrated melody an octave lower, while percussion is provided by snare, bass, side drums and maracas. These bands range in size from half a dozen to several dozen men and boys. The players may be subdivided into three echelons of proficiency and permanence in the group, with those in the most expendable bottom level contributing more visually than musically (Booth, 1990). Today bands play mainly pop music, which means mostly film tunes, but also Indian folk tunes such as *kajālī* and Western marches, folk and pop tunes. A few decades ago in the Varanasi area they still played items they referred to with the names of Hindustani rāgas such

as Pīlū and Bhairavī, although these did not conform to classical norms. The latest fashion is for the soloist, often a trumpet player, to play from a hand-pushed flat-bed wagon with a diesel motor-driven generator on it that powers not only an amplification system with echo and reverberation, but also the bevy of fluorescent lights carried by bearers who walk among the bandsmen.

[India, Subcontinent of, §VII: Local traditions](#)

2. South India.

While many common themes may be identified running through performance across South Asia, southern India is linguistically and culturally distinct by virtue of its languages, history, geography and religious practices. In contrast to the Indo-European north, south India is populated by Dravidian language speakers (Telugu, Kannada, Malayalam and Tamil) who, in general, inhabit the modern states of Andhra Pradesh, Karnataka, Kerala and Tamil Nadu respectively. South India has relatively little history of Muslim rule, a geography comprising the Deccan Plateau, the Western and Eastern Ghats and fertile coastal regions, and an overwhelmingly Hindu population that, while acknowledging the pan-Indian gods of the Sanskrit pantheon, more often owes a primary allegiance to a regional deity; many people also worship and propitiate a complex network of village goddesses. This distinctiveness has been expressed politically through regional political parties and, particularly in the mid-20th century, by the pan-Dravidian movement. Devotion is an element of many South Indian genres, as are the differing spheres of public and private space, expressed in the Dravidian terms *akam* ('house', 'interior') and *puram* ('exterior'; see Ramanujan, 1986, pp.44–51; Claus, 1991, pp.139–40).

In contrast to north India, the south has been relatively ignored by ethnomusicologists until recently, and information on the local musical traditions of south India has to be gleaned from a wide variety of sources. A.A. Baker's monumental collection of south Indian traditions carried out in 1938–9 is still to be fully investigated, although a preliminary study has been undertaken by Nazir Jairazbhoy and Amy Catlin (1991). Further information lies in the work of scholars investigating folklore and oral epics, in the *Fairs and Festivals* section of the 1961 Government Census and in Thurston and Rangachari (1904).

(i) [Vocal performance.](#)

(ii) [Instrumental musics.](#)

[India, Subcontinent of, §VII, 2: Local traditions, South India.](#)

(i) Vocal performance.

Vocal traditions in south India vary across both caste and geographical boundaries, and according to context and the gender of the performers. However, certain practices may be grouped together, displaying either common contexts, themes or groups of performers. In addition to devotional genres and genres delineated by gender, local song traditions have been used in the political sphere, both by the state and against it. The use of local musics as a form of resistance is typified by the Andhran folk singer Gaddar, founder of the Jana Nāṭya Mandali, the cultural wing of the outlawed People's War Group of Andhra Pradesh. Although primarily aimed at encouraging a political consciousness among the dispossessed,

Gaddar's songs, with their explicitly Marxist messages, are widely popular and have been used in many films. Vocal genres also provide evidence of the movement of peoples within and into south India. Marathi *lāvanī* were brought to Tamil Nadu in the 18th century (Deva and Kuckertz, 1981, p.43). Traditional lullabies sung by mothers in agricultural settlements in the hills of northern Kerala originated in the region around Ernakulam. Under land reform measures families had been encouraged to move by the State Government from this populous area to others where land was more easily available.

(a) Women's song.

The category of 'women's song' covers many genres, used variously to comment on the singer's social position and domestic circumstances, and for devotion. Brahman women in Andhra sing passages from the Rāmāyana at private gatherings or while carrying out domestic work. Men are usually excluded from these performances, although they may overhear them. The women build a narrative that concentrates on the role of Sītā, episodes concerned with childbirth, marriage and relations, and the revenge of Rāvana's sister Śūrpanakha. Although the songs are not overtly provocative and are sung primarily as an act of devotion, V. Narayana Rao (1991, pp.128–30) has argued that women use these performances to challenge the male-dominated tellings of the Rāmāyana (to make it in effect a 'Sītāyana') and to replace the ideal family of the standard epic with a complex joint family grounded in their own experience. In contrast to the Brahman women's telling of the Rāmāyana, low caste Andhran women, mostly of the Māla and Mādiga castes, sing Rāmāyana songs in the public space of the fields, not the private spaces of the house and courtyard. While also concentrating on 'women's themes', they tend to ignore issues of gender inequality in favour of episodes that subvert caste boundaries, expressing both the comparative gender equality within their castes and the collective inequality between high and low castes.

Protests against social injustice are more explicit in the *oppāri* laments and *ayira pāttu* ('crying songs') of Tamil Nadu. *Oppāri* are improvised mourning songs performed exclusively by women. Although sung to mourn the death of a male relative, the texts ignore the deceased and concentrate on the position of women in a society where widows are considered inauspicious and in which on the death of a husband a woman will become materially disenfranchised. Low caste women are professionally engaged to sing *oppāri*, but close relatives may also join in, and Ramaswamy (1994, p.33) notes that it is still a living tradition in Brahman households. Crying songs, *ayira pāttu*, are performed by women of the low Paraiyar caste and are so called because the singer weeps as she sings. They are wholly improvised; each line has a rising contour and increasing volume and ends with a quieter descent. Performances are spontaneous and tend to take place away from other people, though Egnor (1986, p.303) maintains that the songs are sung in 'semiprivacy' in order that the song's complaint becomes in some way audible to whoever it is directed against. Themes include the separation of mother and daughter at the daughter's marriage, unhappy marriages and the status of widows. The repetition of imagery and themes between songs is a device for increasing the probability of the message reaching its intended audience.

(b) Epic and narrative traditions.

South India has many traditions of narrative performance, some of which contain a large element of dance and are therefore often distinguished as 'dance-dramas', although it is often hard to draw a clear line between these and other narrative traditions (for the Tamil *terukkūttu* and Kannada *yaksagāna*, see §IX, 2(i) below). The traditions discussed here all have strong links with ritual and devotion, as do many dance-dramas, but may perhaps be distinguished in terms of performance by their predominant use of vocal performance to present a text, rather than movement to portray action. In addition to local tellings of the pan-South Asian narratives of the Mahābhārata, Rāmāyana and the stories of the *Purāna*, south Indian epic traditions also include tellings of the tales of local heroes and actions often related to the worship of a local goddess. These sometimes draw on pan-South Asian narratives to enhance the status of local heroes and deities, as well as place them in a wider mythological and legendary context.

Tamil *vil pāttu* ('bow song') are narrative songs accompanied by an instrumental ensemble and performed in local temples during a festival season that lasts from January to May. They are found in the region around Nagercoil, at the southernmost tip of India. The name of the genre derives from the large musical bow, *vil*, used as an accompanying instrument. The *vil* is around three to four metres long, decorated with coloured paper or cloth and brass animals, and hung with large pellet bells. The bow is mounted on a clay pot, *kutam*, used as an idiophone, and its cowskin string is struck with two sticks (*vīcukōl*) with attached jingles that sound when shaken. Although the bow is usually played by the main singer (who may be female, even though all the other musicians are male), it plays a fairly minor musical role. The text is sung by two groups, a main group (*vilampāti*) and a chorus (*itampāti*), who sing antiphonally. Each group plays different instruments. The lead singing group includes a cymbal (*jāira*) player, while the choral group has the *kutam* player, a *kattai* (a wooden idiophone) player and the *utukkai* (variable-tension hourglass drum) player, who traditionally begins the performance with a virtuoso solo.

The songs are grouped into two categories: stories of 'birth', telling of deities of divine birth (*teyva piravi*); and stories of 'death', local stories of people who became deities on their death. The first group starts on the holy Mount Kailāsa and uses figures and themes from wider South Asian mythology to account for the worship of a local goddess at a particular temple; the second deals with localized historical figures. Each type of tale has a different narrative structure (Blackburn, 1988, pp.32–3). The vocal lines have two contrasting styles of delivery, a 'sung' delivery (*pāttu*) and a style closer to speech (*vacanam*), which are used according to performance context. Rather than repeating entire lines, the chorus tends to repeat sections of the lines sung by the leading group, giving an echo-like effect. The *kattai*, *vil* and *jāira* keep the pulse of the rhythmic cycles, which vary according to the content of the narrative: cycles of three or four beats tend to be used for straight narrative, those in six or twelve beats are used for descriptive passages. A special rhythmic effect, called *tutukku* ('hastening', 'urging on'), is used at points of great emotional intensity. It involves the *kutam* and *utukkai* playing a polyrhythmic pattern over the

basic cycle, maintained by the *kattai* and *jāra*, which 'pushes' the music on.

In contrast to the predominantly middle-caste performers of the bow songs, the singers of the Palnādu epic of central Andhra Pradesh, known as *vīra vidyavantulu*, are predominantly of the low Māla caste (the other large Telugu low-caste group, the Mādiga, perform the epic *Kāthamarāju Katha* for Golla patrons). The Palnādu epic is performed in its most complete form at the annual Festival of the Heroes at Karempudi, the site of the battle that concludes the story. Although this is perhaps the primary context for its performance, a version of the epic is sung by the Piccaguntlu, itinerant narrative singers who are also genealogists. They visit a village every two to three years to sing to village patrons, accompanying themselves with a *tambūrā* (fig. 14). The complex narrative centres around the fight between two sets of half-brothers for control of the kingdom of Palnādu.

The Festival of the Heroes takes place during the month of Kārtika (October–November). Invitations are sent out to surrounding villages 15 days prior to the festival. The invitations are sent to the Māla, but members of all castes congregate at the Īrlagudi (Temple of the Heroes) in Karempudi for the seven-day festival, which starts on the day of the new moon. The epic is sung over the first five days, culminating on the fifth with an account of the Karempudi battle. The *vīra vidyavantulu* are allocated particular episodes to perform. Not all the episodes of the epic are allocated for performance, however; some of the more popular may not be and are performed on request (it is traditionally claimed to take 30 days to perform the epic in full). The singers are accompanied by a drummer who plays the *pambajōdu* (or *pamba*), a pair of double-headed brass drums, using a stick on one head and a hand on the other. A drone is provided by the *titti*, a bagpipe with a goatskin bag and bamboo mouthpiece, while a third musician plays *tālalu* (cymbals). The drummer and cymbal player intersperse the singer's narrative with vocables that come from spoken Telugu. These serve, literally, to punctuate and occasionally elaborate the narrative line. Although the drummer does provide a pulse, there is no rhythmic cycle, and the relationship between the drum pulse and the rhythm of the vocal line is relatively free. The *tālalu* may follow either the vocal line or drum patterns.

While the Palnādu epic is firmly rooted in local history and geography, the pan-South Asian epic of the Rāmāyana is performed by the Tamil-speaking puppeteers of Palghat in central Kerala. The performers sing, recite and comment on a version of the 12th-century Tamil *Kamparāmāyanam*, passed down and modified among the puppeteers since at least the late 17th century. It is learnt over a period of 10 years, from printed and handwritten sources handed down from the *pulavar* ('teacher') to student. *Tōl pāva kūttu*, the shadow puppet theatre, is performed in temples dedicated to the goddess Bhagavati between January and May; the performances take place during temple festivals or at the request of a sponsor. A performance takes at least eight nights, often many more, and is presented in a special 'drama-house' known as a *kūttu mātam*. The leather puppets are lit from behind and their images projected on to a white curtain. Performances are usually accompanied by the jakwood *elupara* barrel-drum and cymbals. Blackburn (1996) observes that the

performances take place with a minimal, often absent, human audience, and concludes that it is the puppeteers themselves, as well as the deity Bhagavati, who form the audience for the plays.

A different shadow puppet tradition is found in Andhra Pradesh, that of *tōlubommalāta*. The Marathi-speaking Andhran puppeteers perform Telugu versions of both the Rāmāyana and Mahābhārata. Although they undergo no formal training, they do, like the Keralan performers, draw on printed and handwritten sources to provide some of the text and structure for their performances (including the 14th-century *Ranganātha Rāmāyana* and 15th-century *Bhaskara Rāmāyana*). Traditionally the plays would have been performed at weddings and village celebrations, but with the rise of alternative forms of entertainment, particularly the cinema and television, patronage is now more likely to come from official bodies trying to preserve local traditions. A troupe consists of two to three puppeteers, a harmonium, drummer and two to five members of a chorus, who sing and play cymbals. The narration and commentary is given by the *bhāgavatar* (the stage manager). Unlike the smaller Keralan puppets, the Andhran ones are life-sized (between one and two-and-a-half metres tall). Another difference is that the stage and curtain are temporary structures, usually set up in the village square; performances start at around nine in the evening and last from one-and-a-half to four hours.

(c) Devotional group song.

South India is no different from other regions of South Asia in having groups of devotees who come together to sing *bhajan*, or devotional songs, in praise of particular deities (see also §VI, 1 above). However, three devotional traditions stand out for both the rising number of their pan-South Indian devotees (all three figures attracted very large numbers of followers during the 1990s) and the degree to which they are praised through music: the worship of Aiyappa, Sai Baba and Kalki Bhagwan. Worship of these deities through music is not limited to live group singing but is also achieved through the use of playback technologies for devotional performance (Greene, 1999).

The deity Aiyappa is believed to be the offspring of Mohinī and Śiva, who was incarnated as Manikantha into a Keralan royal family. His worship is centered on the temple at Sabarimala in the Western Ghats and is manifested in a huge annual pilgrimage in January. Great numbers of Aiyappa devotees from all over South India take part in the walk to the temple, before which they will have undergone 41 days of penance. The devotees, who must be male or post-menopausal women, wear black and abstain from sex, meat and alcohol. Every night during the period of penance the devotees gather to perform devotional songs, widely available on cassette all over south India, and dance ecstatically. The music-making continues throughout the pilgrimage itself, particularly the chanting of the name of the deity, a fundamental part of the spiritual experience.

Sai Baba and Kalki Bhagwan are similar figures to the extent that they are both seen as living deities by their followers: the first as an incarnation of earlier holy men (in particular Shirdi Sai Baba, identified by his place of birth, who died in 1918), the second as the tenth and final incarnation of Visnu. The singing of *kīrtanam* (devotional songs) is an essential part of

their followers' devotions; Kalki Bhagwan has decreed that it is the primary way in which to worship him (fig.15). The extremely rapid growth in the worship of these two figures has supplanted the singing of devotional songs to other deities in many towns and villages. Sai Baba *bhajan* are extremely popular and may be heard almost anywhere in south India, both recorded and live (fig.16), while Kalki Bhagwan is recognized as the only true deity by his followers, and his evangelical message is promoted in large part by the prominent music-making of his devotees.

India, Subcontinent of, §VII, 2: Local traditions, South India.

(ii) Instrumental musics.

As with the vocal practices above, instrumental traditions across south India display considerable diversity. Although more formalized performance practices are described below, the use of instruments is not restricted to so-called professional specialists. Instruments, particularly membranophones, are used by a variety of street vendors to attract attention to their wares, often playing complex rhythmic patterns. They range from a man parading around the streets of an Andhran village with a small frame drum, announcing the price of commodities such as rice and jaggery at a weekly market, to a low-caste fruit seller in Madurai using the *davandai*, more often used as a temple drum, to attract customers (fig.16).

(a) Temple ensembles.

In addition to the Tamil *periya melam* temple ensemble (see §III, 6(v)(b) above), which has now made its way on to the Karnatak concert stage, there exists a separate tradition of instrumental temple music in Kerala, known as *ksētram vādyam*. The three main genres of this tradition, *tāyampaka*, *pañcavādyam* and *centā melam*, differ greatly from Tamil temple music in being largely rhythmic in conception, as opposed to the vocal, melodic basis of the *nāgasvaram* and *tavil* repertory. In addition, the Keralan genres are based around a different group of *tālas* (rhythmic cycles) than those used in Karnatak music.

Tāyampaka is performed during pauses in temple festivals, when the image of the deity rests during an evening procession outside the temple's inner sanctum. Parts of the repertory may also be performed after the daily *dīpārādhanā* (evening ritual), and its growing popularity now means it is performed as entertainment during festivals. It is a virtuoso genre performed by a solo *centā*, a double-headed cylindrical drum played with a pair of sticks, traditionally played by the Mārār caste. It is supported by other *centā* and *ilatalam* (pairs of cymbals). The performance comprises five sections, themselves comprised of learnt patterns (known as *ennam*) and improvised sections (known as *manōdharmam*). The performance, which starts slowly, becomes progressively faster, culminating in the very fast tempo of the final *irukita* section. The whole performance is closed by the cadential *Ganapati kai* in the original tempo.

In contrast, the *pañcavādyam* and *centā melam* include very little improvisation. These are performed during the procession itself and, like *tāyampaka*, occasionally during temple rituals. The rising popularity of these genres now means that they are also performed outside the traditional temple context, including during the civic procession in

Trivandrum for the Ōnam celebrations. *Pañcavādyam* and *centā melam* are ensemble genres that depend on the repetition of rhythmic patterns set against rhythmic cycles. A performance of a *pañcavādyam* piece typically lasts around one hour, while a *centā melam* performance may last up to four hours. Although the numbers are variable, the *pañcavādyam* ('five instruments') ensemble consists of 10–15 each of the variable tension hourglass drums *timila* and *itakka*, about 10 *maddalam* (barrel drums) and *kompū* (semi-circular trumpets), and some 15 pairs of *ilatālam*. A conch-shell trumpet is also used occasionally. The *centā melam* is even larger, comprising some 45 *centā*, 15 *kombu* and 15 *kurum kulal* (small oboes). It is the collective performance of such large ensembles that precludes improvisation.

(b) Band musicians.

Bands in south India perform functions similar to those found in the north: accompanying weddings and public processions (fig. 17). Differences are found, however, particularly in their caste-based composition and in the role they play in ritual; another difference lies in the performance of the Karnatak repertory of *kṛiti* and *varṇam* by some bands (Booth, 1996–7). While brass band musicians in the north are not drawn from any one caste or religion (Henry, 1988, pp.219–20; Booth, 1990, p.248), bandsmen in the south tend to be drawn from castes that traditionally are village musicians. One such caste is the Mangali of Andhra Pradesh, who are also the barber caste. Most bands and band members in eastern Andhra are run by and drawn from this caste. The bands have a similar composition to those in the north, lead by a bandmaster who usually plays either a trumpet or clarinet, and their repertory consists almost exclusively of Telugu film songs. (Individual bandmasters do have a repertory of improvisatory *rāgas*, akin to *ālāpana*, which are closely related to their Karnatak counterparts.) However, due to their status as a caste-based ensemble, with caste-based obligations, they are integrated into the ritual life of the village. Unlike northern bands, Mangali bands play throughout the wedding *pūjā* itself, and they play an important ritual role by acting as the *pūjāri* for, and propitiating, potentially dangerous village goddesses.

[India, Subcontinent of, §VII: Local traditions](#)

3. Ādivāsī music.

Distinguishing the Ādivāsī peoples from those governed by caste is sometimes problematic. Until recently Ādivāsīs tended to live in more isolated locations in homogeneous groups, speaking languages distinct from the surrounding peoples, but now peoples are often mixed. One concentration of Ādivāsī groups is to the north and east of Bangladesh, and a few scattered groups lie south of the Krishna river, but the principal cluster lies across the central hills. The Bhils live in the western part of this region. In the centre and east are the Gonds, whose traditional language is Dravidian, and the Mundā-speaking populations (Mundā, Hō, Savaras and Santāl). Mundā is an Austro-Asiatic language related to such South-east Asian languages as Khmer.

Two external developments have devastated Ādivāsī cultures for the last 130 years: population pressure and techno-economic change. Land-hungry peasants have invaded their areas and now outnumber them in many of

their indigenous locales. Industrialization has been a national priority since 1947; the Ādivāsīs live in areas rich in ore, coal and forests, and many have been alienated from their land by the exploitation of these raw materials. Nearly a million Ādivāsīs are threatened by hydro-electric projects that will inundate their lands. One musical consequence of this has been the composition of protest songs to traditional forms (Joshi and Palit, 1992).

Some Ādivāsī music uses are identical to those of the surrounding peoples, in particular the use of women's song for rites of passage. This seems especially true for the Bhils, although some of their women's songs have distinctive topics, such as that of famine. Bhils also dance and, like the people around them, dance the *garba* in worship of a goddess. But like the Ādivāsīs all the way across the centre of India, and unlike the caste peoples, they dance and make a great deal of music in mixed gender groups. A study of the Mundā-speaking peoples of southern Bihar reports that the young Mundā males and females dance and sing on a weekly basis, and song and dance are essential components of ritual and festival occasions (Babiracki, 1991). Each seasonal repertory is based on two or three song types, characterized by occasional diaphonic singing; drum patterns, dance patterns and song phrases are normally of different lengths and out of phase with each other. Their tunes are more distinct from nearby non-Ādivāsīs than are their metres, but the women's marriage songs are sung in the same seven-beat metre and to some of the same tunes as those of the non-Mundā peoples. Music symbolizes Mundā identity, and conservative forces in their music include the desire to maintain the musical identity of the group.

In the Gond peoples of eastern central India, as with the Mundā, when boys and girls sing their antiphonal songs together the girls' part is higher than the boys', as seen in [ex.30](#) (Knight, 1983). This may be attributed to the pitch levels comfortable to the two sexes. Gond music commonly shares another trait with the Mundā: drum patterns, dance patterns and song phrases, although synchronized to one beat, are normally of different lengths and out of phase with each other. There is also hemiola in some of their songs, as in the stilt dance introduced in the 1960s. The Gonds play many other instruments, including a buffalo-horn trumpet, a bronze transverse trumpet, transverse flute, slit drum, a great long double-headed drum (see [Dhol](#)), clapperless bells and pellet bells, iron cymbals, jew's harp and a composite idiophone in which the stick of the scraper operates the wooden clappers by means of strings.

The song transcribed in ex.30 is an expression of independent Gond religious ideology.

Oh what is the name of the supreme being?
Boys, who is the lord of the earth?
Boys, the lord of the earth is Lingo.
Boys, these dance steps were taught by Lingo.
Boys, this song was taught by Lingo.
Boys, Lingo created the *pirwir* rattle and drum and *sulur* flute.

This performance continued with topical lines about flowers, food and the railway line that now pushes its way through South Bastar for iron ore.

The Gonds are famous for the *ghotul*, a youth club and dormitory not uncommon among other Ādivāsī groups in the central hills. Among the Muria Gonds all boys and girls of the village belong to the club from puberty to marriage, and one aspect of membership is sanctioned pair-bonding involving sex. The performing arts are centred on the *ghotul*. Some of the Muria *ghotul* s in the last few decades have taken on aspects of professional dance troupes, performing dances from other Gond groups and performing for dignitaries and other visitors and for the Republic Day festivities in New Delhi. In these contexts their ritual music becomes entertainment music, one of the most important changes taking place in Indian folk music today.

[India, Subcontinent of, §VII: Local traditions](#)

4. Local traditions and classical music.

Perhaps the strongest connection between folk and classical music is that many professional traditional musicians, such as the Langās and Manganiyārs of Rajasthan, clearly have and use the concept of *rāga*, i.e. they discuss the key tones and phrases basic to a *rāga*'s essential character, and they use the term *rāga*. Some Gujarati musicians use the

term *dhāl*, which refers to something between a *rāga* and a melody (Thompson, 1995). Other characteristics shared by Manganiyār music and Hindustani music include the fact that some of the Manganiyār compositions are as complex as classical compositions and that their performing practices utilize some of the same devices, such as the *tān*, *gamak*, *mīnd*, *ālāp* and the *tihāī* (see §III, 3 and 5 above).

The Manganiyārs use some of the same *rāga* names as Hindustani music; however, the *rāgas* designated by these names usually do not conform to classical norms (Kothari, 1994). They also play pieces having precisely the characteristics of certain classical *rāgas* and *tālas*, such as *rāga* Bhairav and the seven-beat Rūpak *tāla*, but without awareness that they are doing so (Jairazbhoy, 1984, p.12). Not all of their music is as easily classifiable in terms of classical music, and it is not known how they could have acquired their classical connections, given their isolation.

One necessary condition for the development of a 'classical' music is secure musical employment, and that was a part of the *jajmānī* system at the royal level, as discussed above. In the western Deccan plateau of Maharashtra and Karnataka many songs, including those of the 16th-century poet-saint Purandara Dasa, are sung in clearly recognizable *rāgas* without the singer knowing anything of the *rāgas*, including their names. B.C. Deva and J. Kuckertz (1981) write of a reverse process occurring: Śivaputra Komkali (popularly called Kumar Gandharva) draws 'almost all of his music material from the folk round him ... metamorphosing them into *rāgas*'. They believe that one way classical music has filtered into traditional music is through professional dramatic groups who use classical music and perform for villagers as well as city dwellers. Classical *rāgas* occurred in the music of traditional theatre throughout India, particularly in south India. Now most of the dozens of different regional theatre traditions have been much attenuated if not obliterated by films, television and video, and the influence of theatre song on folk music has been replaced by the influence of popular, mostly film, song.

[India, Subcontinent of, §VII: Local traditions](#)

5. Music and cultural change.

As discussed above, the end of royal patronage and decline of *jajmānī* patronage of musicians has driven many into brass bands and non-musical occupations. The advent of industrial technology, especially the mass media, has also had profound effects on Indian folk music. Industrialization continues to compete with agrarian institutions and culture in India: 74% of the population is still classed as rural, but in India as elsewhere the outside job or educational institution draws the individual away (sometimes far away) from the agrarian-based family and community, with new time commitments and loyalties. At the same time, material goods are made available and desirable, motivating people to take paid employment. More time at work means less time for family, including weddings and other musical get-togethers. In 1971 three-day weddings were the norm in rural Bihar. By 1995 one-day weddings were common, and the need for professional musicians thereby much reduced.

The effects of new technology on folk music have been both negative and positive. New technology in some cases has simply removed the traditional

contexts of music. For example, women used to sing while grinding grain at their querns. In all but the smaller villages women now take their grain to electric mills for grinding. But new technology also brought new musical instruments to India. The harmonium became one of the most common instruments in Indian folk music, and the impact of Western band instruments has been discussed above. Musicians in the 1970s began adding electronic amplification to acoustic instruments such as the slide guitar and 'bānjo' or *ānandalaharī*, a zither originally imported from Japan. Now electronic instruments such as keyboards are also being used.

Mass media, printing, radio, film, records and cassettes, television and video tapes have also wrought extensive changes in traditional music, both positive and negative. Initially the printing of cheap newsprint booklets with song texts to be sung to traditional tunes no doubt expanded the repertoires of singers. Radio broadcasts of local musicians and styles also stimulated pride and interest in local music as well as enhancing the reputations of radio performers. The use of traditional-style music in films also no doubt enhanced the attractiveness of the music to people in the regions whose music was employed or imitated.

By the 1970s regional music stores/record companies such as Madan Machinery Mart in Varanasi had substantial lists of traditional songs in regional languages on 45 and 78 r.p.m. records. These were not performed in purely traditional styles but were regularized and accompanied by classical instruments such as *tablā* and *śahnāī*. The appearance of traditional music on such records must have excited and encouraged local musicians and music enthusiasts. It also made local music available in modern form, to compete with the nationally circulated product of larger record companies, which in many cases lacked regional cultural significance. Films by this time had for decades been exploiting traditional music styles. But the relationship between traditional music and films worked both ways, and traditional musicians have been setting traditional texts to the melodies of film songs for almost as long.

The advent of records, and later cassettes, augmented the destruction of traditional music. This became noticeable at village weddings in the 1970s, at which disc jockeys would be hired to play records, in those days entirely film songs, over loud public address systems. These systems also amplify film music outside various commercial establishments, *bhajans* (live and pre-recorded) at Hindu shrines and temples, the Muslim call to prayer, commercials for lottery tickets and politicians' harangues, some at ear-splitting volume. Village women would sing despite the blaring pop music, but their songs were not heard over the din, and they were discouraged. Then came the more affordable and portable cassette technology. In 1995 the broadcast of cassette recordings of traditional music and *śahnāī* was clearly supplanting live singing and *śahnāī* ensembles at weddings in Bihar. During the spring season, when Saraswati, the goddess of music and learning, was traditionally worshipped with *kīrtan* singing at temporary outdoor booth-shrines, cassette players and public address systems in the shrines were now broadcasting film music on cassettes. This is the ritual use of recorded music.

The undeniable result of recorded music in these contexts is less live music, and what creativity there is in the playing of recorded music is limited to the selection of items to be played. In another context for recorded traditional music, the music is played purely for listening enjoyment by the purchaser. Here the use of the music is changed from ritual requirement to entertainment, no doubt the most common use of recorded traditional music. This is also true of another type of change taking place in Indian traditional music contexts, which Jairazbhoy has called 'festivalization' (1991, pp.65–6). Music, once a part of the religious ritual of a group, becomes entertainment, which tends to push music style in the direction of spectacle, as with the Gond dance troupes mentioned above.

Other changes in society have contributed to the decline of traditional music. In the Chattisgarh region of eastern-central India it has been observed that formal education may result in 'a perception of what it means to "act literate"', which may preclude participation in certain performances and festivals (Flueckiger in Appadurai etc., 1991). Changes in society and economy in some regions have added more stigma to the occupation of professional traditional musicians. Some people in a caste involved with music performance for many centuries, the Cārans of Gujarat, now do not want their caste associated with music (Thompson, 1992). This has also been noted of a similar group, the Jogīs of Rajasthan. Many of them are not passing on their musical knowledge to their children. Verma (1987) notes that this is because 'it was getting more and more demeaning and less and less remunerative'.

VIII. Film and popular musics

Since the mid-20th century India has hosted one of the world's largest popular music industries. The field of Indian popular music has been dominated by film music, particularly as associated with the Bombay (Mumbai)-based Hindi film industry. Indian films and film music are popular not only in South Asia itself, but also throughout much of the developing world. Since the early 1980s the diversity and vitality of the Indian music industry have been dramatically enhanced by the advent of cassette technology and of regional-language folk-pop hybrids that flourish independently of cinema. Concurrently, as South Asian communities in

Europe, North America and elsewhere grow in size and economic power, Indian popular music has become an even more extensive international phenomenon.

BIBLIOGRAPHY

India, Subcontinent of, §VIII: Film and popular musics

1. Film music.

The term film music in India generally refers to the songs in commercial Indian films. Indian film makers have incorporated both songs and dances in virtually all popular films since the first Indian sound feature film in 1931. Producers of the early talkies drew on native dramatic traditions combining song, dance and drama as a means of attracting audiences to the cinema, and the overwhelming success of their musical productions led all subsequent commercial film producers to adopt this musical formula. Background music and other musical components of the film, corresponding to the term 'film music' in the West, have little market value beyond the production and are not discussed in this article.

Since the 1930s the Indian film industry has grown enormously, and India has become the largest feature film-producing nation (795 films in 1995). Its cinematic extravaganzas, designed to appeal to hundreds of millions of Indians, combine melodrama, romance, comedy, tragedy, violence, music and dance in two and a half to three hours of escapist entertainment. An average of six to ten songs per film enhance the entertainment value and highlight the film's main characters. In addition to their role in cinema, film songs became the first commercial popular music in India, mass produced on vinyl, cassettes and CDs and marketed nationwide. Various non-film popular music forms have arisen since the 1980s, but film songs still represent a significant proportion of India's popular music market. Hindi film song styles, on which this article focusses, have influenced regional film and non-film music and have affected musical taste throughout India.

From the 1930s to the 1950s film song composers ('music directors') experimented with the musical forces available to them in an effort to create a new, modern Indian music that served the increasingly Westernized film productions. The early sound-films, like the very first Indian talkie, *Alam ara* ('Light of the World'), produced by the Imperial Film Company in Bombay, were filmed stage plays; their songs were indistinguishable from the Indian stage songs or light-classical vocal pieces of the time. Within the first decade of sound film production, composers were beginning to introduce Western instruments, Western scale patterns and other non-traditional musical elements. In attempting to suit the music to the character of the film, music directors found greater opportunities in the developing genre of the 'social film' than in the earlier mythological, historical and devotional film subjects (fig.18). By the late 1940s a distinctive film song style had emerged that was recognizably Indian but different from existing genres, synthesizing native and foreign musical features. The vocal melody had become simpler and less ornamented than non-film vocal music, the lyrics contained less poetic, more 'everyday'

language, the song settings incorporated more prominent instrumental interludes, the orchestral arrangements included Western harmonies, and advances in recording technology enabled the introduction of effects such as reverberation and echo. Music directors drew on all types of Indian music, from the classical traditions to their native regional music (e.g. [Naushad](#) from Uttar Pradesh, Anil Biswas from Calcutta and Ghulam Haider from the Punjab). Some took a more eclectic approach, like C. Ramchandra from Maharashtra, who adopted swing in *Shin shinaki boobla boo* (1952), jazz in *Shehnai* (1947) and Latin American rhythms in various films such as *Albela* (1951) and *Ghungru* (1952).

Whereas composers in the 1950s and 60s emphasized song lyrics and tunes, many in the 1970s created film songs to suit the violent action-movie trend of the decade. These later films contained fewer songs (averaging four or five) with more angular vocal lines, fast rhythms and long instrumental interludes to accompany screen action. The 1970s marked the end of the 'golden age of melody', although in the 1980s and 90s lyrical melodies began to appear once again in Indian cinema. Imitation of Western pop styles is pervasive, and the copying of Western pop songs is far from uncommon. However, Indian film music still retains its Indian character through its vocal style and use of Indian languages, and it remains a popular music within South Asian culture.

(i) Production.

Film song composition is the work of a music director and musical assistants, while film song production requires an entire production team. The film music director begins the process by composing a melody or drawing upon a previously composed tune to suit the mood of a scene. Until the 1950s the song writer often composed the lyrics first, enabling the music director to provide a meaningful text setting. With the greater workloads and shorter production schedules of more recent years, however, music directors frequently compose melodies without lyrics or with 'dummy' (senseless) words, and the lyricist must compose a text to fit the tune. The task of orchestral arrangement, the next step in the compositional process, today rests often with musical assistants whose jobs range from creating and notating orchestral parts to conducting the studio orchestra. In the recording studio the orchestral musicians, the recording engineer(s) and the singer(s) all play their role in the production process. The singer (called a playback artist, since the song recording is 'played back' during the shooting of the song sequence) learns and rehearses the song for the first time immediately prior to the recording. Singers generally write down the lyrics in their own songbooks and may add notations to help them remember the song melody when the music director orally transmits the lyrics and tune in the recording room. Playback singers must reproduce the song according to the music director's wishes, though some directors allow singers a certain amount of freedom in

expressing the song text (such as adding vocal ornaments or stressing particular tones), especially when the singer is experienced.

The recording engineer participates in the creative process through technical decisions ranging from balance and dynamics to track mixing and post-dubbing (necessary if a singer is unable to be present at the song recording). Multi-track recording enables the recording engineer, music director and lyricist (and in some cases also the singer, film director or producer) to be involved in the recording and mixing of the song. The music director's initial conception of a song can be vastly different from the final recorded version.

India, Subcontinent of, §VIII, 1: Film and popular musics, Film music.

(ii) Style.

Hindi *filmi gīt* (film song) has played a dominant role since Bombay became the centre of north Indian film production in the late 1940s, following the decline of the major film studios in Pune and Calcutta (fig.20). Although annual film production in south Indian languages surpassed that of Hindi in the 1980s, Hindi cinema has nevertheless produced tens of thousands of film songs since 1931 that have strongly influenced Indian musical culture and in some cases replaced traditional music genres. The Hindi film song genre employs several musical forms related to traditional Indian song forms on which they are based: film *bhajan* (see §VI, 1 above), film folk song, film *qavvālī* (see §VI, 2(ii) above), film *ghazal* and film *thumrī* (see §IV above). The most common film song form is a refrain-verse structure similar to the two section *sthāyī-antarā* of north Indian music or *pallavi-anupallavi* of south Indian music (see §III, 5(i) above). Typically a song begins with an orchestral introduction followed by the accompanied vocal refrain sung in the lower part of the singer's range (occasionally a vocal introduction precedes the orchestral opening). The singer repeats the refrain after each verse, which is usually set in the singer's upper range. Orchestral interludes, called 'music' by music directors, follow each verse-refrain section.

The current film vocal style differs dramatically from traditional Indian singing styles. During the first two decades of Indian sound-film, film actor-singers (such as Kundental Saigal and Pahari Sanyal) and actress-singers (such as Shamshad Begum, Rajkumari and Zohrabai) were predominantly theatre artists trained in classical or light-classical vocal music, whose voices were strong, forceful and open-throated. Following partition in 1947, when many film music directors and singers settled in Pakistan, a new 'thin', high-pitched voice was heard in cinemas and on radios. Lata Mangeshkar presented a new vocal style to the world of Indian cinema, of which the public became enamoured, as did such composers as Khemchand Prakash, Anil Biswas, Naushad, C. Ramchandra and Sajjad, who began moulding songs for her wide vocal range, smooth voice and less ornate singing style. Among male singers, Kundental Saigal is often credited with popularizing the sentimental 'crooning' style from the West and the sweet, softer vocal style that spread rapidly among such playback singers as Mohammed Rafi and Mukesh in the 1950s.

Most music directors in the first few decades were classically trained musicians or singers who drew on this musical background for film song

compositions. At the Prabhat Film Company in Pune, music directors Keshavrao Bhole, Master Krishnarao and Govindrao Tembe were performers of Indian classical music and Marathi stage music. They employed rāga, classical vocal compositions (*cīz*) and ornamentation (*gamaka*) in their film songs, which suited the mythological, historical and devotional film subjects of the 1930s and 40s. At the same time, music directors at Prabhat and the New Theatres Film Company in Calcutta experimented with new ideas, from the use of meaningless song lyrics and multilingual verses of Master Krishnarao's songs in *Aadmi* (1939) to the incorporation of Western scale patterns, song forms, orchestration and vocal vibrato in New Theatres' songs by Rai Chand Boral and Pankaj Mullick. 'Social' films set in the present, and socially conscious films dealing with issues of social injustice, provided these composers with the opportunity to introduce novelty into film music. Music directors of this era were limited, however, both by technology (noisy, cumbersome recording equipment and the initial inability to record sound and picture separately) and by the vocal abilities of the singer, which ranged from little or no musical training among some early film actor- and actress-singers to experienced classical singers.

Knowledge of Indian classical music was considered a requirement for film music directors even up to the 1960s, but some composers of the late 1940s and the 1950s chose to draw inspiration less from this musical source than from further afield. Hindi music directors Naushad, C. Ramchandra and S.D. Burman, for example, introduced folk music from their native states of Uttar Pradesh, Maharashtra and Bengal respectively, and Ramchandra experimented with Latin American rhythms and Western swing. In this heyday of melody-orientated film song, film productions could earn box-office success on the popularity of their songs alone, and the status of popular music directors soared. By the 1970s the romantic song and dance extravaganza of earlier decades gave way to action thrillers, and music directors such as R.D. Burman, Ravi and the duos Lakshmikant-Pyarelal and Kalyanji-Anandji produced Westernized, rhythm-dominated numbers and disco songs to complement the latest trend. Since then new music directors have succeeded in entering the industry with little or no musical training or background, and music directors in general have come to rely heavily on music assistants who compose individual elements of the film song, which are then combined in the finished product.

The majority of film song lyrics are on the subject of love. Lyricists also write devotional, seasonal, festive and work song texts depending on the nature of the film narrative and the requirements of the film producer and director. Hindi-Urdu film songwriters of the 1930s, such as Arzoo Lucknavi, Pradeep and D.N. Madhok, were often poets in their own right who employed stylized poetic language. Those of the next decade, many of whom were also well-respected poets such as Pyarelal Santoshi, Pandit Bhushan, Pandit Indra, Narottam Vyas, Shams Lucknavi, Qamar Jalalabadi and Narendra Sharma, introduced a less stylized, freer form of lyric writing. By the 1950s and 60s three Hindi film lyricists in particular – Rajendra Krishan, Majruh Sultanpuri and Shakeel Badayuni – were much in demand for their poetic song texts that conveyed meaning and emotion to the audience. The language of film lyrics in more recent years has become

less poetic, less literary and more commonplace, as songwriters have attempted to appeal to an ever broader mass audience.

[India, Subcontinent of, §VIII, 1: Film and popular musics, Film music.](#)

(iii) Singers.

Unlike music directors, singers have always needed musical training to gain entry into the film music industry. The well-known male Hindi film playback singer [Mohammed Rafi](#) (1924–80) studied with classical vocalists Abdul Wahid Khan and Bade Ghulam Ali Khan, and Manna Dey's teachers included Aman Ali Khan and Abdul Rehman Khan. The greatest and most successful female playback singer in the history of Indian film, [Lata Mangeshkar](#), received her early musical training from her theatre actor-singer father, Dinanath Mangeshkar. After his death in 1942 she became a disciple of Aman Ali Khan Bindibazarwala until his departure for Pakistan in 1947, and of Amanat Ali Khan until his death in 1951. Her younger sister, [Asha Bhosle](#), studied classical music in the late 1940s at the beginning of her playback career.

Between the 1940s and the 1970s a relatively small number of singers achieved success and popularity as Hindi film playback artists. Besides Rafi and Manna Dey, [Mukesh](#) (1923–76), Talat Mahmood and Kishore Kumar (1929–87) were the best-known male singers. Geeta Dutt and Shamsad Begum joined the Mangeshkar sisters as the principal female singers. Since this time an increasing number of singers have made their débuts, including male artists Abhijeet, Mohammad Aziz, Amit Kumar, Nitin Mukesh, Udit Narayan, Sonu Nigam, Kumar Sanu, Manmohan Singh and Suresh Wadkar, and female singers Kavita Krishnamurti, Sapna Mukherjee, Jaspinder Narula, Anuradha Paudwal, Sadhana Sargam and Alka Yagnik. Notable playback singers of south Indian films include P. Susheela, Srinivasan and Jamunarani of the early years, S. Janaki and T.M. Soundarajan of the 1960s, and Shushila, Vani Jairam, S.P. Balasubramaniam, Yesudas and Ilaiyaraaja of more recent decades.

[India, Subcontinent of, §VIII, 1: Film and popular musics, Film music.](#)

(iv) Instrumentation.

The ensemble that accompanies film songs resembles a Western symphony orchestra with strings, woodwinds, brass and percussion, in addition to electronic instruments and traditional Indian instruments. Musicians work freelance, and most belong to the Cine Musicians Association, which grades artists according to their musical skills and fixes rates of pay for each grade. Music directors hire musicians for their studio recordings according to the needs of the film and the film budget. Large orchestras were unknown in the 1930s and early 1940s. The first film song accompaniments were provided by a small instrumental ensemble typical of light classical Indian music – harmonium, violin, *sārangī* and *tablā* – and musicians were employed by the major film studios in Bombay, Pune, Calcutta and Madras. By the late 1930s studios were already increasing the size of their 'orchestra', adding Indian instruments such as the *sītār*, *sarod*, *tablātarang* (set of tuned *tablā*) and *jaltarang* (set of tuned, water-filled bowls), and the Western piano, cello, trumpet, saxophone and clarinet. When the film studios declined in the late 1940s, unable to compete financially with the massive influx of independent film producers

who were benefiting from business investments and wartime profiteering during World War II and India's independence from the British, film makers were forced to exploit cinematic elements such as film songs in order to achieve box-office success. Film producer-director Raj Kapoor, together with a music director duo Shankar and Jaikishen, employed much larger instrumental forces than had previously been used in Hindi film song accompaniment. Their songs highlighted the large violin section, and they began to associate particular instruments with screen characters in a systematic manner (e.g. the violin with actor Raj Kapoor in *Barsaat*, 1949, the piano accordion with the same actor in *Awara*, 1951). Such efforts increased both the recognition, popularity and status of music directors and the role of the orchestra in film songs. In more recent decades music directors have expanded their musical forces to include such instruments as electronic keyboards and synthesizers.

India, Subcontinent of, §VIII, 1: Film and popular musics, Film music.

(v) Social impact.

Film music has had a major impact on Indian musical culture in the 20th century. For several decades film songs were India's only mass-produced popular music, and the aggressive and widespread distribution and exhibition of Indian films disseminated these nationwide. Radio and television broadcasting, legitimate and pirated cassette sales and live musical performance have also spread Indian film songs both in India and abroad. With little competition from other entertainment forms or popular music styles, film songs dominated the market. Only with the introduction of cassette technology in the late 1970s have independent recording companies been successful in challenging the dominant position of the Gramophone Company of India and in fostering the growth of regional and local popular music styles (see §2 below). Such developments have provided the Indian public with alternative forms of native popular music, yet film songs remain a significant sector of the Indian popular music market. Despite their creation not by the people themselves but by a large corporate industry, film songs have succeeded in appealing to millions of Indians at home and abroad, Indians of all social classes and castes, all age groups, economic levels, religions and political persuasions.

The popularity of Indian film song throughout South Asia and the South Asian diaspora may be traced to a variety of factors. Firstly, film song composers sought to create a modern music that would appeal on a national scale, developing an eclectic musical style that avoided specific regional identity. Secondly, the mass media in India, from the film and recording industries to the state-run radio and television networks and popular journalism, have heavily promoted film song. Thirdly, Indians have responded to film music not merely as passive consumers but as active participants, performing film songs both in private and public venues. In some cases film music has replaced existing musical traditions, while in others it has served as a vehicle for new developments, as in the *birahā* genre in Varanasi and in brass band performances at Indian weddings. A fourth factor among others influencing the popularity of film song is its symbolic nature: film song has encapsulated through its mixture of traditional and non-traditional elements India's juxtaposition of modernity and tradition in the 20th century.

India, Subcontinent of, §VIII: Film and popular musics

2. Popular music.

Although film music has been the dominant category of Indian popular music since the 1930s, other kinds of commercially marketed music predate the cinema era and, in recent decades, have come to rival film music in sales. In many respects the popular musics produced independently of cinema since 1980 have been able to reflect to a much greater degree the cultural and linguistic diversity of India's heterogeneous population and have been vehicles for some of the most dynamic aspects of contemporary musical expression in South Asia.

(i) Non-film musics to 1980.

Commercial production and marketing of recordings in India commenced in 1902, nearly three decades before the advent of sound-film in the region. The market for the earliest recordings, however, was largely restricted to upper-class consumers able to afford such luxuries. Although in the early decades of the century several small Indian-owned record producers emerged, from its inception the music industry was dominated by the British-owned Gramophone Company of India (which adopted the logo HMV in 1910 and was acquired by EMI in 1931). The expansion of the record industry in the 1930s coincided with the marketing of somewhat cheaper phonographs, the spread of radio and the advent of sound-films and the attendant film music industry, which soon came to dominate record production and the popular music scene as a whole.

Aside from film music, record production in the first half of the century comprised a variety of music categories, including classical and light-classical items and assorted regional and devotional genres. Much of this output was essentially traditional in style and falls outside the category of commercial popular music. By the 1930s, however, certain trends and stylistic developments had emerged, which reflected, however obliquely, commercial marketing strategies and the impact of recording. In north India such tendencies were most marked in the recordings of the Urdu *ghazal* (see §IV, 2 above), which, aside from being a major sub-genre of film music, also constituted the single largest category of 'non-filmi' music. *Ghazal* is the predominant genre of Urdu poetry, consisting of thematically independent couplets set to a strict metre and rhyme scheme in the form AA BA CA etc. In north India as elsewhere, *ghazal* had flourished for centuries as a light-classical music genre, alternating tuneful, reiterated refrains on the rhyming (A) lines of each couplet with affective melodic improvisation (*bol banāo*) on the non-rhyming lines. From the start of commercial recording in India, producers had found the *ghazal* to be an effective vehicle for mass marketing, since it was popular among a relatively broad spectrum of educated, upper-class Hindi- and Urdu-speakers throughout north India. Recorded *ghazal*s, aside from being restricted to a three-minute format, came to acquire certain features that distinguished them from live light-classical renderings. Most evident was the decline of improvisation, both in the vocal renderings of the couplets and, more conspicuously, in the tendency to replace *tablā* improvisations (called *laggī*) between verses with pre-composed instrumental passages, often played by ensembles that included Western as well as indigenous

melodic instruments. By the 1940s such features were standard both in film *ghazal*s (such as those of Talat Mahmood) and in those marketed independently of the cinema. They also distinguished *filmi* and non-*filmi* commercial versions of *qavvālī* (see §VI, 2(ii) above) from traditional live *qavvālī*, which emphasized expansive and often virtuoso vocal improvisations. Implicit in such stylistic changes was a transformation of the music from an excerpted process – of improvisation – to a commodified product, more in the nature of a fixed, pre-composed song.

In the decades after World War II, diverse genres of regional music arose that, although related variously to folk or light-classical idioms, could be regarded as commercial popular musics in their close association with the record industry. In north India such genres would include urban versions of Marathi *lāvni*, the Punjabi songs of vocalists such as Asa Singh Mastana and Surinder Kaur and the semi-classical Bengali *ādhunik gān* ('modern song') associated with such composers as Salil Chaudhuri and Kazi Nazrul Islam. To a certain extent, producers of such regional popular musics may have incorporated some aspects of film music and utilized parts of its production and distribution infrastructure. However, on the whole they suffered from competition with film music, which some likened to a great banyan tree under which little else could grow. Indeed, Indian popular music culture from 1940 to around 1980 was marked by the near hegemony of film music (see §1 above). The concentration of the film music industry itself was extreme, with a single multinational (EMI) and a tiny coterie of Bombay- and Madras-based singers and music directors producing a relatively standardized mainstream style of music for a vast and diverse mass audience. Although eclectic and vital in its own way, film music embodied little of the heterogeneity of South Asia's regional music cultures and, firmly embedded as it was in the commercial cinematic context, offered little scope for oppositional or idiosyncratic personal expression.

(ii) The impact of cassettes.

From the late 1970s the Indian music industry underwent a dramatic restructuring that ended the monopolistic domination of EMI and of mainstream film music culture. The democratization of the industry was precipitated primarily by the spread of cassette technology subsequent to the liberalization of state economic policies in 1978. Cassettes proved to be a far more suitable mass medium for music in India than vinyl records. Cassettes and cassette players are inexpensive, durable, portable and have minimal power requirements. As such, by the mid-1980s they had become widespread in rural regions and among lower-class communities previously enjoying little access to phonographs. Most importantly, cassette production is incomparably cheaper than the production of records (not to mention films or CDs). The advent of cassette technology thus enabled several hundred music producers, large and small, to emerge throughout the nation, effectively decentralizing the music industry as a whole.

The transformation of the Indian popular music scene, however, happened over a period of several years, involving certain transitional stages. The most visible initial result of the spread of cassettes, aside from the rapid decline of vinyl record production, was the flowering of cassette-based

piracy in the form of unauthorized duplication of extant commercial recordings. Until the enforcement of revised copyright legislation in the late 1980s cassette piracy plagued EMI, Polydor and emerging legitimate cassette producers in India, although it also promoted the spread of cassette players and in that sense laid foundations for the growth of legal enterprises.

Ultimately more significant a development than the rise of piracy was the emergence, from the late 1970s, of popular music genres that had no direct connection with cinema. The first of these was a modernized version of the Urdu *ghazal*, initially popularized by Pakistani singers Mehdi Hasan and Ghulam Ali. The new 'crossover' *ghazal*, with its leisurely vocal improvisations and sparse instrumentation (*tablā* and harmonium), retained some of the aura of its light-classical predecessor while featuring a softer, crooning vocal style and a more populist approach to *bol banāo*. Around 1980 a new set of Indian, mostly non-Muslim, performers such as Jagjit Singh further popularized the *ghazal* using simplified Urdu, soft, silky, string-based accompaniments and an improvisation style that classical aficionados regarded as tame and bland. The pop *ghazal* (disseminated primarily via cassettes) soon came to enjoy prodigious pan-regional popularity, especially among members of the growing Hindi-speaking bourgeoisie, who sought a music that sounded more refined than the increasingly disco-orientated film songs but that would at the same time be more accessible than classical music or, for that matter, the traditional light-classical *ghazal*. The cassette-based pop *ghazal* thus became the vehicle for the first group of singers to achieve mass popularity independently of cinema and for the rise of several independent recording companies that eclipsed HMV's former domination of the music industry. The *ghazal* vogue represented a transitional stage in the cassette boom, at a point when cassette usage had spread among the urban middle classes but not significantly beyond them.

Concurrently, Hindu vocalists Anup Jalota, Pankaj Udhas, Hari Om Sharan and others popularized a modernized form of the devotional Hindu *bhajan*, the style of which derived primarily from the pop *ghazal* and earlier 'stage *bhajans*' of such singers as V.D. Paluskar. Like the modern *ghazal*, the pop *bhajan* was disseminated primarily on cassettes to a pan-regional, Hindi-speaking, predominantly middle-class audience. The commercial *bhajan* has played a substantial role in the incorporation of Hinduism into mass-mediated popular culture and its continued reorientation toward *bhakti* (see §VI, 1 above) rather than ritual and orthodoxy.

By the mid-1980s, as cassette technology spread to rural communities and the lower classes, cassette producers of various sizes proliferated throughout the country. Many of these are small companies marketing specialized, regional-language genres to local audiences whose musics and dialects had been ignored by the film music and vinyl record industry. Much of the output of these 'cottage cassette' producers has consisted of traditional genres, such as narrative epic ballads, which had never before been disseminated via mass media. Of greater relevance here are the folk-pop hybrids, the styles of which seem in various ways to reflect the impact of commercialization. Perhaps the most conspicuous of these innovations is the common usage of accompanimental ensembles combining traditional

and modern instruments, playing pre-composed passages during and between sung verses. While producers have found that certain consumers, such as Rajasthani villagers, generally prefer the traditional, sparse, drum-and-harmonium accompaniment, audiences in the less isolated regions of India prefer the perceivedly more modern sound of ensemble orchestration or, at the least, an electronic keyboard. Nevertheless, such accompaniments are seldom as elaborate as those typical of mainstream film music, with its violin sections and juxtapositions of contrasting orchestral timbres.

One category of the new cassette-based popular musics comprises the vast and diverse forms of devotional cassettes, sung in regional languages and honouring various deities or saints whose renown may be similarly regional. Like other folk and folk-pop recordings, such cassettes may adhere to traditional melodic and textual models, or they may reflect the more elaborate approaches of studio production, often setting new verses to melodies of familiar film songs.

Even more numerous than devotional music recordings are cassettes of diverse, secular, regional-language genres, many of which are best seen as modernized and commercialized versions of extant traditional styles. The Punjab (which straddles India and Pakistan) has been a particularly dynamic region for modern music, with performers like Gurdas Maan self-consciously combining traditional and modern elements in a popular song idiom generically labelled **Bhangra**, whose rise parallels that of a similar British-based Punjabi pop genre of the same name. Modern Gujarati popular music styles such as 'disco *dandia*' draw liberally from the genres of *rās* and *garba* traditionally associated with the Navrātri festival. Commercial recordings of Braj-region *rasiya* and Bhojpuri *birhā* remain stylistically closer to their local roots, although enjoying unprecedented mass dissemination. Particularly popular among working-class consumers in the Bombay region are stylised versions of *koli gīt* or fishermen's songs. Other regions throughout India have generated various local pop musics, whether marketed by grassroots producers or by large, urban-based companies such as New Delhi's T-Series ('Super Cassettes'). In north India, 'Hindi pop' has emerged as a substantial pan-regional genre, which includes many Hindi-language versions of American pop hits. These cassette-based popular musics have attained mass dissemination despite receiving little or no airplay on radio, which remains state-owned in India.

Unlike film music, which almost invariably deals with sentimental love, song texts in regional cassette-based musics reflect a prodigious amount of topical variety, in accordance with local conventions. As amateurs join established singers in releasing cassettes, regional folk-pop lyrics deal variously with local folklore, satire, politics and current events, as well as perennial romantic concerns. Particularly popular among lower-class male consumers are ribald, 'spicy' songs portraying titillating sexual encounters, often involving the traditionally flirtatious liaison between the young wife (in north India *bhābhī* or *sālī*) and her husband's younger brother (*devar* or *jījā*). Some such songs were traditionally performed at weddings and other informal festivities by women in sexually segregated contexts. Others, such as Marathi *popat* and Punjabi truck-drivers' songs, appear to be more modern in origin. Their widespread dissemination on commercial cassettes

is controversial, as they are seen as crude and vulgar by many women, elders and bourgeois listeners.

In general, critics have charged that much of the cassette-based regional music is of low quality, that it represents a commercialization of traditional music cultures and that in some cases it may be thriving at the expense of live performance traditions. However, the latter allegation, and the effects of cassette marketing in general, are in many respects contradictory. Genres like *birhā* and Rajasthani *kathā* seem to be flourishing both live and on cassette. Cassette dissemination may further be seen to stimulate interest in certain traditional genres and to provide access to some styles that are otherwise declining. Similarly, while cassettes have served to disseminate film music even more extensively than before, they have also come to offer an unprecedented abundance of alternatives. Thus, due to the expansion of the music industry as a whole, sales of film music recordings have increased, but their share of recorded music sales has dropped dramatically.

In recent years, as income inequalities in India have heightened, the compact disc has become an increasingly popular format for the dissemination of classical music, film music, *ghazals* and other genres aimed at the wealthy. Disco-orientated re-mixes of old and new Hindi film songs using digital sampling techniques represent another sort of eclectic innovation popular among upper-class youth. The intensification of diaspora connections, the expansion of media networks and the ongoing integration of India into the global economy have further increased exposure to and popularity of Western music among the urban bourgeoisie. Accordingly, the exponential growth of the Indian music industry has accommodated tendencies both toward Westernization (as in genres such as Hindi pop and Gujarati rap) as well as indigenization, in the form of proliferating recordings of folk and folk-pop musics. As a result of such developments, the Indian popular music scene is considerably richer, more diverse and more receptive to its heterogeneous audiences than ever before.

3. Jazz.

European colonial influence in India paved the way for the emergence of African-American music on the Indian subcontinent. During the mid-19th century black-face minstrel troupes, which had arrived first in Australia and subsequently went to India, provided the channels through which black American music and musicians were introduced into Indian urban culture.

Jazz arrived in India during the 1920s, when travelling dance bands from overseas (England, Canada and the United States) and local Indian bands began to perform at the major hotels in Bombay and Calcutta. Jimmy Leguime's Grand Hotel Orchestra and Abriani's Six were among the best-known foreign bands that performed in India around this time. These bands provided entertainment primarily for Europeans living in India.

While travelling in Europe in the 1930s, well-to-do Indians had discovered African-American jazz musicians, particularly in Paris, and subsequently arranged for Indian hotels to hire them for parties and other social

occasions. Among such musicians were Leon Abby and Crickett Smith, who led bands in India and worked at the Taj Mahal Hotel in Bombay. Musicians from Goa also led groups and performed with jazz-orientated dance bands in India, while players from South Asia such as the clarinetist Reuben Solomon and the guitarists Cedric West and Pushkar Bahadur (George Banks) were making recordings in Calcutta. The African-American pianist Teddy Weatherford played at the Taj Mahal Hotel during the 1930s. Later he went to Calcutta, where he led dance ensembles from 1942 to 1944.

During the mid-1940s live big-band jazz declined in popularity in India for several reasons, including the prohibition movement following India's independence in August 1947 and the ensuing backlash against Western culture. The decline in the popularity throughout the world of big-band jazz in general also contributed to this phenomenon. By this time it had become increasingly difficult to earn a living playing jazz in India. By the late 1940s and early 1950s the hub of the local Indian jazz scene was the Bombay Swing Club, which was patronized largely by Anglo-Indian fans and featured primarily Anglo-Indian players until the mid-1950s, when many musicians decided to move to England. This left a void in the Indian jazz scene. One attempt to fill the gap began in the early 1950s, when jazz impresario Niranjan Jhaveri founded and edited *Blue Rhythm*, regarded as the first Indian jazz periodical, and established the Blue Rhythm jazz society, which sponsored performances by American jazz musicians in India.

As employment opportunities for jazz musicians decreased, some players were able to find employment in the Bombay film music industry. In the 1950s studio pianist Kersey Lord introduced film music composers such as Laxmikant Pyarelal and Rahul Dev Burman to jazz, which they incorporated in their scores into the next decade. The 1950s also marked the beginning of the career of Goan saxophonist Braz Gonsalves, one of the first Indians to play modern jazz and to master rāga-based improvisation in jazz. Gonsalves would go on to become one of the best-known Indian jazz musicians on the international scene.

The US State Department sponsored concert tours in cities such as Bombay, Madras and Bangalore; these served as the main source of live jazz in India during the 1950s and 60s. In the early 1960s in Bombay the Duke Ellington Orchestra gave a series of concerts that stimulated interest in jazz there. Ellington's concerts spawned jam sessions featuring local players. This contributed to a new-found appreciation of traditional jazz and swing among local fans into the early 1970s. Sponsored by the US Information Center in conjunction with local musical organizations and colleges and Bombay's American Center, numerous jazz appreciation classes and performance workshops were held in Bombay in the 1970s and 80s. In 1975 Niranjan Jhaveri founded Jazz India, a non-profit organization for the promotion of jazz. In 1978 that organization sponsored the first Jazz Yatra ('pilgrimage'), India's biennial jazz festival, regarded as one of the most international jazz festivals in the world.

Throughout this period Niranjan Jhaveri, in consultation with Braz Gonsalves, the pianist/arranger Louis Banks, the vocalist Rama Mani and

others, promoted Jhaveri's concept of Indo-Jazz, a musical mélange that fuses the elements and instruments of modern jazz with those of Hindustani and Karnatak music.

IX. Dance

There are seven Indian dances regarded as 'classical': *bharata-nāṭyam*, *kathak*, *kathakali*, *kūcipūdi*, *manipuri*, *mohiniāttam* and *odissi*. The patronage of dance has been maintained in India's fast-expanding urban centres, and knowledge of a classical dance style has become an important social accomplishment for young, middle-class women. In addition to the classical styles, India has a vast number of local traditions. The set pieces of the huge South Asian film industry draw on many dance traditions. New influences, in the form of popular styles of dance music from expatriate communities abroad, feed back into the South Asian popular music scene.

[India, Subcontinent of](#), §IX: Dance

1. [Classical dance styles](#).

Dances are deemed 'classical', or not, by the central Sangeet Natak Akademi in Delhi, a governmental organization. Achieving the status of a classical art confers benefits, not only in the sense of 'respectability' but also in terms of eligibility for funding in the form of grants and the patronage of an urban, middle-class audience. The choice of what is and what is not 'classical' is to a certain degree arbitrary, as many dance traditions can claim equal degrees of complexity, history and textual support, all of which might be considered part of a 'classical' canon. The choice of the seven dances discussed below can be seen as an aspect of the central government's project of national integration – 'unity through diversity' – in light of the dances' geographic and stylistic spread ([Table 22](#)). A local tradition which has received support and funding from the Sangeet Natak Akademi, the *chau* dance of parts of Orissa, West Bengal and Bihar, is noted by von Lamsweerde as being 'often included in the classical dance-forms of India' (1969, p.23).

(i) Theory and sources.

The earliest references to dance in South Asian literature are found in the *Rgveda* (c1500–1000 bce): Usās ('dawn') is personified as a dancer, and Indra, the most powerful god of the vedic pantheon, is often called the 'leader of dancers'. His associates, the Āśvin (twin gods who ride in front of Usās) and Marut ('wind') are also dancers. Gamblers and dancers are described as meeting in an assembly called *samana*. Descriptions include solo, duet and group dances. The language of mime, with special reference to the symbolic gestures of the hands, distinctive in South Asian classical dance, has its origins in the elaborate rituals described in the *Kṛṣṇa yajur-veda* and the *Atharva-veda*. Although dance is associated with many ceremonial rituals in the Vedas, there is no evidence in this early literature of temple dancing, which is closely associated with Indian dance of later times.

References can also be found to dance in the Rāmāyana and Mahābhārata, the dramatic and poetic *Nāṭaka* and *Kāvya* (11th century bce to 8th century ce) and the 18 *Purāna* s. In the *Harivamśa-purāna* (a supplement to the Mahābhārata) a graphic description is given of Kṛṣṇa and the *gopī*s dancing. In the Rāmāyana, Rāma is taught dance as part of his general education, and in the Mahābhārata, Arjuna is accomplished enough to play the part of a professional (female) dancer while in exile. In these texts dance is the vocation of the *ganikā* (professional musicians and dancers), the precursors of the court dancers. The god Śiva dances to

preserve the cosmos and is often portrayed in his characteristic pose as Nātarāja ('king of the dance').

The *Nāṭyaśāstra* of Bharata (pre-3rd century ce) describes in some depth gestures for different parts of the body: for instance, 67 *hastā* (hand gestures) and 32 *cāri* (movements of the lower limbs). A combination of these with movements of the other parts of the body, especially the torso, is called a *karana*, of which 108 are mentioned. The first exclusive treatise on dance as distinct from both theatre and music is the *Abhinaya-darpana*, attributed to Nandikeśvara and written between the 5th and 10th centuries. Particular emphasis is placed on postures and movements of the hands and feet. *Nāṭya* (the dramatic element) and *nṛtya* (sentiment and mood) are defined, and *abhinaya* (dramatic expression) is described.

Dance features prominently in classical Sanskrit drama, which is an amalgam of spoken word and mime. The choreography follows elaborate conventions and is based on spatial divisions of the stage, the use of musical modes, and mime that uses stylized movement. The tradition continued in the medieval period after the 10th century. Drama gave rise to the musical play, known as *Sangīṭ-nāṭaka*, which has a rich repertory stretching from the 12th to the 19th century. In earlier compositions the actor would speak, sing and enact the lines; at a later stage, speech and enactment were omitted, and the part was only sung. Finally the actor became the musician who sang the lines, providing an accompaniment for the dancer who interpreted the words through mime and dance. It is from these plays that many elements of the contemporary classical dance forms evolved.

The *Sangīṭa-ratnākara* (13th century) devotes the whole of its last chapter to dance, and between the 13th and 19th centuries texts on the dances of particular areas were written with theoreticians codifying regional variations. These important sources include the *Nṛṭa-ratnāvalī* of Jayasena (1253) from Andhra Pradesh; the *Sangītopanīsat-sāroddhāra* of Sudhākalaśa (1350) from Gujarat, the *Nṛtya-ratnakośa* by Kumbhakarna (1443–68) from Rajasthan; the *Sangīṭa-dāmodara* of Raghunātha and the *Abhinaya-candrikā* from Orissa (16th–17th century); the *Hasta-muktāvalī* from Assam (1650); the *Sangīṭa-mālikā* of Muhammad Shāh (17th century) from Uttar Pradesh; the *Bālarāma-bharatam* of Bālarām Varma from Kerala (18th century); and the *Sangīṭa-sārāmṛta* by Tulajā-rāja of Thanjavur (18th century). (For differing views on authorship and dating see §§I–III, Bibliography, above.)

In South Asian classical dance the main parts of the body, known as *anga*, are identified as the head, torso, and upper and lower limbs. The *upānga* (the minor parts) are the facial features, ranging from the eyebrow to the chin. Little emphasis is placed on the muscular system; more is focussed on the joints and the bone structure. The poses that the dancer adopts follow the rules used in sculpture, where the vertical and horizontal axes (*sūtra*) and the deflection of the body (*bhanga*) are of fundamental importance. Compound movements give rise to two distinct aspects of classical dance. The first, known as *nṛṭa*, is an abstract pattern of movement of the limbs with musical accompaniment. It does not set out to express mood or sentiment, and therefore no facial expression is used. In

the second, *nrtya*, mood and sentiment are conveyed by the use of facial expressions and appropriate gestures.

Other important classifications used are *tāndava* and *lāsya*. *Tāndava* is used to describe all dance that expresses actions and feelings with strength and vigour. There are seven types of *tāndava*, said to have been danced by Śiva. *Lāsya* is that element of the dance that is graceful and delicate and expresses emotion on a gentle level. Kṛṣṇa's dance with the *gopī* (milkmaids) is in *lāsya*. In dance, *abhinaya* is the means by which the mood and sentiment of *nrtya* is conveyed to the audience; it can be subdivided into four categories (Table 23).

India, Subcontinent of, §IX, 1: Dance, Classical dance styles.

(ii) **Bharata-nāṭyam.**

Originating in the temple dances of the Tamil *devadāsīs*, *bharata-nāṭyam* (fig.20) has become the most widespread and popular Indian classical dance, not only within South Asia but also internationally. Temple dancing was formally outlawed in the 'Madras Prevention of Dedication of Devadasis Act' by the then State of Madras in 1947. This followed a long campaign that had identified the dancers with prostitutes and courtesans. Gaston (1996) reports that in addition to the ritual and sacred dance of the temples, there was a parallel secular dance of the courts known as *sadīr* or *dāsīāttam*, and it is from this that *bharata-nāṭyam* largely derives.

At the same time as the Indian middle and upper classes, mainly Brahmans, were agitating to have the dance banned from the temples, they were also keen on seeing *bharata-nāṭyam* (as the dance became known, to distinguish it from that of the *devadāsīs*) established as a 'pure' art form. Instrumental in this was the Brahman dancer and teacher Rukmini Devi, at whose school, Kalakshetra (established 1936), the 'improved' dance was taught to the girls of respectable Madras families. One of the last dancers to have undergone *devadāsī* training and initiation was [Thanjavur Balasaraswati](#), who, on moving to the concert stage, continued to perform in the traditional *devadāsī* style. While men of the Icai Vēlālar community had always been the teachers of and musicians for the *devadāsīs*, it was

not until the 1930s that non-hereditary male dancers took up *bharata-nāṭyam*. The dancing of female roles by male dancers was, and to a certain extent still is, controversial.

Teaching was traditionally a hereditary profession, carried out by the males of a dancer's family for whom the ability to dance themselves was not a prerequisite. With the emergence of *bharata-nāṭyam* as a concert art many non-hereditary dancers, both male and female, have begun to take on students. In addition, dance academies, modelled on Kalakshetra, have been set up in large towns and cities. Many of the female students passing through the academies or being trained by a private teacher are not learning to dance with the aim of becoming professionals, but as a social accomplishment. The teacher and student work towards his or her *arankerram*, the dancer's first full public performance, which is considered to complete the student's training. A successful *arankerram* is personally important for the student and also, in terms of reputation, for the teacher.

A performance of *bharata-nāṭyam* is accompanied by the *cinna melam* ensemble (see §III, 6(v) above) led by the *nattuvanār*. The *nattuvanār*, a male hereditary profession like that of the teacher, keeps time with *tālam* (cymbals) and calls out the dance patterns, or *jāti*. The sound of the dancer's ankle bells, *keccai* (see [Ghantā](#)), is represented by the syllables of a *jāti* called *śolkattu*; *jāti* played on the *mrdangam* are called *śollu*.

Ideally, a *bharata-nāṭyam* programme consists of seven items – *alāriṭṭu*, *jāṭisvaram*, *śabda*, *varnam*, *padam*, *tillānā* and a concluding *śloka* – even if this pattern is now not often followed in full. The *alāriṭṭu* is an invocation to the deity; it is a short dance during which some of the basic positions of *bharata-nāṭyam* are used. The most important of these is known as *ardhamandali* (fig.21). The *jāṭisvaram*, consisting again of *nrtta*, emphasizes rhythm through the interaction between the dancer and drummer, accompanied by vocal passages of *svara* and *śolkattu*. Before the *jāti* begins, the dancer beats out the rhythm with his or her feet. The *śabda* introduces *nrtya* for the first time. The *śabda* begins with a short series of *adavu* (movements of the feet), known as a *tīrmāna*, before interpreting the song. The *varnam* is the most complex piece in performance, alternating between *nrtta* and *nrtya*. The melody is sung using both the text and *svara* s. *Padam* deal with love; in order to explore fully the *abhinaya* of the *nāyikā* (the beloved) yearning for the *nāyaka* (the lover), the dance movements are slow in comparison to the *varnam*. In the much faster *tillānā* the dancer combines movements of the waist and shoulders, fingers, hands, feet, neck and eyes. The performance concludes with the recitation of a *śloka* in a *rāga*; there is no rhythmic or melodic accompaniment, and *abhinaya* is used to express the text.

(iii) Kathak.

Historical sources for *kathak* dance are mainly found in Hindi and Braj-bhāsā literature and schools of miniature painting dating from the 15th–18th centuries. Poetry of the 16th–18th centuries shows that a dance-style flourished from the 14th century to the 18th in Gujarat, Rajasthan, Uttar Pradesh and Delhi. Treatises such as the *Nāṭya-ratnakośa* (15th century), *Nartananirnaya* (16th century) and the *Sangīta-mālikā* (17th century) show

that, as elsewhere, the style derived theoretical sanction from written sources. The history of *kathak* is also closely connected with the growth of Hindustani music, particularly *Khayāl*, *thumrī* and *dādrā* (see §IV, 1 above). The *rāsalīlā* and the *rāmalīlā* of the areas around Mathura, Ayodhya and Varanasi (see §2(i)(b) below) have strong affinities with *kathak*, as do many other traditional forms in the north.

In the movement technique of *kathak* there are no deflections and no sharp bending of the knees; in the basic stance the dancer stands straight, holding one hand at a higher level than the head and the other extended at shoulder level. *Nr̥tta* is all-important: complex rhythmic patterns are created through an intricate system of footwork, involving the use of flat feet and the control of 100 or more pellet bells (*ghungrū*) attached to the dancer's ankles. *Nr̥tta* is also built in sequences combining different units of movement. The cadences are known as *tūkrā*, *torā* and *paran*, which indicate the dance syllables used and the accompanying rhythmic instrument. In the sequence termed *thāt*, gliding movements of the head, eyebrows and wrists are introduced. The *āmad* (entry) is a series of slow movements; the *salāmī* (salutation) is based on the Muslim greeting of raising the hand to the face. Characteristic of *kathak* are the permutations and combinations of rhythmic passages interspersed with and culminating in pirouettes (*cakkar*), arranged in multiples of three (fig.22). Loud recitation of the dance syllables (*bol*) is common: the dancer often pauses to recite these to a specific *tāla*, after which they are interpreted in the *torā*, *turkrā* and *paran* sections.

The *nr̥tta* portion of *kathak* is performed to a repeating melodic line known as the *nagmā*. Two instrumentalists, one of which is either a *pakhāvaj* or *tablā* player, and a singer usually provide the accompaniment. The singer is traditionally accompanied by a *sārangī* player, now often replaced by a harmonium. *Tālas* of 16 (*Tintāl*), 10 (*Jhaptāl*) and 14 (*Dhamār*) beats provide the foundation for the dance. The *nr̥tya* section follows the *thāt* with elements called *gata*, based on stories from mythology, particularly those featuring Kṛṣṇa. In other *nr̥tya* elements the texts of genres such as *dhrupad*, *kīrtan*, *hori*, *dādrā* and *ghazal* are portrayed in dance, with a close synchronization between word and gesture.

Like some other dance-styles of north India, *kathak* was exclusively performed by women known variously as *tawāif*, *nautch* dancers etc. (see [Courtesan](#)), and had for a long time been associated with brothels. *Kathak* was revived as a concert dance by performers in Lucknow, assisted by the patronage of some princely states, such as Rampur. The three main styles are from Jaipur, Lucknow and Varanasi. Since the 1950s it has gained remarkable popularity and is performed by both professional and non-professional artists.

[India, Subcontinent of, §IX, 1: Dance, Classical dance styles.](#)

(iv) Kathakali.

This is a dance-drama (see also §2(i) below) of Kerala, traditionally performed only by male dancers. Its origins lie in a range of ritual and traditional dances and traditional dance-dramas, including local *kūttu* s (theatres) and the Sanskrit *kūṭiyāttam* dance-drama. *Kathakali* emerged in the 18th century out of the dance-dramas *kṛṣṇāttam* (which closely follows

the *Gīta-govinda* in narrating the life of Kṛṣṇa and which can be traced back to the 15th century) and *rāmānāṭam* (on the life of Rāmā and traceable to the 17th century). Like many other Keralan traditions, *kathakali* uses elaborately stylized make-up with a set pattern of colour symbolism. Characters are thought of as existing on a continuum from the most refined to the most depraved. *Pacca* ('green') characters have green faces offset by a white border (*cutti*), and include the greatest heroes, such as Rāmā. They are followed by 'shining' characters (*minukku*), distinguished by yellow-orange make-up, who are heroines or other characters of great spirituality. Below these two categories are the *katti* ('knife') characters, who are evil yet have noble blood; their make-up is very similar to that of the *pacca* characters, but with a red moustache. Following these are three type characters who are identified by the colour of their beards: *vella tāti* (white beard) are divine characters such as Hanūmān; *cukanna tāti* ('red beard') characters are vicious and evil; and *karutta tāti* ('black beard') characters are evil and scheming. Below them are all the black-faced characters (*kari*), who are female demons.

Traditionally performances take place in temple courtyards and may last many hours. Today, however, some troupes perform much shortened versions, or extracts, on the stage. *Kathakali* derives its textual sanction from later texts than those of *bharata-nāṭyam*, particularly the *Bālarāma-bharatam* and the *Hāstalaksanam-dīpika* of the 18th century. The literature of *kathakali* is extensive: many renowned writers in Malayalam have written plays for *kathakali* performances.

An important part of the *kathakali* dancer's training is massage, which helps agility. *Nrtta* and *nṛtya* are used, as is the spoken word. The *mandala sthāna* (bent-knee position) occurs frequently, and a characteristic of this dance-style is the resting of weight on the side of the foot. There are 24 basic *hastā*, or hand positions. *Kalāsama* are passages or phrases of abstract movement set to a particular tāla. The musical accompaniment is provided by two singers, a *maddalam* (tuned barrel drum), *centa* (cylindrical drum), *cennala* (gong) and *ilatālam* (flat cymbals).

The performance starts with the *kelikottu* (drumming) and is followed by the singing of devotional songs behind the *terissila* (curtain). After this, *todayyam* (a devotional dance) is performed, in which the dancers symbolize *śakti* ('power', associated with the goddess) and *māyā* ('illusion'). The *manjutara* that follows is accompanied by songs from the *Gīta-govinda*, after which there is a drum interlude. In the next item, the *purappad*, the hero and his partner appear. Love scenes may be enacted during any part of the drama, although these occur most often at the beginning. The most popular themes are from the Mahābhārata, Rāmāyana (fig.23) and the *Purānas*.

A closely related dance, *ōttan tullal* ('running and jumping'), was created by the poet Kunjan Nambiyar in the mid-18th century. It is less elaborate than *kathakali* and is performed by a soloist in *kathakali*-like costume, who acts and sings the Malayalam texts to the accompaniment of a *maddalam* player and *ilatālam* player; occasionally a singer provides added accompaniment. This dance often includes criticism of the government and social order.

India, Subcontinent of, §IX, 1: Dance, Classical dance styles.

(v) Kūcipūdi.

This dance-drama is named after the village in the Krishna-Godavari delta, Andhra Pradesh, where it is traditionally performed. It is sometimes known as *bhāma-kalāpam* (after Bhāma, a consort of Kṛṣṇa). A related style is performed in the village of Melattur, Thanjavur District, Tamil Nadu. A Telugu Brahman, Sidhyendra (c1350–1450), is credited with founding the *kūcipūdi* style. The Brahman men of the village, sole dancers of the *kūcipūdi* style, were also noted as performers of the disguise-theatre *pagati vēśam* (which dancers from the village continued to perform until the 1930s). In 1675 the Nawab of Golconda granted the village and the surrounding lands to the families of the dancers with the stipulation that the tradition be carried on.

The main themes of the dance-drama are from the *Parijatapaharana*, attributed to Sidhyendra, and the *Gollakalapam*, credited to Rāmayya, a dancer and poet of the late 19th century. The *Pārijātāpaharara* of the *kūcipūdi* drama concentrates on the emotion of Bhāma, who is separated from and eventually reunited with Kṛṣṇa. The *Gollakalapam* depicts the philosophical conversations of a milkmaid, Gollabhāma, with a Brahman. The use of Telugu as the language of the texts (as opposed to the Sanskrit used in some other traditions) preserved the popularity of the dramas, making them accessible to local audiences. The dancers also sing the texts of the drama. They are accompanied by a group of three to four musicians: the *sūtradhāra* recites the dance syllables and keeps time on *tālalu* (cymbals), in a similar fashion to the *nattuvanār*; the other musicians are a *mrdangam* player, a flautist or clarinetist and sometimes a violinist. The music is from the Karnatak tradition; occasionally the *kṛitī*s of Tyāgarāja are used.

A performance of *kūcipūdi* usually starts about 9 p.m. and lasts until dawn. It takes place in the courtyard of the Bālatripurasuntarī temple in the village. The drama starts without warning when Hysagadu, the fool, jumps on the stage. The musicians then take their place on the side of the stage and play a short piece (*jatī*) on the *mrdangam* and *tālalu*, followed by a prayer to the goddess. A *śloka* follows, in which the significance of the dance-drama is explained. An introductory dance called *dāru* is performed by the important characters; in this the dancer performs the first movements, revealing only his head and feet; a sheet (which is later removed) obscures the rest of his body. *Dārus* occur throughout the drama in different forms and are an important part of the style. *Pagati vēśamu* (comic interludes, from the disguise theatre) are inserted after the longer movements and form part of the dance-drama.

The role of Bhāma is one of the most challenging in the *kūcipūdi* repertory. One of the decorations worn by the dancer is Bhāma's *jada*, or artificial hair. Traditionally the *jada* would be thrown on to the stage at the beginning of the performance as a challenge to anyone in the audience who might doubt the abilities of the dancers. Although all the parts in the drama are traditionally played by Brahman men, since Independence a growing number of women have been trained as *kūcipūdi* dancers. The roles played by female dancers have been mainly solo dances. These have been taken

up by *bharata-nāṭyam* dancers, who often perform short extracts from *kūcipūdi* works. It is these solo items that are most often performed today with the full-length dramas rarely seen outside of the traditional village.

India, Subcontinent of, §IX, 1: Dance, Classical dance styles.

(vi) Manipuri.

Manipuri dance is performed by the Hindus living in the main valley of the north-eastern state of Manipur. They are devout Vaisnavites, and the content of the dance is drawn from the *Harivamśa* and a sizable body of medieval *bhakti* literature, including the *Gīta-govinda* of Jayadeva. The repertory of classical *manipuri* consists of five principal group dances known as *rāsa*. Unlike *bharata-nāṭyam*, *odissi* and the solo forms of *kūcipūdi*, *manipuri* makes use of solo, couple and group dance forms. It is performed by both sexes. The five principal *rāsa* dances are performed both as stage dances and as rituals connected with the full moon; the play of Kṛṣṇa as a cowherd is also included among these. The *rāsa* is preceded by drumming and dance items called *nāṭa sankīrtana*.

The performance begins with an invocation played as a solo on the *pung* (barrel drum; fig.24). This is followed by a *pung* sequence in which several players participate. After the introduction the main *sankīrtana* begins with an invocatory sung verse and a series of songs called *padāvali*. In the *rāsa* itself *nṛtta* and *nṛtya* alternate. The *nṛtta* is accompanied by the *pung* and the *pena* (a small bowed chordophone made from a coconut shell with a bamboo neck); the *nṛtya* is performed to a line of poetry set to highly ecstatic high pitched devotional music, often sung by women.

Two dance sequences are important in the technique of *manipuri*: the first, known as the *pareng*, is similar to the *adavu* of *bharata-nāṭyam*; the second, the *colam*, are different types of walk similar to the *cālī* of *odissi* (see below). The *pareng* is further divided into five varieties, each using a different *tāla*. The *pareng* is lyrical and built on an intricate series of movements. In contrast, the *colam* is vigorous and energetic, often performed by male dancers who also play the *pung* or cymbals.

The characteristic movements of *manipuri* are circular; arches and figures-of-eight are important. Some varieties of *manipuri*, performed by men, use the *ardhamandali* position, jumps, spiral movements and sitting positions. Movements of the wrists and hands are important; the hands gradually fold and unfold. Of the foot movements, toe contacts are the most significant; the heel is hardly ever emphasized. The dancer's training begins with the movements of hands and fingers, waist exercises and methods of walking (*colam*), followed by instruction in the technique of spinning. These are built into the long sequences of the *pareng*.

The *lai haroba* and the *rāsalilā* are two important varieties of *manipuri*. In the *lai haroba*, performed in the month of *Caitra* (March–April), the most important roles are performed by a *maiba* and a *maibi* (male and female temple dancers). The themes are drawn from myths in the local language, Meitei, including one that nine gods and seven goddesses carried the earth down from heaven. The *rāsalilā* are concerned with the exploits of Kṛṣṇa, Rādhā and the *gopī*s (see also §2(i)(b) below). In Manipur there are seven types of *rāsalilā*: *vasant* ('spring') *rāsa*; *kuñja* ('arbour') *rāsa*, performed at

the time of the harvest moon in November; *mahā* ('great') *rāsa*, performed during the full moon in December; *nitya* ('everyday') *rāsa*; *diba* ('daytime') *rāsa*; *natna rāsa* (of Kṛṣṇa and eight *gopī* s); and *gosta gopī cyam rāsa*, performed in April.

India, Subcontinent of, §IX, 1: Dance, Classical dance styles.

(vii) Mohiniāttam.

These Kerala dance-dramas are traditionally performed only by women. *Mohiniāttam* seems to have evolved as a distinct form in the 18th and 19th centuries, although the first mention of a dance of this name is found in the 16th-century *Vyavaharamala*, by Malamangalam Nārāyaṇan Nambūdiri. By the beginning of the 20th century the dance was falling into disuse, having already been revived earlier through the efforts of the ruler of Travancore, Svātītirunal (1813–46). The major impetus for the dance's current popularity came from the founding of the Kerala Kalamandalam in 1927 by the poet Vallathol Narayana Menon. The first dancer of *mohiniāttam* to study at the centre was Thankamani in 1932; since then many other students have been trained there.

The dance is an expression of devotion to the goddess Mohinī (the form of Viṣṇu as a seductress). *Nṛtta* predominates in *mohiniāttam*, although *abhinaya* is also used, and the dance follows a similar pattern to that of a *bharata-nāṭyam* performance: invocation, *jāṭisvaram*, *varnam*, *padam* and *tillāna*. There are four basic steps: *taganam*, *jaganam*, *dhaganam* and *sammisram* (known collectively as *adavu*). Sudden gestures are avoided, and importance is not placed on moving the feet to accentuate the tāla. Previously the dance was accompanied by Karnatak music played on the *toppi maddalam* (barrel drum) and *vīṇā*; the present-day dance has an accompaniment consisting of violin, *mrdangam* and a singer. The dancer may also sing. The texts to the devotional songs are in Manipravālam, a heavily Sanskrit-influenced version of Malayalam.

India, Subcontinent of, §IX, 1: Dance, Classical dance styles.

(viii) Odissi.

The history of this Orissan dance can, in part, be traced through temple sculpture. 12th-century inscriptions provide information on the dance rituals depicted in the temples of Jagannāth at Puri, Bhubaneswar and Konarak. Textual support comes from manuals written in Orissa between the 16th and 18th centuries, particularly the *Abhinaya-candrikā* and the *Nāṭya-manoramā*. The modern dance is based, like *bharata-nāṭyam*, on the temple dances of the *māhārī* (*devadāsīs*). The *māhārīs* were auspicious women who were married to the deity of the temple, Jagannāth. Although they were held to be auspicious (and the singers of 'auspicious songs', *mangala gīta* (Marglin, 1985, p.18)), the *māhārīs* were also courtesans (courtesans attached to the court were known as *dei*), making them ritually impure.

The outlawing of *devadāsī* inductions in Tamil Nadu had a widespread impact; the passing over of the Orissan temples to the control of the state government and the effect of the 'anti-nautch' campaign led to a severe decline in the activities of the temple dancers. In the 1950s a series of seminars was arranged with the aim of reviving the dance as a 'classical'

concert form. At these seminars much emphasis was placed on sculpture as a primary source for the dance's reconstruction, and the name *odissi* was decided on (until then the dancers had referred to it as *nāca*, 'dance'). Notably absent from the discussions were the remaining *māhārīs*. However, male dancers and teachers were included; young men aged up to 18 did become dancers (known as *gotipua*), a tradition said to have started in the 16th century; after this age they became the teachers and musicians for the *māhārīs*.

The basic posture of *odissi* is the *ardhamandali* position. The *bhangi* posture (known in sculpture as *tribhanga*) has a triple bend (fig.25). In the characteristic pose known as *chowk*, the thighs and feet are turned out and the knees bent. From the *bhangi* and *chowk* positions other patterns emerge. Cadences of movement, *arasā*, are built on *tālas* with between four and nine beats. Also characteristic of *odissi* are the different types of walk known as *cāri* or *cāli* ('walking'). The *nr̥tta* sequences are followed by passages in *nr̥tya*; many of these are inspired by Sanskrit poetry, particularly the *Gīta-govinda*. The recital ends with items in *nr̥tya*: either the *tarjam*, which ends in a very fast tempo, or the *mokhya*. Training for *odissi* begins with eight body positions (*beli*), each of which has many varieties. Sitting positions are known as *baitha*; *sthanka* are standing positions. Rising and jumping movements are known as *utha*; *cāli* are also practised. *Bhāsa* is used to describe the bending of the body from left to right; *bhaumri* are fast whirls, and *bhura* are quick movements. Movements towards the back of the stage culminating in short dance sequences are called *pali*. The instruments used to accompany the dances are the *mardala* (barrel drum), *gini* (cymbals) and flute; a violin or *vīnā* may also be used, and a singer is usually part of the ensemble.

India, Subcontinent of, §IX: Dance

2. Local traditions.

Local dance traditions vary widely across South Asia. They include traditional dance-dramas, such as the *yaksagāna* of Karnataka, and many dances related to calendrical festivals and life-cycle rituals. Ādivāsī traditions are similarly widespread and diverse.

- (i) Dance-dramas.
- (ii) Calendrical, life-cycle and festival dances.
- (iii) Dances of trance and ritual.
- (iv) Ādivāsī traditions.

India, Subcontinent of, §IX, 2: Dance, Local traditions.

(i) Dance-dramas.

Many dance-dramas (the depiction of a story, often religious and with a ritual element, through music, dance and spoken and sung texts) are performed throughout South Asia apart from the 'classical' *kūcipūdi*, *kathakali* and *mohiniāttam* dances described above. In addition to the dramas described below, others include the *kuravañci*, prevalent in many parts of south India, particularly in Tamil Nadu, and performed by women (see Peterson, 1998); the Sanskrit *kūtiyāttam* of Kerala (Richmond, 1990); and the *bhāgavata-mēla* of Tamil Nadu.

(a) Chau.

Traditionally danced at the spring festival of *Caitra Parva*, *chau* is found in adjacent areas of Orissa, Bihar and West Bengal. There are four forms of the dance, all danced only by men of the farmer caste and named after the places in which they are predominantly found: *māyurbhanj chau*, and the *jhargram chau*, *puruliā chau* and *serāikela chau* (which are masked dances). It is thought that *māyurbhanj chau* was masked until the end of the 19th century. The themes, often martial, are taken from the Hindu epics, particularly those stories featuring Kṛṣṇa. It has been greatly influenced by the dances of the surrounding Santāl people and other local dances; the *māyurbhañj chau* incorporates elements of the Orissan *paik* sword and shield dances. The different dances vary in their execution. The *māyurbhañj chau* is predominantly a dance between two competing groups (there is also a solo dance associated with the *māyurbhañj* style), and the *serāikela* dance concentrates on small ensembles of dancers; the *puruliā chau* is the most energetic and, perhaps, closest to its Ādivāsī origins. Vocal music is rare as an accompaniment. The instruments that accompany the dance include the *dhamsā* (a large drum played with sticks); the *dhol*; *cadcadi* (kettledrums played with sticks); a *mahurī* (a short oboe); and a flute. Other instruments occasionally used include a *tikārā* or a *tuila* (a single-string fretless plucked stick zither) (see also [Madar](#)). A government Chau Dance Centre was set up in 1964 under the dancer and teacher Kedar Nath Sahu. Its aims have been to teach and preserve the form.

(b) Rāsaliḷā.

This religious drama, which dates back to the 15th century, takes place in a region historically known as Braj, associated with the god Kṛṣṇa and his adventures with the *gopīs* ('milkmaids'), which lies around the towns of Mathura and Vrindavan in present-day Uttar Pradesh. The area is littered with holy pilgrimage sites connected with exploits of the god. The *rās* is the dance performed by Kṛṣṇa and the *gopīs*, and the *rāsaliḷā* seeks to re-enact this. Following this a play is presented of one of Kṛṣṇa's *līlās* (lit. 'sports, play'), stories from his youth.

Performances take place during the monsoon at the time of the greatest number of pilgrims to the region: the fortnight leading up to Kṛṣṇa's birthday, *Janmāṣṭamī*, in the month of *Bhādom* (August–September). Another important time of pilgrimage is *Holī*. Performances occur in private homes, at pilgrims' hostels and at the sites on the *banjātrā*, the pilgrimage trail around Braj. The round dancing platform used for the performances is known as a *rāsmandalī*. The main characters, Rādhā and Kṛṣṇa, are played by boys aged around 11–12, known as *svarūps*, who must give up the role at the onset of puberty. For the duration of the performance the young actors become the embodiments of the characters, and thus of the divine, for the audience.

The troupe, *rāsmandalī*, is headed by the *svāmī* or *rāsdhārī* who trains the performers. There are four actors to play the *gopīs* (also young boys) and an accompanying ensemble known as the *sangīt samāj*, which plays a mixture of Hindustani genres and popular styles. This consists of *sārangī*, a pair of *tablā* or a *pakhāvaj*, *jhāñjh* (cymbals) and a harmonium. The texts of the plays are kept by the *svāmī*, who may collect them from various

sources; Hein (1972, p.154) notes that troupes have a repertory of 30–45 plays.

A performance consists of two contrasting parts, the first (the *nitya rās*) comprising a set ritual, the second a drama (the *līlā*). The opening is the *mangalācaran* during which the *svāmī* sings a devotional song, followed by the *ārati* (fire sacrifice). During the *gopī-prārthanā* and the section that follows, Rādhā, Kṛṣṇa and the *gopī*s prepare to dance. The *rās* dances then follow, including group, circle, duet and solo dances, the precursors of *kathak*. This is sometimes concluded by a *pravacan*, a speech by Kṛṣṇa. The second part then follows: the performance of a *līlā*, which consists largely of songs and narrative.

(c) Terukkūttu.

The Tamil *terukkūttu* (*teru*, 'street'; *kūttu*, 'drama, dance') are ritual dramas performed in villages by all-male troupes of professional, semi-professional and amateur dancers. The stories are taken from the Mahābhārata and in particular those of Draupadī; an important episode in *terukkūttu* is *Tiraupatai vastirāpaharanam* ('the removal of Draupadī's clothes'). Many of these stories, traditionally passed down on palm-leaf manuscripts, are now commercially printed. Although performances take place throughout the year, Frasca (1990, p.23) reports that the busiest time for professional troupes is between *Pankuni* and *Āti*, March and August. The performers fall into four categories: the *vāṭiyār*s ('teachers'), who train the other performers and take on the major roles; those who play *periya vēśam*s ('large roles') but who are not as experienced as a *vāṭiyār*; those who play the *cinna vēśam*s ('small, lesser roles'); and the younger trainees and understudies.

The dance steps of *terukkūttu* show a distinct correlation with those of *bharata-nāṭyam*. The two basic stances of both forms, *samapātnam* and *arai-manti* (*ardhamandali*), are very close (fig.26). Similar correspondences can be seen for a number of other steps of both traditions (see Frasca, 1990, pp.92–111). A performance of a *terukkūttu* begins and ends with devotional hymns. The music for the performance is provided by an ensemble known as a *melam*. This consists of a *mukavīnai* (short oboe) which plays the melody, *tālam* (cymbals), a *petti* ('box') drone-harmonium and what Frasca calls a '*mrdangam-dholak*' (pp.30–31). This is a composite drum that consists of a *mrdangam* turned on its end with the higher-pitched skin upwards and a *dholak* on the player's lap. The *dholak* has a bamboo strip over the right-hand head, which may serve to imitate the sound of the *tavil*.

The music of *terukkūttu* is played in Karnatak rāgas. The most often used are Nāṭtai, Mukāri, Mōhanam, Nātanāmakriya, Kētārakaula and Tanyāsi. Different rāgas are used for different dramatic purposes, emotions and moods; one of the most important is Nāṭtai, used for heroic and ferocious characters. The music also uses a system of tālas, with the most common being Āti (eight beats), Rūpaka (six beats), Ata (14 beats) and Cāpu (seven beats). They differ from their Karnatak equivalents by the ways in which they are counted and subdivided.

(d) Yaksagāna.

Yaksagāna dance-dramas (also known as *bailāta*) are performed in the villages of coastal Karnataka between November and May. There is both a northern (*badagatittu*) and southern (*tenkatittu*) style of performance, both with elaborate make-up and costumes. The southern style, performed around Mangalore, is stylistically and musically closer to *kathakali*. The open-air (sometimes in a tent), night-long performances are supported by local patronage, often that of a landlord or businessman who chooses the story, and are performed to mark the *pūjā* for a new house, a good harvest etc. A little support has come from the state and central governments via the Sangeet Natak Akademi, and a few *kēndra* (schools) have been set up in Karnataka. The performers in the travelling groups are all male, and training takes about 10 years.

The stories, *prasanga*, are written by Kannada poets. Ashton and Christie (1977) report there are more than 100 in print, of which some 45 are performed regularly; an individual group would have a repertory of about 35 plays. Common themes include the battle between the Pāndavas and the Kauravas (most stories climax in a battle, or a battle followed by a marriage) and stories involving Kṛṣṇa. The ritual literature for the plays is contained in the eclectic *Yaksagāna śabhālakṣana muttu prasangapīthike*. An introductory dance, *oddōlaga*, similar to the *dāru* of *kūcipūdi*, is performed by the major characters. The narrative is punctuated by comic interludes performed by the *kōdangi* (clowns). The performance concludes with the *mangalam* dance, in which a dancer playing a female role, *strīvēśa*, prays to Durgā and Viṣṇu.

The musical accompaniment is provided by an ensemble of *maddale* (*maddalam*, barrel drum), *cande* (*centa*, cylindrical drum), *tāla* (cymbals) and a singer, known as the *bhāgavata*, who is the leader of the ensemble. The *bhāgavata* is assisted by trainee singers who share the task of singing throughout the night. At important points in the drama the *bhāgavata* may take over the drumming from the other players. The texts are sung at a high pitch using Karnatak rāgas and tālas, chosen by the *bhāgavata*; the drone (*śruti*) is provided by a harmonium with the required key held down by a stick. Of the 40 or so rāgas in use, three are only found in *yaksagāna*. Six different tālas, and a rhythm in seven called *ti ti tai*, are used. In addition to the Karnatak repertory a number of traditional songs are used: *harake* (devotional song), *jōgula* (lullaby), *lāvani* (a work-song), *śōbhāne* (an erotic song sung at weddings), and the Hindustani genre *thumrī*, here called *tumirī*.

[India, Subcontinent of, §IX, 2: Dance, Local traditions.](#)

(ii) Calendrical, life-cycle and festival dances.

The Hindu year is marked by major religious festivals, many of which also mark changes in the seasonal, agricultural cycle. These festivals are celebrated with music and dance, as are rites-of-passage, particularly weddings. There are a vast number of local dances and festivals (and means of calculating when these occur); the account below gives a broad outline of the Indian year as celebrated in dance.

In north India the first day of the lunar new year, *Cait*, and the latter part of the preceding month of *Phālgun* (February–March), are marked by the spring festival of *Holī*. *Holī* dances in north India are usually danced by

men, particularly in Gujarat and Rajasthan. However, the *Holi* circle-dance of Haryana and the *ghūmar* dance of Rajasthan are danced by women during *Holi*. The latter is also danced at the spring festival of *Gangaur*. In Gujarat, people of the fisherman caste perform a mixed dance around the *Holi* fire (*hustaśni*). Further south in Maharashtra, the Ādivāsī, Warli and Thakur communities perform the *tarapi* dance, named after the aerophone (*tarpe*, a double clarinet) that accompanies it.

The month of *Vaiśākh* (April–May) is the time of the north Indian harvest, before the onset of the monsoon rains. In the Punjab this is traditionally celebrated with the *bhangra* and *jhummar* dances. Danced by men, *bhangra* is a complex circle dance accompanied by a *Dhol*, playing in two or three beat cycles, and one or two singers performing *boli* or *dhola* traditional songs. Punjabi women may also perform the *giddhā* group dance at this time (see *GEWM*, v, 'Punjab', J. Middlebrook). In neighbouring Haryana the harvest is celebrated with dances by men or by men and women, accompanied by the *daph* (frame drum) and the seasonal *dhamyal* songs played and sung by the dancers. The lively *karam* dance, which is associated with a fertility ritual and which may include trance, is also performed at harvest time by men in villages in Mirzapur District, Uttar Pradesh.

The harvest and hot season are followed by the monsoon. The recreational monsoon dances of Uttar Pradesh are performed principally by women. A swaying line-dance is accompanied by the singing of *kajalī* swinging songs. Men also perform two versions of *kajalī*: one is a dance known as *dhunmuniyā*, the second is a professional song genre. The women's dance is also performed at the festival of *Tij* (held in August) during which women fast for their male relatives; in Rajasthan this is marked by the dancing of the *ghūmar* circle dance. The Keralan festival of *Onam*, which comes at the end of the rains, is marked by the women's festival dance *kaikkottikkali*, during which the dancers perform responsorial *tiruvatirakali* songs. The Andhran *Vināyakacaviti* festival also falls at the end of the monsoon. This is marked by processions that include many performers, including low-caste 'recording dancers, who reproduce the dances of famous film-stars (fig.27).

The pan-Indian goddess festival of *Daśahrā* and the preceding period of *Navarātrī* ('nine nights') take place during *Āśvin* (September–October). This is the period during which crops are sown following the rains. *Navarātrī* is marked in Gujarat by the *rās* and *garba*. There are many versions of these popular dances; one of the most widespread is the *dandīā rās*, a circular stick dance (see *Danda*). The women's *garba* dance takes place around a pot (*garbo*) in which there is a light. As they dance the women sing responsorial songs (see *GEWM*, v, 'Gujarat', G.R. Thomson). The *dappu* dance of Andhra Pradesh (named after the accompanying round drum) has five different forms; *majili dappu* is a stamping dance performed at *Daśahrā*. Other forms of the dance are performed at *Holi*, for the local goddess Pochamma and at weddings.

Dīvālī (the festival celebrating the return of Rāma to Ayodhya) falls in the month of *Kātik* (October–November) and is celebrated all over India. In Karnataka it is marked by the costumed *karadi vēsa* ('bear dance'). The shield and sword *paik* dance of Orissa (see also §(a) above) is performed

at this time. The dance represents a battle and is characterized by an increasing tempo. It is accompanied by the *mahurī* (double-reed aerophone) and drums. The widespread south Indian *kōlāttam* (*kōl*, 'small stick'; *āttam*, 'play') pole dance is also traditionally associated with *Dīvālī* (Tamil *Tīpāvali*). Ropes or ribbons attached to a central pole are used by the dancers to weave a pattern. It is usually now performed by young girls.

The festivals of *Sankrānti*, known as *Pongal* in the south, and *Śivarātrī* come at the end of the Hindu year (in *Pūs*, December–January, and *Phālgun* respectively). In West Bengal young girls gather every evening to perform songs called *tusu*; these are sung on the day of *Makar Sankrānti* itself to accompany group dances. Men perform songs known as *bhaduriya saila* to accompany their circular dances. In some areas the women of Andhra perform a dance around the *bhōgimanntalu* (hay-fire) to celebrate the harvest.

In addition to these festivals marking the passing of the year are the celebrations held to mark events such as weddings and births. The birth of a child in Bihar is celebrated by the mother and father dancing a *bakho nāc* (which may also be danced at weddings). Weddings are the focus of many performance traditions in India. In Madhya Pradesh the women's *suā nāc* ('parrot dance'; see Flueckiger, 1996) is performed at harvest but comments on the feelings and situation of a newly married woman. The *jhorīa* dance of Rajasthan is a stick dance performed by men and women, in two separate circles, at weddings, while in the Punjab the women's *giddhā* dance is performed at both the bride's and groom's houses. The accompaniment for the *jhorīa* is provided by a *śahnāī*, *dhol* and *nagara* (kettledrums); the *giddhā* is accompanied by singing. The Siddis of Hyderabad, Andhra Pradesh (descendants of black African slaves and labourers of 12th-century Muslim rulers), perform a sword dance, the *dhamal*, at weddings. It is possible that elements of the *dhamal* are African in origin.

India, Subcontinent of, §IX, 2: Dance, Local traditions.

(iii) Dances of trance and ritual.

Dance in India is also used in rituals to propitiate deities, often involving trance and often linked to local goddesses. These dances may be used to ward off disease, commonly smallpox, which is associated with a number of village goddesses. Vatsyayan (1976, p.182) notes that the women in Uttar Pradesh would dance around the shrine of Sitala Devi until they fell into a trance, this signifying that the goddess had removed the disease.

In addition to dances performed to propitiate local goddesses are those associated with possession; these have a more regional distribution. Notable among these are the *teyyam* dance of Kerala and the *bhūta* dances of Karnataka. *Teyāttam* is performed by low-caste professionals who, in their elaborate make-up and masks, embody the deity – Śiva or Kālī – that they are portraying. During the performance, accompanied by a singer who recounts a mythological story, the *teyyam* dancer (who does not portray the narrative) moves ever quicker, entering a trance at the end of each of the dance's three sections. The performance is preceded and followed by rituals at the village shrine. The dancer acts as a medium between the village and the deity, often to cure disease. In the Keralan

mutiyettu dance, a precursor of *kathakali*, the dancers, who enter states of trance under the power of the goddess Bhagavati, represent the story being narrated.

The *bhūtha* dancers of Karnataka also embody the village deity. In this role the dancer dispenses justice to the audience and mediates in village problems. Like the *teyyam* dancers of Kerala, the *bhūtha* performers wear striking costumes and make-up. The dance takes place at the village *bhūtha sana*, a small-roofed shrine, on moonlit nights. The *bhūtha* s dance and sing with an instrumental accompaniment that includes drumming, often breaking off to give their messages to the crowd.

India, Subcontinent of, §IX, 2: Dance, Local traditions.

(iv) Ādivāsī traditions.

Ādivāsī dance shares many of the characteristics of other local traditions, being linked to agricultural festivals and the celebration of events such as weddings. However, many of the dance traditions are distinct and vary considerably from group to group, often reflecting the rituals and mythology of the individual peoples. In addition, it should be noted that Ādivāsī and non-Ādivāsī musics have influenced each other greatly and are often indistinguishable.

A ritual dance associated with agriculture and fertility, shared by many Orissan and Bihari Ādivāsī groups, is the *karam*. This involves the planting of a tree that is dedicated to a deity; the men and women of the village then dance around the tree. The boys and girls of the Oraons of Bihar, who consider this a harvest dance, perform the *jadar* dance at the spring festival of *Sarhul*, accompanied by the *khel* (barrel drum; see *Madar*).

The Santāl of Chota Nagpur, like many Bihari groups, have mixed and group dances, for example the *maghi* performed at *Sankrānti* (a circle-dance, accompanied by *madar*, flute and *jhāl*, cymbals), but no paired dances. In dances such as the *jhika* and *don enec* the women form a circle on the inside of the men. Another widespread group are the Bhil, many of whom live in Madhya Pradesh. At *Holī*, young Bhil men and women perform the *bhagoriya* dance. This takes place around a pole set up in the village; the accompanying drumming is led by the village headman. The Bhil of Rajasthan perform many dances that they share with non-Ādivāsī Rajasthani villagers, for example the *ghūmar*, the *jhoria* and a form of the *garba* dance.

The Gonds, who speak a Dravidian language, live across central India. They form many different groups, all with differing traditions. The ritual bison dance, or *gaur*, of the Maria Gonds of Bastar, Madhya Pradesh, is accompanied by large *dhol* s, played by male dancers wearing bison-horn headdresses. The women, carrying *tirududi* (sticks), dance around the men to the polyrhythmic accompaniment. The buffalo is also ritually important to the Toda, who live in the Nilgiri Hills of Tamil Nadu. The deity On is considered responsible for bringing the buffalo to earth, and dances are performed at the Toda shrines as part of his worship.

India, Subcontinent of, §IX: Dance

3. 20th-century trends.

(i) Modern dance.

In the 1920s **Uday Shankar**, much influenced by his meeting with Anna Pavlova, was the first to break away from traditional styles. He created impressionistic dances and freed movement from the constraints of mime by using the whole body instead of concentrating purely on the hands and face for expression. Although inspired by Indian myth, he was also interested in developing as a theme the increasing mechanization of human life. His early creations, such as *Labour and Machinery – Rhythm of Life*, laid the foundations of a new idiom that introduced elements of realism. Shankar founded a school of dance in Almora, Uttar Pradesh; although traditional teachers worked there, a new style of dance emerged as a result of Shankar's influence. Elements from classical dance were freely incorporated into the new technique, although the sculptural pose and the basic motifs of individual styles were abandoned. The dance movements themselves became the primary focus, with music only providing an accompaniment and no longer guiding the actions.

Shanti Bardhan (d 1954) was one of Shankar's associates, responsible for creating two important ballets: the *Rāma-līlā* and the *Pañca-tantra*. He was also involved in the production of the ballet *Discovery of India*, based on Nehru's book of the same name. The *Rāma-līlā* uses one single movement for the whole ballet, in which a puppet show is presented. In the *Pañca-tantra* the characters are birds, whose movements are depicted through a distinctive use of the spine and arms.

The movements used in modern dance gave new stimulus to the performers in the traditional schools. New themes and new literary sources were used in creating dance-dramas in classical styles. *Bharata-nāṭyam* was no longer restricted to the solo dancer: many dance-dramas were composed using both *bharata-nāṭyam* and *kathakali* by Rukmini Devi and Mrinalini Sarabhai. In *odissi*, full-length dance-dramas based on the *Gīta-govinda*, using many characters, have been attempted. In *kathak*, a number of ballets on traditional and modern themes have been choreographed by Brijū Maharaj, and in *manipuri* by Singhajit Singh. Some choreographers have drawn on material from local forms; a ballet called *Bhairavī* by Prabhat Gangully uses the *māyurbhanj chau*.

(ii) Dance in film.

Dance has been an important aspect of Indian film since the very first 'talkies' in the 1930s and may be seen as a continuation of traditional Indian theatre (and particularly the Marathi theatre of the end of the 19th century), where dance, mime, text and music have always been integral to the presentation of the story. Music and dance in film perform much the same function as in classical Sanskrit drama, that is, to provide an interlude during which the action moves forward in time.

The first dances were classical; many traditional teachers of *bharata-nāṭyam* had emigrated from their villages to Madras and Bombay to seek work in the film industry. However, choreographers soon broadened their range of influences to include elements of contemporary dance and local traditions, so that group dances, as well as duets and solo items, with complex, synchronized choreography have been an enduring feature of

Indian films. During the 1970s disco from the West influenced choreographers, as did the later videos of Western stars, such as Michael Jackson. Techniques such as 'moon walking' and break dancing were now seen on screen alongside more 'classical' styles in duet and group dances. The result has been an increasingly syncretic dance style peculiar to film, an amalgam of 'classical' styles, local traditions and Western popular dance, generally known as *disco*.

(iii) New Asian dance music.

This term is adopted by Sharma, Hutnyk and Sharma (1996, pp.33–41) as a catch-all term for a variety of popular musics associated with the British South Asian community. The terms **Bhangra** and 'post-bhangra' also cover these musics, which may have little or nothing to do with the Punjabi traditional dance (see §2(ii) above) from which the name comes (cf. Baumann, 1990). They arose as a South Asian counterpart, in Southall and Birmingham, to the club and dance scene of the 1980s and 90s and owe a debt to black dance musics coming from the USA, such as soul, hip-hop and rap.

The earliest bhangra bands were formed on the immigrant Punjabi wedding circuit playing traditional music, including that used for the *bhangra* dance. This traditional music had less and less appeal to the generations of South Asians born and raised in Britain, who more often identified with black musics such as reggae. At the beginning of the 1980s bands such as Alaap and Heera integrated these sound-system-based musics into the more traditional forms being played on the wedding circuit. As recordings and experience of this music spread through young South Asian communities, a club and dance scene coalesced around these bands, with gigs and raves taking place both during the day and at night.

As the scene developed it became more diverse and moved beyond the original designation of 'bhangra'. Artists such as Apache Indian incorporated elements of ragga into their music, while Bally Sagoo mixed in drum 'n' bass to produce 'acid bhangra' and turned his attention to Hindi film songs, producing re-mixed versions of hits on albums such as *Bollywood Classics* and *Bollywood Flashbacks* (both 1994). These artists have achieved great popularity in India itself, with many of these innovations feeding back into the South Asian popular music and dance scene. More recently, groups such as the Asian Dub Foundation and Fun^Da^Mental have mixed South Asian instrumentation and lyrics with rap, producing music with an explicitly political message, while Cornershop, a guitar-based band, has produced rock-oriented music.

India, Subcontinent of

X. Research

In the 1980s and 90s the pace of research and publication by Indian and non-Indian scholars on South Asia's performing arts continued much as before. There were four primary areas of research: the performance genres of both Hindustani and Karnatak music; systematic and theoretical research (e.g. on pitch, rāga etc.); the life and music of a particular artist; and research that is primarily historical, focussing on musical instruments as well as culture.

Prospects for future research are rich, emerging both from previous work and from the adoption of new perspectives. Gradually the boundaries formed by scholarly conceptions of South Asian cultures in terms of master cleavages – 'national cultural centres' and regional culture, 'great' and 'little' traditions, Hindu and Muslim, to name a few – are being broken down. There is an increasing awareness of the political assumptions that underpin these simplistic conceptions of one of the world's largest and most complex cultures.

In focussing on genres and on particular master artists, attention has remained largely on the overarching spheres of Hindustani and Karnatak music and to a certain extent on pan-Indian culture, since artists of both traditions perform regularly throughout the country. The performers and performance activity thus documented are those in the centres of Madras, Bombay, Delhi and Calcutta. A gradual, centuries-long process led to the existence of a pan-regional and pan-Indian musical culture. An analysis of the dynamics of that process would not only reveal a great deal about the nature of Indian culture today, but would also contextualize recent scholarly work.

While the nation-state has created the pan-Indian performance sphere, music throughout South Asia historically has flourished and developed at more localized levels, as has become clear through recent studies on Lucknow in north India and on Thanjavur in the south. Historical sources from cultural centres offer the opportunity for much deeper historical study of Indian music. Musical activity in princely states such as Gwalior and Rampur remain to be investigated in depth. Ethnographies of contemporary musical life in those regional centres would explain much about Indian culture at the present time, building on work done in Jaipur and other Rajasthani cities.

Local Indian culture is incomparably rich but largely neglected by scholars. While interdisciplinary studies of narrative forms have been exciting researchers around the world, local Indian narrative forms such as *kathakali* and *yaksagāna* have been ignored. Music in the Deccani area of India – that important meeting place of north and south, of South Asian and West Asian cultures – remains largely unexplored, either historically or in contemporary times. Recent writings on Maharashtrian and Gujarati culture border on it, but insufficient recognition is accorded such 'localized' studies, due primarily to the focus on pan-regional traditions.

The artificial division between 'great' and 'little' traditions (in musical terms, classical and other) has kept imaginations confined within the categories of 'classical', 'folk', 'tribal' and 'popular', and concentrated primarily on the 'classical', with genre study generously incorporating the 'light classical'. Finally, however, scholars are according more attention to music at village

level or to the music of a particular social group, e.g. Rajasthani musician castes, south Indian Christians and Ādivāsī groups. Likewise, studies of women in the 'great' tradition and even women's musical traditions are gaining momentum. The film music and cassette industries in India are attracting, indeed compelling, attention to popular music. These are all rich and important areas for research.

In addition, work has just begun on sources long available but untapped. For example, Persian-language writing from the medieval period onwards, in literature, official chronicles or scholarly work, is being mined for the history of musical instruments and for tracing the development of the two 'classical' traditions (see §II above). Mughal paintings and early photographs are sources of invaluable information and new perspectives.

Significantly, scholar after scholar is starting to understand that the vitality of the Indian performing arts lies in the dynamic interplay between categories: 'great' and 'little', 'classical' and 'non-classical', Ādivāsī and non-'tribal', village and urban. Thus, such boundary-crossing topics as patronage, social mobility, musical mobility (for instance, the important role of mendicant musicians in Indian culture), music in ritual, popular culture and the interdependence of social groups through the arts in South Asian cultures emerge as rich subjects for study.

India, Sigismondo d'.

See [D'India, Sigismondo](#).

Indianapolis.

American city, capital of Indiana. It was founded in 1821.

1. Early concert life.

The city's early musical life was characterized by church choir performances, notably by the 50-voice ensemble at the Second Presbyterian Church, where Henry Ward Beecher was pastor from 1839 to 1847. Stimulated by German immigration during the 1830s and 1840s, singing societies flourished in the mid-19th century. In 1854 the Indianapolis Männerchor was founded and has remained active, having sponsored visits from such international artists as Ernestine Schumann-Heink, Maggie Teyte, George Enescu, Myra Hess and Nathan Milstein. It was followed by a number of other male singing societies.

The May Music Festival, held in 1874–5 and from 1886 to 1898 (when it was also known as the Grand Festival), was modelled on that of Cincinnati. The festival of 1886 had a chorus of about 600 and an orchestra of 60. Visiting orchestras included the Theodore Thomas Orchestra and the Boston SO; among guest conductors were Walter Damrosch and Frederick Stock.

The Indianapolis Matinee Musicale (founded in 1877 as the Ladies Matinee Musical), a society for instrumentalists and singers, continues to play an active part in the city's musical life. Membership by 1927 was no longer

restricted to women. After its participation in the World's Columbian Exposition (Chicago, 1893), it became affiliated with the National Federation of Music Clubs. Guest artists in the programmes sponsored by the society (usually about 30 a year) have included Alfredo Casella (1920), Wilhelm Backhaus (1925), and Eugene Istomin (1947). Other choral groups included the Mendelssohn Choir (founded 1916) and the Haydn Festival Choir (1932). Solo recitals flourished from 1900 to 1960; the series at the English Theater was particularly notable and included such performers as Rachmaninoff.

2. Orchestras.

In 1896 Karl Schneider formed a 60-member orchestra, which survived until 1906 and was occasionally referred to as the Indianapolis SO. The most important other early attempts to form orchestras were the Indianapolis Orchestra and another short-lived Indianapolis SO, under Alexander Ernestinoff (1910–14). The latter rehearsed at the German House (Athenaeum), which has remained an important centre of musical activity.

The Indianapolis SO was formed in 1929, and first performed on 2 November 1930 under Ferdinand Schaeffer, a German violinist and conductor. The orchestra is supported by the Indiana State Symphony Society (founded 1931) and by its women's committee (once numbering 5000). Until 1937 it was a cooperative, semi-professional orchestra. That year the society was reorganized under the leadership of the industrialist William H. Ball of Muncie, Fabien Sevitzy was appointed conductor and the orchestra became a fully professional ensemble. During the 1937–8 season, Lotte Lehmann, Albert Spaulding and Emanuel Feuermann appeared as guest soloists; the Indianapolis Symphonic Choir was formed as an affiliate of the orchestra; and ten concerts were broadcast by the Mutual Broadcasting Network (broadcasts continued to 1945). In 1943 the state passed legislation permitting the use of tax revenue for the orchestra; in 1951–2 it was the first significant orchestra to appear on commercial television and was considered one of the ten best orchestras in the USA. Sevitzy's tenure was marked by his performances of contemporary American music, the engaging of young musicians, several recordings (from 1941) and the initiation of children's and other community concert series. Dissatisfaction over his programming and other issues led to his dismissal in 1955, and Izler Solomon became director in 1956. In 1963 the orchestra moved to Clowes Memorial Hall (cap. 2182) on the Butler University campus. The hall is a centre of musical activity in Indianapolis, and has a flexible stage to accommodate solo recitals, ensembles, orchestras, opera and ballet. In 1984 the renovated Circle Theater (cap. 1847) became the orchestra's home.

The orchestra achieved increased international recognition under Solomon, who resigned his post in 1976. Following two seasons of guest conductors, John Nelson became music director in 1976. Raymond Leppard succeeded him in 1987 and has brought the orchestra high acclaim. In 1982 the quadrennial International Violin Competition was initiated in Indianapolis.

3. Opera.

Despite frequent appearances by world renowned groups, it was not until after World War II that local opera began to develop. An interest in light opera from the 1880s resulted in the founding, by Ora Pearson, of the Indianapolis Opera Company, which lasted about a decade. A professional company, the Indianapolis Opera, was founded in 1975 and gives about four productions a year at the Clowes Memorial Hall. The Indiana Opera Theater, a community-based opera company, was founded in 1983.

4. Education.

In 1907 the College of Musical Art was founded. It merged with the Indiana College of Music and Fine Arts in 1918 and by 1922 it had 1000 students and 30 instructors. The Arthur Jordan Conservatory of Music was formed in 1928 through the merging of the Indiana College of Music and Fine Arts, the Metropolitan School of Music (founded 1895) and a number of smaller institutions. It was affiliated with Butler University (founded 1855) from 1928 to 1951. In 1968 the college began sponsoring the Romantic Music Festival, held each April until 1988. Succeeding annual festivals have presented the Soviet arts, contemporary American music and the works of Brahms and Schubert. In the mid-1990s 200 undergraduate and 70 graduate students were enrolled at Jordan, which has a faculty of 50 and offers BA, BM, BS and MM degrees in performance, theory, composition, education, history and arts administration. Degree programmes are also offered at the University of Indianapolis (founded as Indiana Central University in 1902) and the school of music at Indiana University in Bloomington, about 80 kilometres south of Indianapolis.

5. Ragtime and jazz.

Although Indianapolis was not one of the points of origination for ragtime, it became an important centre for its publication. After a late start, the publication of ragtime in Indianapolis reached a peak in 1908 and remained high until 1916. Leading ragtime composers included May Aufderheide, Julia Niebergall, Paul Pratt, J. Russel Robinson and Russell Smith.

The early history of jazz in the city featured extended visits from the Wolverines with Bix Beiderbecke, Red Nichols (and his Syncopating Five) and Hoagy Carmichael; from the 1930s a more indigenous jazz evolved. Among those whose careers began in Indianapolis are the trumpeter Freddie Hubbard; the trombonists J.J. Johnson, Slide Hampton and David Baker; the alto saxophonist Jimmy Spaulding; the pianists Leroy Carr and Carl Perkins; the guitarist Wes Montgomery; the double bass players Monk Montgomery and Larry Ridley; and the drummers Earl 'Fox' Walker and Sonny Johnson. The most important groups included the Montgomery/Johnson Quintet, the Dave Baker Quartet and the Wes Montgomery Trio. David Baker of Indiana University at Bloomington has also achieved recognition as a jazz educator, author and arranger.

Indiana University School of Music.

The university was founded in 1820 and began to offer music instruction in 1893. A music department was organized, at Bloomington, in 1910; in 1921 it was made a school of music. Under the deanship (1947–73) of Wilfred C. Bain the school experienced great expansion which has made it one of the largest and best-equipped schools of music in the country. Charles H. Webb succeeded Bain. In the mid-1990s over 1400 students were enrolled at the school, whose teaching staff numbered about 140. Degrees are offered in performing, theory, composition and musicology, as well as in recording technology, stagecraft and string instrument building; an artist diploma is also awarded. The school has a strong opera programme. The library houses almost 550,000 items, including nearly 160,000 recordings; rare books and music (including over 125,000 titles of American sheet music and the personal papers of Hoagy Carmichael) are in the university's Lilly Library. Other important resources include an Early Music Institute, a Latin American Music Center, a Black Music Center and the Archives of Traditional Music.

BRUCE CARR

Indie music.

Before the punk explosion in the UK in the mid-1970s, six major record labels (what are now CBS/Sony, the American Warner and MCA, the Dutch Polygram, British EMI and German BMG) operated an effective monopoly on access to mass public taste, especially throughout the Anglophone world. Through its explicit challenge to bourgeois values, punk broke this monopoly, enabling independent (hence indie) labels to gain an effective market share. Consequently Stiff Records became immediately important, especially through their promotion of Elvis Costello and the Attractions. Other notable labels include: Rough Trade, who marketed the Smiths; Creation, who marketed Primal Scream, Teenage Fanclub and, latterly, Oasis; 4AD with the Cocteau Twins; Kitchenware with Prefab Sprout; Beggar's Banquet; Demon and One Little Indian. Such labels' real independence from larger competitors was called into question particularly by Rough Trade's distribution problems in 1991.

As a style label indie is not particularly useful, although it does carry connotations of sensitive, somewhat introspective personas who generally lack strong vocal projection. Indie music eschews overt commerciality and relies on dense, overdriven guitar chords rather than riffs, alongside the presence of thousands of small-time dedicated bands. In the late 1980s the term became particularly associated with a new wave of Manchester bands such as Inspiral Carpets, Happy Mondays, New Order and Stone Roses. By the mid-1990s the best of indie was regularly on show at large-scale festivals, such as Glastonbury and Reading in the UK and Lollapalooza in New York.

Indonesia, §I, 1: General: Cultural and musical geography

(i) Introduction.

Currently the fourth most populous nation in the world, Indonesia covers a vast archipelago of some 17,500 islands, of which about 6000 are inhabited (fig. 1). Its people belong to approximately 300 ethnic groups and speak roughly the same number of languages. The Melayu (Malay) language, originally spoken by ethnic Melayu of the Malay peninsula, eastern Sumatra, and the Riau islands, developed into a trading, administrative and literary lingua franca in many parts of the archipelago; under the name Bahasa Indonesia it has been successfully established as the national language of independent Indonesia. Some 85–90% of the country's inhabitants profess the Muslim faith, making Indonesia the world's largest Muslim nation. Irian Jaya, the easternmost province of Indonesia, comprises the western half of the island of New Guinea; its population and cultures are Melanesian rather than Indonesian and it is therefore treated more fully elsewhere (see Melanesia, §II).

The territory of modern Indonesia is coterminous with that of the former Dutch colony known as the Dutch East Indies. From 1976 to 1999 Indonesia also claimed East Timor, not part of the Dutch colony. After establishing footholds in western Java and Ambon at the beginning of the 17th century, the Dutch gradually extended their control throughout the archipelago, though some regions (e.g. Bali, northern Sumatra and parts of eastern Indonesia) were not fully brought under Dutch authority until the beginning of the 20th century. During World War II the Japanese army expelled the Dutch and occupied Indonesia. On 17 August 1945, with the defeat of the Japanese imminent, Indonesia declared its independence; the Dutch, however, attempted to return, and only after four years of guerrilla warfare did they accept Indonesia's sovereignty.

Indonesia, §I, 1: General: Cultural and musical geography

(ii) National and regional culture.

As Indonesia has only been an independent nation for half a century, and indeed has only existed with its present boundaries for the last 100 or so years (since the Dutch achieved full control over the archipelago), the question arises of what exactly 'Indonesian culture' is. If the notion requires the existence of an Indonesia, then nothing created before about 1900 can be considered Indonesian; alternatively, Indonesian culture could be considered to be whatever has developed, over thousands of years, among hundreds of ethnic groups, on the thousands of islands now grouped together as Indonesia. These issues have provoked extensive and unresolved debate (Mihardja, 2/1977).

Government statements and policies on national culture are ambiguous and contradictory (see Yampolsky, 1995). On the one hand, the government claims the so-called 'peaks of culture' of the many ethnic groups of modern Indonesia as part of the national heritage. On the other, according to critics, the government's cultural engineering policies and programmes to 'preserve' and 'foster' the 'traditional' (that is, in this context, ethnic, or 'regional') arts show a low regard for the arts themselves

as traditionally practised and a distrust of the ethnic identity and ethnic pride they symbolize and affirm (see Widodo, 1995 and Yampolsky, 1995). The government also discountenances the so-called 'animist' religions with which traditional arts are often associated. Indonesians are pressured to adopt instead one of the five world religions: Islam, Christianity (counted as two: Catholicism and Protestantism), Hinduism and Buddhism. Unless an indigenous belief-system can be interpreted as a form of one of the world religions, its adherents are described as 'not yet having a religion'.

Many Indonesians outside the government are equally uncertain about the value of traditional culture, which is often seen as backward and (in the eyes of those who have accepted Islam or Christianity) heathen. Moreover, shared nationality has apparently not broken down musical barriers. With a few short-lived exceptions (e.g. Sundanese *jaipongan* and Minangkabau-language *hiburan daerah*; see §VIII, 1 below), attempts by the entertainment industry and the government to disseminate the music of one ethnic group to the rest of the country have failed, especially when the music in question is sung in a regional language rather than the lingua franca, Indonesian.

Even if traditional arts are in principle accepted as an element of Indonesia's national culture, they are not shared by or known to all Indonesians. In music, a paradoxical situation has arisen: since no indigenous musical idiom or instrumentation is accepted by all Indonesians, any 'national' music must use foreign idioms and instruments, i.e. those of Western and, to a lesser extent, Middle Eastern music. The result is that the only kinds of music accepted throughout Indonesia are the various forms of 'national' popular music, which are sung in Indonesian and are not tied to specific ethnic groups. A related paradox is that in a country where nearly three-quarters of the population lives in rural areas, the music with the highest prestige and widest dissemination is the urban popular music of the cities, particularly Jakarta.

Within their home regions and ethnic groups, however, traditional musics survive and, in some cases, thrive. Often where one of the officially-sanctioned world religions has become dominant, an accommodation has been reached with traditional culture, permitting traditional practices (including music) so long as they do not violate the tenets of the world religion. Such accommodations favour secular entertainment forms of traditional music, the sort that might be performed to celebrate weddings, circumcisions or community anniversaries. Typically, traditional music is enjoyed and supported more by the middle-aged and old than by the young, who prefer forms of urban popular music, but there are frequent exceptions to this rule.

[Indonesia, §I, 1: General: Cultural and musical geography](#)

(iii) Musical overview.

The outline that follows of the principal kinds of music that have developed or taken root in the islands now part of Indonesia focusses on genres, contexts and musical materials (instruments are discussed in §3 below).

Indonesia is so large and fragmented that few generalizations about music can apply to the entire country. Some observations of this sort are

attempted here, but attention is also given to genres and musical traits that, while not distributed over all of Indonesia, cross one or more of the major cultural or geographic boundaries within the country. Music characteristic of a single clearly bounded entity (e.g. of Kalimantan, or of the Javanese ethnic group) is discussed in the appropriate regional sections below.

Margaret Kartomi has attempted to classify the music of much of Indonesia according to periods or 'strata' in the music-history of the region and to identify instruments, genres and techniques characteristic of those strata (Kartomi, 1980). The principal strata she distinguishes are pre-Islamic, Islamic and post-European. This effort is related to Kunst's attempt to identify the elements of a 'megalithic' stratum (Kunst, 1939 and 1942), and to the interests of some scholars in determining the Austronesian foundations of Indonesian music. One objection to all such projects is that foreign musical influences have been felt in Indonesia for so long – Indian influence for perhaps 2000 years, Muslim influence for at least 1000, European influence for 500 – that they can in many cases no longer be disentangled from each other, let alone from an 'original' stratum. While it is true that certain features are often likely indicators of one or another strand of influence, many genres mix features from several strata. Historical classification will be avoided here in favour of identifying traits and complexes that may stand alone or in combination with others.

This survey is inevitably incomplete. Specific instances of genres or practices discussed here have been chosen because of availability of recorded examples or because of substantial coverage in the scholarly literature (see bibliography). Scholarly and popular documentation of Indonesian music has concentrated on Java and Bali and, to a much lesser extent, Sumatra. Although excellent studies of instrument construction and distribution throughout Indonesia were produced in the colonial era, the musical practice of the 'outer islands' (including Sumatra) was drastically under-reported until the late 1970s: there are some scattered studies from the 1920s and 30s, mostly based on brief fieldwork, overviews by Snelleman (1818) and Kunst (1946; Eng. trans. in *Indonesian Music and Dance*, 1994) and occasional descriptions by ethnographers, usually without much musical detail. Recordings of this period are even scarcer than written materials and often have only minimal documentation.

This situation began to change when recordings with scholarly commentary were published on music in Lombok by Seebass, East Kalimantan by Maceda and Revel-Macdonald, and Timor by Clamagirand. Further recordings with documentation have followed on North Sumatra by Kartomi and by Simon, Irian Jaya by Simon, East Kalimantan by Grolinski, and highland South Sulawesi by Rappoport. In 1991 Smithsonian Folkways Recordings, in collaboration with the Indonesian Society for the Performing Arts (Masyarakat Seni Pertunjukan Indonesia, formed as Masyarakat Musikologi Indonesia in 1988), launched an extensive survey: the *Music of Indonesia* series of 20 compact discs presenting music from all over the country. Publication of another recordings series, *Musik Tradisi Nusantara*, was begun by the Indonesian government's Departemen Pendidikan dan Kebudayaan, in 1998.

Useful books and articles on the music of hitherto little-known areas have begun to appear, and there is a growing stream of dissertations and theses in Indonesia and abroad. In 1990 the Indonesian Society for the Performing Arts inaugurated a journal, *Seni Pertunjukan Indonesia*, with frequent articles by Indonesian and foreign researchers on lesser-known traditions and regions. Ethnographic attention to these regions has also heightened. Nevertheless, the picture of Indonesia's music is still sketchy and tentative. Only the 'art' music traditions of Java, Bali and Sunda (West Java) and some of the village traditions of these areas, can be said to be well covered.

(a) Scales and metres.

(b) Genres and ensembles.

Indonesia, §I, 1(iii): Cultural and musical geography: Overview

(a) Scales and metres.

Tonal bases are most commonly pentatonic or tetratonic, but hexatonic and heptatonic scales exist. Vocal melodies and those of certain instruments or ensembles are sometimes restricted in range to less than an octave (extreme examples include Toba Batak melodies with an ambitus of a perfect 5th and Minangkabau *saluang* (flute) songs covering only a tritone). Some hexatonic and heptatonic scales or scale systems are imported from Europe or the Middle East, but some are apparently indigenous (e.g. Petalangan, Bugis and Makasar examples). Others, like seven-tone *pélog* in Java and Bali, are concatenations of discrete five-tone scales, albeit sometimes with modulation within a single piece, thus producing a total of six or seven tones). Modulation and chromaticism may also occur in the imported heptatonic systems, leading to total collections of more than seven tones. Among the Kenyah in East Kalimantan, melodies for the *sampeq* lute may use different five-tone scales in the upper and lower registers, again producing six or seven tones altogether.

In ensembles combining instruments of permanently or temporarily fixed pitch (such as metallophones, zithers or fretted lutes) with singers or instruments capable of variable intonation (fiddles, oboes, certain flutes), the more flexible group may provide additional tones not present in the fixed scale. This practice is pervasive in Sundanese music and is also found in the *barang miring* technique of Central Javanese gamelan music. In the *gondang* and *gendang* ensembles of the Toba and Karo of North Sumatra, the double-reed aerophones have six basic pitches determined by their fingerholes, but they are played with such variable intonation that the basic scale is elusive, similar to the *saluang* flute in West Sumatra. Messner (1989) has analysed the singing style in the Tanjung Bunga region of East Flores as structurally microtonal, but this has not yet been confirmed by cognitive research among the singers. Jaap Kunst observed melodies containing tritones in South Nias and Central Flores (Kunst, 1942, pp.35–8) noting that they occurred in conjunction with triple metre and alongside various culture traits he labelled 'megalithic'. On this basis he speculated that tritones and triple metre might themselves belong to a very old megalithic cultural stratum.

Metres are most commonly duple (especially quadruple), with the melodic phrases usually of four, eight, sixteen (and multiples thereof) beats in

length. As Kunst pointed out, triple metre is found in the so-called megalithic cultures of Nias and Flores, but it is also found in other contexts: in Melayu music (the *lagu dua* rhythm, a six-beat measure that may be organized as 2+2+2 or 3+3); in Mentawai and forest Riau; in Timor, interior West Kalimantan and North Sulawesi. In most of these instances there is no association with Kunst's tritone melodies or megalithic traits.

In addition to duple and triple metres, there are also some oddly distributed and as yet little-noticed pockets of 'irregular' and shifting metres. Examples of the first type are seven-beat metre in Sumba; five-, seven- and fourteen-beat metres among certain Dayak groups in Kalimantan; and ten-beat metres in western Timor. Instances of shifting metre drawn from commercially available recordings include a dance *hoho* from Nias with a cycle of 30 beats phrased 10+8+6+6 (with each beat subdivided in three); a Minangkabau *talempong* (gong-chime ensemble) piece with the structure 16+12+18+8 (interior phrases are repeatable); and a dance song from Timor phrased 5+5+5+4 (again, like the Nias *hoho*, with ternary subdivision). Certain genres or repertoires are pervaded with elusive shifting metres: the *tabuik* or *tabut* music of Minangkabau and Bengkulu, the old funeral repertory of the Balinese *angklung* ensemble and the music of the bamboo *senggayung* ensemble in southwest Kalimantan.

Indonesia, §I, 1(iii): Cultural and musical geography: Overview

(b) Genres and ensembles.

Sung narrative. Genres of sung narrative, performed by one or two singers unaccompanied, or accompanied by only one or two instruments and sometimes with a chorus chiming in at the end of a line, are widely distributed. Performers are normally specialists – professionals, or others recognized as having particular aptitude for performance of the genre in question. A partial listing of genres includes *hikayat* in Aceh; in mainland Riau, *nyanyi panjang* among the Petalangan, and the Melayu genre transcribed and translated by Derks (1994); *dendang Pauah*, *rabab Pariaman*, *rabab pasisie* and *sijobang* in West Sumatra; *kunaung* among the Kerinci in Jambi; *taknaa'* among Kayan and *belian tekena'* among Kenyah in Kalimantan; old-style *karungut* among Ngaju in Central Kalimantan, accompanied by a single *kacapi* (lute); *cerita pantun*, accompanied by *kacapi* (zither) in West Java; *kenstrung* in Central and East Java, accompanied by frame drum; in South Sulawesi, violin narratives among the Bugis, *sinrilli* among the Makasar (accompanied by a spike-fiddle) and *kacapi* (lute) narratives in both groups; *gelong* among the Sa'dan Toraja; and *aten* in Buru. Some of these genres use a single repeating melody for long stretches of narrative, whereas others insert free-standing songs for variety. Most have a high degree of textual extemporaneity. In contrast, among the Javanese and Balinese, certain forms of narrative poetry are sung (usually solo) with fixed texts in complex stanza forms (e.g. *macapat*, *kakawin* and *kidung*.)

Examples of solo sung narrative accompanied by larger instrumental ensembles are comparatively rare: *gambang rancag* of the Indonesian-Chinese (*peranakan Cina*) of the Jakarta region, accompanied by the *gambang kromong* orchestra; modern *karungut* of the Ngaju in Central Kalimantan; and *kenstrung* in some parts of East Java. It seems likely that

these are all expansions of genres originally performed by one or two musicians only.

Lyric singing. Specialist performance of lyric singing (that is, verses not part of religious or shamanistic observance and without extended narrative) by a soloist, typically accompanied by one instrument, is equally widespread; indeed, in many places the same musicians sing and accompany both lyric and narrative forms. (Unaccompanied lyric singing by specialists is rare, except for non-narrative *macapat* singing in Central Java and Bali.) The verses may contain advice or conventional wisdom, lament, social commentary, joking or teasing references to individuals or groups, accounts of personal experience, or expressions of longing for home or a loved one. A common pattern is for a male singer and a female singer to trade serious or teasing verses, typically on the themes of love and courtship: for example, *dendang jo saluang* among the Minangkabau, where the singers are accompanied by an oblique flute; *biola rawa Mbojo* in eastern Sumbawa, using a violin; guitar songs in southern Sumatra and South Sulawesi; and songs in Sumba accompanied by the four-string plucked lute *jungga*. Among the Bugis and Makasar verses may be exchanged, but usually by male singers, without the romantic or teasing tone and with two (or more) singers accompanying themselves on violins (Bugis) or *kacapi* lute (Makasar). Exchanged verses accompanied by a larger ensemble are found, for example, in *ronggeng* (see below) music of Melayu groups in Sumatra and elsewhere; in the *gambang kromong* ensemble of the outskirts of Jakarta; in Bugis mixed-instrument ensembles; and in the early, competitive form of *kroncong* singing. Specialist lyric singing by a single vocalist without the exchange of verses is usually also a possibility wherever the other form is found; there are also some societies where the single-singer form (typically accompanied by a plucked lute) is the norm, as among the Kayan of Kalimantan and the Kajang and Mandar of South Sulawesi.

Informal music. Certain forms of private or informal music-making by non-specialists are found throughout the archipelago: singing, of course, for emotional release or for the amusement of oneself or others close by; and the solo playing of bamboo flutes and jew's harps. Reed aerophones may also be played for these purposes, though less commonly than flutes. Jew's harps and other soft instruments are often also used in courtship; for example, a jew's harp played quietly at night can signal a young woman that her sweetheart is waiting for her outside. This practice is reported from many parts of the country.

Collective work is a common occasion for informal music-making. To husk rice, groups of women may pound it in a mortar using long pestles, striking them against the mortar in interlocking rhythms. Often the music is purely percussive; however in Natuna Besar, an island in eastern Riau, the pestles are tuned to produce seven clear pitches. The Javanese *kethoprak* theatre is said to originate in the enactment of stories to an accompaniment of mortar rhythms.

Group singing. Many types of music involving multiple singers exist. There is group singing in unison or octaves and singing in which a soloist is answered by a chorus in unison or octaves. Examples include *didong* from

the Gayo in Aceh; *janger* from Bali; the Islamic popular music *qasidah moderen*; work songs in Sumba; dance songs in Kei and Timor; and the *pakarena* chorus in South Sulawesi.

Two-part homophony, with all or most changes of pitch or text made simultaneously, is uncommon in western Indonesia (Sumatra, Java, Bali and the western and central regions of Kalimantan), but it occurs comparatively often in the eastern half of the country (e.g. among the Toraja of South Sulawesi, and in Flores, East Kalimantan and North Sulawesi). Some styles are characterized by parallelism in a single interval (3rds, 4ths or 5ths); some move more flexibly within a mainly triadic framework or one permitting open 4ths and 5ths; some are flexible within a narrow compass, producing many 2nds (e.g. the Balkan-sounding style of Tanjung Bunga in east Flores). Some styles mix several of these procedures. Sporadic harmony within a predominantly unison or octave texture is also encountered: on specific melody tones, as among the Ot Danum of West Kalimantan, or in brief responses interjected by a chorus, as among the Mek of Irian Jaya.

Homophonic singing in more than two parts is rare outside Christian hymnody. An exception is the three-voice *gore* of central Flores. The 'exceedingly beautiful and curious polyphonic (four or more parts) communal harvest songs of a primitive sort' reported from northern Minahasa (Sulawesi) by Kunst (1946; Eng. trans. 1994, p.183) may be another exception (researchers for the *Music of Indonesia* series looked for them in 1997 but could not find them), but it is not clear from the description whether or not these were homophonic.

Melody with drone has so far been recorded only among the Toraja of highland South Sulawesi, in central Flores, in Roti and among some groups in the Irian Jaya highlands. Among the Toraja a soloist stays close to the drone pitch, rarely venturing farther afield than a major 2nd above or below. In Flores, the drone pitch is often movable, and melody seems less restricted. Another technique in Toraja is the more or less continual sounding of two drones simultaneously, but with a shifting balance such that when most of the singers are on one a few are on the other (*badong*). In Flores, drones are sometimes combined with two-part homophony for all or part of a song.

A polyphonic relation can occur between soloist and chorus when, for example, a florid or parlando solo overlaps or overlies a choral melody. This is found in Nias, where the *hoho* chorus sings in unison; in Flores, where the chorus may be in two-part homophony; and in Central Javanese gamelan music, in the relation between the free-metre female soloist (*pesindhèn*) and the unison fixed-metre male chorus (*gérong*).

Heterophonic singing (individual variation in simultaneous versions of what is conceptually the same melodic line) is common throughout the country. It ranges from relaxed unison singing with occasional harmonies or rhythmic discrepancies (e.g. among the Kayan Mendalam in West Kalimantan and in *ngel-ngel* singing in Kei) to wild hurly-burly. Islamic male devotional singing (see below) often involves heterophony (*dikie rabano* in West Sumatra; *dabus* in Halmahera). Particularly unrestrained heterophony is found in some *wor* singing in Biak (north of western Irian Jaya) and some group

macapat singing in East Java and Madura. As in Javanese gamelan music, prescribed destination tones, where the individual lines come together, keep the *macapat* from disintegrating into chaos.

Simple antiphonal alternation of verses or parts of verses, with one group responding to another (often men responding to women, or vice versa) is found among the Toraja and in dance songs in Timor. Rapid-fire antiphonal responses of short phrases occur in the Irian Jaya highlands.

In Central Flores, Jaap Kunst reported both full canon and a 'collapsing canon' in which the voices 'melt together into unison' after a canonic opening (Kunst, 1942); however, *Music of Indonesia* researchers in Flores in 1993 and 94 found no examples of either technique. Similar procedures are found in the Mek region of Irian Jaya: two singers singing the same song but one starting somewhat later than the other (Simon, 1978), and dance-songs beginning with imitative entries but not continuing imitatively (*Musik aus dem Bergland West-Neugineas*, 1993). Fleeting imitation is also heard in unmetred segments of *salawat dulang* singing in West Sumatra.

Fortuitous counterpoint (i.e. two unrelated pieces performed at the same time) occurs at big celebrations all over Indonesia (Rappoport, 1999; see also Simon, 1978, p.442 for an instance from Irian Jaya), but deliberate, coordinated counterpoint is rare. Two instances are singing for the *wera* dance in western Flores and singing for the *raego'* dance in the mountains of western Central Sulawesi. In both cases, men and women sing different melodies, with contrary motion and some rhythmic independence.

Gong-chime ensembles. Instrumental ensembles dominated by a set of bossed gongs (a 'gong-chime') played melodically or in melodic-rhythmic ostinati are common. The gongs may be placed horizontally in a rack and played by a single player or by more than one; or they may be suspended freely on cords or completely dismounted and hand-held, in which cases several players are needed, each controlling one or two gongs. Drums are often included in the ensemble, as are non-melodic gongs marking (or 'punctuating') the melodic period and internal subdivisions (if there are any); singers, flutes and lutes rarely take part. Examples are found in Minangkabau and Lampung; among the Petalangan of mainland Riau; in Bali (the *bebonangan* or *balaganjur* ensemble); in Central Java (the ancient ceremonial *monggang*); in many Dayak groups of Kalimantan (Kanayatn, Taman, Ot Danum, Ngaju, Benuaq, and along the Jelai river in the southwest); in the Bolaang Mongondow region of North Sulawesi; and in Maluku, Timor, Sumba and Flores. Typically the ensemble plays outdoors for festivities, often accompanying dance. In some regions (Kalimantan, Timor, Sumba and North Sulawesi) it has a particular repertory for funerals or wakes that is not heard on other occasions. Gong-chime ensembles are not reported in Irian Jaya (except those brought there by immigrants from elsewhere in Indonesia).

The gamelan-wayang complex. The famous gamelan of Java and Bali may be seen as a special development or elaboration of the gong-chime ensemble described above. It is proposed here that for analytical clarity the term 'gamelan' should be reserved for ensembles that resemble, in instrumentation and musical organization, the Central Javanese court gamelan or the Balinese *gamelan gong* ensemble.

To be called a gamelan, according to this proposition, an ensemble must contain at least one form of melodic metal percussion idiophone (either gong-chime or keyed metallophone or both) and hanging gongs (or substitutes for them) serving to 'punctuate' the melody; by contrast, in a gong-chime ensemble, the hanging gongs are optional and a gong-chime must be present. Melodic keyed metallophones are very commonly present in gamelan, but they are not (in this definition) requisite.

Regarding musical organization, this proposition stipulates a crucial distinction: that in a gamelan there must be at least two simultaneous melodic lines, related in content but of contrasting musical character, whereas in gong-chime ensembles there may only be the one line carried by the gong-chime itself. The relation between the melodic lines in a gamelan may be, for example, that of a 'full' melody and its abstraction, or a comparatively simple melody and a more complex elaboration based on it. The simultaneous melodic lines may exhibit the relationship that has been described as 'stratified' (Hood and Susilo, 1967), where a simpler or more abstract version of the melody is played at a lower rhythmic density than a more complex version. They may also show a registral form of stratification, with the more complex versions sounding in a higher register. (Forms of stratification are also found in some non-gamelan ensembles, such as Balinese *gender wayang* duos or quartets, Sundanese *kacapi suling* and *kawih*, and *kroncong*.)

Certain ensembles termed 'gamelan' in the literature, or by their own societies, are excluded in this definition. It is, for example, customary in the literature to call every Balinese ensemble a gamelan, including those with no melodic metallophones or no hanging gongs. Gamelan as defined here are found throughout Java and Bali, Madura, Lombok and among the Banjar of South Kalimantan. Migrants from Java, Bali and Madura to other parts of Indonesia have often brought gamelan music with them; there has also been effort by the national government to establish gamelan as a symbol of 'Indonesianness', which has led to the presence of gamelan in the offices of government departments in many provincial capitals.

A number of other performance genres are so closely linked to gamelan as to form a complex, disseminated (with variations) as a unit. In societies where gamelan are found, one or another form of *wayang*, the puppet theatre (or, in the case of *wayang wong*, the human theatre modelled on puppet theatre) is also typically found, usually accompanied by gamelan. Also found in association with gamelan and *wayang* are *topèng* (masked dance) accompanied by gamelan; *macapat* poetry (both as an element in gamelan music and on its own); and imitations of gamelan without melodic metal percussion idiophones and instead featuring bamboo or wooden xylophones (in Banyumas and Bali), flutes (*gong suling* in Bali) or just voices (*jemblung* in Banyumas, *memaca* in Madura, and *cepung* or *cekepung* in Lombok and East Bali).

The Melayu complex. The culture of the Melayu ethnic group has been influential not only in the areas of Indonesia directly controlled, at one time or another, by Melayu rulers (e.g. the east coast of Sumatra, excluding Aceh and Lampung; the Riau islands; the west coast of Borneo; and major settlements in West Kalimantan along the rivers going inland from the

coast), but also in much of the rest of the country, where cultural forms associated with the Melayu were adopted by local rulers who were not themselves Melayu. In the performing arts, certain hallmarks of Melayu culture can be distinguished. These include the following: small ensembles with violin as melodic leader (typically alternating between accompanying a vocalist and taking the lead when the vocalist is silent); use of a class of verse-forms called *pantun*, sung in Melayu, often by two singers in alternation; and female singer-dancers usually known as *ronggeng* (see below). Another important feature is the presence of Melayu-language theatre forms using conventions of the *bangsawan* theatre of Malaysia to tell local and classical Melayu stories, accompanied by a violin-led ensemble (examples of such theatre forms are *bangsawan* itself, once widespread in Riau; *mendu* and *langlang buana* in the Natuna islands; *dermuluk* in South Sumatra and *mamanda* in South and East Kalimantan). Two more elements of the complex can be included: Islamic devotional and entertainment genres (*dikir* or *zikir*, *gambus* or *zapin*), and a particular complementary relation between pairs of identical instruments or between two players on one instrument, such that one plays a simple, repetitive part that the other elaborates or 'responds' to. This relation is not precisely stratification, since in Melayu music both the 'basic' part and the elaboration are played in the same register, and the two parts may move at the same speed.

It should be noted that the Islamic genres mentioned above are sometimes thought to be Melayu in origin. This is because in much of Sumatra, Riau and Kalimantan it was Melayu rulers and settlers who established and practised Islam, and the religion and the ethnicity came to be construed as identical. In eastern and southern regions of Indonesia, however, these genres are seen not as Melayu but simply as Muslim.

Ronggeng, tayuban and joged. A widespread form of entertainment involves professional female dancers who invite non-professional men (guests at a wedding, for example, or spectators at a public performance) to dance with them. The woman's dance is usually flirtatious, combining invitation with evasion, while the man's dance often mimes infatuation or pursuit. The music is provided by the female dancers' own troupe, often with the female dancer singing while dancing. Unlike, for example, the *zapin* dance, which has basically the same movement-pattern and accompaniment everywhere it is found, this dance and its music draw on local dance styles and music repertoires. In rural parts of the Melayu culture area the music for *ronggeng* or *joged* is played by an ensemble of violin, two frame drums and usually a single gong; in cities, the gong is considered old-fashioned and is omitted, and an accordion is often added. In Central Java, on the other hand, this type of dancing at a *tayuban* is accompanied by gamelan. In West Java, the *ronggeng* (dancer) could be accompanied by the *ketuk tilu* (an ensemble of *rebab*, non-melodic gongs, a hanging gong, drums and other percussion) or by *tanjidor* (combining European wind-band instruments with Sundanese percussion). In Bali the accompaniment for a female dancer is an ensemble (*joged bumbung*) of bamboo xylophones organized on the model of a gamelan; in former times there were also male professional dancers (*gandrung*). Still other examples of this form of dance are: *cokek*, accompanied by *gambang kromong*, among the Peranakan Cina (persons of mixed Chinese and Indonesian

descent) in Jakarta; *gandrung Banyuwangi* in East Java; *ronggeng* in Ternate and Tidore; and *jaipongan* in West Java.

Martial arts genres. *Pencak*, *silat* and *kuntau* (among other terms) refer to a variety of martial art or 'self-defence dance' widespread in Indonesia, particularly among Muslims. The common accompaniment to this genre is an ensemble of drums, non-melodic gongs and a double-reed aerophone; among the Petalangan in the forest of mainland Riau, a xylophone or single-row gong-chime is used instead of the double-reed. This type of genre is found throughout Sumatra, Java and Madura, in Muslim areas of Kalimantan, in Sulawesi, Maluku, Bali and in scattered locations in the islands running east from Bali. It has been taken up as a sport and entertainment in rural Islamic schools (*pesantrèn*), which may account for its Muslim associations, but it is not exclusively or essentially a Muslim art (Bouvier, 1995, p.155). Its origins in Indonesia are obscure; it is sometimes said to have come from the Malay peninsula to Sumatra and to have spread to the rest of Indonesia from there.

Music for shamanism, magic and curing. In Sumatra and across Kalimantan from west to east (and perhaps farther east into Sulawesi and Maluku), a form of shamanism is found that involves a journey into the mystical world to obtain medicine to cure an illness or distress (personal or communal), or to obtain the diagnosis necessary to effect a cure. Usually it is the shaman who makes the journey, or the shaman may send the soul of the patient; music is played to guide or accompany the traveller. The nature of the music differs from place to place: among the Petalangan in mainland Riau, it is drumming played by two musicians, one at either end of a long drum; among the Kanayatn in West Kalimantan and the Benuaq in East Kalimantan it is played on a gong-chime ensemble, to which the Dusun Deyah of South Kalimantan add a two-string plucked lute (*kacapi*); and among the Ot Danum in West and Central Kalimantan it is singing (*timang*) accompanied by hourglass drums. The unifying feature of this music is that it consists of many discrete pieces (such as melodies, songs or drum-rhythms), each appropriate to a specific stage of the journey. The term for the shamanistic rites is often *belian* or a cognate.

In widely scattered regions of Indonesia, bamboo flutes have, in addition to their use in many forms of secular music, associations with magic, healing and esoteric practices. In parts of the north coast of Irian Jaya, flutes are associated with men's secret initiation rites; women traditionally may not play them or even see them. Among the Toraja in South Sulawesi, flute ensembles play for curing and to avert disease. In Sumatra (among, for example, the Minangkabau, Petalangan and Toba), solo flutes are sometimes used to cast spells, particularly for love magic.

The Muslim music complex. Indonesia has the largest Muslim population of any nation in the world, generally estimated at 85–90% of the nation's total population. In Muslim communities all across the country, types of devotional, quasi-devotional and secular performance involving music are found, exhibiting similar traits everywhere (here, 'devotional' music is that performed at explicitly religious gatherings, in the mosque or in a public space or private home). For the most part, these Muslim genres show little influence of local musical traditions.

Since at least the 1500s, there has been a strong component of Sufi mysticism in Indonesian Islam, particularly in rural areas, where it has often blended with indigenous and Hindu-Buddhist mystical and magical beliefs. Some forms of Muslim devotional music have clear links to Sufism; others may derive from other strains of popular Islam, probably again with Sufi elements. The very idea of devotional music (as distinguished from Qur'anic recitation or the recitation of poems in praise of Muhammad, both not considered as music by Muslim definition) belongs in Indonesia to popular Islam (if not Sufism) and is mistrusted by the orthodox. Clearly of Sufi origin are the use in devotional service of group singing and chanting of Arabic verbal and melodic formulae (usually called *dikir* or *zikir*), group singing of Arabic poems (*qasidah*), and the openness in these devotions to instrumental music (typically untuned percussion), dance and ecstatic or trance states. These traits may be found individually or in combination; often their origin in Sufi practice is unacknowledged and perhaps not recognized.

The most common forms of Muslim devotional music in Indonesia make use of singing by a soloist and a chorus of men or women (but not both) singing in heterophonic unison. The singers often dance in sitting, kneeling or standing positions. The singing and dancing are often accompanied by a group of instrumentalists playing frame drums in interlocking rhythms, and melodic instruments are not present. Examples of such genres are *salawatan*, *hadrah* and *rudat* or *rodat* in Java and Madura, *dikie rabano* in West Sumatra, *butabuh* in Lampung, and similar genres in Sulawesi and elsewhere. Poems in praise of Muhammad (the *Burda* of al-Busirī and the *Mawlid* of al-Barzanjī) may be recited to the accompaniment of frame drums (without dance). *Samman*, recorded in Aceh and Madura, reported from Halmahera and probably found in many other locations as well, reflects in its name its origin in practices of the Sammāniyya order of Sufism, an offshoot of Khalwatiyya introduced into northern Sumatra around 1800; it uses no drums, and its practitioners are likely to go into trance in the course of a performance.

Another devotional genre with clear links to Sufism is known in Indonesian as *dabus* (and variants of that term in local languages). All forms of Indonesian *dabus* involve (along with *qasidah* and *dikir* accompanied by frame drums) displays of invulnerability: dancers stab themselves with iron awls, but the faith and esoteric knowledge of the spiritual leader (*khalifah* or *syeh*) ensure that they are not harmed. In Halmahera, *dabus* is said by participants to derive from the practice of the Rifā'iyya order (named after Ahmad ibn 'Alī al-Rifā'ī, 1106–82 ce); in Sumatra, a formal connection to Rifā'iyya is not reported, but the frame drums used are called *rapa'i* (an Indonesian pronunciation of al-Rifā'ī's name). The West Javanese *dabus* groups studied by Vredembregt (1973) were not Rifā'iyya, but Qādiriyya.

Many of these devotional genres using frame drums or other percussion may also be performed as entertainment in secular contexts such as domestic festivals (weddings, circumcisions, inauguration of a new house), community celebrations and presentations for tourists and other outsiders (including audiences for cassette recordings or government-sponsored competitions). Secular content may be mixed with religious on such occasions, and the mood and style of the performance are likely to be more

worldly and virtuoso. Genres such as *indang* or *salawat dulang* in West Sumatra are sometimes said to send the performers into trance, suggesting the mystical quest for religious ecstasy, but more often the aim in such performances is mainly entertainment.

In Sumatra these performances may involve coordinated upper-body dance movements by a group of kneeling or sitting dancers; this may originate in Sufi practice or may have been taken up into it and elaborated. The apparent concentration of this dance practice in Sumatra suggests that it is a local element that has influenced Muslim music. Another instance of local influence is seen in *salawatan* groups such as one in Trenggalek, East Java (reported by I.M. Harjito), which uses frame drums but not the interlocking rhythms typical of them in much Muslim music. Instead, the drums provide a four-square rhythmic framework clearly imitating the gong-punctuation of Javanese gamelan music, while a Javanese two-headed barrel drum is added for rhythmic interest. The Central Javanese secular genre *santiswaran* transfers whole pieces from Javanese gamelan to an ensemble of singers and frame drums, plus a Javanese drum.

Secular music and dance featuring the *gambus*, a round-backed, plucked lute with a skin soundtable, is widespread in Indonesian Muslim communities. The instrument is popularly regarded as originating in the Middle East (scholars agree, pointing to the Yemeni *qanbūs* as the probable ancestor). For this reason, the *gambus* is generally perceived in Indonesia as intrinsically Muslim ('an icon of Arabic culture'; Capwell, 1995), and it is thus acceptable to many Muslims who would ordinarily frown upon secular entertainment. Some of the music and dance associated with *gambus* is also thought to be Middle Eastern (e.g. the *zapin* or *jepen* dance). *Gambus* players usually sing while playing, and they are often backed by a group of small two-headed frame drums (usually with the Arabic name *marwas*) played in interlocking rhythms. In rural areas, the song texts typically have little or no Islamic content.

In cities, accompaniment of the *zapin* dance is often taken over by orchestras called *orkes gambus*, which replace the rural *gambus* with the wood-faced Middle-Eastern 'ūd and add violins, keyboards and other instruments (for further information on this and other urban popular musics targeting a Muslim audience, see §VIII, 1 below).

The European music complex. The idiom and instruments of European music have spread through Indonesia in three forms: popular music, the music of military bands and the music of the Christian church.

Initially, in the 19th century and before, the impact of this music was felt primarily among the relatively few Indonesians in close contact with Europeans: 'native administrators' and others wealthy enough to adopt elements of European life-style, Eurasians, soldiers in the colonial army, students (necessarily from well-connected families) in Dutch-language schools and the small group of Indonesian Christians (consisting at that time mainly of Ambonese, Manadonese and Toba Batak). In the 20th century, commercial recording, radio and television broadcasting and the broader dissemination of Christianity have spread European music much more widely through the country. The impact is twofold: on the one hand, European music genres and musical idioms are often adopted wholesale,

producing hymns, popular songs and patriotic anthems (including the national anthem, *Indonesia Raya*) that are composed by Indonesians but are in their music essentially European. On the other hand, many hybrid forms have sprung up, combining elements of European and one or another form of Indonesian music.

In popular music, one such hybrid is *kroncong* (see §VIII, 1 below) or its South Sulawesi version, *gitar los quin*. Another is *katreji*, a genre of popular dance music in Maluku, using European dance forms such as polka and waltz (the name of the genre is an adaptation of 'quadrille'). The instrumentation includes one (or more) violins, guitars (among them possibly a Hawaiian guitar), ukulele and local drums, with performances featuring a person calling out the movements (Gieben, Heijnen and Sapuletej, 1984, pp.95–6).

The solo acoustic guitar is ubiquitous in cities and towns. The basic instrument of regional *lagu daerah* (see §VIII, 1 below) and Western-model popular music, the guitar has also acquired, in some regions, repertoires of strophic singing (usually with verses traded between male and female soloists). Often the melodies to which the verses are sung are in a minor tonality; this, like the song form itself, may be an instance of influence from the local music culture. One melodic strophe is repeated (typically without refrain or contrasting melody) throughout a song, which can continue for 20 to 30 minutes. The guitar accompaniment often consists of an ornamented version of the vocal line, without chordal support other than statement of tonic and dominant in the bass. A four-string, locally-made lute (*jungga*), modelled on and usually shaped like a guitar, is played for such songs in Sumba.

A different development is found in Irian Jaya, where string bands with numerous guitars, a gigantic two-string bass (laid out horizontally and struck or plucked with a stick), singers and an assortment of local single-headed drums play in the 'pan-Pacific pop' style for *yospan* (or *yosim-pancar*) dancing, a genre that developed in the late 1960s and has swept the province.

It should be noted that the guitar does not seem in these areas to have supplanted a pre-existing lute. In Irian Jaya or southern Sumatra, there is no report of an earlier lute (except, in Sumatra, the *gambus*, which has a very different idiom from that of the guitar). In Sulawesi and Sumba earlier lutes do exist, but their music (like that of the *gambus*) is thoroughly unlike that of the guitar. It appears that the guitar has generated its own repertoires without weakening others.

The electric guitar has been taken into at least one ensemble in which its music shows little or no European character (aside from the timbre of the instrument). This is the Cirebonese *tarling* ensemble, which is named for its featured instruments, *gitar* and *suling* (flute), and usually also includes Cirebonese gongs and drums; its idiom is essentially that of Cirebonese gamelan music transferred to this mixed instrumentation.

European wind instruments were introduced to Indonesia by the Dutch and, in North Sumatra, by German missionaries (Boonzajer Flaes, 1993; Herbert and Sarkissian, 1997). They were played for military purposes, in

the household orchestras of wealthy landowners and, in the late colonial period, in public *stafmuziek* performances for civilians. The musicians were mostly Indonesians or Eurasians, and through them the instruments moved out into Indonesian circles. In Batavia they gave rise to a hybrid tradition called *tanjidor* (from Portuguese *tangedor*, an instrumentalist) that still survives among the Betawi (the ethnically [mixed] Indonesians of the Jakarta region). The defining repertory of *tanjidor* is European marches and waltzes, but the ensemble also plays popular tunes, in a style sometimes showing the influence of 1920s and 30s jazz. Jazz influence is also heard in the *lagu sayur* repertory of the *gambang kromong* ensemble in Jakarta, which mixes Chinese, Sundanese and European instruments. Slightly to the east of Jakarta, in the Karawang region, another kind of *tanjidor* is found, also playing marches and waltzes but supplementing them with Sundanese repertory sounding exactly like Sundanese music played on the instruments of a wind band. Both the Betawi and the Sundanese *tanjidor* accept non-European instruments: Sundanese drums and gongs and, in the case of some *tanjidor* west of Jakarta, a Chinese fiddle of the *erhu* type.

Bands called *tanji* or *tanjidor* are also found in South Sumatra around Palembang, in South Sulawesi around Ujung Pandang and in West Kalimantan around Pontianak. The Pontianak variety nowadays plays marches, waltzes and the popular music genre, *dangdut*. A South Sulawesi *tanji* heard by *Music of Indonesia* researchers in 1996 consisted of two trumpets, a cornet, a snare drum and a bass drum with one cymbal attached on top. The cymbal was clashed with a metal pot lid and the heads of the snare drum were thick films (of the sort newspapers are printed from), while the repertory comprised pop tunes.

In North Sumatra, beginning in the second half of the 19th century, Lutheran missionaries from Germany promoted wind bands in Nias and among the Toba Batak. The bands are extinct in Nias but still common in North Sumatra, where they play for church services and at funerals and domestic festivals. Their music consists of Protestant hymns, Christmas carols and exuberant *gondang* melodies from the repertory of the tuned drum ensemble.

In eastern Indonesia, 19th-century Dutch missionaries relied on bamboo transverse flutes rather than wind bands. Flute orchestras playing Western hymns in standard harmony are now common in Christian communities in Maluku, Nusa Tenggara Timur, North Sulawesi and Irian Jaya. In some regions, from the 1860s onwards, bamboo 'trumpets' (*korno* or *tenor*) were added to these orchestras. In North Sulawesi bamboo imitations of other European brass instruments succeeded the *korno*, resulting in a full 'bamboo brass band'. Subsequently the bamboo imitations were replaced in many ensembles with locally-made zinc or copper versions (Boonzajer Flaes, 1992 and 1993). The repertory and idiom of the North Sulawesi bands are thoroughly European; a local component of the repertory (comparable to the Toba *gondang* tunes in North Sumatra) is not found. In Madura, *ngik-ngok* ensembles including zinc horns play music of Madurese, not European type.

Christian hymns (along with secular popular music) have also been powerful disseminators of Western ideas of tuning, scale, harmony, melodic form and syntax. It should be noted, however, that outside of trained church choirs reading notation, harmony tends to be rudimentary, rarely going beyond parallel 3rds. It is tempting to look for the source of the homophonic style of central Flores and Kalimantan non-church singing in church music, but in fact the non-church singing is harmonically freer and more vivid than the church style. It is likely that some traditions of part-singing pre-date church influence and furthermore that these have in some cases mixed with church styles.

2. History.

On the basis of its contact with foreign cultures, Indonesian history can be divided into three somewhat overlapping historical periods: the contact with Hinduism/Buddhism (1st–14th century), the contact with Islam (15th century onwards) and the contact with Western cultures (16th century onwards). Indonesian music cultures reflect a musical heritage that is the product not only of interaction between indigenous and foreign cultural forces, but also of contact among Indonesian ethnic groups. Considering

this diversity, it is to be expected that heterogeneity is the salient feature of Indonesian music.

(i) Pre-colonial.

(ii) Colonial.

(iii) Post-colonial.

Indonesia, §1, 2: General: History

(i) Pre-colonial.

Trade has long been a vehicle for Indonesians to have contact among themselves and with peoples from neighbouring areas. The rise of commerce at the beginning of the Christian era intensified Indonesia's intra- and inter-regional relationships. Contact with Indian culture was a major feature of this period, resulting in the Hinduization of many Indonesian islands and the rise of a number of Hinduized Indonesian empires after the 5th century. For example, the 7th-century Sriwijaya empire of Sumatra, besides being an important political and mercantile centre in the archipelago, was also known as a centre of Buddhism. In the absence of evidence, it is to be assumed that some forms of Buddhist music were practised there. Much pictorial evidence of music on temple walls (for example on the 9th-century Buddhist monument Borobudur) affords tantalizing glimpses of musical life (in the case of Borobudur, of the ancient Central Javanese Mataram empire). However, the absence of collaborative evidence does not allow definite conclusions about the music actually practised there.

As the centre of power moved to East Java (10th–15th centuries), more is revealed about the impact of Indian culture on Javanese religion and literature, including the creation of *kakawin* sung-poetry, a localized form of Indian poetry. In spite of the strength of the Hinduization of Indonesia, however, traces of Indian music in Indonesian music traditions are limited. Instead, this period is characterized by musical developments with distinctive and localized Indonesian characteristics.

Among the many kinds of musical instruments, the bronze gong has had an important role in Indonesian music; indeed, the onomatopoeic word 'gong' may be of Javanese origin. However, lack of evidence has obscured the origins of the bronze gong. It is well known that the **Bronze drum** was the earliest bronze instrument in South-east Asia, originating from the Dong-son culture in Vietnam long before the Christian era. When it arrived in the Indonesian islands, however, its musical function diminished, and it changed to become a ritual object.

Early evidence of gongs of different sizes can be found in drawings on the walls of 14th-century East Javanese temples. In some old Javanese literature, the gong is often mentioned as part of small ensembles. Some literature dating from the 12th to 16th centuries – such as the *Bharatayuda*, *Wretasancaya* and *Wangbang Wideya* – mention small gongs in ensembles for accompanying *wayang* puppet performance. Other instruments in these ensembles included percussion instruments (*salunding* metallophones and *kemanak*, bronze banana-shaped idiophones) and flutes. Such soft-sounding ensembles, often with singing and sometimes with string instruments, were considered 'indoor'

ensembles, while loud processional ensembles consisting of gongs and other percussion instruments (sometimes with wind instruments) were considered 'outdoor' ensembles.

Eventually, gongs became important symbols of power and wealth among Javanese rulers. An early traveller to Java in 1605 describes processional music played before the ruler of Banten (West Java), which consisted of 10 to 12 'copper pans'. The traveller also pointed out that the principal music of the ruler consisted of huge 'pans'. A crude drawing by the Dutch engraver of the royal palace of Banten in 1596 confirms the existence of such an ensemble, consisting of four large hanging gongs and two sets of four gong kettles. Another drawing of a similar ensemble in Tuban (East Java) in 1599 shows it being used to accompany an equestrian tournament.

Subsequently, the gong ensemble developed into a more elaborate orchestra. In the mid-17th century, the Dutch trading ambassador to the Mataram kingdom, Rijklef van Goens, describes a larger gong ensemble in the Mataram court, consisting of 20 to 30 or even 50 small and large gongs. The ensemble's function was to accompany the appearance of the king, processions, equestrian tournaments and perhaps also battle. Van Goens also mentions an ensemble consisting of many small gongs, flute and string instruments: there is a possibility it may have been an early version of the present-day gamelan ensemble.

Beginning in the 12th century, Java became one of the most important political and mercantile centres in the region. Particularly important for this discussion is the 14th-century Hindu-Javanese Majapahit kingdom, whose hegemonic territory included many Indonesian islands. The contact of the centre of Java with South Kalimantan in this period resulted in the introduction of Javanese gamelan, dance and *wayang* performance there. There was also intensive contact between Java and Bali, due to the expansion of Java's centre and the flight of Hinduized Javanese to Bali after the encroachment of Islam into Java in the 15th century. There are some instruments depicted on the walls of the 14th-century Panataran temple in East Java that, while their traces can no longer be found in Java, still exist in Bali. It has been suggested that some contemporary Balinese ensembles (including *gamelan salunding* and the *gambuh* ensemble for the dance drama of the same name) originated in Java, although supporting evidence is hard to find. Whatever musics were transferred to Bali from Java were made to fit with local tastes.

Java has long been known for its gong manufacturing. A 16th-century traveller reported that gongs from Java were exported to other Indonesian islands, including Sumatra, Kalimantan, Sulawesi, Maluku and the Lesser Sunda islands. In these locations (as in Java) the gong was treated as a valuable commodity, a symbol of wealth and power. However, local instruments with more accessible materials of construction were used more frequently in these islands.

Ensembles with bronze instruments in other islands did not develop to the degree of the sophistication of Javanese and Balinese gamelan. Generally, when gongs are used in such ensembles, a set of small gongs provides an short melodic ostinato, accompanied by other instruments. The Dutch

traveller Francois Valentijn, who spent nine years in Ambon in the late 17th century, witnessed such an ensemble in Maluku. In a brief report he mentions the *tataboang* (a set of five or six small gongs) playing in a bar of 16 beats, punctuated by a larger gong every half-bar with the accompaniment of *tifa* (drum). He also mentions a dance accompanied by gong and *rebana* (a frame drum associated with Islam), the use of the latter instrument indicating some contact between the islands and Islam.

The spread of Islam and the establishment of Islamic states throughout Indonesia from the 15th century onwards made possible the introduction and localization of Islamic music. In many instances, the *rebana* was incorporated. The dominance of Sufism in the early Islamization of Indonesia resulted in a positive stance towards music (according to Sufism, music could be used as conduit to communicate with God).

It should be noted that the establishment of the influential Islamic harbour kingdoms in Malacca in the 15th century brought Sumatra and islands in its vicinity under the suzerainty of Malay rulers. This resulted in the adaptation of Malay dances and music in Sumatra, including the establishment of *nobat*, a court ensemble, in a number of Sumatran courts. Consisting chiefly of wind instruments (*nafiri* and *sarunai*) and drums, *nobat*, according to the early 17th-century *Sejarah Melayu* ('Malay Annals'), was first constituted in Sumatra by the Queen of Bintan.

[Indonesia, §I, 2: General: History](#)

(ii) Colonial.

In many traditional cultures, the introduction of European music into the archipelago brought about syncretic dynamism in musical repertoires, ensembles and ideologies for centuries to come. This can be seen either as the result of a European 'invasion' or as an inevitable outcome of colonial Indonesian society. In some instances, European culture had no apparent impact on Indonesian music. For example, because of geographical isolation, indigenous musics in many small communities in upland areas and in remote islands retained their indigenous features. In the period under discussion, Islamic music continued to expand, interacting with regional musics and developing a variety of hybrid ensembles and repertoires.

During the arrival of Western cultures, consisting of the periods of trade domination (16th–19th centuries) and colonization (19th–early 20th centuries), three types of Western music were introduced in the archipelago: church, secular and military. European missionaries first introduced church music in the eastern Indonesian islands in the 16th century, and later in other islands. Besides serving the needs of Europeans, church music was used to convert inhabitants, although Christianity never attained a stronghold in the archipelago.

Along with church music, Europeans also brought secular music with them. Portuguese and later Dutch overlords and colonial officials in the 17th to 19th centuries retained their own slave musicians who performed European folk and art music repertoires on European string and wind instruments. To secure their trade and political domination, traders (later

colonizers) brought military forces, and with them, European-style military bands.

Eventually European secular and military music played important roles in the lives of both Europeans and Indonesian aristocracy. For example, in Batavia (now Jakarta) and its vicinity, music was ubiquitous in European households as well as in concert halls, clubs and theatres. In the courts of Yogyakarta and Surakarta, European music became an integral part of Javanese court life, complementing the existing gamelan music. It not only accompanied European social dancing when the king held receptions for his European guests, but was also played in other court ceremonies, frequently simultaneously or in alternation with gamelan.

Among the indigenized Western musics, the most popular and long-lasting genre is *kroncong*, which traces its development back to the introduction of Portuguese music in the 16th century (see §VIII, 1 below). Initially consisting chiefly of string instruments, the *kroncong* ensemble and its music spread throughout many Indonesian cities, its popularity partly a result of its incorporation of regional musical styles.

Indigenized forms of Western musical ensembles appear in various pockets of the archipelago. In Sumatra, a brass band has featured in various rites-of-passage in the Batak Christian community. Among the Minahasans of Sulawesi, the European brass band has been adopted and evolved through various phases, manifesting itself in a variety of ensembles in which bamboo instruments replace some of the original brass instruments. Among the Betawi of West Java, the *tanjidor* ensemble is also an adaptation of the European brass band, incorporating Sundanese gamelan instruments. Similarly, the *bheru* ensemble (also known as *ngik-ngok*) in the island of Madura uses a mixture of locally-made European brass instruments and snare drums with a few indigenous Madurese instruments. In yet another example, the *prajuritan* military music of the Yogyakarta court is a combination of European drums and fifes with Javanese cymbals, wind instruments, drums and gongs. In the same court, European drums and wind instruments join the gamelan ensemble in accompanying several court dances.

In some instances, colonialism channelled the development of indigenous music in certain directions. For example, in order to 'compete' with colonial might, Javanese court musicians created gamelan ensembles with larger and more numerous instruments. In Bali, through diminishing the power of the Balinese aristocracy, colonialism contributed to the democratization of gamelan music. Consequently, a wealth of new dances and musical forms emerged, including the well-known *gamelan gong kebyar*.

Dutch scholar-officials, residing in Indonesia in the 19th and early 20th centuries, initiated the formal study of Indonesian culture and music. They also introduced Indonesian intellectuals to European modes of thought. In Java, this exposure to European thinking led the Javanese élite to consider gamelan as 'high' culture that was compatible with European art music. Notation for gamelan, which was introduced in the late 19th century and modelled after Western notation, reinforced this view.

At the turn of the 20th century, the colonial government introduced Western music lessons in Dutch schools attended by Dutch children and children of the Indonesian élite. In particular, the teaching of Western music at schools for Indonesian teachers contributed significantly to its proliferation. Concurrently, other Western music genres, popular and classical, were introduced through films, music books and private lessons.

Indonesia, §I, 2: General: History

(iii) Post-colonial.

The rise of nationalism at the beginning of the 20th century led to the independence of Indonesia from the Dutch in the late 1940s. Indonesian nationalists were keenly aware that hundreds of ethnic groups, each with their distinctive cultural traditions, would have to be united under the newly-constructed Indonesian nation-state. The quest for national unity and identity was of critical importance, and its impact was reflected in music. On the one hand, nationalism inspired Indonesians to recognize the role played by regional musics in Indonesia's identity. On the other hand, Western music, which had long been known by most Indonesians (regardless of their ethnic backgrounds), played an important role in this search for national identity. The creation of many patriotic songs (including the national anthem) in Western musical style was in many senses a natural outgrowth of the national awakening.

Indonesians were caught between the desire to identify themselves with regional arts and the need to create a unified pan-Indonesian art. Responding to this dilemma, Indonesian nationalists and intellectuals promoted various ideas, ranging from the notion that national art should consist of the pinnacle of regional music (namely Javanese court gamelan) to the suggestion that Indonesia's national music should be a form of indigenized Western music, such as *kroncong*. The definition and redefinition of what constitutes 'national' music continues to influence government policy in the construction of Indonesia's national image through the performing arts.

It was with the backdrop of this dilemma that state-sponsored conservatories and academies of Western and traditional Indonesian music were founded in Java and Bali in the 1950s and 60s (similar schools were founded in Sumatra and Sulawesi in the 70s). Each school of traditional music focusses on the music of the region where the school is located. Yet, ideally, the establishment of the schools was also intended to foster the creation of Indonesian 'national' music.

Aside from the continuing study of traditional musics, in the 1970s some of the faculty members and students of the schools became the proponents of new music composed on their regional instruments. Along with other Indonesian composers, who received training in the West or in Indonesia, they have performed this music primarily in government-sponsored festivals.

Meanwhile, forms of indigenized Western popular music have continued to increase, despite its restriction in the early period of Indonesian independence. The development of inexpensive audio-cassette recording in the late 1960s has led to greater dissemination of these musics. In

addition, new genres have been born, such as the regionally-based Sundanese *jaipongan* and *dangdut* (a hybrid of Western rock and Indian film music; see §VIII, 1(v) below). The forces of nationalism, government policy and tourism also bring about new performance contexts, which in turn inevitably shape the aesthetic and the content of music.

3. Instruments.

The vast and diverse instrumentarium in Indonesia is particularly strong in percussion and flutes, but most of the main categories of instruments are well represented. Trumpets and keyboards are rare in non-European form, while only one harp is reported, and lyres and bagpipes are wholly absent.

The principal surveys and catalogues covering a wide geographical range within Indonesia are Sachs (2/1923/R), Huyser (1928–9), Balfourt (1930–31), Halusa (1938), Ijzerdraat (1954) and Kartomi (1985). Studies with a narrower geographical focus include Kunst's valuable summary of literary and iconographic sources on Javanese instruments before the coming of Islam (1927, 2/1968); Kaudern (1927), focussing on Central and North Sulawesi; Kunst on Nias (1939), Flores (1942) and Irian Jaya (1967); Shelford (1904) and Grabowsky (1905) on parts of Borneo; and Brandts Buys and Brandts Buys-van Zijp on Madura (1928) and on noisemakers and other folk instruments of Java (1924–33 and 1925–6). Kunst's Nias book (1939) has particularly useful maps showing the distribution of certain instruments throughout the archipelago.

BIBLIOGRAPHY

[Indonesia, §I, 3: Instruments](#)

(i) Idiophones.

Bronze drums were introduced into Indonesia from the Dongson culture of northern Vietnam during the last few centuries bce, perhaps around 200 bce (Bellwood, 1985, 2/1997). The drums were played at festivities and rituals. Examples have been found in many parts of the archipelago, particularly in Java, Sumatra and southern Maluku; local manufacture had

begun in Bali by the first two centuries ce. In Alor, small forms of these drums were in use in to the 20th century; some (if not all) were manufactured in Gresik, East Java.

Hood (1980) has speculated that the practice of playing kettle-gongs in sets (gong-chimes) derives from the ancient use of bronze drums in the same manner. Be that as it may, gong-chimes with bossed gongs are common in most parts of Indonesia except Irian Jaya. In some cases the gongs are played melodically, whereas in others they provide a repeating rhythmic pattern (see §1(iii)(b) above). The gongs hang from a crossbar, rest in frames, or are hand-held. They are often played in ensembles with larger hanging gongs or drums or both; non-metallic melodic instruments may be added. The famous gamelan orchestras of Java and Bali (also Lombok and South Kalimantan) are the most elaborate Indonesian forms of gong-chime ensemble. In contrast to bossed gongs, flat-gong sets are very rare in Indonesia; perhaps the only example is the *gerantung bos* of the Pakpak in North Sumatra.

While instruments with wooden bamboo keys are widespread in Indonesia, keyed metallophones occur almost without exception only in gamelan cultures and are thus restricted to Java, Bali and their cultural extensions. (In most cases they are played only in gamelan, though in Bali they may also be played on their own in duos or quartets.) There are two types of keyed metallophone: the *saron* type, with keys resting on cushions over a trough resonator, and the *gendèr* type, with 'floating' keys strung on cords over tube resonators. Instruments of the *gendèr* type but with only one or two keys suspended over a pot or box resonator are used as gong-substitutes in Java. Cymbals and various small metal percussion instruments are also found mainly in gamelan cultures; an exception is the European iron triangle, which occurs in certain violin-led ensembles (*gandrung Banyuwangi* in East Java; *katreji* in Maluku; it is also reported in early *kroncong* (see §VIII, 1 below).

Wooden and bamboo xylophones are common as solo instruments for private amusement, in xylophone ensembles (Bali, Banyumas) and as members of mixed ensembles with no dominant instrument-type (e.g. *gambang kromong* in the Jakarta region; Central Javanese gamelan; the Kenyah *jatung utang* ensemble along with plucked lute; and the Toba Batak *gondang hasapi*).

Aside from bamboo xylophones, bamboo tubes are struck together for agricultural ritual music (as in *senggayung* in West Kalimantan), stamped against the ground or other hard surface and struck with beaters in interlocking rhythms by groups patrolling neighbourhoods at night. The *Angklung* of Java and Bali is a wooden frame in which two or more bamboo tubes are loosely mounted so as to sound when the frame is shaken; originally non-melodic in function, sets of tuned *angklung* are now used to play melodies in European idiom (see also §V, 1(ii)(b) below).

Wooden and bamboo 'slit-drums' or 'slit gongs' are used as signalling instruments, calling people together or sounding an alarm; in Central Javanese gamelan music they are also used to give cues to dancers. Wooden mortars are struck with wooden pestles in interlocking rhythms by women pounding rice or other foodstuffs; they may also be played in

virtuoso manner by men in agricultural rites or harvest celebrations (see [Lesung](#)). A lithophone played in this way is reported among the Minangkabau. Jew's harps are found nearly everywhere in bamboo or metal varieties. In Bali and Lombok there are jew's harp ensembles (plus flute and drums), but for the most part they are played informally. A highly unusual double jew's harp, with two tongues side-by-side, their tips pointing at each other, is reported for the Kenyah Lepo' Ma'ut of East Kalimantan by Lawing (1999), who unfortunately does not describe how it is played.

[Indonesia, §I, 3: Instruments](#)

(ii) Membranophones.

The three most common varieties are double-headed drums, often with interlaced heads and conical-, cylindrical-, bellied- or hourglass-shaped exteriors, while the interior cavity may match the exterior or may have an hourglass shape; single-headed cylindrical, hourglass-shaped or conical drums (the latter sometimes with a flare at the open end); and round frame drums with one or two heads (one is more common).

The double-headed drum-type is prevalent from Sumatra to as far east as Sulawesi and Sumbawa. Drums of this type are the principal variety played with gamelan, where they are usually positioned horizontally and played on both heads with complex technique. In some non-gamelan cultures (e.g. Petalangan in mainland Riau and Toraja in South Sulawesi) they may have two players, one for each head. The single-headed type is less common in western and central Indonesia, though by no means rare (found, for example, in Nias, Mentawai, interior Kalimantan and West Java); east of Sulawesi and Sumbawa it is the predominant form. In Maluku and Irian Jaya it is often called *tifa* or a cognate name. The frame-drum type, found all over the country, is closely associated with Islam and probably originated in the Middle East; it is often called *rebana*. Also associated with Islam (though probably originating in China) is the *bedug*, usually a large barrel drum with nailed or pegged heads; it is present outside most mosques and is used to announce prayer times.

Drums take a wide range of roles in Indonesia. They dominate certain shamanic ritual musics, during which strings of discrete rhythmic patterns are played on them; in drum-ensembles (typically consisting of frame drums) intricate interlocking rhythms are featured, either alone or accompanying voice. They often provide a beat or simple phrase-marking accompaniment for other instruments and voices (this is a common role for *tifa*-type drums in Maluku and Irian Jaya) or play semi-autonomous parts, adding rhythmic and timbral interest to melodic lines (as in much gamelan music). In certain ensembles among Toba Batak and other North Sumatran groups, a set of tuned drums of the double-headed type carries the principal melody (doubled by a double reed aerophone); there is also an ensemble of tuned frame drums in Lombok that imitates the interplay of gamelan instruments.

[Indonesia, §I, 3: Instruments](#)

(iii) Aerophones.

Bamboo or wooden flutes of one form or another are found almost everywhere in Indonesia. Probably the most widespread is the end-blown

'ring flute' (an external-duct flute with an attached ring at the blowing end); this is especially common in Java, Bali and Sulawesi. Open, 'edge-blown' flutes are played mainly in Sumatra. Internal-duct flutes and ring-stop and screen-stop flutes are found in Sumatra, Sulawesi and elsewhere, though not often in Java and Bali. All these varieties are often played using the technique of circular breathing. Other flutes of scattered or restricted distribution (most of them now quite rare) are nose flutes, piston or slide flutes, central-hole flutes and the double- and triple-flutes of central Flores. Panpipes are reported in Irian Jaya, Flores, Timor and West Java.

Flutes are played most commonly as solo, self-delectative instruments. In West Sumatra and mainland Riau they may also accompany narrative and lyric singing, and they also figure in some Javanese and Balinese gamelan and in other mixed ensembles (e.g. *gambang kromong*, *gondang hasapi*, *gambuh* in Bali, the modern *karungut* ensemble of Central Kalimantan, *tarling* in Cirebon and *togal* in Halmahera). Among ensembles and genres dominated by flutes, some featuring long flutes (70 cm or longer) may be noted: funeral music of the Kajang of South Sulawesi, for two flutes and two singers; Toraja curing music for four or more flutes; and sacred music for paired flutes on the north coast of Irian Jaya. Other ensembles dominated by (shorter) flutes are the Balinese *gong suling*, a gamelan imitation, and flute bands established by Christian missionaries in eastern Indonesia. Playing hymns and other tunes in European idiom, these flute bands consist mainly of transverse flutes; for bass tones they may include the 'blown gong' described below.

Double-reed conical-bore aerophones are common in northern Sumatra and the Riau islands, in the southern tier from Java to Sumbawa and in South Sulawesi; elsewhere they are rare, though they may occasionally be found in music for martial arts dance (*silat*, *pencak*) or in the royal music of local sultanates. There are solo, duo and vocal-accompaniment uses for the *preret* in Lombok, but mostly these instruments play in mixed ensembles (e.g. *ajeng* gamelan in West Java, *gondang sabangunan* and other North Sumatran ensembles and *sronen* in Madura).

Single-reed aerophones are more widespread. Clarinets made from rice-stalks, often amplified by a funnel of wound leaf, are found wherever rice is grown. Bamboo and wooden clarinets are reported from Nias, Sumatra, West Kalimantan, Sulawesi, Central Java, the islands of Nusa Tenggara, and Kei; some of these are double-clarinets. Unlike the double-reed instruments, the clarinets play mainly solo, in informal contexts, with some exceptions: the Toba Batak *sarune na met-met*, which plays with *gondang hasapi*, and the Central Javanese *puwi-puwi*, which plays in the *prajurit* music of the Sultan's palace in Yogyakarta.

A mouth-organ consisting of free-reed pipes and an air-chamber was formerly common among Dayak in Kalimantan but is becoming rare; this instrument is pictured in the reliefs on the 9th-century temple at Borobudur. Accordions are a 20th-century addition to Melayu dance-music ensembles; harmoniums, now obsolete, were used in both Christian music and a form of Muslim secular music (*orkes harmonium*) in the 19th and early 20th centuries.

The 'blown gong', sometimes used as a gong substitute in Javanese village gamelans and found as well in flute bands in eastern Indonesia, consists of a long, thin, open pipe without fingerholes, which is partially inserted into a larger stopped tube; a stream of air, blown (or hummed) through the smaller tube, causes the air in the larger tube to vibrate. The 'bamboo tuning fork' (*duri-dana*, *rere*) is an unusual struck aerophone found in the widely separated locations of Nias, Sulawesi and Sumbawa (for further information on the *duri-dana* of Nias, see §VI, 4(i) below).

European-style wind bands, sometimes mixed with Indonesian instruments, are found in several regions (see §1(iii)(b) above). All have a European repertory (marches, waltzes and pop tunes, or, in Christian communities, hymns) and some also play band arrangements of local repertory. In North Sulawesi, local imitations of trumpets, trombones, tubas etc. have been made out of bamboo, zinc or copper. Aside from these wind bands, conch trumpets and wooden and bamboo trumpets, end-blown and side-blown, are found almost exclusively in eastern Indonesia (Maluku and Irian Jaya), used mainly for signalling and for ceremonial purposes.

Indonesia, §I, 3: Instruments

(iv) Chordophones.

A class of instruments sometimes called boat-lutes (after their shallow, flat- or slightly round-bottomed resonators, often with a prow-like point) is found in the northern tier from Sumatra to Sulawesi and also in the eastern Nusa Tenggara islands. Typically these instruments have two strings, though some have more; they have wooden soundboards, and their resonators may be closed or open at the back. Many of the names of these lutes are cognate (*hasapi*, *kacapi*, *katapi*, *kulcapi*, *kanjapi*, *konyahpi*, *sapi*, *sapé*, *sampeq*), though some (*belikan*, *jungga*) come from different roots. The Sumatran varieties and some of the Kalimantan ones have no frets, whereas the old Kayan *sapé* from Central Borneo has scalloped frets carved out of the neck, and the Sulawesi and Nusa Tenggara forms have (in common with the Philippine *kudyapi*) high finger-posts carved integrally from the neck and soundboard. These various lutes often play in mixed ensembles; one (or in South Sulawesi, two or more) may accompany solo narrative and lyric singing; and among Kenyah in Kalimantan there is a genre of solo and duo instrumental playing for dance.

A second class of plucked lutes is commonly called **Gambus**. The instrument is believed to derive from the *qanbūs* of Hadhramaut (Yemen). Though it has no religious associations in Indonesia, it is considered an essentially Muslim instrument and is found in Muslim communities throughout the country. Although there are many variant forms, the *gambus* typically has six or seven strings, a skin soundtable, a pear-shaped resonator and a pegbox bent back from the plane of the neck. The instrument accompanies lyric singing and social dance, usually in an ensemble with several frame drums. Instruments modelled on the Middle Eastern *ūd* are sometimes substituted for *gambus*.

European plucked lutes are thought to have first come to Indonesia with Portuguese sailors and merchants in the 16th century. Voice- or violin-led string bands have developed using guitars and other European plucked lutes or local approximations of them (banjo, ukulele, mandolin, pizzicato

cello, string bass) for rhythmic and harmonic support. Examples are *kroncong* (Jakarta), *gitar los quin* (Ujung Pandang), Ambonese string bands and dance-ensembles such as those for *yospan* (Irian Jaya), *togal* (Maluku) and *bidu* (Timor). The musical idiom often mixes European and local elements. Hawaiian guitars may be added to some of these ensembles (e.g. *kroncong* and Ambonese bands). As described in §1 above, the acoustic guitar accompanies both popular (Western-style) songs and strophic solo singing in local languages. Electric guitars are used in popular music bands playing *pop Indonesia*, rock and *dangdut*.

Spike fiddles are prominent in Sumatra (particularly the northern half), Java, Bali, Central and South Kalimantan, and Sulawesi. Violins on the European model are common among Melayu and affiliated groups, particularly in northern Sumatra, Riau and in coastal settlements in Kalimantan; they are also important among the Bugis (in South Sulawesi), in Bima (eastern Sumbawa), Timor and northern Maluku. The spike fiddle seems primarily to accompany narrative and lyric singing, though it also figures in Javanese, Sundanese and some Balinese gamelan, and in the mixed *karungut* ensemble of Central Kalimantan. The violin accompanies narrative and lyric singing (*rabab pasisie selatan* in West Sumatra; *biola rawa Mbojo* in eastern Sumbawa; *biola Aceh*) and plays in many mixed ensembles (e.g. *gandrung Banyuwangi*, the Melayu *ronggeng* ensemble, various Bugis ensembles and string bands), though never in gamelan. Spike fiddles of another type, the Chinese form with the bow passing between the strings, are found only in the mixed Chinese-Sundanese *gambang kromong* ensemble in and around Jakarta (and its Chinese-Javanese offshoot in Semarang).

Bamboo tube zithers are common throughout the archipelago. Usually they have only a few strings and are plucked or struck in simple repeating patterns as accompaniment to singing or other instruments, but on Roti in eastern Nusa Tenggara a fully melodic variety, the *sasandu*, has developed, which may accompany singing or may play pieces from the repertory of the local gong-chime ensemble, along with a single small drum.

In Sunda the board zither *kacapi* accompanies narrative and lyrical singing, sometimes along with flute or spike fiddle. The Central Javanese board zithers, *celempung* and *siter*, are optional members of the gamelan; they also form the nucleus of the itinerant *siteran* ensemble, which plays the repertory and imitates the texture of gamelan. A board zither said to be a flattened-out version of a tube zither is reported among the Kenyah Lepo' Ma'ut of East Kalimantan (Lawing, 1999). A keyed board zither, with strings stopped by bars like those of a manual typewriter, is occasionally found among the Bugis and the Minangkabau; the instrument is modelled on the Japanese *taishō-goto*. Stick zithers, now rare, were prominent in Sulawesi in earlier times and are reported from Sumba and Maluku; they are pictured on Borobudur but are now unknown west of Sulawesi and Sumba. Ground zithers have been reported (as rarities) among the Pakpak in Northern Sumatra and in Java (Brandt Buys and Brandt Buys-van Zijp, 1932), and from Muna and the Tolaki in south-east Sulawesi.

There are harps on Borobudur, but only one has been reported in the 20th century: the four- or five-string *engkeratong* of the Iban of Borneo (Shelford, 1904).

Indonesia, §II, 1: Bali

(i) Introduction.

The island of Bali is home to one of the last remaining Hindu cultures that once were widespread in the Indonesian archipelago. Although small (5620 km², population almost 3 million) and close to Java, Bali maintains a strong cultural identity. Nine distinct regions, roughly based on former kingdoms, have fostered the development of many distinct musical traditions and cultural practices due to geographic and political boundaries. The predominant religion, Hindu-Dharma Bali, or *Agama Tirtha* (holy-water religion), practised by approximately 90% of the Balinese population, is a synthesis of indigenous animistic religion with Saivite-Buddhist traditions of India, which mostly reached Bali via Java. These links are demonstrated by the many languages and literary traditions kept alive in performing arts. Gunung Agung, the largest volcano on the island, is considered the Indian seat of the gods, Mahameru, transported to Bali. The four cardinal directions are orientated towards and away from the spiritually powerful mountain, determining the placement of all ritual activities, including music and dance.

Minority groups include the Sasak, who migrated from the neighbouring island of Lombok and, for the most part, practise a form of Islam. Many live in eastern Bali (which has had the most contact with Lombok, beginning in the 1700s) and maintain many musical practices such as the use of the double-reed aerophone, *preret*, and *wayang Sasak* (shadow puppetry accompanied by a bamboo flute ensemble). There is also a substantial Chinese population.

Apart from Hindu-Dharma Bali, other religions include forms of Islam, Christianity and Buddhism. Followers of these faiths live completely divorced from Balinese Hindu culture and usually live in individual communities. There is also a substantial Chinese population that practises

Confucianism. The Indonesian government's *pancasila* policy recognizes only monotheistic religions, thus forcing Balinese Hindus to alter their views on the Hindi Pantheon and marginalizing other religions (such as Confucianism, which has no deity).

The performing arts are an indispensable component of Balinese religious rituals and are promoted, supported and guarded by Indonesian and Balinese government institutions. Reinforced by the large numbers of tourists they attract, the arts continue to be viewed by the Balinese as one of the most important aspects of their heritage. Music, dance and theatre are virtually inseparable. Poetry is always sung, and narratives are enacted through music, dance and shadow puppetry. The many diverse ensembles and theatrical genres are closely linked with literary traditions of different periods; however, innovation is an intrinsic part of Balinese tradition, reflecting adaptability and allowing for individual expression that perpetuates the relevance of Balinese cultural expressions.

Music is exclusively an ensemble tradition, reflecting the communally-organized society. Ensembles, collectively referred to as *gamelan* (or the Balinese term, *gambelan*), have historically served specific functions in religious ceremonies and (prior to their demise) in Balinese courts. At least 30 distinct types of ensemble have their own tuning, timbre, repertory size and function. A standard body of repertory exists in myriad versions and variants, owing to oral transmission and diverse regional styles and practices. Gamelan is mostly performed by men and boys; however, 17th-century manuscripts depict female court musicians, a practice that probably ended with the destruction of the courts in the Dutch conquest. At present there are some women's gamelan groups and women music students at government arts institutions. Gamelan music thrives outside institutions. Most villages possess communally-organized gamelan groups that perform for village ceremonial functions, some reaching professional status or employing professional musicians from elsewhere to direct and teach the groups.

(a) History.

Contact between Hindu-Javanese and Balinese courts began around the 9th century, with strong cultural exchange beginning in the 11th century (Kadiri period), when the Balinese-born King Erlangga became ruler of East Java. Stories glorifying his life became central to many of the 'classical' dance-dramas still performed (*calonarang*, *legong*), while some of the oldest Balinese ensembles date from this period. In the mid-14th century the Javanese minister Gajah Madah defeated a Balinese king, causing Bali to become part of Majapahit, Java's last Hindu empire. When Majapahit fell to the Muslim kingdom of Demak in the late 15th century, many Hindu-Javanese courtiers fled to Bali, where Javanese-modelled courts already existed. Following the fall of Majapahit, the eastern Balinese kingdom of Gelgel (late 14th century to the 17th) is regarded as the pinnacle of Balinese arts, and the origins of most musical traditions are traced to this time.

In many respects, Bali's cultural development has been independent of Java's, although elements of Hindu-Javanese culture were adopted in Bali and supported by the courts, including aspects of gamelan, dance and

literature. Bali is seen as a 'living museum' of early Indian Sanskrit literature, which is still in use in rituals performed by Balinese Brahman priests. It is also the repository for 10th–15th-century Old Javanese (Kawi) literature, now extinct in Java, but preserved in Bali on palm-leaf manuscripts (*lontar*) and kept alive through sacred vocal chanting, sung recitation in poetry-reading clubs and in many theatrical genres such as *wayang kulit* (shadow puppet theatre; see §(vi) below).

Dutch colonization of Bali, which began in the mid-19th century and spread throughout the island by the early 20th century, caused a shift in patronage from the courts to local villages and the Dutch government. Court gamelan were sold to villages, where many gamelan clubs (*sekaha*) were formed. This period is recognized as a time when music flourished throughout the island. The Dutch instituted a policy of preservation of Balinese culture and opened Bali to the first Western tourists (see Picard, 1990, 1996). During the 1930s foreign scholars began to study Balinese traditions, among them the Canadian composer [Colin McPhee](#), who conducted extensive research (McPhee, 1966/R).

After Indonesian independence, two government institutions were created that had tremendous impact on the performing arts. The music conservatory Konservatori Karawitan Indonesia (KOKAR), founded in 1960, later became the music high school Sekolah Menengah Karawitan Indonesia (SMKI). In 1967 the dance academy Akademi Seni Tari Indonesia (ASTI) was founded, later to become Sekolah Tinggi Seni Indonesia (STSI), which now encompasses music, dance, theatre and visual arts. These institutions have played major roles in supporting and reviving performing arts genres all over Bali, as well as introducing 'standardized' versions of genres. Performers from these institutions are renowned as some of Bali's finest and are often sent abroad on diplomatic missions.

(b) Performance contexts.

The *Pancayadnya* (five ceremonial categories), which comprise all Balinese religious ceremonies, honour the living (*manusayadnya*, rites of passage including weddings and tooth filings), the dead (*pitrayadnya*, e.g. cremations), the gods (*dewayadnya*, e.g. temple ceremonies), sages (*resiyadnya*) and demons (*bhutayadnya*). Music plays a powerful role of accompanying ceremonies: gamelan ensembles, genres and repertoires are associated with each category and with functions within each category, depending on, for example, the ensemble's age, tuning system, timbre and dynamic range. Furthermore, many large ceremonies contain a sequence of rituals honouring each of the five categories. The choice for any given event is subject to tradition, local preference and to the availability of the ensemble and performers; in general, the older the genre, the more sacred and unchangeable it is.

The ceremonial soundscape comprises a blend of seemingly disparate yet essential musical genres. Often several gamelan play simultaneously, some accompanying sacred ritual dance (*rejang*) while others accompany dance-dramas or shadow puppetry or play instrumental music in close proximity to sacred vocal chanting, resulting in a sound-ideal of fullness and boisterousness (*ramé*). Its opposite, *sepi* (emptiness), is considered

dangerous and is aesthetically and spiritually important only once a year on *nyepi*, a day of purification when no sound is made. Every village possesses several temples that celebrate their anniversaries (*odalan*, *dewayadnya*) every 210 days (one Balinese year) with elaborate ceremonies involving music, dance and theatre.

As a way of protecting the older sacred performing arts from being exploited by tourism, in 1971 a committee of artists, religious specialists and government officials proposed a classification system, organizing music, dance and theatre genres into three general categories, subject to regional variation. *Wali* (sacred) activities are integrated into rituals and take place in the innermost courtyard of the temple or house compound (closest to the sacred mountain) for an audience of gods; *babali* (ceremonial) activities occur in the middle courtyard, are for an audience of gods and humans and are not integrated into the ceremony, but are parallel to it; and *balih-balihan* (secular) activities are performed outside the temple or in an outer courtyard and are entertainment for humans. In practice these categories often overlap: the distinction between *wali* and *bebali* is sometimes irrelevant, and performance traditions may shift from one category to another (e.g. secular offering dances performed on a *balih-balihan* secular programme).

The 20th century saw an expansion of performance contexts, in particular with secular performances on proscenium stages. The art centre Werdi Budaya, opened in 1976, is a frequent venue for STSI students and faculty, for tourist performances and for the annual Bali Arts Festival (Pesta Kesenian Bali, instigated in 1979), a competition and exhibition of gamelan, dancers and artisans from all over the island. The major focus of the Bali Arts Festival is the gamelan festival, which promotes a competitive atmosphere and regional pride among gamelan groups and audience members. These performances are held in 'battle of the bands' format, with a gamelan group on either side of the stage. Repertory (which includes instrumental and dance pieces) must fit into the categories established by an official committee each year, and most pieces are newly composed for the occasion. The culmination of the festival (attended by up to 8000 people) involves the *sendratari* and *drama gong* dance-drama performances. *Sendratari*, an acronym of *seni*, *drama* and *tari*, (art, drama and dance) is a huge spectacle involving a narrator and hundreds of dancers and musicians. *Drama gong* is a dance-drama in which the actors speak, accompanied by *gamelan gong*. Aspects of these forms depart from traditional Balinese theatre and dance in their set scripts, choreographies and pieces (leaving little room for improvisation) and the playing-out of entire epic narratives in encapsulated form.

Indonesia, §II, 1: Bali

(ii) Musical principles.

- (a) Tuning systems.
- (b) Notation.
- (c) Instruments.
- (d) Performing practice and musical structure.
- (e) Kotekan.
- (f) Form.

Indonesia, §II, 1(ii): Balinese musical principles

(a) Tuning systems.

Instruments are tuned in pairs, with one tuned slightly higher than other resulting in acoustic 'beats'. When played together, the lower (*pa*)*ngumbang* ('exhaler') and the higher instrument (*pa*)*ngisep* ('inhaler'), create a shimmering timbre, literally breathing life into the sound of the ensemble. There is no standardized tuning. All instruments of an ensemble are tuned together and do not match any other ensemble, giving them a unique character. However, every gongsmith (*pandé*) has his own conception about particular tuning and the intervals for each type of gamelan that fit into a generalized system. Tuning systems (*saih*, 'sequence') of four, five, six and seven pitches are named after the type of gamelan with which they are usually associated (e.g. *saih gender* after the *gender wayang* ensemble) or the number of pitches (e.g. *saih pitu*, a sequence of seven).

The terms *slendro* and *pelog*, (adopted from Javanese terminology where they describe five-tone and seven-tone tuning systems, respectively), are frequently used to classify scales that were not formerly grouped together but can be made to fit roughly into these two categories. Many gamelan tunings and vocal genres do not fit neatly into either system, however.

The rich modal possibilities inherent in seven-tone ensembles distinguish them from pentatonic gamelan. Modes of five main pitches (known as *tekep*, 'covering' of the holes of the *suling* flute, or *patut*, 'agreement') employ two extraneous tones (or *pamero* called *bero*, 'false') for colour and modulation purposes. A revived interest in seven-tone ensembles, such as the court ensemble, *semar pagulingan*, has instigated the creation of experimental seven-tone gamelan that are capable of producing both *slendro* and *pelog* scales such as *gamelan semara dahana* (or *semarandana*) and *gamelan manikasanti* (created by I Wayan Sinti).

Pentatonic tunings are the most prevalent; in the early 20th century, to facilitate the playing of complex figuration (and to avoid leaping over the unused *pamero* tones) many seven-tone gamelan were melted down and transformed into pentatonic gamelan.

Tuning can convey ritual meaning. The modes produced by the group of rare, seven-tone sacred ensembles have specific correlations with deities. The most prevalent tuning, the pentatonic *pelog selisir* of *gong kebyar* and *balaganjur*, is generally associated with the human and demonic realms. *Slendro* tuning of *gender wayang* and *gamelan angklung* is considered to connote sadness; it is a means of communicating with the spirit world and is used in rites of passage such as tooth filing and cremation ceremonies. Old treatises on music explain that for each pitch there is a corresponding deity, cardinal direction, colour etc.; usually male deities are associated with *pelog* and their female counterparts with the corresponding scale degrees in *slendro*, but for most musicians, this philosophy is not part of general musical awareness.

Indonesia, §II, 1(ii): Balinese musical principles

(b) Notation.

Most Balinese music is transmitted orally. Notation is rarely used in the transmission process and never in performance. However, versions of the notational system known as *grantangan* are used for preserving the skeletal pitches of long compositions. Syllables comprising the pitch notation systems are also used as vocalized mnemonics in teaching. There are several such systems (Table 1). The oldest, used in *gamelan gambang* and other seven-tone sacred ensembles, is derived from sacred vocal music notation in which the vowels of poetry are translated into musical pitches. The vowel sound in each word of text has a corresponding syllable representing a pitch that is played as a tone on a single octave metallophone. At the KOKAR music conservatory, notation systems (known as *notasi ding dong* and *notasi KOKAR*) devised in 1960 have become standard; occasionally cipher notation is also used. Drum patterns are also transmitted by rote using a system of mnemonics.

Indonesia, §II, 1(ii): Balinese musical principles

(c) Instruments.

Gamelan are comprised of gongs, metallophones, xylophones, gong-chimes, drums, cymbals, flutes and spiked fiddles in various combinations (Table 2). Materials of construction include bronze, iron, wood and bamboo. Gongs range in size from small to very large. Most are hung vertically and struck with a padded mallet and provide a framework that marks the form. Others are held horizontally, are struck with a hard mallet and provide secondary punctuation or serve as a time-keeper. Metallophones are in pairs and consist of two types: with keys suspended over bamboo resonators (e.g. *gender*), and with keys resting on trough resonators (e.g. *gangsajongkok*). Each metallophone in a pair is precisely tuned slightly apart from the other to produce acoustic 'beats'. Gong-chime instruments consist of a row of graduated tuned kettles, which are played either as a solo melodic leading instrument or by several people playing interlocked figuration. Various non-pitched idiophones, such as *ceng-ceng*

(cymbals, large or small) or *gentorak* (bell tree), complement ensembles. *Suling* (flutes) are played using circular breathing to produce a continuous sound; the *rebab* (bowed spike-fiddle) is played only in soft ensembles, with a technique that differs from that of Javanese *rebab*. Various sizes of two-headed drums (*kendang*) are played with and without mallets (see also [Gamelan, §1, 5\(iv\)](#)).

Although there are many varieties of gamelan, most follow similar musical principles; discussion here will use *gamelan gong* (developed from *gamelan gong gede* and *semar pagulingan*) as a model.

Indonesia, §II, 1(ii): Balinese musical principles

(d) Performing practice and musical structure.

All players of a Balinese gamelan work together with extreme precision, held together by a network of leading instruments that provide aural and visual cues. Characteristic features of Balinese music are the rapidity of melodies and rhythms played in close coordination with one another and sudden shifts of tempo and dynamics, from slow, lyrical extended melodies to fast, highly dramatic, short *ostinati*. The stratified texture in Balinese music generally consists of a slow-moving skeletal melody (*pokok*) played on the lower, single-octave metallophones (*calung* or *jublug*, ornamented by *penyacah* metallophones tuned an octave higher), usually in evenly-spaced beats divisible by two. This is punctuated by even lower metallophones (*jegogan*) and ornamented by a multi-octave, leading metallophone (*ugal* or *giying*). Elaboration of this melody in interlocking style occurs on higher metallophones with a two-octave range (*gangsa*) and a 12-kettle gong-chime played by four musicians (*reyong*). Another gong-chime (*trompong*), lower in pitch than the *reyong*, is played by a soloist as a leading melodic instrument in certain types of pieces. The form of the piece is marked by a group of gongs in graduated sizes with the largest marking the end of each cycle and the smaller ones subdividing the cycle. The ensemble is led by one or two drummers who play interlocking parts on *wadon* (female, larger, lower in pitch) and *lanang* (male, smaller, higher in pitch) drums, cueing introductions, tempo, dynamics, transitional passages, endings etc. Over this texture floats a melody played on *suling* and sometimes *rebab*.

Most melodies are cyclical and in multiples of two or four, with the stress falling on the final beat of a group (rather than the first beat); sometimes this coincides with a gong. The music played on elaborating instruments is highly syncopated, often juxtaposing three-beat groupings against duple rhythms.

Indonesia, §II, 1(ii): Balinese musical principles

(e) Kotekan.

The *gangsa* and *reyong* players play interlocking figuration (*kotekan*, also called *candatan*) consisting of two complementary parts, the *polos* (the basic, main part, usually playing on the beat) and the *sangsih* ('differing', fitting between *polos* notes). When *polos* and *sangsih* are sounded together the composite melody has a faster tempo than any single player could produce, usually four or eight times as fast as the *pokok* melody. In order to play *kotekan* the musicians involved must hear their parts in relation to each other rather than as isolated units.

Further timbral distinction between the low, slow-moving parts and the figuration is achieved with the mallets themselves (*panggul*). The *gangsa panggul* are hard wooden hammers producing a sharp attack, whereas the lower instruments (*penyacah*, *calung* or *jublaga* and *jegogan*) are struck with padded mallets, producing a softer, warmer sound. The damping technique can be very complex in playing *kotekan*, as every note struck by the right hand must be damped with the left precisely when the complementary part strikes. Instruments that are played with two *panggul*, such as *reyong*, have an even more difficult damping technique, requiring the musician to stop the sound with the mallet after striking without producing another sound.

There is little room for improvisation, since many of the parts are in pairs that are dependent on precise figuration in order to interlock properly. The leading melodic instrument has some leeway for improvisation, but because of its role as leader, it must remain connected to the *pokok*, anticipating, following and embellishing.

There are many types of *kotekan*, from rhythmically simple to highly syncopated. Each type is associated with specific genres, forms, melodies, ensembles and moods. Some are closely tied to the *pokok*, reinforcing, surrounding or anticipating its pitches, while others are independent (ex. 1); in *kebyar* compositions these types are often combined.

Augmentation and diminution frequently occur in compositions. When a skeletal melody is played at its 'basic' tempo it is known as *panca periring*,

and when played twice as slow it is called *wilet*; the result is similar to the Javanese *irama* ratios: as the *pokok* is played slower, other instruments fill in with their own faster figurations.

Interlocking drum patterns employ a number of strokes specific to genres, gamelan types and drum size. Drumming styles range from melodic to percussive, and their intricate patterns add a variegated texture to the ongoing *ostinati*. *Panggul* (mallet) drumming for the *gong gede* ensemble is heavy and powerful; drumming for *gambuh* and *palegongan* ensembles (ex.2) employs delicate hand strokes that ring melodically, while *kebyar* drumming is a display of rapid virtuoso percussion.

Indonesia, §II, 1(ii): Balinese musical principles

(f) Form.

Many compositions have several movements with contrasting gong structures, melodies and tempi, combining cyclic repetition with linear progression. Likened to parts of the body, pieces often open with the *gineman* (head), a metrically and rhythmically free introduction played by one or a few instruments and joined by the drums, which cue the entrance of the rest of the ensemble; this is sometimes followed by a *kawitan* ('beginning') section; the main body of the piece (*pangawak*, 'body'), is the

longest, slowest section; finally, the *pangecet* (legs and feet) usually consists of a short gong cycle in a fast tempo. Repeating sections of pieces are sometimes linked by non-repeating transitional passages. The basic model of *gineman–pangawak–pangecet* is often expanded to encompass other movements. Usually there is recurring thematic material, giving the composition cohesion.

The cycles, divided and marked by one or more gongs, are associated with particular drum patterns. Forms range from cycles of two beats (often a short ostinato) to 256 beats (extensive melodies). They are closely associated with theatrical and dance genres, even when taken out of their original context and incorporated into multi-sectional *kebyar* compositions. In theatrical music a single gong cycle may be repeated many times to support the drama; when a new mood or character piece is needed, there is a switch to another melody with a differing gong framework. Pieces with shorter gong cycles accompany highly dramatic or action scenes, articulated by the frequency of gong strokes, whereas long, extended cycles usually accompany calmer scenes or refined character dances.

The repeated cycles are enlivened by *angsel*, syncopated rhythmic accents or breaks in the melodic figuration, played while the beat and colotomic pattern continue (ex.3). These are borrowed from (but not restricted to) dance music, in which movement is tightly coordinated with the gamelan via drum cues. There are many types of *angsel* rhythms, articulating movement, marking tempo or pitch changes, closing phrases or linking sections etc. In certain styles of dance (usually accompanied by solo drum) the dancer decides when to initiate an *angsel*, cueing the drummer, who cues the musicians. Other dances have a set choreography with *angsel* built into the composition, which are memorized by the musicians and dancers.

Forms are highly contextualized to specific types of gamelan and associated repertoires, although repertory is often transferred from one type of gamelan to another in order to fulfil ceremonial and aesthetic functions. The form of a piece is usually named after the genre or melody with which it is most closely associated, even when it has been transferred to another genre or melody (Table 3). Forms are marked by

different types of gongs, depending on the instrumentation of the ensemble. In the court ensembles (*gambuh*, *semar pagulingan* and *palegongan*), the largest gong marking the end of each cycle is the medium-sized *kempur*, and divisions in the cycle are articulated on *kemong* (a small hanging gong struck with a hard mallet wrapped with string, also called *klentong*), *kajar* (small horizontal gong with a flat boss, held in the lap and struck with a wooden beater) and *klenang* (the smallest horizontal gong, playing the off-beat). Forms are also distinguished by drum patterns.

TABLE 3: Some colotomic forms

k = kajar or kempli t = klentong P = kempur G = gong

<i>Form</i>	<i>Structure</i>			
Batel	x k	x G		
Bapang	x	xxxxxxx P t P G		
Bapang Gede	.	x · x · x · x (augmented pokok, twice t G as slow as Bapang)		
Gilak (Baris)	x	xxxxxxx 8 or 16 GP PG		
Kalé (same form as Gilak but pokok consists of repeated note)				
Gabor Sisir	x	xxxxxxx t P		
Gegaboran	x	xxxxxxxxx P t	x	xxxxx P G

Forms range in size and scope from the fast, two-beat *batel* in *gamelan gambuh* to *lalambatan* ('slow' music), which are stately, grand pieces played in the temple during the *odalan* (temple ceremony). Traditional *lalambatan* pieces are the longest and perhaps most difficult to memorize of all Balinese music. Most have several movements, beginning with a slow, free introduction played on the *trompong*, moving through many long, slow sections and ending in a compressed section in a fast tempo. Associated with the huge *gamelan gong gede* (which has a deep range and timbre), they are commonly played on the standard *gamelan gong* ensembles with the addition of a group of large, hand-held cymbals (*ceng-*

ceng kopyak) that play interlocking rhythms. *Lalambatan* compositions are venerated and old but are also frequently adapted to the flashy *kebyar* style. The cycles are marked by much larger gongs than those of *gumbuh*-derived ensembles. In *gong gede*, instead of the *kempur* there are two large gongs, a male (*lanang*) and a female (*wadon*); often only one gong is used in *gamelan gong*. The cycle may be subdivided by the *kempur* and the *kempli* (equivalent to the *kajar* but larger, with a raised boss).

Indonesia, §II, 1: Bali

(iii) Gamelan ensembles.

Palm leaf manuscripts (*lontar*), bas-reliefs on temples and stone and copper inscriptions from Java and Bali (some dating back to the 10th century) comprise the evidence for historical study. Two *lontar* address the subject of music directly: the Prakempa and Aji Gurnita manuscripts (anonymous, probably 19th-century) discuss *suara* (sound or voice), *pelog* and *slendro* tuning systems and courtly ensembles. Many other *lontar* also contain useful information about gamelan.

Based on this evidence, Balinese scholars group gamelan and repertory according to certain lineages of ensembles that are linked historically and musically. The many diverse ensembles share fundamental elements and have exerted mutual influences upon each other over time, so it is very difficult to date them precisely. Scholars such as I Nyoman Rembang and I Wayan Sinti group Balinese ensembles chronologically into three rough periods: *tua* ('old', considered to be indigenous Balinese), *madya* ('middle', probably from the Kadiri and Gelgel periods, beginning with the emulation of Hindu-Javanese court life in Balinese courts) and *baru* ('new', beginning with the creation of *gong kebyar* in 1915; see Gold, 1998).

Theoretically, there is a progression in function of ensembles in these categories analogous to the *wali*, *babali* and *balih-balihan* categories (see §(i)(c) above). 'Old' ensembles are rare (except for *gender wayang* and *angklung*), highly sacred, and generally associated with priestliness; 'middle' ensembles are revered and ceremonial, associated with courtliness; and 'new' ensembles tend to represent secular culture and accessibility to the general public. The specific time periods, narratives and languages with which the ensembles are associated link them to certain rituals. However, the actual function these ensembles may fulfil in rituals is not fixed but dependent on local preference, availability and the repertory played. For example, *gong gede* is often considered *wali*; *gender wayang* may be played for *babali* or *balih-balihan* activities and *gong kebyar* may play sacred *lalambatan* pieces in the *wali* context.

Instrumentation is one major distinguishing factor: most 'old' ensembles do not include drums, or accord them a colotomic rather than agogic role, whereas in the 'middle' category drums are essential for controlling the ensemble and delineating form; and in the 'new' category, drums have the additional role of featured soloist. *Rebab* and *suling* do not appear in ensembles of the 'old' category, whereas they play prominent roles in some ensembles of the 'middle' category, perhaps indicating Javanese influence. In the 'old' category four sacred ensembles are distinct from other Balinese gamelan due to their materials: *gamelan selonding* is made of iron and *gamelan gambang*, *luang* and *caruk* combine bronze with bamboo

instruments, resulting in a timbral similarity to some Javanese ensembles. These four are linked in other ways (see below) and are distinct from 'middle' and 'new' ensembles that show clear influence from either *gambuh* or *gong gede*, although they share some musical elements and techniques.

(a) Pre-Hindu Balinese instruments.

(b) 'Old' ensembles.

(c) 'Middle' ensembles.

(d) 'New' ensembles.

(e) Bamboo ensembles.

Indonesia, §II, 1(iii): Bali: Gamelan ensembles

(a) Pre-Hindu Balinese instruments.

Nekara, bronze kettledrums from the Dongson culture (4th century bce to 1st century ce) of southern China, spread to what is now Vietnam (Tonkin and Annam) and are considered the precursor to gamelan. Bali possesses one of the most important specimens in the temple, Pura Penataran Sasih (*sasih*, 'moon'), at Pejeng (Intaran) (see [Bronze drum](#)).

There are only two examples of *Gong beri* (*bheri*) gamelan in south Bali: in Renon and Semawang. It accompanies the rare *baris cina* ('Chinese baris') trance ritual. Featuring a flat bossed gong, the origin of the instrument is the subject of several legends. It is associated with China because of the dance and the design of the gong itself, and is considered to be highly charged with spiritual power (Rai, 1998).

Indonesia, §II, 1(iii): Bali: Gamelan ensembles

(b) 'Old' ensembles.

The four sacred ensembles *gambang*, *selunding*, *luang* (also known as *saron*) and *caruk* have some unifying features: they share contextual function and seven-tone tuning; some are associated with Bali Aga ('original Bali') communities (villages that resisted Hindu-Javanese culture, predating the Majapahit period); and their repertory (which is preserved in *lontar*) is linked to vocal melodies of sacred poetry (*kidung*). *Kidung* are no longer performed together with instrumental accompaniment (see §(iv) below), but some scholars have attempted to reunite them.

Gamelan gambang. 60 of these rare ensembles are scattered throughout Bali, with 22 in east Bali. This ensemble is often associated with *pitrayadnya* and *dewayadnya* ceremonies. Depicted in temple reliefs in the East Javanese temple Pura Penataran (1375), it features the Balinese *gambang*, which has 14 bamboo keys that are not arranged in an ascending sequence from low to high, but rather in groups of three and four ascending pitches, and is played with two forked mallets, the tips of which span an octave on each mallet (for illustration, see [Gambang](#), fig.2). The ensemble consists of four *gambang*, each starting on a different pitch, and one or a pair of large, bronze, seven-keyed *saron*, tuned an octave apart and played by a single player; some ensembles have two pairs of *saron*.

Gambang is known for the *saron* rhythm comprising a 5+3 stress pattern or its reverse. The *saron* provides the *pokok* (often *kidung*-derived), and the *gambang* play a complex interlocking figuration called *oncangan*, a term derived from rice-pounding ensembles. The *oncangan* figuration follows the

pokok but is based on an even rhythm. Each tone in the mode has a special *oncangan* form.

The repertory comprises 50 pieces in some areas, composed in one of seven pentatonic or hexatonic *saih*, which are linked to melodies (*taksu*) that accompany the dancing of specific deities and other temple rituals (ex.4).

Gamelan caruk (saron). This extremely rare, small ensemble, found around Karangasem and named after the bamboo-keyed xylophone (*caruk* or *saron*), is played by two musicians. One musician plays the *pokok* in parallel octaves on two bronze, seven-keyed *saron* tuned an octave apart, while the other doubles or plays simple figuration on the *caruk*. In some ways it is a simplified form of *gamelan gambang* and is sometimes

substituted for it in *pitrayadnya* or *dewayadnya* rituals. For the most part the *caruk* repertory is shared with that of *gambang*; however, a few *lontar* of exclusively *caruk* pieces do exist.

Gamelan salunding. There are two forms of *gamelan salunding* (also *salonding*, *salundeng*, *selonding*). One, now extinct, with wooden keys and coconut-shell resonators, is said to have been played by hermits meditating in the forest, whereas the prevalent form of *gamelan salunding* is a sacred ensemble consisting of two to ten iron-keyed, trough-resonated metallophones. The graceful resonance of iron keys, the absence of drums and gongs and the frequent slow-tempo are unlike any other gamelan. They are located in Bali Aga villages such as Tenganan and Trunyan, and in several non-Bali Aga communities, mostly in east Bali. Most *salunding* have their own legend ascribing their creation to a gift from the gods. The gamelan are the abode of the gods during temple ceremonies; in some cases it is forbidden to touch or even to see *gamelan salunding* when not being played for ritual. Most *salunding* have a documented ancient history: the set in Selat (near Besakih), for example, was first mentioned in 1181 in edicts (bronze plaques) in Klungkung.

Two eight-keyed *gangsa*, an octave apart, carry the melody. Figuration is provided by two other metallophones, each played by two musicians. A similar instrument, pitched an octave lower than the lowest *gangsa*, has an inter-punctuating function. Sometimes a *kempul* and very occasionally a pair of *ceng-ceng* are added for punctuation. A fixed repertory of sacred pieces is played only for ritual functions. Some of these, called *gaguron*, may neither be recorded nor even recalled outside performance. Pieces are composed in one of three pentatonic modes. Many of the pieces were taken from the *gambang* and *caruk* repertories. Other pieces exist outside of the *kidung*-related repertory; a few new compositions are sometimes composed at STSI and in Tenganan.

Gamelan luang. This ensemble is associated with *pitrayadnya* ceremonies in most areas, and with *dewayadnya* ceremonies in some. Some scholars believe *luang* to be a source for *gamelan gong gede*: its double-row *bonang* (and other features) resemble some archaic Javanese ensembles. The melodic interlocking figuration played on the *bonang* (also called *trompong*) are called *sekatian*, another possible link with the archaic Javanese *gamelan sekatan*; other similarities include the colotomic function of the *kendang* and the name of one of the modes (*nyura*, *manyura* similar to that of Java).

Luang shares some pieces with the previous three ensembles, but for the most part it has its own repertory. The pieces, known as *tembang*, exist in seven modes known as *jalan* ('ways', 'paths'), but usually only about four are in regular use.

Slendro ensembles: gender wayang. This consists of a pair or quartet of ten-keyed metallophones (see [Gendèr](#)) played with a complex two-handed technique. A *polos-sangsih* pair (doubled at the octave in a quartet), play interlocking figuration in the right hand, set against a slower-moving left-hand melody and resulting in a rapid composite melody and a stratified texture. Sometimes each hand plays a different *kotekan*, resulting in a more active four-part texture; in slow pieces both hands play in parallel

octaves or *empat* (the interval spanning four keys, approximately a 5th) with delicate grace notes and rubato (ex.5). Aesthetically, the ensemble is regarded as an emblem of refinement and complexity. It is considered to be a member of the sacred ensembles category due to age and function. The primary function of this ensemble is in *wayang kulit* (shadow puppet theatre), which plays a central role in ceremonial and secular Balinese life (see §(v)(b)) accompanies the *dalang* (shadow puppet master), who sings and provides dialogue and puppet movement. *Gender wayang* is also used to accompany two forms of dance-drama, *parwa* (Mahabharata stories) and *wayang wong* (Ramayana stories), and is essential in certain rituals where it is played without *wayang* (fig.2).

Pieces used in the shadow play are classified according to their function in the drama: purely instrumental pieces, played as the audience gathers (*pategak*, 'sitting pieces'), an extended multisectional overture (*pamungkah*), pieces for action, mood songs, background mood music, special character pieces, ending music and ritual music. Pieces accompanying action consist of a left-hand ostinato against a right-hand *kotekan*, which is repeated a number of times, followed by a transitional passage leading to a repetition in another pitch area. The standard repertory is based on pieces accompanying *wayang parwa* (stories drawn from the Mahabharata); however, the ensemble is also used to accompany stories such as the Ramayana, in which case the ensemble, called *batel*, is augmented by percussion and gongs shared by the *gambuh* ensemble. The *batel* ensemble also accompanies *wayang wong* ('human' Ramayana-based *wayang*). Pieces from the *wayang parwa* repertory are also used to accompany tooth filing ceremonies and cremation processions, when they are sometimes played on the tower carrying the corpse to the burning grounds at the Death Temple. The *slendro* tuning is said to guide the spirit of the deceased to the land of the deified ancestors. Regional and personal variation are expressed in many styles and versions of the repertory (see Gold, 1998).

Gamelan angklung. This ensemble is named after a bamboo shaken idiophone (*Angklung*) that was formerly part of the ensemble but is now rarely used. It is a delicate ensemble consisting of small, four-key *gangsa*, *reyong* with eight kettles, two *jegogan* and other instruments. Led by two tiny drums, the four-tone, *slendro*-derived tuning and the *kempur* tuned to a pitch outside of the four-tone *slendro* system give *angklung* a unique quality that connotes melancholy sweetness to a Balinese audience. It is often performed during cremation rites and temple and house ceremonies. Due to its small size and affordability, it is probably the most prevalent type of ensemble in Bali and a favourite for beginning and children's gamelan as well as virtuoso professionals. It can also be made portable and played in processions (ex.6).

The repertory includes pieces unique to *angklung* as well as standard repertory adapted from larger *pelog* ensembles, such as *gong kebyar* dance compositions and *lalambatan*. Characteristic of *angklung* are *pangawak*, in which the *gangsa* play a lyrical melodic line in unison without figuration, often with melodic syncopation, expressing the sweet mood associated with this ensemble, followed by *pangecet* with *kotekan*. The complex *kotekan* characteristic of this somewhat restricted tuning is an example of maximum use of minimal materials. As in *gender wayang*, phrases and gong cycles are frequently asymmetrical in length with flexibility of form, unlike structures found in larger ensembles such as *gamelan gong*.

Indonesia, §II, 1(iii): Bali: Gamelan ensembles

(c) 'Middle' ensembles.

Gamelan gambuh. This small ensemble, in which the main melody is carried by four large bamboo *suling* rather than metallophones, forms the basis for the repertory, forms and performance practice of pieces played by most later ensembles. Legends claim that *gamelan gambuh*, played to accompany the *gambuh* dance drama (see §(v) below), was formerly known as *gambelan meladperana* ('cutting to the quick') and was created by the god of love, Semar, and his spouse Ratih to be played in heaven by divine beings. This ensemble inspired the creation of others, each related to one of the gods of the four quarters: *semar haturu* or *pagulingan* (the god of love sleeping); *semar patangian* (the god of love rising), now known as *palegongan*; *semar palungguhan* (the god of love seated), now known as *pajogedan*; and *semar pandirian* (the god of love standing), now known as *barong*. These ensembles have come to represent courtly refinement, glorifying Bali's Hindu-Javanese heritage and the customs and practices of the Balinese courts of the Gelgel period. The *gambuh* drumming patterns, musical forms and *pokok* are carried over in these four ensembles. *Gambuh* has been revived relatively recently, although interest in it is still marginal and esoteric.

Gambuh compositions are broadly classified into pure music compositions (*pategak*) and pieces that accompany the *gambuh* dance-drama (*pangiring tari*). The repertory is further classified by mode (*tekep* or *patut*) and form, corresponding to specific characters and situations. *Gambuh suling* are end-blown flutes, approximately 90 cm in length with a diameter of about 4.5 cm, which require a circular breathing technique resulting in a continuous sound. There are usually four *suling*, tuned in pairs of *pangumbang* and *pangisep*, each with six fingerholes. The pitches, which span a range of about two-and-a-half octaves, vary in timbre depending on the register. An elaboration of the *suling* melody is played on the *rebab* (see Table 2 above for full instrumentation).

Gamelan semar pagulingan. The name of this ensemble (Semar, the god of love sleeping) refers to its original performance context: adjacent to the bedchamber of the nobility and played during love-making. The oldest form of this ensemble, in the seven-tone *pelog* (*saih pitu*) tuning, was almost extinct during McPhee's time in the 1930s and has since been revived, but it is still rare. Later *semar pagulingan* are pentatonic. Much of the seven-tone *semar pagulingan* repertory, colotomic structures and *kendang*

patterns is adapted directly from *gambuh*, although the intervallic and modal systems vary from those of *gambuh*, the gamelan is tuned around a minor 7th above *gambuh*, and there are many pieces unique to *semar pagulingan*. Four modes are generally known, although most *semar pagulingan* pieces are in *tembung* and *selisir* modes.

The melodic leader of the ensemble is the row of tuned horizontal gongs (*trompong*), played in a delicate, somewhat improvised manner. Other instruments include single-octave *gangsa* (metallophones), of which there may be three sizes, ornamenting the slower-moving *pokok*. In certain modes melodies played on the *trompong* exceed the single-octave range of the *gangsa*, resulting in octave displacement; when *semar pagulingan* pieces are adapted for ensembles that have *gangsa* with double-octave ranges (e.g. *gong kebyar*) this octave displacement is often preserved to maintain the character of the original piece. The drums are slightly larger than those used in *gambuh*. The lyrical melodic instruments, *suling* (smaller in size) and *rebab*, remain important in this ensemble (see Table 2 for complete ensemble).

Gamelan palegongan, bebarongan and calonarang. Believed to have developed around the 18th century, the ensemble accompanying the highly popular dance-drama forms *legong, barong* and *calonarang* (see §(v) below) is derived from *semar pagulingan*. These genres all share the ensemble type, and their name denotes the repertory (e.g. the *legong* repertory is played on the *gamelan palegongan* (fig.3)). As it is tuned to a pentatonic *selisir* or *tembung*, pieces from the *gambuh* and *semar pagulingan* repertory must be adapted. The *trompong* is replaced by two 13-key *gender rambat*, on which the leading melody is played, and doubled on two *gender barangan* tuned one octave higher. The delicate sound of the *gender* with its two-handed playing technique (here mostly playing in parallel octaves with much use of grace-note passing tones, rather than with a contrapuntal technique) and mallets with disc-shaped ends (as in *gender wayang*) make this ensemble even lighter-sounding than *semar pagulingan*. The pieces are multi-sectional, with lively, contrasting tempos and gong-cycle lengths ranging from two beat forms to long, slow *pangawak* with lyrical and complex melodies played on the *gender*. *Gangsa polos* and *sangsih* play patterns anticipating and surrounding the *pokok* pitches. *Angsel* are incorporated into the compositions to articulate the dance movements and mark transitions.

Gamelan palegongan was a favourite of the renowned composer [I Wayan Lotring](#), who composed many innovative pieces for this ensemble during the 1930s that are still popular.

Gamelan gong gede ('great gong'). This rare, stately ensemble is closely connected with the temples and old court ceremonies and is thought to have developed around the same time as *gambuh* (see [Gamelan](#), fig.5). The instruments are enormous, with thick, bronze-keyed metallophones, gong-chimes, *ceng-ceng kopyak* and huge drums played with mallets (see Table 2 above). The number of musicians required can reach 50. The *gangsa jongkok* and two pairs of *penyacah* play a slow-moving melody and are struck with large mallets, giving the music a weighty presence. Smaller versions of *gong gede* were made for village use by the late 19th century,

later developing into the *gong kebyar* ensemble. This interim form of gamelan is known as *gamelan gong*, a term that can also be used to refer to the standard *gamelan gong kebyar* present in many villages.

Indonesia, §II, 1(iii): Bali: Gamelan ensembles

(d) 'New' ensembles.

Gamelan gaguntangan and gamelan paarjaan. From about 1915 to the 1940s, the *arja* dance-drama (often known as 'Balinese opera') was accompanied by a small chamber ensemble known as *gamelan gaguntangan*. This ensemble, consisting of flutes, various percussion and two bamboo-zithers (*guntang*) borrowed some of its drum patterns and form structures from *gambuh*, with the melodies remaining distinct. The current *arja* ensemble, consisting of seven to twelve instruments (see Table 2), is similar to that of *gambuh*, with the addition of the *guntang* that play primary and secondary punctuation. The large *suling gambuh* were used in the 1920s, but smaller *suling* are now used. There are two sizes of four to seven differently-tuned *suling* that are adaptable to match the singer's vocal range, in *slendro* and *pelog*.

Gamelan gong kebyar. This 20th-century ensemble and musical style developed in north Bali around 1915, when the need arose for instruments that would accommodate virtuoso *kotekan* at newly increased tempi, with dynamic contrasts and an extended four-octave range (five including the gong). *Gong kebyar* remains the most popular and ubiquitous ensemble in Bali. Many earlier ensembles were melted down to create *gong kebyar* with two-octave *gangsra* to allow for extension of single-octave melodies. The instruments are smaller than those of *gong gede*, allowing for agility of movement, but much larger than those of *semar pagulingan* and *palegongan*, with a louder, stronger timbre. The *kebyar* drumming style uses large drums played with the hands in rapid, intricate interlocking. The overall timbre of the strokes is less melodic and more percussive than those of *gambuh* and *palegongan*. The drums are the most dominant in *gong kebyar*: often a section of the piece features the two drummers (with the *ceng-ceng*) displaying their virtuosity. The *Reyong* features four musicians playing tightly-coordinated interlocking patterns. Several *reyong* techniques are used: all four players may play a chord of eight pitches on the bosses, a texture and pitch combination that stands apart from most other ensembles (ex.7); they may strike the rim of the kettles in percussive unison with the *ceng-ceng* and drums, or they play melodically on the bosses, employing a number of *kotekan* techniques.

The ensemble is named after the *kebyar* (lit. 'explosive') sections of pieces in which all instruments play sudden rhythmic and melodic flourishes in unison that are not tied to a steady beat, covering a wide melodic and dynamic range. Rather than playing in constant stratification, as in the earlier ensembles, different instrument groups play antiphonally at certain

points in interlocking or *kebyar* segments. Prior to *kebyar*, individual composers were not generally acknowledged, but certain *kebyar* composers have become known for their pieces and are invited to teach throughout the island. Most *kebyar* compositions draw from pre-existing forms and techniques for material, reinterpreting it in a new context. Sections played by the entire ensemble in stratification with a steady pulse and gong cycle may resemble musical elements of other forms, drawing on *semar pagulingan*, *palegongan*, *lalambatan* and theatre music for forms and figuration. Specific *kebyar* forms known as *kreasi baru* ('new creations') have also developed, marked by three sizes of gongs (*gong*, *kempur*, *klentong*). Many pieces depart from the traditional norms of other ensembles in using asymmetrical gong structures, highly syncopated *pokok* and innovative *kotekan* patterns. Compositional devices imported from other ensembles become known by the ensembles with which they are usually associated, such as *gegenderan* (when the *gangsa* section plays a lyrical melody together in imitation of *gender*) or *leluangan* (*reyong* style that imitates the *bonang* rhythms of *gamelan luang*). A new category of contemporary compositions (*komposisi baru* or *kontemporer*), mostly created at the government arts institutions, experiment with techniques and materials, breaking the conventions of *kebyar*.

Balaganjur, the marching gamelan (also called *bebonangan* because the *reyong* kettles resemble *bonang* kettles), is often associated with the demons of the earth (fig.4). The ensemble consists of instruments taken from the *gamelan gong* and made portable for processions. These include *reyong*, *ceng-ceng kopyak*, drums played with mallets and hanging colotomic and time-keeping gongs. Requiring a high level of interlocking skill, *reyong* kettles are removed from the rack and held and played individually by members of the procession, producing a complex hocket of four or more pitches (fig.5). This texture is offset by the clashing cymbal group, also playing interlocking parts; both groups play antiphonally as well as together. There are a variety of forms used for distinct situations. *Balaganjur* is used for cremation and other processions to instil enthusiasm in the crowd and for exorcism; contemporary ensembles have developed *balaganjur* to a competitive virtuoso form.

Indonesia, §II, 1(iii): Bali: Gamelan ensembles

(e) Bamboo ensembles.

The abundance of bamboo growing throughout Bali results in a wide variety of bamboo ensembles comprised of flutes (*gong suling*), tuned bamboo stamping tubes played by female musicians and derived from rice-pounding (*Lesung*), bamboo jews harps (*genggong*) and a variety of ensembles consisting of bamboo xylophones. Other than the sacred bamboo ensembles from the 'old' historical category, most bamboo ensembles developed from the 'middle' category in the 20th century. The keys of these xylophones are either flat slabs of bamboo suspended or laid over a trough resonator (e.g. *gamelan gandrung*) or bamboo tubes split lengthwise over half their length and suspended over resonators (e.g. *grantang*, *rindik* and *tingklik* of *joged bumbung* and the xylophones of *gamelan jegog* of west Bali). They may be tuned to *slendro*- or *pelog*-derived tunings. Historically, the oldest bamboo ensemble is considered to be *gamelan gambang* (see §(b) above). Secular ensembles also exist,

such as *gamelan gandrungan* (accompanying the male *gandrung* dance) or *joged pingitan* (accompanying its female counterpart), both involving the transfer of *gamelan palegongan* repertory to bamboo, some time after the inception of *legong* (see below).

Gamelan pajogedan. Also referred to as *joged bumbung* (bamboo dance), this ensemble of bamboo xylophones (*rindik*) is modelled after *palegongan* and accompanies a social dance form based on *legong* dance movements, one of the few forms of social dancing between a man and a woman. It is popular, affordable and abundant in Balinese villages. The *joged* (dancer), a teenage girl or young woman, of which there are usually several in a troupe, performs some dance excerpts and is then spontaneously joined by a succession of male audience members, either chosen by the dancer or volunteering, who engage in flirtatious dance surrounded by cheering crowds.

Consisting of approximately 12 players, the timbre of this small bamboo ensemble is light and delicate. Because the bamboo sound is not prolonged as in bronze ensembles, damping is not necessary, and in order to sustain the pitch, staccato repeated notes and rapid figuration are required. The leading *gender* part is played on two large *rindik*, and ornamentation is provided by smaller *rindik* tuned an octave higher. The equivalent to the *kempur* is played on a *kempur pulu* (or *kempur komodong*), two thick bamboo slabs suspended over earthen jars and tuned slightly apart, simulating the beating effect of a gong.

Tingklik. Most often played alone or in pairs, this bamboo-keyed instrument is purely for personal entertainment. Similar to *gender wayang* in employing a two-handed, sometimes contrapuntal technique, the lack of required damping makes this instrument far more accessible than *gender wayang* because the technique is easier and the compositions simpler. Most *tingklik* are tuned to *slendro* (*saih gender*) and played with mallets with long sticks and rubber-tipped ends. This instrument is easy to construct with readily available materials and is extremely prevalent throughout Bali.

Gamelan jegog. Found only in west Bali, where bamboo grows to an enormous size, each xylophone in this ensemble is made up of eight tubes that may reach three metres in length with a circumference of 60–65 cm; it is struck with mallets and has a powerful, earth-shaking sound (fig.6). It is tuned to a rare four-tone tuning that may be *pelog*-derived. Often more than one *jegog* ensemble play in competition with one another, first alternating and then finally playing together.

Many folk ensembles also exist, including interlocking blown reeds, vocalized gamelan (*cekeprung* or *genjek*) and wooden cow-bell ensembles (*tektekan*). *Kendang mabarung*, restricted to west Bali, includes two huge drums and four-tone *pelog*-derived *angklung*.

Many innovative ensembles develop from pre-existing ones, such as the musical accompaniment to the popular form of *wayang tantri*, which includes a *pelog gender* quartet and draws on a number of sources. Some of the foremost innovative ensembles becoming widely accepted are *gamelan genta pinara pitu* (similar to a two-octave, seven-tone *semar*

pagulingan), *gamelan semara dahana* and *manikasanti* (see §(ii)(a) above), *gamelan mandolin* (a Chinese-influenced string ensemble), and *adi mredangga* (like an expanded *balaganjur* processional gamelan with 10 to 12 pairs of drums in several sizes, 20 to 30 sets of *ceng-ceng kopyak* and featuring dancing during the procession). Some of the experimental forms are only accepted in esoteric circles; others become incorporated into Balinese traditional performance contexts, where they are performed alongside centuries-old traditions.

Indonesia, §II, 1: Bali

(iv) Vocal genres.

These range from austere sacred chant to highly melismatic, popular Balinese operatic songs. There is a hierarchy of five main, context-specific vocal categories with distinct poetic forms, revered according to age, text and function.

Sloka in Sanskrit is the oldest chant form in Bali. Restricted to Brahman priests, it is a highly esoteric vocalization of Hindu-Buddhist philosophical-cosmological principles employing five magic syllables with corresponding vocables in very restricted melodies.

Kakawin (*wirama*), sung in Kawi (Old Javanese), is based on *sekar ageng* ('large form') poetic metres. Preserved in *lontar* dating from 9th–10th-century Java, the texts are long, often Indian-derived narratives such as the Ramayana, books of Parwa (Mahabharata), and Tantri. Some *kakawin* were composed in Bali. In reading clubs (*pepaosan*) and during *odalan* and rites of passage the esoteric language is paraphrased line by line into vernacular Balinese. *Kakawin* encompass a 3 to 4 pitch system with a specified number of syllables per line.

Kidung texts and melodies, composed in Javanese metres (*sekar madya*, 'middle form') and considered to be indigenous rather than Indian-derived, are preserved in *lontar* believed to date from the 16th–17th centuries. Their poetic content is restricted to romantic or historical tales that evoke the last of the East Javanese Hindu-Buddhist kingdoms or mystical or erotic topics, set to a specified syllabic length and vowel sound at phrase endings. The *lontar* frequently contain musical pitch-notation (*grantangan*) alongside the text, leading scholars to believe that at one time certain ensembles and a *kidung* singer performed together. *Kidung* are usually sung in ritual situations; whole texts are rarely known: instead, people use memorized excerpts from selected poems for ritual purposes. The three most commonly sung are Malat (tales of the Javanese hero, Prince Panji), Wargasari (a mystical journey) and Tantri (didactic tales). Text setting in *kidung* often obscures the meaning, as words are broken up and embellished in three or four syllabic melodic fragments relatively unrelated to the syntax of the text (ex.8).

Tembang macapat and *geguritan* (*sekar alit*, 'small form') are both sung in theatrical forms and are the only forms still being created in Bali. Both are accompanied by instruments that accommodate the tuning of the voice (*suling* and *rebab*) and contain through-composed, conjunct melodic stanzas in which the melody is congruent with the text. *Tembang macapat* are sung in the popular *arja* dance-drama (§(v) below); the melodies are highly ornamented and the vocal timbre unique to *arja*.

Sekar raré (*raré*, 'baby') or *lagu rakyat* ('popular song'), similar to the Javanese *dolanan*, is a form of folksong often sung by youth groups or workers for entertainment.

Indonesia, §II, 1: Bali

(v) Dance and theatre.

Dance, theatre and music are linked and classified according to specific historical time periods, genre, ensemble and context. Dances range from highly sacred (such as the female offering dance, *rejang*) to secular (e.g. *sendratari*). In general there has been a tendency to adapt highly sacred dances for more secular contexts such as tourist performances; examples of these are *kecak*, *legong*, *baris* and *topeng* (for details of accompanying ensembles, see §(iii) above).

Character types are broadly defined by dance movements, vocal production, costume, headdress, physical body type and musical accompaniment. Refined characters have small, fluid movements, high, thin voices and smaller bodies and narrower eyes, while coarse character types have broad, swift, direct and sudden movements, lower voices, larger bodies and wider eyes. Further distinction involves whether or not the character speaks, and the language spoken. In *topeng* (masked dance), the refined characters wear a full mask and do not speak, whereas the comic servants wear half-masks and speak (figs.7 and 8); in *wayang*, nobility speak or sing in Kawi (Old Javanese) and coarse servants paraphrase and translate into the local vernacular Balinese.

Characterization is portrayed musically: in general, pieces that accompany refined characters have longer gong cycles, slower tempos and are higher in pitch. The dramatic situation is also a consideration: shorter cycles accompany agitated, active scenes.

Individual dances are classified according to one of three types: *alus* (refined), *keras* (strong) and *beban-ci* (androgynous) for both male and female dance styles; however, within a single dance there are usually sections of all three types.

The vocabulary of dance movements is highly stylized and codified to suit character types. Important movements include *agem*, the basic stance that

defines character, *mungkah lawang*, opening of the curtain, and *seledet*, a quick eye movement from side to side, synchronized with gongs. Hand gestures (*mudra*) are used, perhaps a retention from Indian dance, but with no particular meaning.

The *gambuh* dance-drama genre enacts the Panji Malat text, written in Kawi and dealing with the adventures of the Javanese hero, Prince Panji. Slower and more fluid than later forms of Balinese dance, the dance style and the Kawi poetry (sung and declaimed in stylized speech) illustrate links between Javanese and Balinese kingdoms before and during the Majapahit period. *Gambuh* includes the prototypes for many forms of Balinese dance, such as the female attendant to the princess (*condong*), who plays a prominent role in *legong* and *arja*.

Legong is a dance performed by three pre-pubescent girls enacting stories reflecting Bali's ties to its Hindu-Javanese past (fig.9). It developed from the sacred trance dance *sanghyang*, of which there are many versions performed for ritual purposes only. Of the many *legong* stories (each with its own musical accompaniment) the most common is *legong kraton*, believed to have been first performed around the turn of the 19th century; it enacts the Lasem story, related to the Panji cycle depicted in *gambuh*. The performance opens with the *condong* character performing a non-narrative dance before she is joined by the two *legong*: the three then enact the story along with a singer-narrator (*juru tandak*). The dance movements are based on *gambuh* but are faster, lighter and with more contrasts. *Legong* is so popular that most tourist performances are called 'legong dance' whether or not *legong* is actually performed. A complete performance can include many sections and last over an hour, but it is usually shortened.

The *barong* is a sacred ritual dance enacting the ever-changing balance between divine and demonic forces. Two dancers animate an elaborate costume of a *barong*, a mythological creature with a mask (of which there are many varieties, such as a wild boar, tiger or cow). The most prevalent is the *barong ket* (*keket*), with a mask with large round eyes and fangs that is held by the dancer in the front part of the costume. The entire creature is about 2.5 metres in length and is covered with long, shaggy hair made of palm fibres; it may have derived from the Chinese lion dance, which developed during the Tang dynasty (7th–10th centuries). The *barong* is the protector of the Balinese village, and a special repertory of pieces is played to accompany its dances. In another context, the *barong* enters into the *calonarang* dance-drama, which enacts the story of Rangda the witch, personification of demonic forces. The masks are highly sacred and possess magical powers; trance frequently occurs, and these dances are often used for exorcism purposes.

Another form influenced by *gambuh* is the *arja* dance-drama, often referred to as 'Balinese opera' because the characters sing and dance throughout the performance. Its inception may have been instigated by a collaboration of the royal *gambuh* dancers of the kingdoms of Gianyar and Badung in 1825 for a performance at a royal cremation ceremony in Klungkung. The dancers then sang in Kawi, and the dance movements were based on those of *gambuh*. A later development of *arja* was created around the turn of the 20th century as a village form, as the artistic centres shifted from the

courts to the villages. This early form of *arja* consisted primarily of sung melodies without instrumental accompaniment; it was performed by males only and had very little *gambuh* influence.

Female performers were added in the 1920s, and around the 1940s–60s the dance-drama developed into its present form of *arja gede* ('grand *arja*'). Performances became quite elaborate and would sometimes last all night. As the *sendratari* dance-drama form rose in popularity *arja* became less popular, but it is still held in high esteem by professional performers and literati. Because of the use of Balinese language, it is more accessible to the general population than *gambuh*. Since its inception, special 'all-star' *arja* troupes known as *bon arja* (*bon*, 'invited') have been assembled by collecting the finest performers from various areas of Bali. There are also village *arja* troupes (*sebunan*). The performance context is primarily one of secular entertainment. Until 1965 *arja* was performed on a *kalangan* traditional stage area, but by the 1970s the primary performance space became the proscenium stage.

There are usually four to six noble characters and six male and female servants. The structure roughly follows that of *gambuh* but without *juru tandak*, allowing for individual improvisation in response to the audience. Like *gambuh*, *arja* stories are based on the Panji Malat texts, but the vocal forms sung by soloists (*tembang macapat* or *pupuh*), though based on Javanese songs and metres adopted between the 14th and 16th centuries, are newly composed and in Balinese. There are 13 song-types, seven most frequently used. The singing style of *arja* is highly developed, employing ornamentation techniques such as tremolos and melismas (*geregel*), slides (*iluk-ilukan*) and *pamero* pitches (ex.9). The singer improvises upon a set skeletal melody. Other vocal forms such as *kakawin* are sung by noble characters as a symbol of formality and dignity; folksongs and contemporary Indonesian popular songs are sung by servants and coarse type principals. Moods and feelings are also expressed by scale (both *slendro* and *pelog* are used) and melody.

The *kebyar* dance form allowed for dance compositions independent from narrative content. Pieces such as *Teruna Jaya* were created, depicting the contrasting moods of a youth, based on the *legong* dance and containing elements of strong male, androgynous and female styles. In an early *kebyar* dance created by I Mario, the dancer remains seated throughout (*Kebyar Duduk*); this became a standard segment of *kebyar* dance choreographies. His later creation *Kebyar Trompong*, based on *Kebyar Duduk*, involved the dancer also playing a *trompong* solo.

The sacred *baris gede* dance is a martial processional dance that has been transformed into a solo, secular dance performed by boys, which contains the basis for most male dance forms such as the masked dance form, *topeng*. In the ceremonial form (*topeng pajegan*) a single male dancer enacts all parts of a story, changing masks behind a curtain. *Topeng* involving several actors is also performed. The drama is preceded by character (non-narrative) dances: *topeng-keras*, depicting a strong character type, *topeng tua*, depicting an old man, and *topeng dalem*, a refined king. *Topeng* stories are Balinese historical chronicles (*babad*).

Kecak, known as the 'monkey chant', was created in the early part of the 20th century and is now a popular form of entertainment for Balinese and tourists. The Indian-derived Ramayana epic is enacted by a group of men representing monkey armies and a few male and female principal dancers. Seated in a circle, the monkey army provides a vocalized form of gamelan by chanting the syllable 'cak' (chak) in interlocking parts over a sung melodic line. Similar to *legong*, *kecak* draws on elements of the *sanghyang* ritual (fig.11)

Indonesia, §II, 1: Bali

(vi) Wayang kulit.

The shadow puppet theatre of Bali (*wayang kulit*) plays a central role in ceremonial and secular Balinese life. It incorporates vocal and instrumental music with sung poetry, artful puppet carving and manipulation and dance movements, and portrays the many narrative traditions at the core of the Balinese worldview. Performance contexts range from highly sacred *wayang lemah* (daytime ceremonial *wayang* in which no puppet screen or lamp is used, and the puppets rest against a line of sacred cotton threads suspended between two sacred saplings) to pure entertainment held in conjunction with *odala* or life-cycle rites. The most frequently performed stories are taken from the Mahabharata (known as *wayang parwa*) and Ramayana.

The shadow master (*dalang*) is both a spiritual practitioner and storyteller and a major repository of knowledge of all sorts, as well as being a highly trained musician and singer. Most *dalang* are men, but there are now some women *dalang* (fig.10). The *dalang* is accompanied by a quartet (sometimes a duo) of *gender wayang* musicians (see §(iii)(b) above), who draw from a body of dramatic and ritual repertory.

The *dalang* sits before a cloth screen illuminated by a coconut-oil lamp. The puppets are intricately carved from hide to cast shadows on the screen. The *dalang* narrates and supplies all character voices covering a wide range of timbres and registers. As in dance, characterization includes *alus* (refined) and *keras* (strong) characters, expressed by vocal production, movement, iconography and eye shape. Coarse characters have larger eyes, deeper voices, a more raspy timbre and large, jerky movements, while refined characters have narrow eyes, high melodious voices and smooth, small and curvy movements. Noble characters speak only in Kawi (Old Javanese), and two pairs of comic servants, one on the right side of the *dalang* (generally the kingdom of the good characters) and one on the left (generally evil), translate all dialogue into the vocal vernacular Balinese that the audience can understand. These four comic servants (the *punakawan* or *panasar*) are the only indigenous Balinese characters not from the original Indian epics and act as mouthpiece of the *dalang* (for a detailed study of *wayang*, see Gold, 1998).

Although Mahabharata and Ramayana stories are the most typical, there are many innovative forms of *wayang* that draw on other narratives and musical accompaniment from dance-drama counterparts. These include *wayang gambuh* (Panji tales, accompanied by *gamelan gambuh*), *wayang Calonarang* (stories of Rangda and Barong accompanied by *semar pagulingan* or *gamelan batel*), *wayang Cupak* (indigenous Cupak tales, accompanied by *batel*), *wayang arja* (Panji tales, developed in 1976 by I Made Sija of Bona, accompanied by *gamelan arja* or various experimental ensembles), and *wayang Sasak* (Islamic tales performed by the Sasak population and accompanied by a *suling* ensemble similar to *gambuh*). There are two rare but important dance-drama forms based on *wayang*: *wayang wong* ('human puppets', featuring Ramayana stories, accompanied by *batel*) and *parwa* (also danced by humans, featuring Mahabharata stories and *gender wayang* quartet or *batel*).

Many contemporary experimental works reflect the interest in reaffirming traditional Balinese culture and village life in the face of a quickly changing Bali. Drawing on sacred vocal chant, everyday village sounds, modern and ancient themes exploring Indian and Balinese heritage, as well as elements of Western music and dance, these multimedia productions reflect a new self-consciousness of the arts, which co-exists with a thriving traditional performing arts culture well integrated into Balinese culture.

2. Lombok.

This small island is situated east of Bali and west of Sumbawa in the Indonesian archipelago. Its area is about 5435 km² and its population almost two million. The north of the island rises to the elevation of 3726 metres and has a narrow and humid coast, while the central belt (where most of the population lives) consists of fertile lowlands that are fairly dry but permit rice cultivation. The south is hilly, arid and almost uninhabited.

The majority of the population are Sasak, with a Balinese minority. The Boda and the Sasak Wetu Telu have maintained older ways of life, living

far from the lines of communication on the northern coast, in the mountains and in the southern hills. But even in the most inaccessible places their culture shows traces of contact with the neighbouring islands and the Balinese minority.

Judging from the close relationship between the Sasak language and western Sumbawanese, it is probable that contact between the two areas existed until the end of the first millennium ce. During the centuries of Hindu-Javanese domination in the archipelago, Lombok came in contact with the Javanese courts. In the 16th century, the Gelgel dynasty of Bali exerted political and cultural influence, the western part of Lombok receiving the surplus of overpopulated Bali. From the 17th century onwards, the Balinese and the Islamic rulers of Mataram (Java) and Makasar (Sulawesi) battled for influence. In the 18th century the *rajas* of Karangasem in east Bali subjugated the local rulers and set up court in Cakra Negara, which flourished until the late 19th century, supporting an important library and various gamelan ensembles. In 1894 the Dutch government took over, resulting in the mass suicide of the Balinese court, after which the musical tradition of the Balinese in Lombok continued only in the villages. Family contacts brought Sasak servants to Bali, where they now form a minority in the district of Karangasem. In the late 19th century, orthodox Islam (hostile to non-Islamic ceremonies) began to spread on the island, its followers calling themselves the Waktu Lima; the religious and political power of its followers has gradually increased.

Up to the end of World War II only two short articles (Goris, 1936, and Soedijono and Hooykaas, 1941) and two recordings by the Beka company (1928) were produced. Other information is scattered in publications by geographers, biologists and scholars of literature. In 1972 a team of Indonesian and Western musicologists undertook a survey tour and documented every major musical genre of the island (Seebass and others, 1976); this has been followed by research of a more monographic character in selected locations (Harnish, Shimeda and Suwondo).

(i) Music of the Sasak.

At the core of Sasak instrumental music is a small ensemble consisting of a pair of large cylindrical drums played with sticks (*kendang beleq*), a number of large pairs of bronze cymbals (*ceng-ceng* and *jamprang*, with a diameter of 30 cm), two pairs of gong kettles sitting on a small rack (*réong*, also *klenteng*, *klenong* and *barong setengkok*), a small flat hanging gong (*oncer*) and a larger gong; if the occasion requires it, a small flute is added. The large drums and the small flat gong are unique to Lombok and give the ensemble its name, *kendang beleq* or *oncer*. This ensemble is basic to a number of rituals involving dance. Processional use occurs during wedding rituals, feasts at shrines and temples when sacred cloths are woven, and in connection with official receptions or warfare. *Oncer* is also used in theatrical performances and in the 1930s was observed in connection with healing ceremonies. The melodic role is secondary; sound and cyclical process are dominated by pulse and syncopated rhythms on the one hand and the dense texture of *réongan* on the other. The size of the ensemble varies from place to place. In the decades after the dissolution of Balinese rule many gamelan instruments found their way to Sasak villages. This led

to new combinations of instruments and the development of hybrids, which sometimes resulted in new musical genres. A derivative of *oncer* is a larger ensemble called *tawaq tawaq*. This ensemble is led by two barrel drums; the number of *reong* and cymbals is increased, and the top part of each pair of cymbals is mounted on a lance decorated with a small banner. A unique feature that, again, gives the ensemble its name, is a medium-sized hanging gong with an extremely large rim, called *tawaq tawaq*. The occasions for performance are the same as for *oncer*.

The *tawaq tawaq* ensemble is related to the *rebana* ensemble; here the gong kettles are replaced by tuned frame drums (*rebana*) played with a small stick, and large cylindrical drums replace the suspended gongs; the cymbals are reduced to one small *kecek* (placed on a rack). The *rebana* ensemble is favoured by the Waktu Lima. The idea of using tuned drums for playing interlocking patterns is an acculturation from orthodox Muslims in North Sumatra, but the structural organization of the ensemble is the same as *tawaq tawaq* and *oncer*; *tawaq tawaq* and *rebana* also share a repertory of tunes.

A traditional instrumental genre in which melody plays a prominent part is *kamput* (or *preret*). A *preret* (double-reed aerophone) and a *suling* (duct flute) play together the melody that is repeated, a *jedur* (frame drum) and cymbals provide the pulse and the *kendang*, the rhythmical ornamentation.

In addition to these older, widely distributed Sasak ensembles and genres, there are also newer traditions. The *kelenang* ensemble performs the Balinese *gong kebyar* repertory but consists of several *gong kemodong*, metallophones with two iron keys of slightly different pitches, which are suspended over wooden soundboxes and struck with a soft beater. A remote Sasak village in the south-east mixes some gamelan instruments (possibly from the *semar pagulingan* ensemble) with Sasak instruments and vocals; a similar change and reduction of a (formerly Balinese) *gong gede* ensemble has been found in Sembalun.

Research into the island's vocal music has not yet been undertaken. The Balinese communities cultivated the genres they had brought from Bali, but the vocal music of the Sasak is a more complicated matter. There exists a body of Sasak literature written on *lontar* (palm-leaf manuscripts) and belonging to the category of *geguritan* (*tembang macapat*); but *pantun* (the ubiquitous Malay quatrain) and other metres are also known. The Sasak use *geguritan* in two ways: as solo performance for ritual purposes and in *cepung* (*cekeprung*), a sophisticated male entertainment that takes place when gathering over a gourd full of palm wine in the evening and reading the 'Monyeh' story; the performance requires a *lontar* reader and a translator. The two are joined by an instrumentalist with a large, long flute and occasionally by a *rebab* player and a chorus of singers. Reading and translating alternate with sections in which the chorus sings gamelan pieces, imitating a number of instruments and simultaneously performing a sitting dance. *Cepung* is also known in east Bali and could have its roots in the same ritual practice as the Balinese *kecak*, i.e. *sanghyang*. The research team of 1972 (Seebass and others, 1976) witnessed a performance in a village where the topic of the two singers was a complaint against the government for neglecting their remote and arid area and not

providing them with much-needed wells. This genre, as well as solo and choral singing, belongs to the non-literary vocal traditions of *tandak* and *lawas* (see Seebass and others, p.50).

The vocal genre *gilokaq* (*gicilokaq*) shows the influence of overseas contacts with the Bugis, Makasarese and, more generally, Malay traders and seafarers. *Pantun* are the textual base, sung by a lead singer and followers to the accompaniment of indigenous guitars (*gambus*, *penting* or *mandulin*), indigenous violins, *rebana* (or *jedur*), *kecek* (or *copeq*) and *kendang*. This ensemble, together with the *rebana* ensemble, is used to accompany *rudat* dance and performs as well on national holidays. The occasion and the use of Indonesian texts reflect the influence of the pan-Indonesian movement.

Due to the strong presence of the electronic media and Islamic doctrine, casual music-making is on the verge of disappearing, except where tourism has created a new demand. Traces of it are found in the xylophone music, *serdong* and *grantang*, in group rice-pounding with interlocking patterns, the playing of the rice straw (*gendola*) and of two types of jew's harp made from palm rib and sounded by pulling (*genggong*) or plucking (*selober*). Under the influence of tourism and through the cultivation of a pan-Indonesian type of formalized performance, *genggong* is not only played in the traditional manner (by pairing two instruments) but also in orchestral formations with the addition of small *suling* (flute), *guntang* (a percussive, one-string tube zither) and *kecek*.

The musical practices of the Waktu Lima and the Wetu Telu cannot be completely separated from each other. The extent of musical activity in a village depends on the attitudes of local religious authority and on the demand of cultural presentations of music and dance for tourists. Because it was never tied to pre-Islamic rituals, *rebana* is the most accepted ensemble among the orthodox; *wayang* performances with appropriate plots are also permitted.

(ii) Music of the Balinese.

Until the destruction of the Balinese court in Cakra Negara, a number of gamelan in *pelog* tuning probably existed in Lombok. Most of these seem to have been broken up and their instruments sold or otherwise dispersed. Some of them have been incorporated in Sasak ensembles of small size in remote places such as Sembalun (a '*gamelan gong gede*' consisting of five instruments and used for masked dancing), or Rembitan (a *gandrung* ensemble with singers, gongs, cymbals, flutes, *preret*, metallophones and drums) and Baru (a *jurujeng* ensemble, with similar instruments to the *gandrung* ensemble, for a traditional temple festival of the Boda). As in Bali, the traditional Balinese society in Lombok has a well-defined set of musical genres tied to the various rituals. For temple festivals, rites of passage, funerals, dance-drama, courtly entertainment and warfare the most important ensemble was the *gamelan gong gede*. In its processional version it contained a few pairs of *réong*, several pairs of large *ceng-ceng*, hanging gongs in various sizes and a pair of large *kendang* played with sticks. When played in situ the gamelan was completed by metallophones (*jongkok*), in pairs and four sizes, one or two *trompong* (gong-chime) and a pair of *jegog* (large metallophones with tube resonators). A colonial survey

of the crafts in Indonesia, published in 1931, mentions the existence of gong smiths, and this finding has been corroborated in recent times.

Whereas on Bali the spread of *kebyar* ('to burst open') style took place in the 1920s and 30s, its spread was less accelerated among the Balinese in Lombok. Although they added a number of *gangsa* (*gantung*, metallophones) and *rincik* (cymbals) to the gamelan for occasional *kebyar* entertainment, this was not done at the expense of melting down old instruments. Still, when changing musical styles, instruments are switched instead of mixing old types with newer ones, as in Bali. *Kebyar* style has also entered the Sasak repertory in the *kelenang* ensemble.

The use of *gender wayang* for the performance of shadow play has also been documented. So far no data have been collected in Lombok on the types of vocal music current in Bali, nor is anything known about the existence in Lombok of the heptatonic ritual instrumental genres of Bali. Evidence of their use in the 19th century is provided by the *lontar Pupuh gending gambang*, which survives in the Kirtya Library in Singaraja (Bali). The manuscript contains 14 pieces with *kidung* (middle-Balinese vocal genre) texts to be sung with the accompaniment of *gamelan gambang* (ensemble featuring four wooden xylophones), three of which are not found in Balinese sources. This single manuscript compares with almost 100 music *lontar* surviving in Bali.

It is possible that the village tradition of heptatonic ensembles (*gamelan saron*, *gamelan gambang*, *gamelan salunding*, *gamelan luang*) so common on Bali was never popular among the Balinese on Lombok, who have their own ritual music: the solo performance of the *preret* (double-reed aerophone) at temple festivals. In Bali the *preret* is an extremely rare occurrence; apparently the Lombok Balinese took it over from the Wetu Telu, with whom they share many rituals.

(iii) Wayang.

The most tangible evidence for pre-Islamic contacts with Java is the existence of a Sasak version of the shadow play. The style of the puppets is more realistic than in Java but not as realistic as in Bali, and they are comparatively small in size. This suggests contact with the Javanese courts before the elaborate stylization of human representations under Islamic influence. Among the most popular plots used today is the *Serat Menak*, which relates the adventures of Amir Hamzah and his successful conversion of enemies to Islam. Goris (1936) also reported Sasak stories (*gubahan Sasak*). The music of the *wayang sasak* is unique, with no close relative in Bali or Java. The ensemble lacks the metallophones common in Javanese and Balinese ensembles accompanying forms of *wayang* and can only be compared with the Balinese *wayang gambuh*, with which it shares the combination of long vertical flute and spike fiddle, a pair of drums, a suspended gong, small cymbals on a rack and two or three small gong kettles. The structure of the music is not based on the Balinese heptatonic modes and colotomic *tabuh* forms; instead the mode is pentatonic and strongly hierarchical, with a few nuclear tones ornamented by many secondary pitches. The protracted colotomy typical of Balinese *gambuh* is absent; rather, the instruments responsible for rhythm and tempo (two drums and the *kecek*) develop a dense web, rich in

syncopations and at a fast pace, while the musical sections are distinct through rhythmic patterns.

(iv) Dance.

Although a number of scholars have mentioned a variety of dances, here, too, substantial research has not yet been undertaken. The combination of processional drumming with dancing seems to be frequent (for example in the genres *telek* and *sesatang*), and the use of lances and shields indicates their relation to preparations for war or initiation (such as in the dances *oncer* and *perisean*). Almost nothing is known about the dances connected with temple festivals. Another category includes *geroh* and *gandrung*, the flirtatious public dances of a single female with a series of males who buy the right to join her with a small fee, a genre which is also common in Bali (under the term *joged*) and Banjuwangi, East Java. Modern solo dancing (*kecimol*) also takes place with the accompaniment of popular music of the *cilokaq* ensemble. Trance dances with the *oncer* ensemble and sitting dances (with *cepung*) have also been observed.

Indonesia, §II: Bali, Lombok and Sumbawa

3. Sumbawa.

Sumbawa is thinly populated (about 300,000 people). Anthropologically and linguistically the western and central parts of the island are closely related to the Sasak peoples of Lombok, but the musical ties are not particularly close, while the language of the Bima region in the east is distinct.

Gamelan and shadow play have not reached Sumbawa because of its distance from Indo-Javanese and Indo-Balinese spheres of influence. Although the island is mentioned in the list of countries ruled by Majapahit and although a dynastic connection to Bali existed at one time, Sumbawa's history, language and culture has been shaped by relations to the Makasar and Bugis peoples of South Sulawesi. As a result of orthodox Islamic doctrines, and in contrast to its western and eastern neighbours, no significant instrumental genres seem to have developed. As it is only in recent surveys by Indonesians that preliminary musical data has been unearthed, a detailed account of its music can not yet be given.

The list of musical instruments is headed by the *rebana* drum (in two sizes, the large *rebana kebo* and the small *rebana ode*), followed by the double-reed aerophones *bagandang* and *serune*. These two instruments are most typical for Islamic areas and occur on other islands as well. Other instruments include the rice stalk double-reed aerophone and the four-string bamboo tube zither *genang air*. The two inner strings of the *genang air* are placed above the soundhole and connected with a piece of bamboo; the right hand beats the open end of the tube while the left hand plucks the outer strings or beats the inner ones. The slit-drum, the large Islamic mosque drum and the pounded rice trough are also found.

Responsorial and group singing are common. *Lawas*, a poetic genre consisting of three lines with eight syllables each, is performed solo, among two singers, or under the name *saketa* with choir (*gero*). It is also performed with instrumental accompaniment under various names, for

example *sakeco* and *langko*, which are accompanied by *rebana* and *bagandang* with *serune*. The occasions for *lawas* are many and range from poetic exchange among lovers to social criticism and work songs (herding, rice-pounding etc.). Another important genre is *badiya*, epic recitation with the accompaniment of the tube zither.

In the Bima and Dompu regions, where feudal structures with *Kerajaans* and sultanates developed, courtly ceremonies with music and dance were known (Mantja, 1984, 45–7), among them the *ded* or *baded*, a special vocal genre connected to ancestor worship, performed with dancing and occasionally with the rhythmical accompaniment of idiophones. Other dances are the *perisean*, a ritual duel between two young men with leather shields and sticks, the *mpisi donggo*, performed at funerals to the accompaniment of singing, and for traditional ceremonies, *bao daya*, *pakon* and *gerok*.

III. Central Java

The central portion of the island of Java, where wide, fertile lowland valleys lie between several large, active volcanoes, became the first centre of Javanese political and cultural power well over 1000 years ago. Explosive growth from the early 19th century to the mid-20th has made this one of the most densely populated areas in the world. Today most of some 60 million ethnic Javanese reside in Central Java alongside a significant Chinese minority. Islam is the religion of the vast majority of Javanese, many of whom also maintain significant animist and Hindu-Buddhist beliefs and practices. Various Christian sects have made converts mainly in the cities. While urban centres have developed around royal courts and elsewhere, the population remains predominantly rural and agrarian, connected to the cities through a complex patchwork of territorial and political allegiances. Extensive social stratification fostered by Javanese nobility is still evident in use of linguistic levels and deferential behaviour.

The music and practices associated with Central Javanese [Gamelan](#), an ensemble of varying composition usually including numerous metallophones and gongs as well as other instruments, are the main topic of this entry. From the late 20th century other types of music have been performed and consumed in Central Java, yet while certain types of popular musics may receive great exposure (see §VIII, 1 below), gamelan music (*karawitan*) continues to constitute the distinctively Javanese medium of musical expression.

BIBLIOGRAPHY

[Indonesia, §III: Central Java](#)

1. History.

Little is known of music in early Java. Hood (1980) has speculated on the derivation of Javanese gongs and playing styles from Dongson bronze drums of mainland South-east Asia around 200 bce, though the transition

from cast drums to forged gongs remains unclear. Indian influence, which lasted from the 5th to the 10th centuries ce, has not left obvious traces in the music but is central to literature and theatre, where the pre-eminent narratives are the Mahabharata and Ramayana. The term 'gamelan' does not appear until much later, but it has been argued that *gendhing*, used frequently from the 9th century, meant ensemble, not composition as it now does, and that *gong* was used similarly (Becker, 1993, pp.31–5). Early literary sources, dating mainly from the period when Javanese culture centred in East Java (11th–15th centuries), include numerous brief descriptions of music played for war, celebrations and rituals at the Hindu-Javanese court of Majapahit, centre of a large empire. Terracotta figurines of that period depict not only instruments that are familiar but also some that have continued to be used in Bali but not in Java (such as two small gongs mounted on either end of a pole and a keyed instrument played with two forked beaters), as well as some that have left no direct descendants (such as lutes). Because Bali was under the rule of Majapahit and because Javanese nobility are believed to have fled to Bali when Majapahit fell to Muslim kingdoms from the north coast of Java around 1500, it is widely presumed that archaic aspects of musical instruments and practice maintained in Bali today are closely related to the music of Majapahit.

Little musical evidence survives from the centuries following the fall of Majapahit, although some court instruments still in use are believed to date from that period. Following a tumultuous succession of coastal kingdoms, the centre of power shifted back to Central Java, where Sultan Agung founded a new empire in the 17th century. Reports by early Dutch colonial figures, such as Van Goens, ambassador to Sultan Agung's court in 1656, give little detail but indicate the existence of a variety of ensembles, including a loud one with gongs, cymbals and drums, as well as ensembles featuring singing and some softer instruments. In this period Chinese and Europeans entered the area in numbers, with the Dutch gradually gaining control of Javanese territory and Chinese providing both middlemen and labourers. In the next centuries the Chinese minority patronized Javanese performing arts as well as Chinese forms and syncretic combinations. The 200 years of Dutch colonial presence (with a brief British interregnum during the Napoleonic wars) have also affected the arts in complex ways not immediately discernible (see Sumarsam, 1995). The Dutch-imposed treaty of Giyanti split Central Java in 1755 into two kingdoms with rival courts (*kraton*) located in Yogyakarta and Surakarta (also known as Solo). Further rivalries led to the creation of a minor court in each of these cities: the Paku Alaman in Yogyakarta and the Mangkunegaran in Surakarta.

By the 19th century many composition titles known today were already recorded in court manuscripts such as the famous *Serat Centhini*, and there is reason to believe that there has also been substantial musical continuity. *Pélog* and *sléndro* ensembles may not yet have been combined into one large gamelan, but most of the instruments known today were included in each, and the two were united in the now standard *sléndro-pélog* gamelan later in the century. The number of *kenong* (horizontally-suspended bossed gong) and *kempul* (vertically-suspended bossed gong) has since grown, a few instruments (such as the *gambang gangsa*, a multi-octave metallophone) have dropped out of use, and at least one, the *gendèr panerus*, has been added (about 1850). Current forms of dance

and theatre can also be traced to this time, though considerable change has occurred.

From the middle of the 19th century to World War II, there was tremendous activity in all performing arts. The four courts marshalled large numbers of musicians, dancers and *dalang* (shadow puppeteers), vying with one another (perhaps in lieu of warfare, which the Dutch suppressed) by presenting numerous spectacular performances and sponsoring creation of new genres and compositions. Attribution of works to rulers began to give way to naming actual composers and choreographers; various village practices, such as particular dances and drumming styles, were adopted and adapted at the courts. Court practices also spread to villages and urban performers through schools for dance, *wayang* (shadow play) and music established by the courts in Surakarta and Yogyakarta, as well as through radio broadcasts, which began in the 1920s. Vocal compositions proliferated, and innovation mainly involved creating parallels to existing forms (similar activity may have occurred earlier, but probably not to such a degree). Activity in the performing arts ended with the Japanese occupation (1942–5) and the subsequent struggle for Indonesian independence from Dutch rule (1945–9).

As the new Indonesian republic replaced both colonial rule and the feudal system embedded within it, the royal courts lost much of their wealth and ability to maintain large numbers of musicians and other performers. Many found new homes at the state radio stations in Surakarta and Yogyakarta. Some went to teach at the state-established conservatories (Konservatori Karawitan in Surakarta, 1951; Konservatori Tari Indonesia, Yogyakarta, 1961) and later the academies of the arts, ASKI (Akademi Seni Karawitan Indonesia, Surakarta, 1964) and ASTI (Akademi Seni Tari Indonesia, Yogyakarta, 1963), maintaining some of the dominance of court practice. These state schools fostered creative work alongside documentation and preservation of older practices. Beginning in the 1970s compositional activity has ranged from rearrangement of traditional elements to radical departures, including the development of new instruments (see [Suwardi, al.](#)). As these schools took in students and instructors from other parts of Indonesia and adopted a pluralistic curriculum that included other Indonesian traditions (particularly Balinese and Sundanese), a broader spectrum of instruments and idioms became available, and composers at these institutions entered a pan-Indonesian arena of intellectual and artistic discourse.

Alongside this academy-centred activity, musical innovation was led in the post-independence decades by figures such as [Kanjeng Radèn Tumenggung Wasitodiningrat](#) (see fig. 11) and [Ki Nartosabdho](#). This has involved considerable mixing of genres and styles, so that regional and genre distinctions have been blurred. The breakdown of regional distinctions was also hastened by the rapid spread of cheap cassettes from the 1970s onward, most recordings featuring Solonese style. The most popular *dhalang* now appear to have the greatest influence over musical change as they promote their own compositions and compete for an audience by introducing new elements (such as cymbals and snare drums) or other types of popular entertainment into *wayang kulit*. Non-traditional instruments such as electric bass have been added to the gamelan for the

campursari ('mixed essence') genre. In recent decades the characteristic smoothness of Javanese music has been disrupted by sudden contrasts of tempo and dynamics.

Gamelan has long been a potent icon of royal power, both because of the spiritual power vested in royal regalia (*pusaka*) and because of the expense and exclusivity of such instruments. The courts maintain numerous old sets of instruments; gamelan instruments, compositions and dances have been tools of diplomacy for several centuries at least, exchanged as gifts at marriages joining the royal families of not only Central Java but also of Madura. Political connections also brought Javanese musical instruments and practices to Sunda, West Java and Banjarmasin, Sulawesi. In post-colonial and post-feudal times the Indonesian government has spread arts diplomacy to many parts of the world through gifts of gamelan and frequent missions by performance troupes, including many from Central Java. These are some of the ways in which the government has assumed some of the roles of the royal courts as arts patrons; its establishment of performing arts academies, staffed at first by former court performers, is another, as is the mandate given these institutions to record and preserve previously restricted royal repertory.

[Indonesia, §III: Central Java](#)

2. Musicians.

Javanese of all social classes play gamelan, but aristocrats and members of other élites rarely perform professionally; music and dance are seen as training for achieving refinement and harmony. Professional musicians are predominantly male, but female singers (*Pesindhèn*) stand out as the most visible, audible and highly paid performers. Women also play all of the instruments of the gamelan, but with the exception of *gendèr* players (Weiss, 1993), they usually do so in gender-segregated amateur groups. Remuneration for performance is usually quite low for all but drummers and female singers; only musicians who perform regularly in popular shadow-play troupes and those who manage to find a position in the government bureaucracy, teaching in the schools or performing in the radio station ensembles, are able to make a living as musicians.

Formal musical study was uncommon until the mid-20th century. Despite the spread of institutionalized teaching, musicians continue to learn from many sources through repeated exposure and attempts at imitation. Since most musicians do not own instruments, learning and practicing are inherently social activities, requiring access to a set of instruments and involvement in a group situation. Sitting in and around the gamelan in performance is widely accepted from earliest childhood. The incorporation within a gamelan of roles of graduated difficulty enables beginners to participate alongside far more capable musicians. Most musicians gain competence on all of the simpler instruments; many can also play at least some of the complex ones. It is particularly common to learn from older relatives, who may demonstrate or correct but rarely teach systematically. Cassette recordings have facilitated and altered the process of imitation from the 1970s by offering a broad array of stylistic resources and enabling exact, unlimited repetition of a model for imitation.

The establishment of performing arts schools has changed education processes by offering students systematic training in gamelan, dance and puppetry, though many musicians continue to learn informally. Students at these institutions develop a broader competence than other musicians because they learn several different styles of Javanese gamelan as well as music from other parts of Indonesia (principally Bali and West Java). Use of notation and a more verbalized, analytical approach to musical practice also distinguish this training. Since students from these institutions often teach gamelan in general schools, their standardized versions of performance practice and repertory are affecting the mainstream, diminishing but not eliminating regional and individual stylistic diversity.

Javanese royal courts and lesser noble houses maintained numerous musicians, dancer-actors and puppeteers. In the heyday of the Kraton, the major palace of Surakarta, seven different groups of musicians were part of its many-tiered bureaucracy, including those associated with the crown prince and the prime minister. Musicians moved through an explicit system of ranks linked to particular instruments of the gamelan, with a few musicians at the apex of this system attaining noble rank. Members of the aristocracy often studied music and dance but were far more likely to dance than to play gamelan in court performances. Today a small number of musicians perform for court occasions and radio broadcasts from the palace (similar complexity and subsequent decline occurred at the Kraton of Yogyakarta). Smaller versions of these organizations developed at the Mangkunegaran and Paku Alaman, the minor courts of Surakarta and Yogyakarta.

The gamelan musicians at the government's radio stations in Surakarta and Yogyakarta have been highly influential, spreading their playing styles and repertory farther afield than most other groups through frequent broadcasts and numerous commercial recordings. The only non-governmental groups to approach such distribution have been those associated with the most influential shadow-puppet masters (*dhalang*), [Ki Nartosabdho](#) and [Ki Anom Suroto](#).

There are numerous other professional and semi-professional gamelan groups, some associated with a particular *dhalang* and others with municipal or educational institutions. The spectrum of experience and ability shades off into amateur groups linked to schools, banks, government offices and other institutions that tend to serve a social function, but may also provide music for the sponsoring institution's celebrations. Other performance opportunities include regional competitions and radio broadcasts on public and private stations.

[Indonesia, §III: Central Java](#)

3. Instruments and ensembles.

Gamelan instruments are tuned to two systems (*laras*): pentatonic *sléndro* and heptatonic *pélog*. Pitches are commonly represented by *kepatihan* notation, with 1, 2, 3, 5 and 6 for *sléndro* and 1 to 7 for *pélog* (superscript and subscript dots indicate upper and lower octaves, respectively). Tuning varies considerably from one gamelan to the next, both in absolute pitch and in relative size of intervals, engendering considerable scholarly debate over the theory and aesthetics of tuning. Further complexity results from

stretching of octaves on fixed pitch instruments, singers' and *rebab* (spike fiddle) players' individual intonations, and the varying relationship between the two halves of a *sléndro-pélog* gamelan: some sets coincide (*tumbuk*) on pitch 6, others on 1, 2 or 5 (Table 4). Certain gamelan sets are valued for their particular tunings and may be models for other sets. The *gendèr* (14-key metallophone) is usually used as a standard for tuning the rest of the gamelan.

Instrumentation is flexible: 'complete' gamelan may vary greatly in the number of *saron* (metallophone, fig.12a), *kempul* (vertically suspended bossed gong), *kenong* (horizontally suspended bossed gong) and *gong* (fig.13; for further detail on instrumentation see [Gamelan, §I](#)). Yet this hardly affects performance practice and repertory. Likewise, the quality of the instruments, ranging from old, beautifully forged and tuned bronze to cheaper brass and iron, affects the overall sound but not the choice of repertory or performance practice. On the other hand, the availability of

only one tuning restricts the choice of repertory, although many *sléndro* pieces may be played on a *pélog* ensemble. Two variant ensembles are sufficiently different to warrant specific terms: first, the small *gamelan gadhon*, which features the softer *panerusan* (elaborating) instruments *rebab* (spike fiddle, fig.11), *gendèr*, *gendèr panerus* (small 14-key metallophone), *gambang* (wooden xylophone), *suling* (bamboo duct flute) and *siter* or *celempung* (zithers) as well as some of the basic instruments including *kendhang* (drum), *slenthem* (low-pitched metallophone), some sort of gong and occasionally other colotomic instruments; second, in *soran* or *bonangan* performance the *bonang* (gong-chime, fig.12b) and *saron* predominate and the soft instruments are lacking. These two subsets may also be heard as alternating textures within a performance by a full ensemble: the loud instruments come to the sonic foreground at certain points (usually beginnings, fast transitions and some endings) and in certain pieces (particularly the shorter forms), while the softer, more complex sound of *panerusan* emerges in slower tempi and longer pieces.

Certain royal ensembles present different (and possibly earlier) approaches to instrumentation. *Gamelan monggang* (see [Gamelan](#), fig.1), *kodhok ngorèk* and *carabalèn* all feature gongs and gong chimes in different sizes and combinations. They are reserved for ceremonial occasions and have a small repertory of pieces specific to each ensemble. Only the ceremonial *gamelan sekarèn* overlaps significantly with the common gamelan in instrument types and repertory (though not in performing practice; see §6 below).

Indonesia, §III: Central Java

4. Fundamentals of gamelan music.

Javanese gamelan music is renowned for its complex texture consisting of many layers that differ in register, speed, timbre and playing idiom. With few exceptions, the faster the part the higher the register. Faster parts relate to slower ones by powers of two except for the complex and often unmetred rhythms of the vocal, *rebab* and *suling* melodies. Heterophony and polyphony are equally unsatisfactory descriptions of gamelan texture, which is characterized both by considerable independence and by extensive melodic derivation of one part from another.

Various functional divisions of the gamelan have been proposed. While all are problematic, partly because instruments may fulfil more than one function, the following functions are useful: a) demarcation of progress through time; b) basic melody; c) melodic elaboration; and d) rhythmic elaboration and control of tempo.

Binary and cyclical organisation are fundamental to Javanese musical structure: most pieces are based on cycles whose length is a power of two (particularly 8, 16, 32, 64 and 128). These may, in theory, be repeated endlessly; in practice, only the shortest pieces are repeated numerous times. Cycles are absent from certain song-based genres such as *sulukan* (which also lack a metre) and *palaran*, in which the phrases are of uneven and unpredictable length. Conceptual stress is also binary: in a four-beat *gatra*, the fundamental unit of Javanese music, the fourth is the strongest, the second is next in emphasis, and the first and third beats are considered weak. This end-weighted pattern of relative stress results from the

convergence of various parts on particular beats rather than dynamic accents played by any one musician. Despite the prevalence of cyclical organization, linear temporality is evident on many levels: within cyclical structures, in the progressions within medleys of compositions and in the overall sequence of pieces in a performance.

Cyclical Javanese forms are defined by cycle length and by the colotomic pattern articulating this cycle and its subdivisions. This pattern consists of a hierarchical sequence of strokes on gongs of varying shape, timbre and register. Three types of gong are used in all colotomic patterns: the end is marked by a large hanging gong (*gong ageng*) or, in the shortest cycles, by a slightly smaller and higher pitched *gong suwukan*; the *kenong* (distinguished from the big gongs by horizontal suspension, shape, a clear, ringing timbre and relatively high pitch) marks the middle and end of the cycle and usually the quarter and three-quarter points; the *kethuk* (horizontally suspended like the *kenong* but much smaller) is used to mark further subdivisions ([Table 5](#)). Its characteristic dull timbre is further differentiated from the *kenong* and gong by playing technique: a damped stroke or rapid series of strokes.

Other colotomic instruments include *kempul*, *kempyang*, *engkok*, *kemong* and *kemanak*. The *kempul* (a medium-sized hanging gong sounding in the octave between *gong ageng* and *kenong*) is not played in long cycles but marks the point midway between *kenong* strokes in cycles of short and medium length (8 to 32 beats) and is hierarchically more important than *kenong* in very short cycles (1 to 4 beats), sounding on every second *kenong* stroke. The *kempyang* (a small, high-pitched, horizontally suspended gong or pair of gongs) and *engkok* and *kemong* (a pair of small,

high-pitched, hanging gongs less common than the *kempyang* and limited to *sléndro* gamelan) mark smaller subdivisions in certain pieces, flanking the *kethuk* strokes. In certain court dances a pair of *kemanak* (small, banana-shaped slit gongs) are played in alternation by two musicians to mark the smallest subdivisions of the cycle.

Irama, another fundamental aspect of temporal organization, denotes not only a given tempo level but a particular rhythmic ratio between the beat and the faster-moving parts. Binary subdivision reigns here too: in a fast *irama* the *saron peking* (or *saron panerus*, a high-pitched metallophone), *bonang barung* (gong-chime) and *gendèr* are played twice as fast as the *saron* melody, whereas in slower *irama* this ratio shifts to 4:1, then 8:1 and finally 16:1. This is accomplished by extreme expansion of the melody rather than by doubling the speed of the elaborating parts: the duration of a cycle depends not only on its length in beats but on the *irama* at which it is played. Virtually every cyclical gamelan piece can be played in at least two *irama*, and some in all five. Change from one *irama* to another is usually gradual, a steady acceleration leading to the next level of contraction or a retard leading to expansion; more limited tempo changes are possible without changing *irama*. Changes are highly significant, cueing the end of a piece or a transition to the next section, for example. Finally, there are often fundamental tempo differences between performance contexts; for example, in a given *irama* theatrical music tends to be played faster than non-theatrical music.

Javanese music is now notated with ciphers ranging from 1 to 7, but no hierarchy is implied by these numbers; some pieces have a clear tonal centre, many others do not. Heptatonic *pélog* scale and pentatonic *sléndro* are mutually exclusive in traditional practice. In some *sléndro* pieces *rebab* and vocal parts overlay *pélog*-like intervallic patterns, a practice known as *barang miring*. Many *pélog* pieces use a five-note subset of *pélog*: elaborating instruments such as *gendèr* and *gambang* exist in versions that are tuned either to 1–2–3–5–6 or 2–3–5–6–7.

Melodic organization is subject to the constraints of *pathet*, roughly translatable as ‘mode’. *Pathet* is both a classification system and a system governing melodic choices (see Mode, §V,4(ii)). As a classification system it is applied to repertory and limits the pieces that can be played at a given point in a performance or joined together in a medley. As a system of melodic choices, *pathet* affects composition and musicians’ semi-improvisatory elaborations of the melodic essence of a piece.

The nature of this melodic essence has generated extensive debate and numerous attempts to pin down the most important or characteristic strand among the simultaneous manifestations of this essence. One candidate, the *balungan* (skeleton), is the relatively simple multi-octave melody played on the *saron* (within its one-octave range), from which some of the other parts can, in fact, be derived; the *rebab* melody is another central strand, while vocal melodies are clearly the source for some compositions (Susilo, 1989 and Sumarsam, 1995), and some musicians claim that all composition is vocally derived. But musicians and scholars also postulate an unplayed conceptual melody that has been named *lagu* (lit. ‘melody’; Sutton, 1979) or ‘inner melody’ (Sumarsam, 1984) or even *balungan*, giving

that term a second meaning (Supanggah, 1988; see Perlman, 1994 for detailed discussion of this topic).

The conceptual melody and the most wide-ranging melodic parts (*rebab*, *gambang*, vocals) have an ambitus of 2.5 octaves. Other instruments, such as the *gendèr* and the *bonang*, have slightly smaller melodic ranges, whereas the *balungan*-playing instruments (various *saron* and *slentem*) are limited to about one octave, which leads to characteristic ways of compressing the melody (ex.10).

Differences of register are tremendously important: on multi-octave instruments it is crucial that musicians know the appropriate register for a given phrase. Many pieces have high-register sections designated *ngelik* or *lik*. Contrasts between low and medium register are also significant in many compositions, although no term specifically designates sections in these registers. There is considerable variety in the shaping of Javanese melodies, but certain characteristic contours recur with great frequency. That contour is a key element in Javanese musicians' conceptualization of melody is evident in the ease with which musicians transpose melodies from one tuning to another and from one scale step to another, often altering the intervallic content of a melody considerably.

The densest and sparsest strands in gamelan texture can be characterized as elaborations and abstractions, respectively, of some central melody. Traditionally, Javanese composers have not orchestrated pieces because they can rely on competent musicians to produce elaborations and abstractions for a given melody following the idiomatic constraints associated with particular instruments or vocal roles. Instead, composers have specified a form and *pathet*, composed a *balungan* to fit that form and perhaps transmitted a conception of the melodic flow of the piece through the *rebab* melody, in some cases also specifying a choral melody.

Garapan ('cultivation') is the creation of an idiomatic realization of the essence of a piece. For instruments such as *saron peking*, *bonang* and *bonang panerus* (high-pitched gong chime) this can be a relatively

straightforward doubling of pairs of notes from the *balungan* involving anticipation ([ex.11](#)). Formulaic abstractions and elaborations may also be played on the larger *saron*. *Garapan* for the more complex parts requires a thorough knowledge of the patterns associated with a particular instrument, the conceptual melody of the piece and familiarity with analogous pieces, as well as an understanding of the constraints of *pathet* and other aspects of performance practice, such as *irama* and drumming styles. Basic patterns of elaboration (*cèngkok*) are conceptualized as abstractions that can generate infinite variations (*wiletan*, see [ex.12](#)).

A *cèngkok* is goal-orientated, characterized by the pitch on which it ends (*sèlèh*), *pathet*, starting pitch and register. Most *cèngkok* can be transposed, but modal identity may change. Transfer of patterns from *sléndro* to *pélog* is particularly common. There are some parallels between instruments (and vocals) although idiomatic characteristics will almost always generate some distinctiveness ([ex.13](#)).

Realization of a piece through selection of appropriate *cèngkok* is not thoroughly formulaic. While *sèlèh* tend to occur at the end of each *gatra* and most *cèngkok* are therefore four beats long, many instances demand different interpretations. Furthermore, the idioms of some instruments are more formulaic than others. Some strikingly idiosyncratic passages for *rebab*, *gendèr*, *pesindhèn* and sometimes *kendhang* are designated *pamijèn* ('singular') and must be learnt specifically from other musicians.

In many cases competent musicians can perform a piece they have never heard by following the lead musicians and choosing corresponding *cèngkok*; the idiomatic time lag between *rebab* melody and *sindhènan*, for example, affords the *pesindhèn* time to follow the *rebab* and other key instruments. Likewise, players of instruments such as *gendèr panerus* and *siter* can repeat static patterns while deducing the approaching *sèlèh* from other musicians' parts. *Garapan* also involves expansion and contraction of patterns by a factor of two in order to adapt to different *irama* (ex.14).

A variety of Javanese musical forms, differing greatly in length and performance practice, derives from various contractions or expansions of a few basic colotomic structures, some regular and symmetrical and others irregular. The length of the cycle in regular forms is between 8 and 256, consisting of four (or, in *ketawang* and *ketawang gendhing*, two) subsections of equal length, each ending with a *kenong* stroke and hence termed *kenongan*. This pervasive structural symmetry is broken in only a few pieces. Longer forms are distinguished by the number and density of *kethuk* strokes per *kenongan* (see Table 2 above). A further distinction may be made between the shorter ones (*lancaran*, *ketawang* and *ladrang*) in which the *kenongan* is no longer than eight beats and is subdivided by a *kempul* stroke, and the longer *mérong* and *inggah* forms, which have *kenongan* of 16, 32 or 64 beats and do not include *kempul* (Solonese terminology is used here; the Yogyanese equivalent of *inggah* is *dhawah*).

The irregular *gendhing lampahan* forms have much denser colotomic structures with phrases of varying length and differ in performing practice. For instance, they begin with a brief drum solo rather than the melodic introductions (*buka*) of colotomically regular forms. They also tend to have special ending phrases (*suwuk*) that can be played at various points in the course of the piece, unlike colotomically regular pieces that must be played through to the end of the cycle. This distinction is particularly significant in theatrical accompaniment.

Mérong and *inggah* sections are not usually performed as separate entities, but are played in relatively fixed pairs to constitute *gendhing*, the longer compositions in the Central Javanese repertory. Some *inggah* sections are firmly bound to a particular *mérong*, whereas others may be

'borrowed' to play with another *mérong*. *Gendhing* may also have transitional sections (*umpak inggah*) played between the *mérong* and *inggah* or *sesegan* sections played as a rapid conclusion after the *inggah*.

A gamelan composition may also extend beyond a single cycle if its melody spans two or more repetitions of a single colotomic structure; or the melody may be expanded and altered for different *irama*. Many pieces feature the distinctive, high-register *lik* or *ngelik* section that contrasts with the basic section of the piece, sometimes called *umpak*. The *lik* may be an integral part of the piece, played at every iteration, or an auxiliary section that is played once or not at all, depending on circumstances and the leaders' decisions.

Irregularly structured *gendhing lampahan* ('walking pieces') are far less numerous than the regularly structured pieces but are played with great frequency, particularly in theatre to accompany movement such as battle and travel. Three types are recognized in Solonese practice: *ayak-ayakan*, *srepegan* and *sampak* (Yogyanese usage differs; see Table 6); some *gendhing lampahan* have *lik* sections.

TABLE 6: Comparison of Solonese and Yogyanese Gendhing Lampahan

Balungan beat per <i>kempul/gong</i>	Solonese Term	Yogyanese Term
8	none	Ayak-ayakan
4	Ayak-ayakan	Srepegan/Slepegan
2	Srepegan/Slepegan	Playon/Sampak
1	Sampak	Sampak Garagara

After Sutton 1991, p.30.

A more radical contrast to *gendhing* is found in unaccompanied song (see §5 below) and in *sulukan*, a genre of short, unmetrical pieces played on a small subset of the gamelan (Table 7). There are three types of *sulukan*: *pathetan* (Yogyanese *lagon*), *sendhon* and *ada-ada*; these are sung in theatrical performances by the narrator to express a mood (calmness, upset and anger, respectively). *Gong*, *kenong* and *kempul* add punctuation, which is connected loosely to vocal phrase endings rather than being bound to a particular colotomic framework. In non-theatrical

contexts only *pathetan* are commonly performed, usually without vocal or gongs.

TABLE 7: Instrumentation for Sulukan (Solonese style)

	Pathetan	Sendhon	Ada-ada
rebab	X	–	–
gendèr	X	X	X
gambang	X	X	–
suling	X	X	–

These contrasting attitudes towards musical time and form are combined in *gendhing kemanak* and *palaran* (Yogyanese *rambangan*). *Gendhing kemanak* accompany certain female court dances and involve a sparse texture of colotomic parts and drum with choral singing that is rhythmically defined but only occasionally aligns metrically with the colotomic structure. *Palaran*, performed by a solo singer and most of the instruments of the gamelan, are based on a rhythmically free vocal melody set to the short colotomic pattern of *srepegan*, but with flexible phrase lengths determined by singer and drummer.

Performance practice varies considerably according to the form of a composition, affecting orchestration, volume, playing style, tempo, *irama* and other aspects of timing. The *mèrong* section of a *gendhing*, for example, is almost invariably begun in *irama tanggung*, slowing to *irama dadi* within the first 20 beats or so, then remaining there until the leading musicians decide to move on to the *inggah*. This transition is cued by an acceleration, returning to *irama tanggung*, and then a retardation as the end of the *mèrong* or transitional cycle is reached. There is more variety in the performance of *inggah*, which are generally more lively in character than the calm *mèrong*. This difference in character may be evident in the drumming style, the choice of *irama* and tempo, the addition of interlocking handclapping by the male chorus and generally more rhythmically active elaboration such as interlocking *bonang* parts (ex.15) or more complex *gendèr* playing. Traditionally, orchestration has not been specified: various groups of instruments and voices shift in and out of the sonic foreground with changes in *irama* and drumming style.

The drummer determines much of the sequence by controlling *irama* and by choosing particular drum patterns (ex.16). On the largest drum, *kendhang gendhing*, sparse patterns are played with little variation. Consisting of particular sequences of low- and medium-pitched strokes (*dah* and *dhung* or *thung*, respectively) played with the right hand, these patterns are linked directly to musical forms; a complete pattern corresponds to one gong cycle. Light filler strokes played with either hand regulate tempo, and a short, simple pattern, varied only to mark ends of phrases, may be added on the smallest drum, *ketipung*, by the main drummer or a second musician. Other drum patterns, chiefly for the smaller forms such as *ladrang*, involve interlocking strokes on large and small drums. The most ornate drumming, with much greater individual variation, is played on a medium-size drum, the *ciblon* (Yogyanese *batangan*), for concert and dance music, or the slightly larger, lower-pitched *kendhang sabet* for theatre. A large vocabulary of drum strokes is used to create a rapid, lively and supple flow of great rhythmic complexity.

Certain forms may have more than one drumming pattern. The drummer's choice, depending to some extent on context and the desired mood, will affect the way other musicians play. For instance, *ciblon* drumming generally calls for interlocking (*imbal*) of large and small *bonang* as well as more ornate playing on instruments such as the *gendèr*. Special patterns are played to end a piece or cue a transition.

Some of the most subtle and crucial aspects of Javanese musical performance involve deviations from metronomic time. The beat is most frequently stretched approaching the end of a cycle, involving a complex interaction that is not solely under the drummer's control.

[Indonesia, §III: Central Java](#)

5. Regional styles and repertory.

Intense awareness of regional traditions is prevalent in Java, as in other parts of Indonesia. Distinctive artistic traditions have developed in various parts of Central Java with commonly recognized traditions linked to each of the four royal courts, the coastal city of Semarang (a tradition that has been largely displaced by Surakarta style) and various rural regions such as Wonogiri, Klaten and Boyolali, the most distinctive being that of Banyumas, an area lying on the border of West Java. There is considerable mixing with neighbouring performing arts traditions in border areas such as Cirebon in the north-west.

Regional diversity is conceived to be characterized by distinctive playing styles, repertory and other aspects of musical practice. Drumming, *bonang* playing, *saron* elaboration techniques and vocal styles tend to differ most dramatically. Repertory also varies, with certain compositions specific to a given area and others existing in several regional variants (ex.17). Many differences are difficult to pin down, but significant issues of local and regional identity persist (Sutton, 1991). Heightened awareness of regional differences feeds both conservative and innovative attitudes towards the arts, leading both to calls for stylistic purity and to extensive borrowing.

Rather than a global Javanese musical repertory there are numerous repertoires, defined by socio-geographical distinctions, performance context or musical structure. These overlap and relate to one another in other ways. Likewise, repertory size is difficult to measure, owing to varying inclusions and exclusions as well as pervasive variation. Some pieces are very specifically defined with titles and relatively fixed musical content. Many are more loosely defined. One large, well-known collection (Mloyowidodo, 1977) contains well over 1000 discrete items from the Solonese (i.e. from Surakarta) repertory; yet even for this stylistic region it is incomplete, lacking *gendhing lampahan*, *sulukun*, other primarily theatrical music, some ceremonial pieces and various lighter pieces, not to mention hundreds of more recent compositions. Pieces are rarely linked to specific composers, and even the work of living composers may be played widely without acknowledgment. Attribution to a single composer can be problematic, since compositional activity can involve rearrangement of existing elements or additions of new texts or vocal melodies to existing pieces.

Singing is an integral part of the Javanese poetic system. Over the past 1000 years the majority of Javanese writing has been cast in poetic verse meant to be sung rather than read silently. Poetic metres include Sanskrit-based *sekar ageng* ('large song/poem') derived from India and indigenous *macapat* metres. Each is associated with particular melody types and performance practices enabling knowledgeable singers to 'recite' any text composed in one of these metres. *Macapat* and *sekar ageng* can be sung unaccompanied in various contexts, including gamelan performances, in which they substitute for the introduction to a gamelan composition (*bawa*) or are inserted in a break in the middle of a piece. The melodies of *macapat* and *sekar ageng* vary with context and performance genre, ranging from syllabic recitation to highly ornate and melismatic settings and from ametrical to strictly metrical.

Macapat are also commonly incorporated into various gamelan genres. At one extreme are pieces termed *gendhing sekar* and *palaran*, in which the *macapat*-derived vocal melody determines the melodic content of the other parts. In many other pieces singers may add vocal lines as part of the instrumental texture. Interchangeability of texts is the rule, with specifically composed texts being much rarer; exceptions include some court dances and the light repertory of *dolanan*, gamelan settings of children's songs.

Purely instrumental music includes ceremonial *gendhing bonang*, featuring the *bonang* and the louder instruments, which may be played on a regular gamelan and the more restricted repertory of ceremonial ensembles such as *gamelan kodhok ngorèk* and *sekatèn*. In addition, various pieces, particularly *ladrang* and *lancaran*, may be performed *soran* (in loud style without vocal and *panerusan* instruments), depending on context or available ensemble.

Gendhing, the most numerous genre, are characterized and classified by tuning, 'mode' (*pathet*), form and sometimes by drum pattern. Musicians of the Surakarta and Yogyakarta traditions differ among themselves over the details of these distinctions, but the principles are similar. Tripartite classifications predominate, often on the basis of large, medium and small 'sizes' of musical forms. As with poetic metres, the modifiers *alit*, *tengahan* and *ageng* refer to gradations of size (small, medium and large, respectively), although in both cases the distinctions are not clear-cut. The full title of a piece usually includes significant information about its form and/or performance practice.

Modal identity is one of the most fundamental characteristics of a piece. While some pieces, such as *Ladrang Sobrang*, exhibit characteristics of two or more *pathet*, each piece has a 'home' *pathet*. This constrains musicians' interpretations and where they will place the piece in the performance (see §6(i) below). Piece types are not evenly distributed across the six main *pathet* of the Central Javanese modal system. There are some general parallels between corresponding *pathet* in the *sléndro* and *pélog* systems (Table 8), such as a preponderance of longer, more serious pieces in *pélog lima* and *sléndro nem*, whereas male choral singing is far more common in the other *pathet*. There are also some important differences between the two tunings. *Sléndro* pieces are commonly performed in *pélog*, but the reverse is not true. Furthermore, the

transformation of pieces does not necessarily follow the pairing of *pathet* that otherwise obtains: a piece in *sléndro manyura* may be transferred to *pélog nem* or *pélog barang*, with strikingly different results. Distinctions between *pélog lima* and *pélog nem* are sufficiently problematic to cause considerable differences of opinion over classification of pieces. In Yogyakarta this is sometimes solved by describing both categories as *pathet bem*.

TABLE 8: Pathet Pairs

	laras	
<i>pathet</i> sequence	<i>Sléndro</i>	<i>Pélog</i>
first	<i>Nem</i>	<i>Lima</i>
second	<i>Sanga</i>	<i>Nem</i>
third	<i>Manyura</i>	<i>Barang</i>

Night performances of *klenèngan* or *wayang* follow this order, theoretically apportioning a third of the time to each *pathet* in *sléndro* or to each pair if both tunings are used. In theory, morning *klenèngan* would use the third *pathet*, then the second, and end in the third while afternoon *klenèngan* use only the third *pathet*.

Pieces are further distinguished, albeit less systematically, according to mood or character. The three fundamental categories are *regu* (majestic, solemn character), *pernès* (lighter, more playful, even coquettish character) and *gecul* (comic character). Pieces in the last category sometimes include the word *gecul* in their titles and may feature some transgression of the conventions that inform most of the repertory.

Indonesia, §III: Central Java

6. Performance contexts.

Javanese gamelan is commonly performed in a variety of contexts; there can be considerable overlap in performance settings, patronage and musical repertory. Many aspects of performance practice, as well as some items of repertory, are context-specific, but even these may be ‘borrowed’ (e.g. transferred from a dance genre to a theatrical performance of some sort). Performers tend to be keenly aware of the original contexts of musical items and practices and differ in their readiness to accept or promulgate such borrowings.

Performance does not usually take place in a concert hall on a proscenium stage, although such settings do exist now at government radio stations

and institutions such as the SMKI (Sekolah Menengah Karawitan Indonesia) conservatory high school in Surakarta. Rather, the more traditional setting is a *pendhapa*, a square or rectangular structure with raised floor and peaked roof supported on numerous columns. One side may be attached to the verandah of a building, while the other sides are open. Musicians and audience traditionally sit on the floor, though chairs have come into use for the audience in some circumstances. Dance and theatre performances generally draw much larger audiences, with the uninvited often standing on the ground outside the *pendhapa*. Such structures were a standard element of traditional aristocratic architecture and are particularly large and numerous in Javanese palaces. Traditional village houses lack such opulent structures but often have a panelled front wall that can be removed, enabling hundreds of people to hear and see the performance that takes place under the *pendhapa*-like roof of the front room. In other situations, temporary structures are erected with a raised platform for the performers, often occupying an alley next to the celebrants' house. More intimate performances may be held inside a house.

Most performances are sponsored to celebrate a particular occasion, such as a birth, a circumcision, a wedding, independence day, the beginning of the Javanese year or some other important event or anniversary. People also sponsor performances to mark their *wétonan* (a commemoration of a birthday that recurs every 35 days), to fulfill a vow or to ward off evil. Sponsors may be individuals or corporate entities such as a bank, a whole village or a government institution. Sponsors not only hire the performers but provide them (and, in some cases, the audience) with food. Invitations are often issued, but the uninvited are rarely excluded and may be numerous, particularly if the performers are well known. Very few events require the purchase of tickets. The Javanese courts sponsor many performances to mark auspicious days, though the number of such performances has decreased greatly in recent years. The *wétonan* of the reigning sultan or prince in each court is marked by a live broadcast on state radio. Other radio broadcasts originate from studios where the traditional etiquette of performance is greatly altered.

The most prominent use of gamelan for a religious occasion is the nearly continual playing of the massive *gamelan sekarèn* in the courtyard of the main mosques in Yogyakarta and Surakarta to mark the birth of the prophet each year. The invention of various aspects of gamelan and *wayang* are attributed to the Wali, the saints who spread Islam in Java, but there is no close relation with Muslim institutions, and gamelan performance does not usually intersect with Muslim religious practice, though some *terbangan* genres (featuring *terbang* frame drum and vocals) share melodies with the standard gamelan repertory (see below). However, gamelan instruments, compositions and music theory have all been implicated in mystical beliefs linked to Sufism and Tantrism (Sastrapustaka, 1984 and Becker, 1993); certain pieces are believed to be spiritually powerful (even dangerous) and gamelan performance is sometimes used for meditation. Alongside the attributions to Muslim saints other origin myths link the creation of gamelan to Hindu gods and legendary Javanese figures (see Hood, 1970). The goddess of the South Seas, Nyai Rara Kidul, figures prominently in beliefs about certain sacred dances and musical compositions. Gamelan is an important element in certain rituals such as

sacred dances performed annually at the major palaces or purification ceremonies involving special shadow play (*ruwatan*). Gamelan has occasionally been played in Javanese churches. New masses and individual pieces have been composed, and existing gamelan compositions have been adapted for Christian use, first in the Catholic Church and later in Protestant churches.

(i) Klenèngan.

(ii) Theatre.

(iii) Dance.

Indonesia, §III, 6: Central Java: Performance contexts

(i) Klenèngan.

These performances may be held independently or, in the case of a major celebration, in conjunction with other performances. The duration ranges from a few hours during the day or evening to an entire night. Audience demeanour may range from formal attention or silent meditation to muted conversation and enthusiastic participation in rhythmic handclapping.

In Solonese practice, compositions are performed according to a *pathet* order that is linked to time of day (see Table 5 above). When a full gamelan is available both tunings are used in alternation, combining the *pélog* and *sléndro pathet* sequences: a piece is played in *pélog lima*, followed by another in *sléndro nem*; this may be repeated or the musicians may then play in *pélog nem* and so on.

In *klenèngan* it is more common to link several pieces together in an unbroken medley than to play individual pieces. The construction of these medleys is often spontaneous, though some are well-known sequences. Generally a medley begins with a *gendhing*, though this may be preceded by a *pathetan* and a *bawa* (solo song). Pieces in shorter forms are appended after the *gendhing*: *ladrang*, *ketawang* and *ayak-ayakan* are all common choices. The later portion of a medley will often consist of a *srepegan* with *palaran* interspersed. It is also common to include lighter, vocal-centred genres such as *dolanan* and *langgam* (*kroncong*-style songs in Javanese language and tunings) towards the end of a medley. While the rules for combining pieces are not explicit, certain principles of contrast and compatibility are widely observable in addition to the progression from longer to shorter colotomic structures: for example, a piece performed with lively drumming, interlocking *bonang* and handclapping will often be contrasted with a slower, more serene piece such as a *ketawang*; compatibility requires that pieces belong to the same *pathet* and that they share a gong tone, though a piece may be adjusted to fit the latter requirement. Linearity is fundamental to the overall progression: with the exception of certain *selingan* (insertion of one piece in the middle of another), compositions earlier in the medley are not returned to. Cycles are also interrupted by the performance of *andhegan*, in which the drummer cues the entire ensemble to stop at a certain point in the cycle, allowing one of the *pesindhèn* to sing a solo (ranging from a single phrase to an entire independent song) before the instrumentalists resume performance.

Indonesia, §III, 6: Central Java: Performance contexts

(ii) Theatre.

There is little theatre and no dance without music in Central Java, and this almost always involves some sort of gamelan. Indeed, dramatic, choreographic and musical elements are so thoroughly integrated in some types of performance that they defy simple classification. However, the less thoroughly dramatic genres are generally referred to as dance (*beksan* (Javanese) or *tari* (Indonesian)), whereas the names of many theatrical genres include the word *wayang*.

Dramatic performances most commonly draw on the Indian-derived Mahabharata and Ramayana cycles with some characters and episodes invented in Java. Some genres are associated with the indigenous Panji cycle, semi-historical plots particularly from the fabled Majapahit period, and Middle Eastern tales.

Plays involve well-known main characters and a host of stock characters, both defined by a matrix of classifications and conventions. One dimension of this matrix is a continuum from refined (*halus*) to coarse (*kasar*). The categories of men, women, gods and ogres form another dimension. These are differentiated by conventions of iconography (of puppets' or actors' body type and costume), type of voice, speech patterns, stance and movement. One category deserves particular mention: the *punakawan*, comical servants who speak the commoner's language and often refer to contemporary events, although some of them have divine aspects. These figures, a Javanese invention dating back at least 1000 years, take a central role in most theatrical performances, mediating mythical and contemporary life.

Most Central Javanese dramatic genres involve a narrator, usually termed *dhalang*, whose role ranges from full control over all aspects of the performance in the shadow play to brief declamation in genres such as *langen driya*. (Only a few women practise the hereditary art of the *dhalang*.) Some genres involve substantial improvisation in many aspects of the performance, whereas others are scripted, choreographed and provided with a fixed sequence of musical pieces (although musicians still have flexibility). A specialized theatrical language is utilized in most performances, and older forms of Javanese are also incorporated, particularly in narration. Careful attention is given to status-differentiated speech levels.

The musical element of these dramatic genres is fully integrated with the other performance conventions. Almost without exception, pieces are drawn from a general stock, distinguished by associations with particular dramatic settings and functions. There is substantial overlap between the musical repertoires of different dramatic genres. Similarly, the system of transformations used to adapt these pieces to specific dramatic needs is common to most Javanese dramatic genres. Music serves to accompany and enhance movement, set a scene, create a mood and articulate the structure of the performance, framing the beginning and the end as well as marking important junctures in between. The *pathet* sequence (see Table 5) is fundamental to the shadow play and underlies most other theatrical genres. The drummer fills a crucial role in all of these genres and plays in a style that differs markedly from other gamelan drumming. In addition to controlling tempo and dynamics, the drummer transmits numerous cues

and provides 'sound effects', amplifying puppet or actor movements with drumstrokes.

Shadow play is the most common type of theatrical performance, and *wayang kulit purwa* is the most common genre of shadow play, defined by its portrayal of episodes from the Mahabharata or new episodes linked to that cycle (or, more rarely, episodes from the Ramayana). The *dhalang* is in complete control of the performance, choosing and developing the plot, narrating, providing all the dialogue and manipulating the puppets, as well as choosing the musical accompaniment and directing most aspects of the music. The *dhalang* is expected to entertain and to educate, lacing the dialogue and narration with comedy and moral precepts.

Until the 1930s the traditional instrumentation for *wayang kulit purwa* consisted of a small *sléndro* gamelan that, in addition to the softer elaborating instruments, *slenthem* and *kendhang*, included cymbals (*kecèr*), only a few *saron*, *kenong*, *kempul* and *gong*, without any *bonang*. Since then, under the influence of *wayang wong* (dance-drama), a full gamelan in both tunings has become the norm. *Dhalang* often add Western percussion to emphasize puppet movement and Sundanese *jaipongan* drumming for certain puppet dances.

Performances traditionally begin in the evening and last about nine hours, ending near dawn. Abbreviated performances, some as short as an hour, have been developed from the 1950s onwards. All full performances and many abbreviated ones are based on a structure of three 'acts', each with its own internal structure of scenes, its own symbolic position in the progress of the play and its own repertory drawn from one of the three *pathet sléndro*. With the advent of double gamelan, pieces in *pélog* have also been incorporated. The importance of music in delineating this structure is evident in the fact that each act is named after its musical mode.

The traditional repertory comprises hundreds of pieces grouped in several large categories: *gendhing*, *gendhing lampahan*, *sulukan* and *dolanan*. These pieces are used to set a scene (*gendhing*), to accompany and represent movement (*gendhing lampahan*), to convey a mood or emotion (*sulukan*), to demarcate the performance structure (a variety of pieces), to entertain the audience (*dolanan* and other light pieces) and as background to narration. Certain pieces are identified with particular characters.

Most performances are unrehearsed and depend on an intricate set of conventions for their success. The network of interacting performers centres on the *dhalang*, whose cues are relayed to leading members of the ensemble, principally the drummer but also the *rebab*, *gendèr* and *bonang* players and the female singers who mediate between the *dhalang* and the rest of the ensemble. There is a complex system of cues and responses that is directly linked to the dramatic and musical structures: a particular cue is meaningful only with respect to a given context and will evoke a different response if it is produced in another part of a piece or of the play. The *dhalang* communicates via song, verbal cues, puppet placement and various rhythms tapped with a wooden mallet (*cempala*) on the wooden box (*kothak*) or a set of overlapping bronze plates (*kecrèk*) hung on the box.

Other forms of puppet theatre are rarely performed. *Wayang gedhog*, for example, paralleled the *wayang purwa* in most respects but utilized a *pélog* gamelan to portray stories from the Panji cycle and had a more rigid plot structure and selection of musical repertory. Rod puppets (*wayang golèk*) have been used mainly in areas closer to West Java, where they constitute the main theatrical medium (see §V, 1(viii) below).

Theatre forms featuring human actor-dancers rather than puppets include *wayang wong*, *kethoprak*, *topèng*, *langen driya* and *langen mandra wanara*. Perhaps the most important of these is *wayang wong*, which exists in two varieties, one a venerable court spectacle in the round and the other a popular off-shoot developed for the proscenium stage at the end of the 19th century. Both depict episodes from the Mahabharata and Ramayana, but the court form is fully scripted and choreographed, features a large cast and intricate costumes and requires intensive rehearsal. The popular *wayang wong panggung* is improvised on the basis of a skeletal story line. It is closely linked to the shadow play, sharing plots, characters and most of its repertory and performing conventions with *wayang kulit purwa*. While it is clearly derivative it has also influenced *wayang kulit*, most notably in the use of a full double gamelan. It differs in its relative brevity: performances last two to four hours, certain scenes are omitted, and shorter musical compositions are favoured. The division of labour also differs: the *dhalang* in *wayang wong* still controls the overall flow of the performance, linking the action to the music with narrative and cues, but the actors take on all of the improvised dialogue, some of which is sung to gamelan accompaniment (Susilo, 1987).

Kethoprak (folk theatre) developed in the 20th century and depicts historical and legendary plots; it is similar in many ways to *wayang wong* but involves less music. *Wayang topèng*, a theatrical form based on masked dance, also involves a *dhalang* who narrates and guides the actions. Representing the indigenous Javanese Panji tales, it had a long history in Java as a popular genre, performed by wandering troupes with a very small gamelan wherever an open space and a potential audience were to be found, but it is now very rare aside from brief excerpts that continue to be performed as individual dances, often in forms that underwent court stylization. *Langen mandra wanara* and *langen driya* are esoteric court forms rarely seen outside the palace walls and hardly performed today even within them. Developed in the late 19th century in Yogyakarta and Surakarta respectively, they employ fully scripted texts, composed in *macapat* metres. Dialogue is sung, unlike the other forms of theatre, which involve extensive speech.

[Indonesia, §III, 6: Central Java: Performance contexts](#)

(iii) Dance.

Gamelan accompanies a wide variety of dance genres developed in the royal courts, towns and villages. Some dances (*jogèd* or *beksan*) are explicitly narrative and closely related to theatrical genres, whereas others are more abstract, lyrical or sensual, fulfilling ritual needs or providing secular entertainment. Underlying Javanese classifications of dance are distinctions of gender, social status, performance settings and function. Female dances include the restricted court forms *bedhaya*, danced by

seven or nine women (fig.14), and *srimpi* dances for four women, as well as *golèk* and *gambyong*, secular dances that originated outside the courts but were reworked there and are widely performed today, either solo or by a group of women. *Bedhaya* and *srimpi* dances and dancers have served as royal symbols for centuries; ascension of a new king necessitated creation of new choreographies, often reworking existing *gendhing* as accompaniment. At the other end of the social scale are the *taledhèk* or *ronggèng*, itinerant dancers who travelled with small bands of musicians, dancing with men from the audience; such dancing is thought to be the source of some of the more refined female dancing and the drumming that accompanies it. A related phenomenon is *tayuban*, a centuries-old form of entertainment in which men take turns dancing with professional female dancers. Choreographed male dances include *wirèng* (warrior dances, fig.15) and *pethilan*, battle scenes from theatrical plots. Mixed-gender choreographies tend to be dramatic in nature, directly related to theatrical genres. The dance drama (*sendratari*), a mid-20th-century invention in which narration is mainly danced without dialogue, is the site of ongoing innovation, building largely on the norms of traditional Javanese dance and theatre, unlike more radical choreographies by figures such as Bagong Kussadiarjo or Sardono Kusuma, who combine Javanese elements with various other styles and approaches to dance in far more eclectic mixes.

Character types similar to those of theatre are performed in dance. In female and refined male characters, the feet are kept close to each other and to the floor, with hands and arms also defining spaces close to the body and eyes downcast. Strong male types, by contrast, stand with legs spread wide and arms stretched straight out, and carve out larger spaces with legs and arms lifted high. Court dances may employ complex choreographies with highly symbolic, asymmetrical formations of dancers.

Most dances are accompanied by full gamelan. The most notable exceptions are those *bedhaya* dances accompanied by *gendhing kemanak*, pieces involving a choral melody, sparse drumming and a colotomic structure in which the *kemanak* figure prominently. In every genre, dance and music are tightly integrated: choreographic sequences generally align with colotomic structures and drum patterns. While many choreographies and musical accompaniments are set, the more overtly dramatic dances are usually quite flexible, requiring close coordination between dancers and musicians, mediated by a drummer. In some cases, a dance master cues the dancers by playing rhythms on a wooden slit drum (*keprak*) and, for battles, bronze concussion plates (*kecèr*).

Drumming for stately court dances consists of fixed patterns played on the large and small *kendhang*. Dramatic dances and those derived from itinerant female dances require the *ciblon* (*batangan*), on which far more complex patterns are played. These patterns, which are open to substantial improvisation, are closely associated with particular movement patterns from which many take their names.

Indonesia, §III: Central Java

7. Non-gamelan genres.

Siteran denotes a small ensemble consisting of as many as three different sizes of *siter* (zither). The players generally sing as well and may be joined

by a drummer, a *pesindhèn* and even a keyed gong substitute. *Cokèkan* is similar but may include a *gendèr*, *slenthem* and *suling*. These small, portable ensembles are usually itinerant, stopping to play wherever they might catch an audience. They share much of the repertory of the gamelan (with an emphasis on the lighter, vocal-centred pieces) and often comprise skilled musicians, unlike the common guitar- and tambourine-playing beggars (*ngamèn*) who are paid not to play.

The *terbang*, a drum whose 'frame' curves inward like a bowl without a bottom, is associated with Islam and a variety of performance genres, often with singing and other instruments. *Laras madya* involves performance of *macapat* by solo male voice leading to choral singing with *terbang*, *kendhang* and *kemanak*. *Santi swara* designates a similar ensemble performance of Islamic texts. In *slawatan*, portions of the Qur'an are sung to similar instrumental accompaniment with seated dancing. Other Muslim genres with clear Middle Eastern origins, such as *gambus* and *qasidah* (see §VIII, 1 below), are practised in Central Java as in many other parts of Indonesia.

Jaran kepong, like *réyog* and *èbèg* in other parts of Java, is a rural genre performed by hobby-horse riders who go into trance to the accompaniment of the double-reed *selomprèt* (oboe), *kendhang*, gongs and *saron*. Sometimes a set of *Angklung* (bamboo slide rattles) are added. Another rural music, *lesungan*, which consists of interlocking rhythms beaten on a hollowed tree trunk (*Lesung*), is played during eclipses to scare off the demon believed to be swallowing the sun. It is also played in the palace by six women to ward off spirits during the preparation of ceremonial rice mountains (*gunungan*) for the court-sponsored processions (*grebeg*) that take place three times a year and was used to accompany *kethoprak* plays in the 1920s together with *suling*.

The Central Javanese public is exposed to Sundanese and Balinese gamelan music (much more than to music of other parts of Indonesia) through live performances at festivals, instruction at conservatories and academies, and television. Western art music (see §VIII, 2 below) is taught at the Akademi Musik Indonesia in Yogyakarta and has a history dating back to colonial times, when it was practised not only by Dutch colonials but by special groups of musicians employed by the Javanese courts (see §I, 2(ii) above).

[Indonesia, §III: Central Java](#)

8. Research.

Javanese and Dutch writers began to create a body of scholarship on Javanese music and related arts in the late 19th century. Poetic treatises by leading 19th-century Solonese court musicians such as *Serat titi asri* (Gunasantika II, 1925) or *Serat sastramiruda* (Kusumadilaga, 1981) gave way to prose works, often more technical in approach (e.g. Djakoeb and Wignjaroemeksa, 1913). Groneman, a Dutch doctor at the Yogyanese court who published an early monograph (1890), was followed by other Dutch writers, the most prolific and authoritative being [Jaap Kunst](#) (whose work extended beyond the colonial period). This colonial period of intense cultural interchange not only affected the performing arts and the scholarship about these arts but also changed fundamental attitudes

towards the place and value of gamelan, *wayang* and dance (see Sumarsam, 1995).

One result was the development of various notational systems, including the cipher *kepatihan* notation that now predominates. At first the primary aim was archival, but later instructional purposes were also served. Collections of general gamelan repertory (e.g. Mloyowidodo, 1977) and various specialized repertories are numerous; these usually indicate only the *balungan* and colotomic parts. Vocal collections are also common. Any of the other parts can be notated, often with the addition of various symbols, but such notation is found almost exclusively in the pedagogical and analytical publications produced by and for the performing arts schools established in the decades following Indonesia's independence in 1945.

Post-independence Javanese writing about gamelan has included theoretical treatises such as *Pengetahuan karawitan* by leading theorist Martopangrawit (1984), pedagogical material and writings about the meaning of gamelan (Sastrapustaka, 1984). Analogous writings about *wayang* and dance often include substantial information on the associated musical practice, and there are numerous collections of *wayang* pieces, especially the songs of *dhalang*. Most of the authors have been performers. More recently, several prominent Javanese scholars have written theses for advanced degrees in ethnomusicology at foreign institutions, and the faculty and students of STSI (formerly ASKI) in Surakarta have produced studies documenting genres or personal styles of leading musicians and analysing performance practice. Little research has been undertaken by either Javanese or foreign scholars on genres not related to gamelan.

Foreign scholarship on Javanese music developed outside of Indonesia largely due to Jaap Kunst, through his writings and his students, particularly Ki Mantle Hood and Ernst Heins. It has grown exponentially since the 1970s, with numerous Americans and contributors from the Netherlands, Great Britain and other countries.

Indonesia

IV. East Java

1. Introduction.
2. Gamelan halus.
3. Kasar ensembles.

BIBLIOGRAPHY

Indonesia, §IV: East Java

1. Introduction.

The traditional music and dance of East Java Province (Propinsi Jawa Timur, which also includes the island of Madura) is chiefly that of three peoples: Javanese, Madurese and Osinger. A fourth group, the Tenggerese, living in the Tengger mountain range east of Malang, speak a dialect of Javanese but, unlike the Javanese, Madurese and Osinger, subscribe to a syncretic religion based on Buddhist, Hindu and pre-Hindu beliefs. In their practice of religion and their ritual music they resemble the people of the eastern Balinese village Tenganan. Both groups have remained somewhat aloof from the societies around them, but the Tenggerese are rapidly undergoing acculturation, many having already adopted standard Javanese speech, Javanese art forms (including gamelan) and Islam.

Gamelan instruments and musical principles are common to all these peoples, though in other respects their music and speech are very

different. Among the three main peoples gamelan and other ensembles are divided into two styles that may be called *halus* ('refined') and *kasar* ('coarse', 'strong'; i.e. folk style), each having three distinct variants. The *halus* styles can be classified as Central Javanese (from Yogyakarta and Surakarta), East Javanese (Surabaya, Majakerta) and Madurese (Sumenep, Pamekasan); the *kasar* styles are East Javanese (Panaraga, Jombang), Madurese (Pamekasan, Bandawasa) and Osinger (Banyuwangi).

In describing the music of East Java an arbitrary division of the province can be made into western and eastern halves on either side of Malang. Central Javanese *gamelan halus* and *priyayi* ('aristocratic') culture in general predominate to the west. In cities as disparate as Bojonegoro, Kediri and Madiun, professional musicians (whether immigrants from Central Java or native East Javanese) consciously adopt Yogyanese or Solonese musical idioms. Certain styles of *kasar* ensembles occur in villages. The *halus* and *kasar* ensembles found to the east differ in instrumentation, playing styles and mode from those found elsewhere in Java. *Gamelan asli jawa timur* ('indigenous East Javanese' *gamelan halus*) centre on the Surabaya–Majakerta area. They are characterized by playing styles rather than instrumentation, and are often called *gamelan Surabaya* to distinguish them from the Central Javanese variety.

Many Madurese live along the coast of East Java, from Surabaya to the Blambangan peninsula and the inland communities of Bandawasa and Jember. In these areas Madurese *kasar* ensembles are very popular. On Madura, Sumenep (the *kraton* or court city) and Pamekasan (the capital city) are centres of Madurese *gamelan halus*, which have the same basic instrumental ensemble as the Javanese. The styles of playing are related to that of *gamelan Surabaya* (discussed below), and the repertory includes many indigenous *gendhing* (compositions) with songs in the Madurese language.

The Osinger live in the Banyuwangi area. Their *kasar* ensembles, partly derived from Bali, are a source of local pride, some of their songs having been absorbed into the repertory of *gamelan Surabaya*. Javanese in Banyuwangi have cultivated Yogyanese, Solonese and Surabaya gamelan styles (and sometimes a curious mixture of the three), which accompany performances of theatrical genres such as *kethoprak*, *wayang kulit*, *wayang wong* and *ludruk*.

Indonesia, §IV: East Java

2. Gamelan halus.

Traditional and newer *gendhing* from the repertories of Surabaya–Majakerta gamelan are becoming increasingly popular in Central Java and throughout East Java and Madura. This is partly due to the spread of *ludruk*, a contemporary melodramatic form of theatre that combines song, dance and comic sketches performed by female impersonators and other actors. Although it is regarded as vulgar (i.e. not *halus*) by the Javanese *priyayi* (aristocrats), *ludruk* is popular among all ethnic groups in Central and East Java. One performance may often contain comic sketches and songs in Javanese, Madurese and Indonesian languages.

The *asli* (indigenous) *gamelan halus* tradition has two aspects: the new, practised in metropolitan Surabaya, and the old, practised in the Majakerta Regency, formerly the seat of the famous Majapahit kingdom. Mutual influence between the two forms has now narrowed stylistic differences to the extent that the following descriptions, based on village practices in Majakerta, also apply generally to Surabaya.

East Javanese and Central Javanese gamelan have certain general similarities. They both have a standard basic repertory of *gendhing* and ensembles with a variable number of instruments, in which some instruments are used for the skeleton or nuclear melody, others for elaboration and others for the colotomic pattern; and in both styles the principles of stratification (the 'layered' arrangement of these elements of the composition) are similar. But the styles are different in that East Javanese gamelan have a more vigorous style, sudden extremes in dynamic levels, more disjunct motion in the improvisations of the elaborating instruments and relatively free drumming patterns. They make frequent use of *imbal* technique (rapid interlocking by two players in one octave) and frequent and extended use of *pancer* technique (inserting a note between each of the main notes of a basic melody), including double *pancer*; and there is an additional, indigenous repertory of *gendhing* and an indigenous *pathet* ('modal') system.

(i) Pathet.

In the music for the *gamelan asli jawa timur*, *sléndro-scale pathet* are the principal vehicles of indigenous *gendhing* as well as for *wayang kulit* (shadow play) and *ludruk* theatre. *Pélog-scale pathet* are popular in certain areas (e.g. Malang) especially among gamelan musicians of the Radio Republik Indonesia in Surabaya. Despite continuing controversies over the exact nature of East Javanese *pathet* and their differences from central Javanese *pathet*, Javanese musicians and theorists apparently agree about the nature of *sléndro pathet*; the comparison is shown in Table 9.

TABLE 9: Slendro patět system as used in the east Javanese gamēlan asli jawa timur

<i>Slendro patět</i>	<i>Usual cadential formula</i>	<i>Preferred finalis</i> or gong tone	<i>Dominant o finalis</i>	<i>Caden tial support</i>
sěpuluh (Central Javanese: nēm)	6532	2	6	5
wolu (Central Javanese: sanga)	2165	5	2	1
sanga (Central Javanese: manyura)	3216	6	3	2
sěrang (Central Javanese: no equivalent)	1653	3	1	6

(ii) Wayang kulit.

During a *wayang kulit* performance in the Majakerta Regency, the four *pathet* occur in sequence (times are approximate): *sléndro pathet sepuluh* (7.30–10.00 p.m.), followed by *sléndro pathet wolu* (10 p.m.–1 a.m.), *sléndro pathet sanga* (1–3.30 a.m.) and *sléndro pathet serang* (3.30–5 a.m.).

The night begins with several instrumental *gendhing* in *pathet sepuluh* called *gendhing bonang*, which are dominated by the gong-chimes *bonang barung* and *bonang panerus*. The *gendhing bonang* are in the *kasar* ('strong') style and, being played in a specially vigorous manner, create a joyous atmosphere and a sense of heightened anticipation. They are followed by one or more *gendhing rebab*, in which the *dhalang* (puppeteer) plays the *rebab* (spike fiddle); these are always in *halus* ('soft') style and provide a quiet, relaxed atmosphere in which the delicate melodies of the *rebab* and other instruments can be heard.

Another change in atmosphere immediately follows with a series of dances by *ludruk* actors, whose colourful, elaborate costumes include long shawls and ankle jingles. The gamelan ensemble often accompanies some of the most popular *ludruk* dances with *gendhing* in *pathet* other than *pathet sepuluh*; after the dances, *gendhing* in *pathet sepuluh* return and continue until the end of the first part of the *wayang* night is signalled by the *ayak-ayakan* (a *gendhing* used to mark changes in mood, *pathet* or story).

The *jejer* (opening scene of the *wayang*) begins with another *gendhing rebab*, now in *pathet wolu*. The *dhalang* assigns the *rebab* to another musician and ascends the stage to prepare the puppets for the opening scene. The *gendhing rebab* continues softly for 20 minutes or more, while the *dhalang* introduces the chief puppets to the audience and, through narration and puppets' dialogues, lays the groundwork for the story that follows (which is not fully revealed to the audience until rather late in the *pathet wolu* section). From this point the *wayang* performance is fundamentally the same as that of Central Java.

(iii) Pancer technique.

Used rather conservatively in Central Javanese gamelan, *pancer* technique has been developed to a remarkably high degree in East Javanese gamelan of the Majakerta Regency, where it is used systematically in almost all *gendhing*. Any note may serve as *pancer*, the general rule being that the *pancer* note in a given *pathet* is the one that is not part of its cadential formula (see Table 9). *Sléndro* tone 6, when used as a *pancer* note, normally occurs in *panthet serang* thus replacing the usual *pancer 2*.

A *gendhing* performed with *pancer* sections has four main episodes. The fixed melody is played first relatively fast (*irama seseg*), then in a moderate tempo (*irama lamba*), and is followed by a statement of the abstracted, or skeletal melody in moderately slow tempo (also *irama lamba*), with *pancer lamba* (single *pancer*) between each note of the skeletal melody in the pattern rest–*pancer*–rest–skeletal-melody note. Finally the skeletal melody is played very slowly (*irama rangkep*), with *pancer rangkep* (double *pancer*)

between each note, in the pattern *pancer–rest–pancer–skeletal-melody* note (Tables 10 and 11).

TABLE 10: Four main episodes of gënding endra (slendro patët sěpuluh), showing use of pancěr 1

	T P T N T P T N 1.131.161.131.151.131.121.131.15 (2) (2) (G)

T - kětuk; P - kěmpul; N - kěnong; G - gong;
m - metric unit

The cadential formula is seen here as PNP, the accented strokes as 6525 (the finalis 5 replacing the usual 2; in contour closest to the standard 6532). Bracketed numbers in fixed melody episode indicate alternative tones occurring only in the lamba and rangkep episodes.

Italic numbers represent the skeletal melody (as in 2nd episode); spaces between each group of four symbol are used in Javanese numerical notation to facilitate reading - they do not indicate breaks in the music.

 (2) (2) (G)

T - kětuk; P - kěmpul; N - kěnong; G - gong;
m - metric unit

The cadential formula is seen here as 2165
 in the final TPTN (G).

Italic numbers represent the skeletal
 melody; spaces between each group of four
 symbols are used in Javanese numerical
 notation to facilitate reading - they do not
 indicate breaks in the music.

The use of single and double *pancer* greatly extends the skeletal melody,
 with the result that a *gendhing* such as *gendhing Endra* in Table 10, with
 only eight skeletal notes, lasts from 12 minutes to 20 or more in
 performance, depending on how many repetitions the players make in each
 of the four sections.

The great extension of the skeletal melody by *pancer* provides the ultimate
 test in elaboration for players of the *genděr* (metallophone), *gambang*
 (xylophone), *rebab* (spike fiddle) and *celempung* (plucked zither). The
 fastest moving parts (played on *gambang*, *celempung* and *genděr panerus*)
 have up to 64 beats between each skeletal-melody note in *pancer rangkep*.
 In the same context the *genděr barung* player must perform highly complex
 elaborations within the framework of 32 moderately quick beats.

[Indonesia, §IV: East Java](#)

3. Kasar ensembles.

(i) Saronen and reyog.

In the most widespread type of *kasar* ensemble in East Java and Madura
 the *saronen* (Indonesian *selompret*: wooden oboe) is the principal, or only,
 melodic instrument. In East Java these ensembles are called *gamelan*
saronen or *gamelan tetet*; in Madura they are called *saronen*. The
 constitution of such ensembles varies greatly, but they generally contain at
 least one *saronen*, one *kethuk bine* (large gong), one *kethuk lake* (small
 gong), one *kendhang bine* (double-headed drum), one *kendhang lake* and
 one gong (using Madurese terminology, in which *bine* means female, or the
 larger instrument, and *lake* male, or the smaller instrument).

The small ensembles of Java that accompany trance dance-dramas known as *prajuritan* are related to the *saronen* ensemble. The *prajuritan* story is based on the mythical battle fought in the 15th century between the leaders of the Majapahit and Blambangan kingdoms. *Prajuritan* and the related but less refined *jathilan* are common in East and Central Java.

In the *reyog* folk drama, a type of *jathilan* famous in the Panaraga Regency of East Java, *barongan* (a mythical monster with a tiger-like head surrounded by peacock feathers) enters into combat with several knights and their followers, who ride on hobby horses (in modern performances the followers are young boys dressed in women's clothes). The participants often number 20 or more, with several hundred spectators.

According to local government sources, in the mid-1970s there were approximately 170 *reyog* organizations in the Panaraga Regency, and because of the immense appeal of *reyog* the atmosphere of a performance is always *ramai* (Madurese *ramme*), a term with a wide range of meanings; its positive connotations are busy, crowded, noisy and, by extension, cheerful. Musicians in certain *reyog* groups drink substantial amounts of a local whisky to help them attain a *ramai* mood, necessary for a successful performance.

The standard modern *reyog* ensemble (see [Gamelan](#), fig.4) consists of a *selompret* (oboe), two *angklung* (the bamboo shaken idiophone, not the Osinger type), a *kethuk* (small gong), a *kenong* (high-pitched gong), a *kempul* (suspended gong), a *kendhang* (double-headed drum), a *tipung* (*ketipung*, small double-headed drum) and sometimes one or more *terbang* (frame drum).

The music of all ensembles of the *saronen* type (including *reyog*) is highly repetitive, presumably to help participants attain a state of trance, and is played at a consistently fast tempo in strict duple or quadruple metre. There is little syncopation except occasionally in the *saronen* (oboe) line, which moves freely over the steady, driving beats of the *kendhang* and the ostinatos of the *kethuk*. The *saronen* is usually played within an octave compass but is capable of a wider compass; tuning is highly variable.

In *jombang*, an ensemble of the *saronen* type combines with the *bumbung* (Madurese *serbung*) to produce a remarkable texture. The *bumbung*, a 'blown gong', is a vessel flute made of two bamboo segments, a thin, open blowing-tube held inside a much larger block closed at the bottom by a node. The *bumbung* has a deep, rich fundamental, as well as 5th and octave. The musicians sometimes replace the *saronen* with the *siter*, a small *celempung* that has a more delicate sound.

(ii) Music of the Osinger.

The Osinger (Orang Osing) of the Banyuwangi Regency trace their history to the Blambangan Kingdom, which ruled much of East Java during the 15th and 16th centuries. Despite some assimilation with Javanese and Madurese peoples, the Osinger still speak a dialect (Bahasa Osing) of which much is unintelligible to a speaker of standard Javanese. The main elements of Osinger traditional music and dance are two unusual ensembles, *gandrung* and *angklung*, both of which use types of *sléndro*

tuning. *Gandrung* is a professional troupe of six adult male instrumentalists and one young, unmarried female dancer-singer; they perform for important all-night social functions, such as wedding receptions. *Angklung* is an amateur organization of young men that performs at less formal occasions, such as carnivals and contests, or simply for recreation. The number of players and types of instrument vary widely.

The term *gandrung* can refer to the organization as a whole or specifically to the dancer-singer. The tradition of *gandrung* is handed down within the family, and the daughter of a well-known *gandrung* nearly always becomes a *gandrung* herself, remaining so until marriage. *Gandrung* means enchanted or enamoured, and the older *gandrung* songs are love-songs. Many early 20th-century songs, however, deal with poverty, injustice and oppression. *Padha nonton* ('All people bear witness'), one of the most famous *gandrung* songs, is sometimes said to be a protest against colonialism. The *gandrung* ensemble consists of two violins (of Western type, with viola tuning), called *biola* in Osinger dialect; a set of two drums (*kendhang* and *ketipung*, both double-headed) played by a single drummer; two *kenong* (inverted gongs, tuned in 5ths), or one *kenong* and one *kethuk* (small inverted gong, one player); one triangle, called *kloncing* in Osinger dialect; and one *gong agung*.

Gandrung performances typically begin after sunset and last all night. After a brief instrumental medley of traditional *gandrung* songs the *gandrung* herself enters. Her costume includes a long, beautifully designed batik skirt, a cloth under-vest, a leather breastplate, and a close-fitting, helmet-like headdress. The breastplate and the headdress are elaborately decorated in gold leaf. The *gandrung* begins by singing a slow song accompanied initially only by the *biola* (which are held on the players' chests) and occasionally punctuated by the *gong agung*. Her singing voice is constricted, and has a narrow range in a medium tessitura.

In the first section of the introductory song the vocal line is very sustained, as is the drone-like accompaniment of the *biola*, and the metre is free. The *biola* players freely imitate the melodic phrases of the *gandrung*. At the end of a long phrase the *gandrung* singer pauses briefly, while the *biola* improvise an interlude based on the melodic contours of the preceding phrase or phrases.

The section that follows has a definite duple or quadruple metre. As the *gandrung* continues to sing, the *kendhang* and *ketipung* enter, after which the *kenong* enter and establish a regular ostinato. When the *kloncing* finally enters there is a slight increase in tempo and in dynamics. Frequent comic and flirtatious comments interjected by the *kloncing* player mark the beginning of the evening's gaiety. The social aspects of the *gandrung* performance begin with the dance of invitation. Like the initial song, the initial dance is performed by the *gandrung* alone and is also slow and formal. This is perhaps the most refined dance of the evening, for as the evening wears on and the atmosphere becomes more festive, the *gandrung* and the musicians become more relaxed and consequently freer in their performances. Having ended the dance, the *gandrung* offers her scarf to a man among the spectators who must then dance with her. In return for this honour he places a small sum of money in a receptacle near

the gamelan after his dance. A similar procedure continues throughout the night.

The *gandrung* and her partner (the latter often called *ngibing*: 'follower') often create comic dances together. If he is at all adventurous the *ngibing* improvises rather unrefined dance movements, ostensibly trying to imitate faithfully the *gandrung*'s movements but usually producing a parody of them. The *gandrung* in turn imitates the *ngibing*, and the comic effect of a parody of a parody is heightened when the *gandrung* keeps a perfectly straight face while imitating the deliberately or unintentionally awkward movements of the *ngibing*.

Gandrung dance movements are less clearly defined than movements in Central Javanese *tledhek* and *srimpi* (see §III, 6(iii) above). *Gandrung* movements are freely improvised in accordance with the nature of the song: thus the movements for a serious song such as *Padha nonton* are different from those of *Jaran goyang* ('Swaying horse'), which derives from the *kasar jathilan* tradition. In *Jaran goyang* the swaying movements of the *gandrung* are nevertheless often subtle, but the *ngibing* often acts the rider and horse simultaneously, consequently whipping himself.

Osinger *gandrung* is related to the *joged* of Bali and its formerly popular Balinese variant, also called *gandrung*, in which a boy served as the *gandrung* dancer-singer. I Wajan Rindi, a star pupil of the famous dancer Mario, performed *gandrung* in the early 1940s, and in the 1970s (living in Denpasar) was one of the last *gandrung* of Bali. The *seblang*, the predecessor of the Osinger *gandrung*, is a religious dance with elements of trance, related to the Balinese *sang hyang*. It is performed as an offering in celebration of a successful rice harvest; the movements are said to imitate farmers harvesting rice.

A Madurese version of *gandrung* formerly existed in eastern Madura. It followed the Osinger tradition in its use of the female *gandrung* but included two *saronen* (oboes) in place of the *biola*.

Though some young Javanese and Osinger now consider the *gandrung* genre old-fashioned and have little interest in it, the Osinger as a whole remain proud of their *gandrung*, and there are probably enough young Osinger with sufficient interest to continue the tradition. Young and old Osinger compose new songs, which are usually quickly absorbed into the repertoires of both *gandrung* and *angklung*. The newer songs express pride in Indonesia and in Banyuwangi in particular.

The Banyuwangi *angklung* is a xylophone consisting of 12 to 14 bamboo tubes cut on the slant at the top and closed by a node at the bottom (fig. 16). The tubes are held on a slant in a wooden frame by a cord running through them. The frame is loosely hinged to a simple stand, and can be easily adjusted to the comfort of the individual player. Two long wooden or bamboo sticks, ending in soft but unpadded discs, serve as mallets. A similar instrument once existed in the Majakerta Regency. The closest relative (in proximity as well as in form) is now the *garantang* of Bali. The Osinger have two traditions of *angklung*: *cara lama* ('old style'), formerly called *bali-balian* ('in the Balinese manner'), and *cara baru* ('new style'). Both are now called *angklung Banyuwangi*. Though the *cara baru* is the

principal vehicle of the newer songs and modern experimentation, both styles are popular among the younger people.

The *bali-balian* consists of one or two pairs of *angklung*, one pair of *slenthem*, two pairs of *saron barung*, two pairs of *saron panerus*, one *kendhang*, one or two *suling* (end-blown flutes) and one *gong agung*. The Banyuwangi *slenthem* resembles a huge *saron*, with keys lying flat above a trough in which resonating tubes are concealed. Its keys are made of iron, as are the keys of the *saron*. The *bali-balian* repertory includes traditional instrumental tunes of Banyuwangi, instrumental adaptations of *gandrung* songs and a small number of *gendhing* from Central and East Javanese gamelan. The principal function of *bali-balian* is to test the abilities of young players by means of a contest, called *angklung caruk* (*caruk*: 'struggle', 'contest'). During the contest (which is always between ensembles rather than individuals) members of the two ensembles, seated at their respective instruments, face one another. The challenging ensemble begins by playing a traditional *angklung* tune, or a short medley of tunes. The other group then follows with the same tune or tunes, attempting to surpass its rival's performance in virtuosity, precision and imagination. The contest continues in a similar manner for two hours or more; it is carried out in a spirit of fun and in a relaxed atmosphere, with occasional breaks for tea or coffee and snacks.

An *angklung* tune in the old style begins with an introduction on the *angklung* consisting of the *pathetan*, a brief, freely improvised section suggesting the tune's modal flavour (the term comes from *gamelan halus*), and the *buka*, the tune's brief stereotyped introduction in fixed rhythms but with an indefinite metre (this term also comes from *gamelan halus*). The *kendhang* enters towards the end of the *buka* and establishes tempo. The *buka* ends with *gong agung* punctuation, which announces the beginning of the main section, in which the remaining instruments enter. A simple statement of the melody on the *slenthem* is duplicated on the *angklung*, *saron barung* and *saron panerus*, and variations are played on the *suling*.

This section is then repeated and followed by elaborate improvisations on the *angklung* and *suling* and rapidly played *imbal* on the *saron*. After *angklung* interludes there is a return to the main section, the tempo being faster in the final repetition. The basic variation technique for the novice *angklung* player is melodic duplication (ex.18), similar to *rincik* style in the Balinese *gamelan pejogedan*. Young players, however, rapidly depart from simple melodic duplication to develop their own styles. As *angklung* are normally played in pairs, the more advanced player usually teaches the novice more complicated melodic patterns and ostinatos. If both players of a pair are experienced, they may depart from the melody entirely. Ex.19, derived from a performance of the new style of *angklung Banyuwangi*, shows two sets of *angklung* ostinatos in cross-rhythms against the vocal line. The ostinatos are based on a simple rhythmic pattern and its derivatives, as shown in ex.20. The basic rhythm (see ex.3a above) is common to many *saronen* and *jathilan* ensembles and the ancient *gamelan kodhok ngorèk*.

The new style of *angklung* ensemble (*angklung Banyuwangi*) differs from the old style in three fundamental ways: it is a smaller, more intimate ensemble, it uses a singer, and it accompanies dance. It consists of at least one pair of *angklung*, a *suling*, a *kloncing*, a *gong agung* and a male or female singer. An ensemble of this kind plays adaptations of pieces in the *bali-balian* repertory and newly composed songs; the old and new types of ensemble share a similar style, and ideas are often exchanged. Some musicians belong to both new and old clubs.

Modern experiments have produced some unique ensembles, including one in which the *angklung* has dual tuning. The Angklung Dwilaras club (Sanskrit *dwi*: 'two'; *laras*: 'tuning') constructed *angklung*, each with two sets of bamboo tubes, one in *sléndro*, the other in *pélog*, placed on either side of the frame. Since the frame is loosely hinged to the stand, the tuning of the instrument can be changed simply by turning the frame over. Other

recent experiments include large ensembles with up to eight pairs of *angklung*, four to six *suling*, a set of *bonang* (*bonang barung* and *bonang panerus*), and up to ten slit-drums of various sizes. These experimental groups add another genre, *cara modern*, to Osinger music.

BIBLIOGRAPHY

Indonesia, §V, 1: The Sunda of West Java

(i) Introduction.

The Sundanese people inhabit the mountainous province of West Java. They are the second most populous ethnic group in the whole of Indonesia, after the Javanese, who originate from Central and Eastern Java. Sundanese language and culture, although related to Javanese, are quite distinct.

While more overtly Muslim than the Javanese, many Sundanese maintain customs and beliefs rooted in older religions. Sundanese language and manners range from highly refined and formalized to vulgar and ribald; such contrasts are reflected in the performing arts, ranging from the exquisite melancholy of courtly poetry sung in *tembang Sunda* to rhythms squeezed from the armpits of *ngajibrut* street entertainers.

Ceremonies and celebrations are the most frequent occasions for musical performance. Music, dance and theatre can be for ritual, entertainment or both. *Hajat* are festive receptions most typically given to celebrate a wedding or circumcision and may include a wide range of performing arts, such as *nyawér*, ritual advice sung unaccompanied by an older person, and *upacara adat* ('traditional ceremony'), comprising the various processions and rituals that make up the wedding ceremony and often including song texts, arrangements of pieces for *gamelan degung* or *kacapi* (zithers), and elements of choreography specially created for the occasion. Later in the proceedings guests may be entertained by anything from the courtly *tembang Sunda* or *gamelan degung*, to brash *jaipongan* dancing and karaoke ballads. Lavish *hajat* finish with an all-night *wayang golék* (rod puppet) performance.

The Sundanese performing arts comprise a dynamic oral tradition in which experiment has always been a vital factor. The most conservative musicians pride themselves on the innovations they have introduced and on preserving intact the tradition they have inherited, without apparent contradiction. Some of the most 'classical' genres, such as *gamelan degung* and *tembang Sunda*, are little more than a century old and have changed fundamentally in the last 50 years. To remain in work, performers must follow artistic fashion. Mass communications create new megastars among singers, *wayang* puppeteers and entertainers, and give the fashions they set a particular potency. The ubiquity of sound amplification (sometimes even used in domestic rehearsals) has transformed vocal technique and brought soloists to the foreground of ensembles.

Many genres give the performers considerable freedom to improvise. Even when melodies and instrumental figuration are fairly standardized, fine musicians cultivate their own subtle but distinctive variations. While the

composers of the older repertory remain anonymous contributors to a group ethic, in more recent years individual composers have gained high profiles. Music is leaving the public domain to become the intellectual property of individuals, who expect recognition and commercial reward; the situation is further complicated when, as often happens, 'new' pieces are based on old repertory.

Young performers learn primarily through informal methods, such as being around when it happens, rather than through formal teaching. Many performers come from a family (or a community) of performers. The government-run SMKI and STSI offer courses in the performing arts at secondary and university level: here academics with high social status coexist rather uneasily with artists who have acquired their skills 'naturally' (*seniman alam*). At the same time, a growing number of young Sundanese musicians learn new repertory from commercial cassette recordings or from recordings they themselves have made with cheap cassette recorders. Few women have the opportunity of becoming serious instrumentalists or puppeteers (although there have been some notable exceptions); their usual roles are as vocalists and dancers.

(ii) Genres and ensembles.

- (a) Vocal music.
- (b) Village music.
- (c) Tembang Sunda.
- (d) Kacapian.
- (e) Gamelan ensembles.

Indonesia, §V, 1(ii): The Sunda of West Java: Genres and ensembles

(a) Vocal music.

The casual listener to contemporary Sundanese music will be struck forcefully by the predominance of female solo singing. Before sound amplification, gamelan ensembles were predominantly instrumental; however, there is now a tendency for the instruments to provide standardized figurations as a backdrop for the voice, rather than play a melodic role. Similarly, the repertory performed is changing: rather than playing the larger, more complex melodic pieces (*sekar ageung*), simpler structures based on a framework of pitches (*sekar alit*) are substituted, which are more appropriate for accompaniment.

Nevertheless, singing (unaccompanied, or in smaller ensembles) has always been an important element in Sundanese music. In Sunda the written word implies melody. The chanting of Qur'anic texts (*pangajian*) is learned in childhood and becomes a regular part of daily life. This is prayer, not music; nevertheless, text is realized through a melody that has been learned orally. A comparable process occurs in Sundanese poetry in one of the 17 *pupuh*, the verse forms brought from Java in the Mataram period (late 16th century to mid-18th). Traditionally, these would never be read silently but always sung to the melody associated with a particular *pupuh*, a style called *wawacan* ('reading').

The basic *wawacan* melodies are simple and syllabic, though texts can also be 'read' with more complex melismatic melodies. *Beluk*, *Ciawian* and

Cigawiran are some of the more elaborate vocal genres in which *pupuh* texts are sung unaccompanied. They are now rarely performed, unlike the accompanied sung poetry of *tembang Sunda Cianjuran*.

Indonesia, §V, 1(ii): The Sunda of West Java: Genres and ensembles

(b) Village music.

The rural Sundanese had a huge array of instrumental genres for ritual and entertainment. Typically, sets of percussion instruments of different pitches would be played in interlocking repetitive rhythms by several players. Many of these genres have fallen into disuse as modern rural life changes, but some of the instruments have been absorbed into more modern, urban genres. Formerly, ritual use would often focus on harvest ceremonies for the rice goddess Nyi Pohaci.

Bamboo is easily obtained outside the cities and is used to make a wide variety of Sundanese instruments. These include the *karinding*, a jew's harp cut from a strip of bamboo, and the *keprak*, a bamboo tube split along part of its length, which produces a buzz of rising pitch when struck.

The *celempung* is a tube zither made from a large closed length of bamboo in which two strips of bark are cut away while remaining attached at both ends. Wooden wedges between the strip and the tube turn the strip into a 'string' that can be struck in imitation of *kendang*, the barrel drums of *gamelan*. Bamboo *celempung* are now rare: modern versions use weighted strips of rubber stretched over wooden boxes and are played by street musicians.

Both *Calung* and *Angklung* work on the same principle. A tube of bamboo is cut away, so that one end produces a pitch when struck and the other provides matching resonance by enclosing a column of air (fig. 17). A set of these tubes, usually tuned to *saléndro* (see §(iii) below) comprises a *calung*. Holes are cut at the nodes of the tubes so that they can be suspended from string or wooden cross-pieces and struck with wooden beaters. When strung, they are either slung across a bamboo frame and played like a xylophone (*calung gambang*), or suspended like a hammock from the player's waist to a convenient tree and played from one end (*calung rantay*); such instruments were used in rice-growing rituals. Modern *calung* ensembles have four sets of different sizes on hand-held cross-pieces (*calung jingjing*). The performers sing, dance and clown around while playing interlocking patterns and fast melodic lines.

In *angklung*, two or three tubes are held loosely in rattan frames. When the frame is shaken, the tubes (generally tuned an octave apart) produce a tremolo sound. *Angklung* sets are still used by the 'Baduy' people of Kanékés (and other rural communities) to accompany ceremonial dancing during rice-planting. The *angklung buncis* ensemble combines nine *angklung* with *Tarompét* (oboe), *Kendang* (double-headed barrel drums) and gong; it is used in ceremonies in honour of Nyi Pohaci or in circumcision parades. Formerly, *angklung* were usually tuned to *saléndro*. Since independence, *angklung* in Western tuning have been extensively used in state music education. Since one player can comfortably manipulate only two or three notes, they are played on the same principle as hand-bells.

Lisung, a hollowed-out log for stamping rice (see [Lesung](#)), is played with poles as a slit drum in the fertility ceremony known as *gondang*. The interlocking structure of the music is dictated by the necessity of taking turns to bring the heavy stamping poles down on the rice. The sides of the trough are struck in faster patterns by smaller sticks to decorate the rhythm. *Dogdog* are a set of long, single-headed cylindrical drums of different sizes held in the crook of the arm, one to each player. Together with *angklung*, *tarompét*, *kendang* and gong, *dogdog* accompanies *réog*. This folk entertainment combines songs, dance, story-telling and horseplay. *Rebana* or *terebang* are a set of shallow frame drums used to accompany songs of Islamic content. The *bedug* or *bajidor* is a very large double-headed cylindrical drum often found in mosques, which is used as a signal for Islamic occasions, such as the beginning of the fast. At the end of the fasting month, *bedug* are played loud, fast and long. In the genre *adu bedug*, drummers vie with each other to play the most interesting and exciting rhythms.

Non-percussion instruments also play an important role in rural Sundanese music. *Jentréng tarawangsa* is a harvest ceremony still performed in the Sumedang area, in which women dance while offerings are made to appease Nyi Pohaci. It is accompanied by a small, boat-shaped zither called *kacapi jentréng* and a fiddle constructed around a boat-shaped resonator, called the *tarawangsa* or *ngék-ngék*. Like the hull of traditional boats (*parahu*), the body of both instruments is dug out from a log. More modern *kacapi parahu* are much larger and constructed from separate planks.

In the epic narrative genre *carita pantun*, a bard (invariably male, often blind) accompanies himself on a *kacapi* while singing, narrating and providing the dialogue and sound effects. The vocal style is high-pitched and penetrating. Performances, which last all night, would normally be part of a *hajat* celebration. *Pantun* performances can also be used to *ngaruat*: bestow ritual blessing or exorcism on a person, house, or venture etc. There are no young *pantun* performers, and the tradition is in steep decline.

Indonesia, §V, 1(ii): The Sunda of West Java: Genres and ensembles (c) **Tembang Sunda.**

Unlike many of the village genres mentioned above, the accompanied vocal genre *tembang Sunda* (also known as *Cianjuran* or *mamaos*) is thriving, especially as a prestigious pastime among the urban élite. It developed as an aristocratic entertainment at the court of Cianjur in the late 19th century and has roots in the *carios pantun* tradition, the sung poetry of *wawacan* and the gamelan repertoires. The solo singing is low-pitched, highly ornamented, melancholy and introvert. The songs in free rhythm (*mamaos*) may be sung by male or female soloists and are accompanied by a *kacapi parahu* (boat-shaped zither) with 18 brass strings and the *suling tembang*, a long six-hole duct flute of bamboo. The *mamaos* songs fall into four categories: *papantunan* and *jejemplangan* (which are taken from the epic narrative *carita pantun* and always in the *pélog degung* tuning), *rarancagan* (the bulk of the repertory) and *kakawén* (taken from the mood of songs of the *dalang* in *wayang*).

Panambih, the metrical songs that conclude a suite of *mamaos* songs, are normally only sung by women. Many *panambih* derive from the gamelan repertoires. In *panambih*, the ensemble is joined by one or two *kacapi rincik*, smaller zithers that are pitched an octave higher. *Tembang Sunda* commonly uses three tunings: *pélog degung*, *sorog* and *saléndro* (see §(iii) below). With songs in the *saléndro* tuning, the *suling* is replaced by the *rebab*, a two-string spike fiddle normally associated with *gamelan saléndro*. These metrical *panambih* songs are performed without singing in the genre *kacapi suling*.

Indonesia, §V, 1(ii): The Sunda of West Java: Genres and ensembles

(d) Kacapian.

This term is used to embrace a range of different vocal genres accompanied by a zither. They differ from *tembang Sunda* in being the domain of ordinary people, as opposed to the élite. Also, instead of the *kacapi parahu*, the *kacapi siter* is used, a smaller zither of box-like shape, with 20 steel strings and a brilliant sound. It is played by street musicians (usually male, often blind), who accompany themselves singing metrical songs in a high register with yodelling inflection and simpler ornaments than *tembang*. A similar style of accompaniment and singing is found in *janaka Sunda*, an entertainment that generally includes hilarious lyrics and dialogue with a second singer.

The *kacapi siter* is a useful instrument for domestic music making in providing a complete accompaniment on its own; it is also used in *kawih*, songs in which the accompaniment has a regular beat and even metre in which it may also be joined by gong, *kendang* and either *suling* or *rebab*. *Celempungan* is the performance of songs from the gamelan repertory using female and male singers, *rebab*, two *kacapi*, gong and *kendang*, the latter having replaced the *celempung*, the bamboo tube zither that gave the ensemble its name.

The influential composer and teacher Koko Koswara created a new virtuoso style of *kacapi siter* playing to accompany his popular *kawih* compositions, which features rapid figuration and runs, dramatic dynamic effects and complex arrangements; this style is widely taught in state schools.

Indonesia, §V, 1(ii): The Sunda of West Java: Genres and ensembles

(e) Gamelan ensembles.

Bronze is considered to be the best material for making the metal parts of gamelan instruments. Gong smithing is in decline in West Java, and the most highly-prized new instruments are often forged in Central Java, then tuned to suit Sundanese taste. Brass and iron gamelan are very common, as these materials are cheap and easy to tune.

Gamelan saléndro and pélog. *Gamelan saléndro* (named for its *saléndro* tuning) originally came to Sunda from Central Java (see Table 12 for instrumentation). *Gamelan saléndro* is used to accompany *wayang golék* (rod puppet theatre) and, in common with *gamelan pélog*, is also used to accompany dance. *Gamelan pélog* (with the same instrumentation as *gamelan saléndro* but in a different tuning) also originated from Central

Java. It is now rarely heard in Sunda; sometimes *gamelan degung* (see below) is used as a substitute. Some of the top *dalang* (*wayang golék* puppeteers) now use *gamelan selap*, which combines both *saléndro* and *pélog* tunings on elongated instruments. Occasionally *gamelan degung* is used to perform *gamelan pélog* repertory.

TABLE 12: Instrumentation of Gamelan saléndro

<u>Sundanese name</u>	<u>description</u>
goong	Pitched gong of approximately 70 cm diameter
kempul	Gong of 40 cm diameter
jengglong	low-pitched six kettle gong-chime
bonang	medium-pitched ten kettle gong-chime
rincik	high-pitched ten kettle gong-chime
panerus	low-pitched one octave metallophone
saron	medium-pitched one octave metallophones (two)
peking	high-pitched one octave metallophone
gambang	four octave xylophone
kendang	barrel drums (one large, two small)
rebab	two-string spike fiddle
juru kawih	female singer (<i>sindén</i>)
juru alok	male singer

Kliningan is the performance of *gamelan saléndro* pieces without dance or puppets. The term is said to derive from the name of a metallophone resembling the Javanese *gendèr* (with the keys supported by nails, rather than string), which is now defunct. *Kliningan* was once popular at *hajjat* but has now been largely replaced either by the popular social dance *jaipongan* or the more prestigious *gamelan degung*.

In fast, loud pieces for *gamelan saléndro*, the melodic lead is shared by *saron* and *bonang*. In slow, quiet pieces, it is taken by the *rebab* and *gambang* (xylophone), who most closely shadow and cue the *sindén* (female singer, often the wife of the *dalang* or one of the gamelan musicians). Until the mid-20th century, *gamelan saléndro* did not often include a *sindén*, with the gamelan musicians themselves singing or contributing interlocking rhythmic cries (*senggak*). Beginning in the 1960s, the *sindén*, as the only females on stage, started to become the focus of musical and sexual attention, even upstaging the *dalang* at *wayang golék*.

Gamelan has also changed musically to accommodate the *sindén*. Loud, adventurous melodic lines on *saron* or *bonang* are no longer considered appropriate, as they would obscure the singer; instead, the gamelan ripples quietly in standardized interlocking patterns. Uneven amplification often renders the gamelan totally inaudible in performance.

The rhythmic lead is taken by the *kendang* player, who provides cues for starting and stopping, changing tempo or making a transition. In dance or *wayang*, the *kendang* player drums patterns that directly reflect the mood and movement. The largest *kendang* is set at an angle, with the rim of the largest head resting on the floor, so that the player can raise the pitch by applying pressure on the drum head with his heel. Within broad constraints,

the individual *kendang* player has considerable scope for musical variation and subtlety. After the *jaipongan* craze of the 1980s, many drummers transferred the *kendang jaipong* style into other musical contexts, such as *wayang* and *gamelan degung*, despite the protests of conservatives.

Gamelan degung. This small ensemble, found only in Sunda, is said to derive from *goong rénténg*, a small ritual ensemble that is now rare. *Gamelan degung* was originally found only in the palaces of the traditional rulers until after independence, when it was gradually popularized. It has fewer instruments than *gamelan saléndro*, but they have a wider range. The instruments used for the classical repertory (*degung klasik*) are listed in Table 13; for more modern repertory, the following instruments may be added: *kempul* (small gong), *gambang*, *rebab* (replacing the *suling*), two *saron barung* (one octave metallophones playing interlocking figuration) and *kacapi siter*. *Gamelan degung* is tuned to the *pélog degung* scale (see §(iii) below).

TABLE 13: Instrumentation of
Gamelan degung

<i>Sundanese name</i>	<i>description</i>
goong	Pitched gong of approximately 70 cm diameter
jengglong	low-pitched six kettle gong-chime (one octave)
bonang	medium-pitched, 14 kettle, single row gong-chime (two-and-a-half octaves)
cémprés (panerus)	two-and-a-half octave metallophone
peking	two-and-a-half octave metallophone of slightly higher pitch than cémprés (the ranges overlap)
kendang	barrel drums (one large, two small)
suling degung	short four-hole bamboo duct flute

In *degung klasik*, the *bonang* is the melodic leader, playing elaborate melodies that other instruments paraphrase or decorate. The *bonang* is also in rhythmic control: here the *kendang* contributes sparse patterns played with a stick (*ditakol*), which do little to affect the tempo. *Degung klasik* melodies often have phrases of uneven length, rather than the usual four-square metre of most gamelan music. There was no singing in *gamelan degung* until the 1960s, when the influential ensemble of Radio Republik Indonesia in Bandung added a female chorus, following the contour of the *bonang* melody.

In the more recent *degung kawih* style, by contrast, the *gamelan degung* provides a bland and regular accompaniment for the female vocal soloist. Her melody, shadowed and occasionally taken over by the *suling*, provides the musical focus. The *bonang* plays in octaves or in simple interlocking figuration with the *panerus* (*cémprés*). On the *kendang* (here the rhythmic leader) elaborate patterns are played with the hands (*ditepak*). Sometimes as a novelty *degung kawih* is performed by women (though never the *suling* or *kendang*).

Gamelan degung is sometimes used to play pieces from the classical repertory of *gamelan pélog*, with *gambang* and *rebab*. It has also become a vehicle for commercially-successful music such as the works of the *pop Sunda* composer [nano S\(uratno\)](#), and its near-diatonic tuning lends it to combination with Western instruments. Nevertheless, with its aristocratic origins, it is still deemed socially more prestigious than *gamelan saléndro*.

Indonesia, §V, 1: The Sunda of West Java

(iii) Instrumental tunings.

Most Sundanese music is based on pentatonic scales. The most commonly used are *saléndro*, *pélog degung* and *sorog* (or *madénda*). Some of these scales can be used in combination, especially in vocal music.

Traditionally, the different steps of the scale have names that are used across the various tunings. Some of the more common note names are presented in [fig.18](#).

For convenience, musicians refer to the scale steps by the numbers 1 to 5, from high to low. The musical terms high (*luhur*) and low (*handap*) are often used by Sundanese instrumentalists to mean the opposite of what they mean in the West. In notation, subscript dots under ciphers indicate a higher octave (in the Western sense); a plus sign after a cipher lowers a note while a minus sign raises it.

(a) Saléndro.

This scale consists of five roughly equal intervals of around 240 cents each (see Table 14 below for Western approximation of *saléndro* pitches). Exact tunings vary and are often demonstrably unequidistant if measured objectively. Nevertheless, *saléndro* is generally perceived by Sundanese musicians as consisting of equidistant (*padantara*) intervals. This is demonstrated by the way both *gamelan* and *kacapi* players, when accompanying voices of limited range, sometimes transpose music down one pitch without needing to retune their instruments.

(b) Pélog degung.

This scale consists of five unequal intervals. Each *gamelan degung* may have its own slight variation in tuning, but in general the scale might be represented as in Table 14.

(c) Sorog.

In the course of a complete *tembang Sunda* session, the *kacapi* (zither) will be tuned first to *pélog degung*, then *sorog* and finally *saléndro*. These three

tunings are also common in other musical styles featuring *kacapi*. The *sorog* (or *madénda*) scale is closely related to *pélog degung* (see Table 14).

TABLE 14: Gamelan tunings and their western approximations	
Saléndro	5 = C ↓ 4 = 3 = 2 = G ↓ 1 = or B ↑ D E or F ↑ A
Degung	5 = B 4 = 3 = D 2 = F 1 = C G
Sorog (Madenda)	5 = B 4 = 3 = 2 = F 1 = C E G

↓ and ↑ indicate pitches slightly lowered and raised, respectively

A *kacapi* tuned to the *pélog degung* scale can be quickly returned to *sorog* by sharpening all the *panelu* (3) strings by a whole tone. With *gamelan degung* it has become common practice to expand the repertory by having an alternate set of keys and pots tuned to the note *panelu sorog* (3-), enabling the musicians to retune the *degung* to *sorog* by physically removing and replacing all the *panelu* (3).

Indonesia, §V, 1: The Sunda of West Java

(iv) Pitch.

The overall pitch of different *gamelan* tunings varies slightly, within the range of approximately a semitone above or below the tunings illustrated. The pitch of *kacapi* tunings can vary much more radically, depending on the musical style and the singer's capabilities. Over the last 50 years the pitch chosen by *tembang Sunda* singers has lowered by about a 4th.

Sundanese musicians define pitch by the length in centimetres of the *suling tembang* required to play at a particular pitch: a *suling* of about 55 cm will produce a *barang* (1) of A; 57 cm will give *barang* (1) of G; and 61 cm will give *barang* (1) of F.

Indonesia, §V, 1: The Sunda of West Java

(v) Notation.

This plays an unimportant role in the dissemination of Sundanese music. However, the Sundanese music theorist r. machjar angga Koesoemadinata (Pa Machjar) devised a system for referring to the notes by syllables (usually notated as numbers), which has gained wide acceptance among academically-trained musicians over the last 50 years. The syllables and corresponding numbers (from high to low) are *da* (1)–*mi* (2)–*na* (3)–*ti* (4)–*la* (5).

In the *saléndro* and *pélog degung* tunings, *da–mi–na–ti–la* corresponds to *barang* (1)–*loloran* (2)–*panelu* (3)–*bem* (4)–*singgul* (5). In tunings of the *sorog* type, *da–mi–na–ti–la* is transposed, so *barang* (1) no longer corresponds to *da* (1); see Table 15.

This practice obscures the essential intervallic difference between *pélog degung* and *sorog*, in so far as the intervals *na–ti–la* are not the same in both tunings. *Da–mi–na–ti–la* can become confusing in melodies that modulate frequently, and when it is not clear whether ciphers refer to traditional names or to *da–mi–na–ti–la*; it is most useful as a convenient oral shorthand.

Indonesia, §V, 1: The Sunda of West Java

(vi) Form.

Most Sundanese forms are cyclical. On reaching the final note (in gamelan marked by a gong), a piece can be repeated from the beginning any number of times, until an ending or a transition to another piece is made. Sundanese pieces fall into two broad types: *sekar alit* ('small songs'), which are based on a framework of notes, and *sekar ageung* ('large songs'), which are based on a melodic line.

(a) Sekar alit.

These are the most frequently performed songs and consist of one or more gong phrases, defined by a rhythm on the *kempul* (P) and *goong* (G), illustrated in Table 16a.

The hierarchy of destination pitches on which *sekar alit* are based is called *patokan* or *kenongan*. The most important destination pitch is marked by the *goong* (G), while the second most important is the pitch at mid-point of the gong phrase, called *kenong* (N). Next in importance is the pivot note played in between the *goong* and *kenong* notes, called *pancer* (c). Table 16b illustrates the *patokan* in its simplest form.

The various destination pitches are realized in a number of ways by the different instruments. Some play patterns that anticipate the next destination pitch, whereas others may reiterate the previous one. In [ex.21](#), *Sorong Dayung* (which can be played in either *saléndro* or *pélog*), the *goong* pitch (G) is *barang* (1), the *kenong* pitch (N) is *panelu* (3) and the *pancer* (c) is *loloran* (2). The two *saron* anticipate each destination pitch

with interlocking parts that combine as runs, while the *bonang* anticipates and reiterates the *goong* and *kenong* parts, treating the *pancer* as a passing note; other instruments realize the *patokan* with their own characteristic patterns.

Sekar alit can be played at different levels of expansion, called *wilet*, a concept similar to *irama* in Javanese gamelan. If a gong phrase in *sawilet* ('one' *wilet*) lasts eight beats, then a gong phrase in *dua wilet* ('two' *wilet*) lasts 16 beats, and one in *opat wilet* ('four' *wilet*) lasts 32 (Table 16). In the *dua wilet* expansion the *patokan* may be *dilipetkeun*, literally 'folded over'. In *opat wilet* the *patokan* sometimes follows the vocal melody, rather than being a literal expansion of *dua wilet*.

(b) Sekar ageung.

In this form each instrument plays its own characteristic elaboration or simplification of the melody. In *gamelan saléndro* or *pélog*, the melody is most clearly stated by the singers, *rebab* and *gambang*. In *gamelan degung* it is carried by the *bonang*, which also controls the tempo and transitions (usurping the *kendang*). The *sekar ageung* of *degung* sometimes have a strikingly irregular metrical structure: while in gamelan all phrases are eight beats long, in *degung* other phrase lengths also occur.

(c) Mamaos and kakawén.

Another type of formal structure is found in the *mamaos* songs of *tembang Sunda* and the *kakawén* songs of *wayang*. These songs are sung in free rhythm, and the phrase lengths are not determined by a steady beat. In some *mamaos* and *kakawén* the accompaniment played by *kacapi* or gamelan is equally free; the accompanists listen to the cadences in the vocal part and tie in their part with the destination pitches. In other songs the accompaniment consists of patterns with a beat, which are repeated as often as is necessary to fit the vocal part (ex.22).

Indonesia, §V, 1: The Sunda of West Java

(vii) Melody.

(a) Kawih and sénggol.

The *sekar alit* forms usually accompany melodies carried by the singer and *rebab* (or *suling*). Although some *sekar alit* are only used for one specific melody, the more common ones can accompany any number of improvisations and pre-existing melodies. Such melodies are called *kawih*. In gamelan the *kawih* is largely improvised; provided she ties in with the destination pitches, the singer can be very creative in her use of ornament, melodic contour, rhythm, text and even tuning system. In *tembang Sunda* the *kawih* melodies are fixed.

The vocalist, *suling* and *rebab* players have considerable rhythmic freedom in interpreting their melody. Although *kawih* melodies are broadly metrical, often with octo-syllabic texts that reinforce the eight-beat metre of the accompaniment, the timing always subtly side-steps the regular beat. The melody usually reaches the destination pitch at the end of a phrase before the accompaniment does.

The term *sénggol* can be used to refer to a melodic line, a particular turn of phrase or just the flavour of an ornament. Great attention is paid to the finest details of ornamentation, for they determine the style of *sénggol*. *Tembang Sunda* aficionados will mercilessly heckle a singer who uses a slide or grace note considered more appropriate to gamelan.

(b) Vocal scales.

Kawih melodies are rich in notes that lie outside the pentatonic scale played by the accompanying instruments. In pieces in the *pélog degung* and *sorog* tunings such excursions are generally confined to single notes or passing turns of phrase, referred to as *modulasi*, from the Dutch for 'modulation' (ex.23).

In pieces in *saléndro*, the vocalist and *rebab* player often superimpose melodies in *sorog*. The *saléndro* accompaniment (on gamelan or *kacapi*) and the *sorog* melody generally share three destination pitches. Many *sekar alit* are based on combinations of the *saléndro* notes 4 2 1. The *kawih* would then use the *sorog* scale 4 3+ 2 1 5+. In the accompaniment the *saléndro* note 5 or 3 would be treated as a *pancer*, a pivotal note in an unstressed position. The contrast between *saléndro* and *sorog* pitches gives the melody great expressive power.

In pieces based on *saléndro* 4 3 1, the *kawih* would use 4 3 2+ 1 5+. The *kawih* for a more complex piece such as *Rénggong Gancang*, based on the *saléndro* pitches 3 (4) 2 (1), alternates between these two *sorog* scales.

Sekar alit based on 4 2 1 may also accompany *kawih* in the *pélog* scale 4 3- 2 1 5-, while those based on 4 3 1 may use the *pélog* scale 4 3 2- 1 5-. These scales are summarized with Western approximations in Table 17.

TABLE 17: Some of the *sorog* and *pélog* scales found in the *kawih* melodies of pieces in *saléndro*

destination pitches (<i>saléndro</i>):	4	2	1	4	3	1				
approximate Western equivalent	D	G	A	D	E	A				
<i>sorog</i> scale in <i>kawih</i> :	4	3+	2	1	5+	4	3	2+	1	5+
approximate western equivalent	D	E [♯]	G	A	B [♯]	D	E	F	A	B [♯]
<i>pélog</i> scale in <i>kawih</i> :	4	3-	2	1	5-	4	3	2-	1	5-
approximate Western equivalent	D	F [♭]	G	A	C [♭]	D	E	G [♭]	A	C [♭]

Indonesia, §V, 1: The Sunda of West Java

(viii) Dance and theatre.

(a) Martial art and dance.

The martial art *penca silat* (or *maén po*) is popular in Sunda. It is accompanied by two drummers, who play interlocking rhythms on large *kendang*, together with a *tarompét* (oboe) and a small gong. The *kendang* rhythms correspond closely to the movement. A similar ensemble, with an amplified female singer and additional percussion, accompanies the circumcision parade *sisingaan*, in which a small boy sits on a life-sized replica of a lion and is carried shoulder high.

Ketuk tilu was a flirtatious open-air dance in which *ronggéng* (female entertainers) sang and danced, accompanied by one *kendang* player, *rebab*, *kecrék* (small metal plates clashed rhythmically with a beater), gong and *ketuk*, a set of three small gongs. Male dancers would pay the *ronggéng* to dance with them. Because some *ronggéng* also worked as prostitutes, this genre has fallen into disrepute, but respectable stage versions are sometimes still performed. Musically the *ketuk tilu* repertory is rich, featuring vertiginous tempo changes and a wide variety of scales. Many *ketuk tilu* melodies have been arranged and absorbed into the *gamelan saléndro* and *gamelan degung* repertories.

Dancing was an important social accomplishment among the aristocracy before independence. At a *tayuban* (dance party) dancers took turns, selecting the next person to come forward by placing a scarf on his neck. The choreography was spontaneous, and the *kendang* player would accompany the movement. By the mid-20th century, less flexible choreographies in the same style were created and termed *ibing keurseus* ('course dance', i.e. learnt through a course of lessons). In the 1950s R. Tjetje Somantri was the first of a series of choreographers to create new dances that used a wider vocabulary of movements and were intended for stage performance. This *kreasi baru* style often relies on striking costumes and may depict animals or actions, such as the *tari merak* (peacock dance), *tari kupu-kupu* (butterfly), *tari céndrawasih* (bird of paradise) and

tari tenun (weaving). *Séndratari*, large-scale narrative choreographies, are sometimes staged.

Since 1980 the most popular dance form has been *jaipongan*, developed by Gugum Gumbira. He combined dynamic movements from *ketuk tilu* and *penca silat* with the daring and dynamic *jaipong* style of the drummer Suwanda from Karawang, using small, shrill *kendang*. As well as being a stage performance, *jaipongan* has replaced *tayuban* and *ketuk tilu* as a social dance. The ensemble is dominated by the drummer, singer and amplifier. Gugum Gumbira owns the cassette company Jugala, and his *jaipongan* tapes have been important in disseminating and standardizing this genre, often replacing live music. Through the 1990s the *jaipongan* craze lessened, but it is still commonly performed, especially at rural *hajaj*.

(b) Theatre.

Sandiwara is a Sundanese theatre genre that combines spoken dialogue and *gamelan saléndro*. Since the advent of television it has become virtually defunct. More often performed is *gending karésmén* (Sundanese opera), which combines singing, acting, dance and narration with plots usually taken from Sundanese legends. *Gending karésmén* have been composed in a variety of musical styles; those produced by the academic establishment are often in the *kawih* style of Koko Koswara, while others draw on the *tembang Sunda* or *gamelan degung* repertoires. The music usually consists of arrangements of existing pieces, or parts of pieces.

Wayang golék purwa (rod puppet theatre) is the most important Sundanese theatre form, based on stories from the Ramayana and Mahabharata epics that have been adapted to include Sundanese characters. *Wayang* is an expensive venture and has to be sponsored by a wealthy individual or institution. It is usually staged as part of the celebrations of a marriage, circumcision, momentous occasion or anniversary. The general public are normally free to crowd round and watch, and the stage is a magnet for milling hawkers, food sellers, fortune-tellers, tricycle and motorcycle taxi riders and others to ply their trades. Performances usually happen outdoors, beginning in the evening and continuing into the small hours.

The *dalang* (or puppeteer) sits cross-legged at the front of a square, covered stage. Mounted horizontally in front of him are two soft banana tree trunks, into which the spike at the bottom of the central rod of the puppets can be planted. To his left is the large wooden chest in which the puppets are carried to the performance. He cues the *gamelan saléndro* at his back by knocking on the chest with a heavy round piece of wood (*campala*). Suspended loosely together on the side of the chest are several metal plates, the *kecrék*, which produce loud, percussive sound effects during fight scenes. Single-handedly, the *dalang* manipulates the puppets in fights, dances and slapstick, provides the different voices and narration (including archaic language in the formal scenes), sings the *kakawén* (mood songs), improvises jokes and directs the ensemble through rhythmic and verbal cues, for up to eight hours without script, score or stretching his legs.

The *kendang* player is the musical link between *dalang* and gamelan, playing dance patterns, making vicious sound effects or signalling a

transition or the end of a gong phrase to match the movement or action. The gamelan players lend vocal support, laughing at jokes, heckling the bad characters and answering rhetorical questions. *Wayang golék* operates at many levels: as sheer entertainment, as philosophical and religious teaching and as a means of promoting government programmes such as family planning, social satire, benediction or exorcism.

2. Cirebon.

This cultural area of the western Javanese littoral includes (but is not limited to) the municipality and regency of Cirebon and adjacent regencies. A recent population estimate of Cirebonese was five million. The region has a distinctive dialect of Javanese (Cirebon Javanese) and a historical tradition dating back to the late 15th century, when the port-polity of Cirebon was founded as an Islamic sultanate. During the 16th century, Cirebon functioned as a minor point in the Asia-Africa oceanic trading nexus, as well as an important centre for Islamic mysticism and the arts. 'Cirebon' is believed to be etymologically derived from an Old Javanese word meaning 'mixture'. Its lively performing arts, including music, reflect and shape an ethos that is openly and consciously hybrid in orientation. Many artistic idioms and forms are unique to the area, whereas others are related to genres found in the Sundanese highlands to the south and elsewhere in Java.

Music making, as in much of Java, is linked primarily to theatre, dance and processions. Performing ensembles are almost inevitably rurally based, and although the city of Cirebon's royal courts act as occasional sponsors, the vast majority of performances occur in the densely populated towns and villages outside the major cities of the coastal plain, in conjunction with individual rites of passage (weddings, circumcisions) and communal celebrations (e.g. harvest festivals). Music is rarely written down, prompting improvisation; only structure and melodic contour are (relatively) fixed. No genres are purely instrumental; all involve singing or chanting of some sort.

There are two major variants of gamelan, Java's ubiquitous gong-chime ensemble – one tuned to a pentatonic scale known as *prawa*, the other to the heptatonic *pélog* tuning. A sacred *pélog* set in the Kanoman royal court reputedly dates to 1520. *Prawa* is used primarily to accompany shadow puppet theatre (*wayang kulit*) and mask-dance (*topèng*), whereas *pélog* ensembles usually accompany rod puppet theatre (*wayang golèk cepak*), social dance (*tayuban*, *pesta*) and costume drama (*sandiwara*, *masres*). The number of musicians ranges from 6 to 15, playing a variety of metallophones, drums and gongs, as well as singing. (Busking genres, such as the horse trance dance known as *jaran lumping* and the itinerant monkey show known as *topèng kethèk*, employ reduced gamelan ensembles of three or so musicians.) The introduction of sound amplification in the 1950s has contributed to the increased prominence of the female vocalist (*pesindhèn*) in gamelan. Performances featuring gamelan inevitably present classical standards as well as the latest popular songs, requested by audience members. Male spectators, viscerally aroused by lively drumming, frequently dance during shows.

A variety of genres feature frame drums (*rebana*, *terbang*, *genjring*), including *genjring*, *qasidah*, *gembyung* and *brai*. The frame drum is conceived of as an Islamic instrument, and texts sung to the accompaniment of frame-drumming are often in Arabic or treat religious subjects. *Genjring*, which now incorporates electric guitars and gongs, is the best known of these genres. *Genjring* ensembles commonly accompany circumcision processions, as well as an acrobatic display (*genjring akrobat*) inspired by the European circuses that began touring Java in the second half of the 19th century.

A number of rare genres, including trance dances known as *sintren* and *lais*, as well as a processional genre known as *réyog* that formerly featured clowning and folk dramatics, were traditionally accompanied by *buyung*, resonant earthenware jars struck on the lip of their necks. Busking mummers costumed as ogres (*wéwéan*) are accompanied typically by a single drum. Sliding bamboo rattles (*angklung*) are associated with a singular ritual dance known as *angklung Bungko*. The practice of unaccompanied singing of poetic literature in Cirebon Javanese (*bujanggaan* or *macaan*, the poor man's alternative to sponsoring costly theatrical troupes) has largely disappeared, along with a number of other minor performance genres, since the advent of tape recorder rental services catering to entertainment needs in the 1970s.

Cirebonese music changed greatly during the course of the 20th century. A nascent version of the comic operetta form today known as *tarling* (from *gitar* and the *suling*, the two most prominent instruments in its musical ensemble) was created by Sugra (1921–99) in 1933. *Tarling* was originally a purely musical form, featuring both guitar and impromptu gamelan instruments, with traces of jazz harmony and *kroncong* ballad singing (see §VIII, 1 below). In subsequent years, *tarling* incorporated story-telling, clowning and drama. *Dangdut*, a pan-Indonesian musical genre inspired partially by Indian film music, had a huge impact on the musical life of Cirebon starting around 1977. It was not long before *dangdut* infused nearly all of Cirebon's musical genres, spawning numerous hybrid forms such as *tarling dangdut* (the generic name for Cirebonese popular music). Sundanese *jaipongan* dance music has also been influential; since the 1980s, mastery of the *jaipongan* idiom has been requisite for drummers in gamelan ensembles. The latest significant generic development has been the inception of *organ tunggal* (solo synthesizer) around 1996, an enormously popular musical concert form with a pared-down *dangdut* ensemble (often a solo keyboard player) and several singer-dancers.

The audiocassette industry has been a crucial development, beginning in 1972. Recordings of both classical and popular musical idioms, as well as dramatic forms, are widely consumed: popular music albums with lyrics in Cirebon Javanese produced by companies based in Jakarta, Bandung, Semarang and Cirebon can sell up to 100,000 copies. Popular music gets much play on local radio, and popular music videos became increasingly visible on provincial and national television during the 1990s, contributing to the superstar status of vocalists such as Itih S. Popular music karaoke audiocassette tapes and other technology are currently widespread.

Music making is seasonal work. There are few performances during the rainy season, for example, and as certain months are considered more auspicious than others for holding ritual celebrations, the frequency of performances varies greatly. Most musicians supplement their income by trading, farming or home industry. During the nights of Ramadan, the Islamic fasting month, villages thrum to the sounds of *obrog-obrogan*, musical processions combining both strictly amateur and highly professional musicians. These roving ensembles nominally wake up sleeping villagers for the prefast meal but also provide entertainment for the masses and vital training for musicians. Many musical genres are represented.

There are a number of well-known (though underpaid) composer-lyricists of *tarling dangdut* songs who are frequently *tarling* producer-actors, including Yoyo Suwaryo (b 1957) and Pepen Effendi (b 1955), whose compositions are prominent on commercially-produced audiocassettes. Some popular songs, such as the now-classic *Warung Pojok* ('Corner cafe') by H. Adul Adjib (b 1942), have catapulted to national attention. Composers writing in other idioms tend to be less recognized for their efforts.

Indonesia

VI. Sumatra

Sumatra is one of the largest islands of the Indonesian archipelago. The Barisan mountain range runs the length of the island, dividing the mangrove forests, peat and freshwater swamps and tropical forests of the east from the narrow coastal region of the west. Culturally, Sumatra's dozens of ethnic groups present a picture of great diversity. For over 1000 years, small-scale forest-dwelling or nomadic societies have co-existed with kingdoms, often trade-based and situated on the coasts. Since ancient times, Sumatra's strategic position in the Asian sea lanes brought it into contact with traders from India, the Middle East and China, whose religions and cultures have marked its societies. More recently, the presence of the Portuguese in the Straits of Malacca (from 1511) and incursions by the British and Dutch in the 19th century introduced Christianity and Western cultural and musical influences.

Ethnomusicological research on Sumatran music has yet to do full justice to this diversity. Much research has focussed on the most populous province, North Sumatra, with important studies on the traditions of West Sumatra and to a lesser extent on those of Riau. Far less is known about music in the southern provinces (Jambi, South Sumatra, Bengkulu and Lampung); hence for most Sumatran ethnic groups no detailed ethnomusicological studies have been published. Given such a wealth of musical variety and a dearth of documentation, this article presents a broad overview of styles and instruments, then focusses on a few of the better-documented traditions. Studies of traditions not mentioned in the text are listed in the bibliography, while Kartomi (*GEWM*, iv) summarizes much unpublished research on Sumatran music.

Indonesia, §VI: Sumatra

1. Overview.

Music in Sumatra reflects the island's long history of migration and trade, both internally and with other areas of Indonesia and Asia. It is tempting to divide Sumatran music into historical strata corresponding to major periods of foreign influence, such as pre-Islamic, Islamic and European-influenced genres. However, this is not a reliable guide to either the sound of a musical genre or its socio-cultural context. Music for the Melayu (Malay) *zapin* dance, for example, is associated with Arab influence and is sometimes played on the *'ūd* lute, yet some of its core repertory sounds no less Western than some of the so-called European-influenced Melayu music and is surrounded by magical beliefs like the so-called indigenous genres. The *korps musik* brass bands of the Toba Batak play Western hymns, yet they are integrated into the ritual oratory and communal dancing of Toba ceremonial precisely like the *gondang sabangunan* ensemble. In the Melayu *ronggeng* tradition, nominally classified as part of the post-Portuguese stratum, European-type diatonicism co-exists with Chinese-sounding pentatonicism and augmented 2nd tetrachords of the *hijaz* type (see Mode, §V, 2).

Rather than privilege historical origin as the key classificatory feature, the following commonalities may be noted.

(a) Choral singing is often performed by single-sex groups (usually male). In Muslim societies it is often tied to Islamic devotional themes (e.g. Melayu *marhaban*, Minangkabau *indang*, Gayo *saman* and Nias *hoho*).

(b) Laments (Toba *andung*, Gayo *sebuku*, Alas *tangis dillo*, Nias *fabölösi*) are sung at funerals, by the bride at weddings or by mediums to communicate with the spirit world.

(c) Percussion-dominated ensembles range from a rack of gong-kettles played by one to three people, through to larger ensembles with drums and/or hanging gongs, which can also include aerophones. Common sub-types include the family of gong-kettle ensembles exemplified by the Minangkabau *talempong*, the Melinting (Lampung) *kulintang* and the Abung *tabuhan*, often played by women. These tuned, bossed kettles, played in interlocking fashion, are usually made of brass or bronze, though among the Alas of Aceh sardine cans may be pressed into service. Often the musicians distinguish a nominally invariable ostinato part (sometimes called *penyelalu*) from a more variable part (*peningkah*). The drums of the drum-based ensembles are also played in interlocking fashion by several musicians, though in some cases a single musician plays melodically on the entire set. In many cases the repertory of both kinds of ensemble can also be played (or at least practised) on a solo xylophone.

(d) Flutes (usually rim-blown or end-blown) sometimes accompany singing and are often associated with narrative poetry, love-magic or laments (e.g. the Toba *sordam*, the Minangkabau *saluang sirompok*, the Nias *zigu* and the Petalangan *sempelong*).

(e) Entertainment music, often accompanying social dances, sometimes combines hand drums with violins and accordions (and more recently, amplified instruments).

(f) Song texts often take the form of *pantun*, stanzas (usually *ABAB* rhyming quatrains) known under various names in many Indonesian languages. They consist of two equal sections: the first (*sampiran*) generally makes an impersonal statement, often a description of nature, while the second (*isi*), rhyming with the first and sometimes syntactically parallel to it, may contain a first-person statement of feelings, an address to the listener or a moral exhortation or reflection on life.

These categories omit more than they include. Not only are there many unique instruments and various ensembles unclassifiable under the foregoing rubrics (the Nias bamboo buzzer, *duri-dana*, the Mandailing earth-zither, *gordang tano*, the Minangkabau giant lithophone, *alu bakatentong*), but this schema ignores the musical practices of the more-or-less distinct immigrant communities of Chinese, Indians and Javanese. The influence of the latter can be seen in the presence of Javanese folk theatre (*ketoprak dor*) in North Sumatra and the hobby-horse trance dances (*kuda kepang*) found there and also among the Rejang of Bengkulu.

Indonesia, §VI: Sumatra

2. Selected musical cultures and regions.

(i) Batak.

These seven North Sumatran groups (Toba, Karo, Simalungun, Pakpak (Dairi), Angkola and Mandailing) have related but distinct languages, customs and traditional arts. The Batak groups are divided by religion (the Mandailing are Islamic, the Toba Christian) and to some extent by language (Toba and Karo in particular are mutually unintelligible), though they share a principle of social organization based on exogamous patrilineal clans.

Music plays an important role in life-cycle ceremonies; indeed, the word for 'ceremony' (*gondang* in Toba, *gendang* in Karo) is also a central musical term, meaning drum, ensemble and musical composition. The central ceremonial activity is a series of dances (Toba *tortor*; Karo *landek*) by several groups of dancers, each usually representing a clan with a definite relationship to the host or some other kind of corporate group (e.g. church, youth-group). Musicians are necessary to accompany the dancing, but they are also considered to be intermediaries between the celebrants and the Creator. The dancing is often preceded by a sort of musical prayer, the ritual sounding of a medley of several compositions (or fragments thereof) played without pause (e.g. the Toba *si pitu gondang* or the Simalungun *gonrang parahot*).

(ii) Toba.

The *gondang sabangunan*, an ensemble of drums, oboes and gongs, is the most prestigious accompaniment for Toba ceremonies. Originally heard only at major life-cycle ceremonies held outdoors and lasting for several days, it now accompanies more modest, indoor events as well. The gongs (*ogung*), two suspended and two held against the players' laps or chests, maintain a rhythmic ostinato. At least one player of the *sarune bolon* (double-reed aerophone) is essential. The *gordang*, a large, low-pitched, single-headed drum, maintains a rhythmic ostinato, and the *hesek-hesek* (a broken hoe blade or a beer bottle) keeps a steady beat. The *taganing* drum-chime, a set of five tuned drums played with sticks, sometimes plays a similar rhythmic role, but it can also follow the melodic line of the *sarune*. The five principal pitches of the *sarune* vary from one instrument to another but are roughly comparable to the first five tones of a diatonic scale. They are mapped onto the more expansive range of the *taganing*, whose five tones are separated by intervals closer to Western 4ths, major 3rds and minor 3rds. Hence a *gondang* composition played in this fashion presents two simultaneous melodic lines of near-identical contour but highly contrasting pitch content.

The *taganing* player's choice of rhythmic ostinato versus melody seems to be determined by a variety of factors; some *gondang* do not permit melodic playing, while some ceremonial performance contexts demand rhythmic ostinato. However, as melodic playing is considered more virtuoso, there may be a tendency for it to be applied to increasing numbers of *gondang*.

The *gondang hasapi* ensemble features one or more *hasapi* (two-string lutes) and *sarune etek* (small clarinets); other instruments, such as the *garantung* (xylophone) and *sulim* (transverse flute), may also be used. Its repertory is identical to that of the *gondang sabangunan*. Indeed, when several *hasapi* are present, those that play the melody (as opposed to a constant rhythmic strumming) are distinguished by the term *hasapi taganing*. Considered to be the proper accompaniment for smaller indoor ceremonies, the *gondang hasapi* ensemble has in fact been replaced for most public purposes by the more prestigious 'outdoor' ensemble, *gondang sabangunan*. The *gondang hasapi* ensemble remains in use for curing ceremonies and plays an important role in the worship of the Parmalim sect.

Uning-uningan refers to the entertainment music performed by the expanded *gondang hasapi* ensemble. Although it may include light-hearted pieces from the ceremonial repertory, most of its music comes from *Opera Batak*, the popular Batak theatre associated with Tilhang Gultom (1896–1970). Some of the melodies stay within the five-tone range of the *gondang hasapi*, but most *uning-uningan* use the full ambitus of the Western major scale.

Toba *gondang* compositions can be analytically classified into two broad categories: paired-phrase and motivic. Paired-phrase *gondang* consist of a sequence of phrases, each of which is played twice (e.g. *AABBCCDDEE*). Usually each phrase lasts an even number of gong-cycles and is typically composed of two similar sub-phrases. Motivic *gondang*, by contrast, consist of a sequence of very short motifs, perhaps two or four beats long.

Each motif is repeated several times before proceeding to the next. The number of repetitions is not precisely fixed: when a large *gondang hasapi* ensemble performs one of these *gondang*, there is sometimes a 'tug-of-war' between the players who move quickly from one motif to the next and those who wish to linger over each one.

In a ceremonial context, each round of dancing is introduced by a speech on behalf of the clan represented. In their role as *patoruson* (intermediaries who convey human speech to God), musicians interact with the orator, punctuating his prayers with rhythmic flourishes. Each speech ends with a request for the musicians to play a composition (*gondang*). This request may be explicit, highly allusive or even cryptic; it is part of the musicians' skill to intuit or deduce the proper piece. Possibly as a result of this practice, the association of titles with *gondang* is highly variable among Toba musicians.

The Lutheran missionaries who converted the Toba in the 1860s also introduced brass bands to play hymns, and by the 1920s there were enough Toba musicians experienced with these instruments to form their own bands (*korps musik*). Now sometimes augmented by drum kit, electric guitars and keyboards, these remain popular in the Balige and Laguboti areas, where they often replace the *gondang sabangunan* at life-cycle ceremonies. The traditional oratory is unchanged but is now punctuated by guitar riffs or synthesizer glissandos instead of the *taganing* rhythmic flourishes. The orator continues to request *gondang* compositions in the usual way, but the band responds with hymns or folk tunes.

Laments (*andung*) are sung by both men and women. Primarily used to mourn the dead, they are also sung while herding, courting, working in the fields or before tapping palm-wine. The number of people singing laments at a funeral is a measure of the prestige of the deceased. Some people are respected for their ability at *andung*; these have mastered the special vocabulary of the lament (about 500 items), can recount the life of the deceased and are thought to have experienced much suffering.

The rim-blown bamboo *sordam* flute is attributed magical attractive powers, and its two main uses depend on this belief. The *datu* ritual specialist plays the melodies of *andung* laments upon it to summon spirits. Similarly, young men seeking to bewitch a girl use it for love magic: the sound of the *sordam*, played in the fields at night, will wake the desired girl and force her to seek the player.

(iii) Karo.

The *gendang lima sedalanen* ensemble is the major musical accompaniment for Karo ceremonies. In striking contrast to the equivalent Toba ensemble, its instruments range in size from the small to the tiny. A *saruné* (oboe) about 25 cm long carries the melody, punctuated by strokes on two hanging gongs, while rhythmic backing is provided by two double-headed drums, *gendang singindungi* and *gendang singanaki*. These thin drums are held by the players' feet against their thighs and played with short bulbous sticks. On the *gendang singanaki* (which plays a rhythmic ostinato) is mounted the *gerantung*, a miniscule drum about 13 cm long. The lead drum, *gendang singindungi*, plays virtuoso variations. The skin is

stretched on a ring-shaped frame deliberately lashed loosely onto the drum's wooden body; this allows the drum strokes to modify the tension of the head, and hence the pitch produced. Rim shot strokes, in striking both the skin and the frame, leave the tension unmodified; strokes on the skin alone pull on the frame, reducing the tension and lowering the pitch. By combining these strokes, a skilful player can produce an extended downward glissando.

The *kulcapi* two-string lute was until recently used only by storytellers, for ceremonial purifications or to appease the spirits. It was not played with drums but with the *keteng-keteng*, a bamboo idiochord zither. Over the past few decades the *kulcapi* has taken over the repertory of the *gendang lima sedalanen*; it is often used to accompany life-cycle ceremonies as well as the social dances for unmarried youths associated with harvest festivals (*guro-guro aron*).

The rim-blown *surdam* flute is used by storytellers, by the *guru belin* (spirit medium, healer) to summon back a patient's wandering spirit (*raleng tendi*) and by young men to enchant girls.

Like the Toba tradition, the Karo repertory contains both compositions with fixed melodies and motif-based pieces. The *perkolong-kolong* songs of professional singers belong to the former category, except for the best-known example of the genre, *Simalungun Rayat*, which is also played by the ceremonial *gendang lima sedalanen* ensemble.

(iv) Mandailing and Angkola.

All Mandailing ceremonial ensembles include drums, large and small gongs, cymbals, single-reed *sarune* aerophones and an optional vocal part. The *gordang sambilan*, using nine tall drums, is the largest and most prestigious. It is played only on special occasions: for the wedding of a village chief's daughter, for example, or to bring rain during a drought. It is installed in a special pavilion and 'inaugurated' by the highest ritual authority before it may be played. The drums are mounted so that the drumheads are at or near eye-level, and the players stand while playing. The drummers often dance to their interlocking rhythms; special offerings are prepared to prevent them from falling into trance. Playing the *jangat* (lowest-pitched drum) demonstrates not only musical skill but also leadership potential: the vigour and confidence with which the drummer beats out cross-rhythms demonstrates the force of his personality and earns him respect.

Smaller and less prestigious ensembles with ceremonial functions are the *gordang lima* and *gondang dua* (also called *gondang boru*), featuring five and two drums respectively. The *gondang bulu* is a bamboo idiochord zither, used for practising the music of the *gondang* and *gordang* ensembles and to accompany girls practising *tortor* (dances).

(v) Simalungun.

The two major ceremonial ensembles both use large and small gongs, the double-reed *sarunei bolon* and optional cymbals, but are distinguished by the number of drums: the *gonrang sidua-dua* employs two, the *gonrang*

sipitu-pitu (also called *gonrang bolon*), seven. As with the Mandailing, the larger ensemble is associated with larger ceremonies, though there are exceptions. For example, at a royal funeral the *huda-huda* masked dances must be accompanied not by the prestigious *gonrang bolon* but by a modified *gonrang sidua-dua* ensemble, to reinforce the humorous effect of the dancing.

To a great extent repertory is common to both ensembles and also to the seven-key *garantung* xylophone, which can be used to practise the *gonrang* repertory.

(vi) Pakpak (Dairi).

Similar to the Mandailing and Simalungun, ceremonial ensembles among the Pakpak (Dairi) exist in different sizes, appropriate to different-sized events. The chief distinguishing factor is the number of drums: the use of two, five, seven or nine drums defines the different types of *genderang* ensemble (suspended and hand-held bossed gongs and cymbals are common to all). Cognate to the Toba and Simalungun *garantung* xylophones is the *kalondang* xylophone, sometimes played with the *kucapi* lute.

Unique to the Pakpak is the *gerantung*, an ensemble of four flat gongs played melodically by a single player and accompanied by a set of bossed gongs. Also notable is the *botul*, a horizontal rack of five to nine small knobbed gongs, to which cymbals and three suspended gongs are added to form an ensemble of the same name. This, North Sumatra's only gong-chime ensemble, is found only where Pakpak territory borders on Karo or Toba areas. It is played to accompany self-defence dances. It is like the *talempong* gong-kettle ensemble, though its curious name has not been explained; Van der Tuuk, whose definition of *garantung* fits the modern Pakpak instrument and not the Toba, lists *botul* as the 'true' variety of *gerantung* (B1861, p.384).

Indonesia, §VI: Sumatra

3. Melayu.

Defining a Melayu (Malay) ethnic identity is not straightforward, since the various criteria that have been proposed sometimes conflict. Confessional and cultural criteria, according to which a Melayu is someone who professes Islam, speaks Malay and holds to Malay customs, are especially attractive to those close to the institutions of spiritual and temporal authority. Genealogical criteria are attractive to the common people, especially those of island Riau, some of whom do not even profess Islam. The historical use of Malay as a trade language throughout the archipelago and the spread of Islam made it relatively easy for people to identify as Melayu, in the cultural sense. The following examples illustrate two highly contrasting Melayu societies; the Petalangan of the Riau forests have a clear genealogical claim to Melayu descent, whereas the Melayu of the east coast of North Sumatra include descendants of several ethnic groups, and many of these musicians are Karo, Banjarese, Javanese, Sundanese or Minangkabau by genealogy.

(i) Petalangan.

This group of about 20,000 forest-dwelling swidden agriculturalists lives around the Kampar river in the interior of Riau and was once affiliated with the Melayu kingdom of Pelalawan. Their vocal music includes epic songs (*nyanyi panjang*) and songs used in the honey-gathering ceremony (*menumbai sialang*). Notable among their instruments are the *sempelong* (flute), *gambang* (xylophone), *calempung* (gong-chime), *gondang* (drums) and particularly the *ketobung* (shamanic drum).

The rim-blown bamboo *sempelong* flute is associated with love-magic. A *sempelong* especially equipped with magical attractive powers (*sempelong pitunang*) is made by boring each of the fingerholes after the death of a child. The sound produced by these holes represents the crying of the dead children, which is thought to waken the maternal instincts of the girl the player wants to bewitch. Even played without seductive intent, the *sempelong* was considered dangerous: men were forbidden to play it near cultivated rice-fields, since someone else's wife might hear it and be tempted.

The gong-chime (*calempung*) and xylophone (*gambang*) share repertory. Each can be played by a single player or by two players in *penyelalu-peningkah* fashion. They may also be added to the *silat* ensemble, which features a pair of double-headed drums (*gondang*) playing interlocking rhythms also in the *penyelalu-peningkah* style.

Essential to the *belian* healing ritual is the double-headed *ketobung* drum. Unlike the paired drums of the *silat* ensemble, only one *ketobung* is used, played by two people: one sounds the *penyelalu* part on one head with bare hands, and the other produces the *peningkah* part on the other head with a cane beater. The *ketobung*, which symbolizes the human body as well as the 'tree of life', can be made only by specialists versed in esoteric knowledge and is used only in shamanic rituals. It accompanies the various stages of the shaman's ascent to the invisible realm with specific rhythmic patterns (50 in all).

(ii) The Melayu of North Sumatra.

Those on the east coast have some genres similar to those of the Petalangan (for example the *gambang* xylophone played by one or two women), but their most distinctive tradition, shaped by the polyglot, multicultural history of the region, is that of the *ronggeng*, the professional female singer-dancer who dances on demand with men from the audience and exchanges sung verses with them.

Ronggeng songs are accompanied by an ensemble of violin and one or more frame drums; nowadays an accordion is also added, whereas the suspended gong, previously common, is becoming rare. The melodies can be categorized into four groups, based on the rhythmic pattern (*rentak*) that accompanies them; in order of increasing tempo, they are *senandung*, *mak inang*, *lagu dua* and *patam-patam*. *Patam-patam* is an instrumental form associated with self-defence movements, but the other genres all use *pantun* as song texts. These are the so-called original or authentic (*asli*) Melayu forms, but professional *ronggeng* must be prepared to sing whatever tunes the male guests request, so many of them can also sing

Javanese, Sundanese, Toba, Karo and Indian songs in the original languages.

The *ronggeng* repertory is often described as indebted to European influence, possibly because of the presence of the violin, the diatonicism of many of the melodies, the use of Western tonality terminology by musicians and the current use of chordal accompaniments. It is clear, however, that Western musical concepts (for example, tonal analysis) are of limited value in understanding this repertory. Indeed, many musicians are as well-versed in the theory of *maqām* (known as *hawa* among the Melayu) as they are in the nomenclature of Western tonality.

Most songs can be divided into two parts, one or both of which are repeated; in *senandung* they are termed the *ujung* and the refrain or *pecah* (the term *pecah* or *pecahan* is more commonly used to refer to the *lagu rentak*, the fast-tempo dance tune that follows the *senandung* in a medley). Often, though not invariably, this bipartite melodic structure corresponds with that of the *pantun*: the *sampiran* is sung to the *ujung*, and the *isi* is sung to the *pecah*. Some songs also have a *senter*, a section the text of which lies outside the *pantun* structure. It may be an invariable refrain or a two-line *pantun*-like verse; in either case, the name of the song is usually worked into its text.

The contrast between symmetrical phrasing and motivic construction noted for Batak music is also present in Melayu music. All of the slow and moderate tempo songs are made up of fixed-length phrases, but some fast-tempo dances consist of a series of short motifs repeated ad lib. In one case, *patam-patam*, this may derive from Batak traditions (*patam-patam* is also the name of a repertory item in Karo music). However, other types such as the dance tune *Pulosari* do not draw on the Batak tradition in their musical style. Whereas today *Pulosari* is commonly played in a fixed arrangement by the composer Lily Suheiry, it was originally a sequence of eight to nine short motifs, each corresponding to a dance step, played in no set order and with each repeated and embellished as needed; only the opening and closing phrases were fixed.

The role of Western musical influence on the formation of the *ronggeng* repertory may be difficult to determine precisely, but its latter-day presence is well documented. The cosmopolitan plantation society of the east coast supported dance bands, and the Delische Kunstkring (founded 1912) brought Italian opera and the Budapest String Quartet to Medan. The Melayu rulers also supported Western music: the Sultan of Langkat had a palace orchestra boasting 20 violins, led by a Singapore-trained musician, while the band of the Sultan of Serdang (complete with trumpets, clarinets and bass drum) toured as far as Aceh. Melayu musicians entertained at Medan hotels, where they found Melayu melodies could be set to the beat of foxtrots, tangos and other popular dances.

The music most Indonesians commonly identify as Melayu is *dangdut*, which until the 1980s was associated chiefly with the urban lower classes. *Dangdut* groups are known as *orkes Melayu*, but Melayu musicians consider it a musical descendant of only one specific sub-type of Melayu music: *calti*, an Indian-influenced genre imported to Sumatra around the turn of the 20th century.

Indonesia, §VI: Sumatra

4. The islands of Nias and Mentawai.

(i) Nias.

In contrast to Batak societies, the most prestigious genres of ceremonial music in Nias are entirely vocal. *Hoho*, the most important of these, is performed at wedding feasts, funerals, war dances and other public occasions by a male chorus consisting of one or two song leaders (*sondröro*) and 4 to 24 chorus members. The *sondröro* (most of whom belong to the nobility) must have a broad knowledge of Nias customs and oral history, a gift for effective storytelling, and must be able creatively to rearrange traditional material and adapt new material appropriate to the performance circumstances. *Hoho* is sung in a significantly higher register than most other Nias vocal genres.

Notable among Nias instruments is the *duri-dana*, a bamboo tuning-fork. This idiophone-aerophone is 30–60 cm long and played in pairs, with one held in each hand; the long prongs of the forks are struck alternately against the bony part of the player's knee. The pitches of the two instruments of a pair are separated by a semitone, tone or minor 3rd. Covering the fingerholes on each instrument lowers its pitch by a major 3rd, giving the player access to four pitches. The *duri-dana* is played for personal amusement, sometimes accompanied by the end-blown bamboo flute, *zigu*.

(ii) Mentawai.

Music here also relies relatively little on instruments. The *tudukkat*, a wooden clapperless bell, is kept in each clan house. It can be played for amusement but also functions as a signalling device, using a system of speech surrogacy in which each of its three tones represents certain vowels. Most musical activity, however, takes the form of songs (*urai*). These encompass dance songs (*urai turuk*), songs of longing (*urai pagalangan*) and songs of the *sikerei* ritual practitioners (*urai kerei*). The latter may only be sung within a ritual context. Some of these songs praise the *sikerei* spirit familiar; others are used to summon back the wandering spirit of a sick person, to placate animal spirits or for other curative purposes.

Indonesia, §VI: Sumatra

5. Minangkabau.

West Sumatra, the homeland of the Minangkabau people, is divided geographically and culturally into two regions, the *pasisie* (coastal plains) and the *darek* (highlands).

Traditional Minangkabau instrumental music includes several varieties of gong-kettle ensemble, ranging from the *gandang aguang* (which includes large hanging gongs and double-headed drums) to portable ensembles used for processions. Generically known as *talempong*, these ensembles fall into two types. In the *talempong duduak* the gong-kettles are arranged on a rack, where they can be played by a single seated musician (or two, in *penyelalu-peningkah* formation). This form, strongly associated with

women, is now rare, but the hand-held *talempong pacik* is still commonly used for occasions such as weddings, circumcision ceremonies and *randai* dance-theatre performances. The kettles (usually six) are played by three or four musicians; players are limited to a repeated one- or two-note figure that they may vary, producing a bright, rhythmically-active figuration. There is also a third, modernized form of *talempong*: the choreographer Achiar Adam tuned it to the Western scale and gave it Melayu-style melodies to accompany his stage arrangements of traditional dances.

There are several forms of vocal music, including religious genres (such as *salawat dulang*) and narrative ones (*kaba* such as *sijombang*, *dendang Pauah* and *rabab Pariaman*; see *Music of Indonesia*, vi (F1994) and xii (F1996) for examples). Of special interest is the tradition of *dendang* songs accompanied by the *rabab* bowed lute or by various types of flute. In the highland areas the instrument most often used for this purpose is a five-tone rim-blown flute, the *saluang darek*, played with circular breathing (*salisiah angok*). There is no standard tuning; its five tones fit into an approximate 5th, more or less equally spaced. Recently, the state music academy in Padang Panjang has tried to tune *saluang* to the first five tones of the Western major scale.

Both men and women sing *dendang*, though not in chorus: it is almost entirely a solo art. *Dendang* do not have fixed lyrics; the singer is free to choose or invent *pantun*. The *saluang* follows the vocal line heterophonically, sometimes providing interludes while the singers pause. *Dendang* melodies associated with the highlands remain within the *saluang* five-tone range, but *dendang* of the coastal plains are heptatonic; when one of the latter ascends beyond the flute's highest tone, the *saluang* sustains its highest pitch. *Dendang* can be categorized by the tonal focus of their melodies, but probably the most culturally salient associations of the tunes are geographic and affective. *Dendang*, even those known throughout West Sumatra, are linked to specific localities; indeed, many of their titles are simply place-names. More generally, the tunes are classified by their emotional content into free-metre 'sad' tunes (often called *ratok*, laments) and fixed-metre 'cheerful' ones.

An evening's entertainment, consisting of *dendang* sung by a singer and accompanied by musicians specially engaged for the purpose (or playing as street musicians) is called *bagurau* (a general term covering all performances or gatherings for pleasure). *Bagurau* can be held for various traditional ceremonies but also for fund-raising, and in some public places one finds informal *bagurau* sessions with singers and musicians playing for tips. Audience members are often involved in these sessions as the object of singers' flirtatious lyrics, but they can also play a more active role by passing notes to the singers and asking for certain messages (directed at other audience members) to be incorporated in their *pantun*.

Indonesia, §VI: Sumatra

6. Aceh.

The three major ethnic groups are the Acehnese of the coastal lowlands and the Gayo and Alas of the central mountains; the languages of the latter two groups are related to that of the Karo.

(i) Acehnese.

The arts of the lowland dwellers include the now-rare *geurimpheng*, performed by a row of seated men who sing and play *rapai* frame drums, with choreographed movements of the arms and upper torso. The *biola Aceh* genre is a quasi-theatrical amusement featuring a solo violin, sometimes accompanied by *rapai*. Two singer-dancers act out humorous skits of family life and sing love songs; the violin player (the director) may also sing.

The best-known Acehnese art, however, is the men's dance *seudati* and its related female form, *seudati inong* or *laweut*. *Seudati* is performed by eight men, accompanied by their own singing and that of two or more *aneuk syahi* (singers). There is no instrumental accompaniment, but the dancers produce their own rhythms by snapping their fingers and slapping their chests just below the ribcage. In recent decades, the dancers have worn long-sleeved undershirts to lend a crisp, loud attack to the body-slaps.

Seudati is usually performed as a competition between two groups (*seudati tunang*). The groups are judged on precision of ensemble, volume of hand-slaps and on the wit of their ripostes. The lyrics for *seudati* are said to have originally been religious, though some of the words have become so garbled as to be incomprehensible. Romantic poetry is mixed with topical references to local grandees or to the host for the evening; the New Order government also encouraged *seudati* singers to promote government programmes such as family planning.

A complete *seudati* performance has seven sections. The first two, the *saleum* and *saleum rakan*, are greetings, performed by each of the competing groups in turn. The core of the performance is the subsequent sequence of five sections (*bak saman*, *saman*, *kisah*, *syahi panyang* and *lanië*) performed by one of the groups, then answered by a similar sequence from its rival. The *lanië* closing section is accompanied by folksongs, or even by popular songs; the dancers may mime to the words of the song.

The last three verses of each section are performed double-tempo, as a signal for the ending. Each section stops suddenly as the dancers freeze in tableaux; there is then a brief pause before the dance continues.

(ii) Gayo.

Inhabiting the highlands of central and south-eastern Aceh, the Gayo can be divided into two cultural and linguistic sub-groups, the Gayo Lut of the Lake Tawar region and the Gayo Lues (their neighbours 160 kilometres to the south). The performing arts of these two groups are represented here by the discussion of *didong* and *saman*, respectively.

Didong is a contest of solo and choral song, performed by two all-male (sometimes all-female) groups who accompany themselves with handclaps and percussive slaps on small square cushions. Before the 1940s traditional melodies were used to present texts elaborating Gayo cultural values or riddles referring to Gayo customs. After the Indonesian Revolution, however, new themes emerged (e.g. narratives of personal

experience or historical events, patriotic or romantic poems), and individualized melodies were composed to fit the more complex prosody of these texts. The competitive element of *didong*, previously expressed as rivalry between villages, was then generalized to the larger political competition between Bukit and Cik, the two precolonial domains of Gayo Lut.

Saman is a competitive performance by 15 or more men kneeling in a tightly-packed row, which combines song, hand gestures and head and torso movements. There is no instrumental accompaniment: the rhythms are emphasized by handclaps, fingersnaps and handslaps on the thighs and chest.

The history of *saman* is obscure, but its sung repetitions of the name of Allah suggest an origin in the *ratib*, a group form of *zikir* (the chanting of the names of God, the Confession of Faith or praises to the Prophet). As performed by Sufi mystical brotherhoods for hours or even days on end and accompanied by nodding movements of the head, *ratib* could induce ecstatic states. In 19th-century Aceh a boisterous *ratib Samman* was practised (possibly related to the form known by the same name in early 18th-century Medina); the modern *saman* may have developed as a semi-secular version of this *ratib*. In pre-colonial Gayoland, *saman* songs concentrated on Islamic themes, and its performers were often seekers of magical power. After the Dutch conquest in 1904, *saman*, seen as preparation for Holy War, was discouraged. It was eventually revived as an entertainment performed by the young, with the religious texts replaced by romantic verses.

There are three elements in a *saman* performance: *lagu* (hand gestures), *jangin* (song) and body movement. Of the three, *lagu* are central. Each village has its own repertory of traditional, named gestures (over 130 of them have been documented), and more are being created. The basic gesture (*lagu selalu*) places the right hand on the left thigh, shifting it to the right thigh and back again, then striking the chest three times. Every group develops its own *lagu geriyet* (virtuoso gestures) in their ongoing efforts to confound their competitors.

Indonesia, §VII, 1: Kalimantan

(i) Introduction.

The four Indonesian provinces of East-, West-, South-[Brunei](#) surrounded by Sarawak and the South China Sea on the northern coast. While sparsely populated at just over 8 million, the 535,000 square kilometres of Indonesian Borneo are home to hundreds of ethnic groups with distinct languages, customs and traditions. The coastal areas and lowland plains are populated largely by Malay-speaking Muslims of local descent. Some of the larger Malay groups include the Samba in the west, Banjar in the south and Kutai and Bulungan in the eastern regions. A significant Madurese population is present in coastal West Kalimantan, while Buginese from Sulawesi have long been established along the island's eastern shores. Substantial Chinese communities exist in virtually every major city, and the Indonesian government's recent transmigration programmes have also brought many Javanese families.

The interior regions of the island are inhabited by numerous groups, usually collectively designated as 'Dayak' by coastal dwellers of Kalimantan, Indonesians from other islands and the Indonesian government itself. Among the most prominent of these groups are the Mualang (who are sometimes considered a sub-division of the Iban people) and the Kantu' of West Kalimantan; the Ngaju, Ot Danum, and Ma'anyan of Central Kalimantan; and the Kayan, Kenyah, Modang, Punan and Kerayan of the eastern province. South Kalimantan is largely Malay. Among the non-Chinese coastal populations, Islam is the dominant religion. Chinese communities usually adhere to Christianity or Buddhism. Many of the peoples living in or originating from the island's interior are Christian, although some groups maintain religious practices that are unique to, and rooted historically in, their own communities.

The extraordinary linguistic and cultural diversity of Kalimantan allows only the broadest of generalizations when discussing a single topic such as music. Further complicating matters is the fundamental lack of documentation, both contemporary and historical, of musical practices in this region. Many early writers, moreover, were apparently unaware of the significance of ethnic differences, and in detailed descriptions of musical activities there are often no references to specific ethnic groups. Further, the musical situation has certainly changed since the 1970s, not to mention

the 19th century; consequently, many residents of Kalimantan may not even have heard of the instruments or vocal forms once attributed to their people. The musical profile presented here, then, is necessarily largely historical.

Indonesia, §VII, 1: Kalimantan

(ii) Instruments and instrumental music.

Idiophones are among the most plentiful and varied of the instruments of Kalimantan. Individual bamboo percussion tubes appear to be more characteristic of non-Malay peoples of the interior regions (e.g. Kayan, Kenyah), where they have been linked to specific phases of the rice cycle. A number of Kalimantan groups have maintained xylophone traditions. Coastal Malays played a wooden *gambang* without accompaniment, sometimes to accompany singing. Some peoples of the interior kept suspended log xylophones in their rice fields, primarily for signalling and warding off pests. Over the past few decades, Kenyah communities of East Kalimantan have developed a small, portable xylophone (*jatung utang*) for use as dance accompaniment. Idioglot jew's harps (e.g. Kayan *tong*, Kenyah *uding*, Iban *ruding sulu*) have been documented in most parts of the island; those without a string (for plucking) enjoyed a wider distribution. Most jew's harps are made of bamboo or palm-wood, although some peoples of West Kalimantan, such as the Mualang, used heteroglot metal varieties. Playing the jew's harp has been a women's activity among some interior groups; especially when played by both men and women, the jew's harp has often been associated with courtship.

Various types of gongs are found throughout the coastal and upland areas of all four Kalimantan provinces. Malay coastal communities, as well as some of the non-Malay peoples of the inland regions, have used gong-chime ensembles to accompany ritual and recreational dance, agricultural festivities, shamanic activities and theatrical performances. The *gemurung* ensemble of the Kantu' of West Kalimantan features a single row of gongs, which resembles the *kulintang* of the southern Philippines. Similar traditions include the *kangkanung* ensemble of the Ngaju of Central Kalimantan and the Tunjung *klentangan* of the eastern province. Gamelan ensembles similar to those found in Java – and usually imported from that island – are present in most of the larger coastal cities. The more elaborate ensembles were usually owned and maintained by the former sultanates (e.g. Kutai, Berau). In South Kalimantan, the Banjar Malays have performed Javanese-influenced shadow-puppet plays with gamelan accompaniment.

Gong-chimes have not been common among the groups living in the most mountainous areas of Kalimantan. Moreover, gongs and the structure of gong music have not held as central a position in these communities as they have among coastal peoples and the populations of the islands of Java and Bali to the west. In the highlands, the striking of hanging gongs in ensemble has usually been restricted to specific ritual circumstances. Purely recreational music has not typically involved gongs or been based on the same structural principles. Unlike the gamelan orchestras of the Malays, highland gongs have not usually been tuned to specific pitches. When combining instruments in ensemble, pitch contrast has been of

primary sonic importance. Kin-relations have also been significant in determining which instruments will be played together, since the instruments have normally been collected from several households. The overall size and composition of a group of instruments in the upland stratified societies has typically depended on the social status of the individual for whom the ritual was to be held. Gongs themselves, whether used as sound instruments, stools, pedestals for dance, ritual paraphernalia, payment or decoration, served as symbols of rank and status in many of these communities.

In contrast to the idiophones, the membranophones of Kalimantan exhibit comparatively little structural variety. The predominant means of securing and tightening the skins of the drums, regardless of body shape, is through cord and belt lacing with wedge bracing. Large, single-headed conical drums have been documented primarily among the Modang (*tewung*), Kenyah (*jatung*) and Kayan (*tuvung*), of the interior of East Kalimantan. A principal function of such drums has been to signal village emergencies, death or meetings, with different rhythms indicating the particular circumstances. Drums have also been used for certain rituals and ritual dances, sometimes sounded together with hanging gongs or other idiophones. While the Tunjung and Benuaq of the eastern interior have employed double-headed drums in their gong ensembles, such drums have tended to be more common in the coastal regions. Among the Malay groups, these have usually been part of the gamelan orchestra. Double-headed drums have also figured prominently in the mixed ensembles accompanying various Malay folkdances known as *jepen*. Most drums are played by men, but some of the goblet-shaped drums of the western and north-western regions have been played by women in shamanic activities, often accompanied by drums of various types. Frame drums have been played alone and in ensemble to accompany song and Muslim recitation among the Malay populations.

Tube zithers, spike lutes and necked box lutes appear to be the most common chordophones. The Kenyah, Kayan and Punan of the interior highlands have been known for their plucked tube zithers with three to six strings. Generally associated with women in these communities, the tube zither has been played alone or in ensemble for entertainment or to accompany dance. Some of the Iban-related groups of West Kalimantan have also used tube zithers, which were usually played by women. Coastal Malays make little use of plucked tube zithers. Bowed spike lutes, on the other hand, have been quite prevalent in these societies. Two-string models have been played together with a zither as dance music in some of the Malay communities. Similarly, two-string instruments have been played by some of the Iban peoples of the western region, but one-string versions have also been popular, as has been the case among most other non-Malay groups of the lower-lying areas.

The plucked box lute, usually with a short neck, is associated with many of the non-Malay, inland peoples of Kalimantan. With some exceptions, most of these instruments are known as *sapé'* or a closely related linguistic cognate. Older varieties of these lutes had two strings, but three or four are now preferred by many players. The frets, typically placed under one string only, have changed from fixed to movable in Kenyah and Kayan

communities, and have increased in number from three to 16 on some more recent models. The *sapé'* has been strongly bound to recreational dancing in most communities, but older two-string lutes were also closely associated with shamanic activity. Men have been the sole performers of the instrument in some societies, but women have been prominent players in others. Coastal Malays do not use the *sapé'*. However, the [Gambus](#), a bowl lute of Middle Eastern origin, has been played with gongs and drums for dancing in some Muslim areas.

Perhaps on account of its organological uniqueness, the gourd-and-bamboo mouth organ (Kayan [Keledi](#), *keredi*; Kenyah *kediré'*) has received the most attention of all aerophones in Kalimantan. Whereas other forms of reed instruments are relatively rare, mouth organs have historically been prominent among a number of peoples of the mountainous interior, including the Kenyah, Kayan and Punan. Iban-related groups the north-western area and similar groups living inland in the northern part of East Kalimantan have also cultivated mouth organ traditions. The instrument has been used variously to accompany ritual and recreational dance, to accompany singing, aid in courtship and provide personal entertainment. Its players have usually been men. Coastal Malay populations do not appear to have used mouth organs, but a single-reed instrument played in ensemble with a gong has been reported in South Kalimantan.

End-blown flutes are scattered widely throughout the island. Both internal and external ducts are common. Nose flutes have been encountered among many of the inland groups, but this instrument is evidently foreign to most coastal populations. The sound of a flute has often been associated with mourning, especially among peoples of the interior. In some communities, the death lament was said to have been performed on the flute, its sounds imitating the quality and words of the human voice. Side-blown flutes have not been common in Kalimantan until relatively recently. Among the Kenyah of East Kalimantan these instruments were said to have been introduced for use in Christian church services.

Of the instruments and ensembles that are tuned, various types of pentatonic scale (with and without semitones) have predominated. Some traditions have employed different pentatonic units (or suggestions thereof) in adjacent registers on a single instrument: many Kayan and Kenyah plucked lute (Kayan: *sapé'*) melodies, for instance, employ semitones in the lower registers but use an anhemitonic tuning in the upper registers. There has also been a tendency among these groups and others in the highland regions towards homogenous ensembles of melodic instruments; formerly it would have been unlikely that a reed instrument (e.g. a mouth organ) would be combined in an ensemble with a lute and a xylophone. Non-melodic or non-tuned instruments, however, have often been used in heterogeneous ensembles (e.g. gongs with drums). Until recently, vocal and instrumental musics have been mutually exclusive among some interior groups. A *cappella* singing, particularly with soloist and chorus alternating in responsorial style, has been common especially in non-Malay communities. In contrast to the situation in many of the inland societies, heterogeneous ensembles including both melodic and non-melodic instruments have been an ongoing part of coastal Malay music, accompanying the performance of *pantun* verses and other vocal forms.

Indonesia, §VII, 1: Kalimantan

(iii) Vocal performance.

Compared to the instrumental repertory in some areas, the vocal repertory is both more diverse and certainly more abundant. Specific songs have been integral components of rituals connected with agriculture, headhunting or warfare, shamanic or other religious activity and death. There has also been a large repertory intended primarily for entertainment, including songs for courtship, work and drinking rice wine, as well as songs to accompany recreational dancing. Long narrative pieces, some taking several nights to perform in their entirety, are deeply rooted in the musical traditions of many communities. Some of these have ritual associations, whereas others are essentially recreational. Their subjects range from genealogical accounts to war stories (of both the human and spirit worlds) and the journey of the departed soul to the land of the dead.

Among the most salient vocal forms in the Malay areas have been *pantun* singing, forms associated with the *wayang kulit* (shadow play), Qur'anic recitations and a great array of songs performed in the context of *jepen* folkdance. Women have been the foremost performers of *jepen* songs in some Malay societies, often accompanying themselves on frame drums while men dance before them. Although some songs may be performed by either men or women, many songs of the interior groups have often been quite strongly gender-specific, rendering it inappropriate in most circumstances for men to perform repertory that has been specifically associated with women and vice versa. In some Iban societies of lower-lying areas, as well as the highlands settled by the Kenyah, both men and women are expected to perform the death lament (Iban *sabak*; Kenyah *tidau*), although women are the preferred vocalists. While in this case men sing a piece that is associated with women, the opposite case has rarely been evident.

In coastal Malay areas as well as the non-Malay inlands, singing has also been integral to the activities of the ritual healer or shaman. Indeed, the terms for 'shaman' and 'singing' appear to be etymologically related both within and between many languages of Kalimantan. Some groups of the central regions, such as the Kenyah, have maintained that the language of song (*ipet*) is itself of spiritual origin. As such, *ipet* is quite distinct from ordinary speech and is rarely wholly intelligible to audiences. Kenyah song, whether recreational or ritual, usually contains a great density of archaic terms, words that are more common in other Borneo dialects or languages, linguistically meaningless words and syllables, and morphologically altered lexical items. Furthermore, the language of song or spirits is usually rich in often obscure metaphors. This is not only the case among the Kenyah but also among many other societies of Kalimantan; interpretation or translation of vocal performances is highly problematic.

Indonesia, §VII, 1: Kalimantan

(iv) New directions.

Many changes have taken place since much of the literature on musical traditions of Kalimantan was produced. National initiatives to promote regional arts have sometimes led to new syntheses of music and

movement. Heterogeneous combinations of Western instruments, or sometimes Western and local instruments, have in some societies replaced the older homogeneous dance ensembles. Tunings have also been adjusted in many cases to correspond more closely to the Western diatonic scale. Because the language of song is so intimately entwined with indigenous belief systems, religious conversion has rendered performance of some repertory inappropriate. Schooling, too, has not only redirected young peoples' interests and values, but the necessity of boarding has often also physically removed them from the musical environments of their home communities. Especially in rural areas, children are no longer exposed to the musics of their parents and grandparents to the same degree, and the conduit of oral tradition has been ruptured. Nevertheless, as any staged or unstaged cultural performance reveals, changes in values, beliefs and environments inevitably elicit creative responses.

[Indonesia, §VII: Outer islands](#)

2. Maluku.

Many musical forms in the province of Maluku (the Moluccas) can be linked to Christian and Muslim rites as well as spiritual practices that predate the arrival of Islam in the 15th century and Christianity in the 16th. Sacred and secular music and dance of the Muslim north contrast with church and secular music of the mainly Christian central and south-east regions (see

fig.19). The ancestral rituals of the Alifuru people living on the 'mother island', Seram, are widely believed to represent the original Maluku cultural forms. Ensembles comprising *totobuang* (bronze gong-chimes) and single-headed varieties of *tifa* or *tipa* (drums) of many shapes and sizes are found all over Maluku (fig.20). In Muslim communities, frame drums (*rebana*, *rabana*) and small two-headed drums (*marwas*) often supplement the *tifa*. Indigenous flutes, multiple-reed aerophones, jew's harps and bowed and plucked string instruments as well as instruments of European and Middle Eastern origin are widely distributed. More than three centuries of Protestant Dutch rule resulted in extensive musical change. Current artistic initiatives are mainly led by the New Order government and involve the adaptation of traditional art forms. Malukan folksongs and international popular songs are broadcast in the media and performed at celebrations.

(i) Central Maluku (Kabupaten Maluku Tengah).

On Seram Island the Alifuru people still practise rituals based on the traditional beliefs of the Patasiwa and Patalima social and kinship groups, which contrast with those of the coastal Christian and Muslim villagers. *Kahua*, the main ritual feast of the Huaulu of northern Seram, is traditionally associated with head-hunting practices. In western Seram, the Hitam subgroup of the Patasiwa perform mixed-gender night dances (*maro*), and during the day men perform vigorous *cakalele* dances in battle dress. Choral *sewa* are performed by the people and *soso* healing rituals by shamans. On the island of Buru Alifuru men play *tifa*, but both men and women perform night-time *lego* and *asoi* responsorial songs. The *totobuang kawat* (bamboo zither) and *viol* (bowed viola-like instruments) with two (Tidore island) or three (Ternate island) strings are also widely played. The main traditional ceremony on Banda island involves *cakalele* dancing. In some parts of central Maluku, musicians play double-row gong-chimes (*totobuang*) and xylophones (*tatabuhan kayu*), usually with *tifa*, *rebana* and gong, and sing *pantun* (two-couplet quatrains) in work contexts and at night-time celebrations. A performance of the autochthonous magic bamboo dance (*bambu gila*), described by van Hoëvell in 1875, was recorded in the Muslim village of Hitu on Ambon Island by Kartomi in 1991. Local officials promote modernized performances of this dance, which features male dancers entering a state of trance as they bounce poles up and down to *tifa* accompaniment (fig.21). European-influenced central Malukan folkdances are still performed by elderly couples and Ambonese children, including the quadrille-inspired *katreji* dances developed in the Dutch military camps. Christian vocal music includes psalm- (*mazmur*) and hymn-singing (*tahlil*) with the accompaniment of bamboo flutes and double-tube bamboo wind instruments (*gumbang*). Orchestras of locally made side-blown flutes (fig.22) play church music. European music adopted in central Maluku from the 17th century influenced the development of the repertory of indigenous Malukan folksongs that are performed throughout modern Indonesia. Ambonese folksongs (*lagu Ambon* or *lagu Maluku*) are accompanied by a *kroncong* (small guitar) and other plucked string instruments or by a Hawaiian-style band of banjos, ukeleles, guitars (acoustic and/or electric), Hawaiian guitar and drum kit. The Ambonese *kroncong* has now been supplemented or replaced by guitars, mandolins, ukuleles, banjos, violin or flute and *tifa*.

(ii) South-east Maluku (Kabupaten Maluku Tenggara).

Inhabitants of the Kai archipelago (Kepulauan Kai) in south-east Maluku are of Malay descent, whereas those of the Aru archipelago (east of Kai) are predominantly Melanesian. The Kai performing arts are maintained in Catholic church services through the singing of Christian texts in a traditional style and the inclusion of *suling bambu* ensembles, usually comprised of two gongs, *tifa* and a bamboo flute (*sawarngil*). There are 52 known types of dance in Kai, including the *tiwa nam*, a fan dance performed by adolescent girls. Unaccompanied refrain singing serves as the basis of the songs (*sekar*). Muslim music consists of devotional singing (*zamrah* or *hadrat*) and social dance (*tari sawat*). In the Aru island network, most villages have developed their own repertory of songs (*didi*). *Dalair* dances are accompanied by *tifa* (*titir*), gong (*daldala*), jew's harp (*berimbak*) and conch-shell (*tapur*). In the Tanimbar archipelago, ancestral ceremonies (*tnabar*) have been combined with Catholic and Protestant practices. In the sub-regions of southern Tanimbar the two ethnic groups Suku Yaru and Suku Timur Lau practise two sets of alliance customs with similar songs and dances. In the early 20th century the church fathers forbade ceremonial dance and music, and much of the repertory has been lost. However, the church now allows villagers to celebrate harvests by dancing and singing around ritual objects and performing Christianized versions of traditional music. Whole communities still widely practise the round dance on ceremonial occasions. In the *tnabar lilike*, requests for bridewealth are made while the women dance and sing to *tifa* accompaniment (fig.23), whereas in the *tnabar falolin* each female dancer and drummer wears bird-of-paradise feather headdresses and inherited ornaments (fig.24). The ceremony *tnabar rdadar mangwate* prepares the soul of a deceased Tanimbar person for the journey to Selu island after death. Elders use a large ancient stone in the shape of a boat as their meeting place; a model ancestral boat is used for a church altar in Ololit Lama village. Dancers stand in an open, boat-shaped circle in order of precedence determined by the arrival of each family founder in the village. Females play the *tival ulu* ('front drums') while males play the *tival muri* ('back drums') and a large three-legged drum (*nfeffik babal*); the lead singer (*kual*) stands at the back of the circle of dancers.

(iii) North Maluku (Kabupaten Maluku Utara)

As a result of the lucrative European-Malukan spice trade centred on the four palaces on Ternate, Tidore, Bacan and Jailolo islands beginning in the 16th century, Portuguese-influenced music and dance forms were superimposed on the existing performing arts. Until the mid-15th century and the acceptance of Islam, the people of North Maluku adhered to local ancestral beliefs. Syncretic art forms developed, combining elements from local, southern European and Middle Eastern styles. Malay dances such as *samroh*, *dana-dana* and *japin*, which show Middle-Eastern influence in both the movements and the music, are still performed. Male martial dances and dances by ladies-in-waiting in the four courts were largely shaped by the sultan's political, economic and cultural needs. Today *ronggeng* social dancing is accompanied by sung melodies doubled on the *filutu* (bamboo duct flute). Sometimes a *gambus* (pear-shaped lute), two pairs of double-headed *marwas* drums and a male or female singer (sometimes both)

substitute for the *filutu* ensemble; at other times electric guitars, *rebana* and a Western drum kit are used. In the Ternate palace the serious martial dances (*hasa* or *soya-soya*) are performed by one or two men of the highest military rank (*kapita*). The male protocol dances (*cakalele*) feature vigorous hopping and jumping movements. Archaic female court dances (*lego-lego*) performed by the sultana's ladies-in-waiting have been re-choreographed by government-organized troupes in Ternate and Tidore as part of their politically motivated revival. Muslim rituals used in life-crisis ceremonies include male *salewat* songs and girls' devotional dances (*samroh*, *tari dana*, *japin*), in which a Middle East-influenced melody (often with *maqām*-like tonal material and an Arabic, or Arabic-derived text) with *gambus*, *tifa* and *rabana* accompaniment is repeated many times. Under the present Sultan of Ternate, the *badansa* set of group martial dances has been revived. Bronze ensembles (called *kulintang* or *kolintang* in the Muslim palace of Ternate and *jalanpong* in the former Tidore palace) have existed in North Maluku for centuries. Containing a set of eight horizontal gongs called *momo*, a vertical gong (*saragi*), a double-headed drum (*baka-baka*), a set of four *tifa podo* (short drums), a triangle (*besi tiga hoek*) and a pair of locally made cymbals (*dabi-dabi* or *cik*), *kulintang* have been replaced to a degree by ensembles combining local and European instruments. A spectacular royal ceremony, the *kololokie*, is held whenever the Ternate volcano threatens to erupt; the sultan encircles the island in a flagship, on which the *cikamomo bum* (an ensemble of gong-chime, gong, drums, triangle and cymbals) is playing.

[Indonesia, §VII: Outer islands](#)

3. Nusa Tenggara Timur (the Eastern Lesser Sundas).

East of Sumbawa lie the two island arcs that comprise the Indonesian province of Nusa Tenggara Timur: the northern arc of Komodo, Flores, Solor and Alor, and the southern arc of Sumba, Savu, Roti and west Timor (East Timor, the former Portuguese colony that was invaded and annexed by Indonesia in 1975, and which won independence from Indonesia in 1999, is not included here). Nusa Tenggara Timur has a predominantly Christian population of about four million, living mainly on the larger islands of Flores, Sumba and the western half of Timor.

(i) Flores.

By conservative reckoning Flores is home to five different ethnolinguistic groups, but some instruments, such as plucked bamboo idiochord tube zithers, struck bamboo idiochords, xylophones and gong and drum ensembles, occur across the island. In the Lamaholot region of east Flores two or more singers sustain intervals that approximate major and minor 2nds in worksongs, clan epic songs and songs for house dedication and harvest thanksgiving. Song often accompanies dance, as in the *hama* dance featuring sung genealogies and local history. Vocal music in Sikka in east central Flores includes both choral and solo song: a male soloist

sometimes participates in a responsorial performance, accompanied harmonically by a mixed chorus.

In Ende-Lio in central Flores the most prominent musical event is *gawi*, a circle dance led by male dancers that occurs as part of rituals concerning agricultural cycles, harvest thanksgiving and fertility. Wedding celebrations in central Flores feature a nuptial duet called *feko genda* involving a side-blown flute and a frame drum; warriors' dances and major community ceremonies and celebrations are accompanied by the *nggo lamba* gong and barrel-drum ensemble.

The people of Ngada in west central Flores possess a variety of end-blown flutes that may be played solo or in ensemble, sometimes accompanied by bamboo stamping tubes (*thobo*). The *foi doa* is a pair of flutes with a single mouthpiece, while the *foi dogo* is a triple flute, with the middle pipe acting as a drone. The *foi mere* (*foi pai*) is an indirectly blown bass flute that is unique to the Ngada region and only rarely heard. Flutes of all types in Ngada are only played while the rice is ripening; after the harvest they are prohibited until the next planting season. The regional vocal style features part-singing and has been compared with song of the central highlands of Irian Jaya (Kunst, 1946). *Laba go* ('drum and gong') ensembles comprise five gongs and a Florinese version of a European side drum called *laba* or *tambur*. The *todagu* ensemble features rhythmically complex music on bamboo slit-drums (*toda*, usually four divided among three players) and two high, narrow drums called *laba toda*. Other drums played in Ngada include the *laba dera*, a squat, single-headed hand drum, and the *laba wai*, a single-headed drum played with sticks. Because of its magical potency, drumming in Ngada is prohibited outside feast days.

Traditional villages in the Manggarai region in west Flores are arranged circularly, with a large ceremonial drum house (*mbaru gendang*) near the centre; these drums are played to ensure the approval of the ancestors when arable fields are allotted to village farmers. Gongs are played to accompany *main caci*, a type of competitive whip-duelling. After these duels, a lengthy vocal performance (*mbata*) may occur as part of a ritual predicting the coming agricultural cycle. Manggarai *mbata* songs are sung by a male soloist accompanied responsorially by a male, female or mixed chorus, with men and women singing in parallel intervals, sometimes accompanied by drums and gongs. Vocal style in some areas of Manggarai incorporates a kind of yodelling; formerly singers would sit on opposite hillsides and compete with one another across the narrow ravines.

(ii) Roti.

The predominant medium and symbol of music culture in Roti is the *sasandu*, a ten- or eleven-string tube zither with a palm leaf resonator usually played to accompany song. As a society, the Rotinese highly value the skilful manipulation of language exemplified in song. A ritual language form (*bini*) reserved for proverbs, poetry and song is the salient feature of song accompanied by *sasandu*, and it is primarily by their knowledge of *bini* and their ability to use it creatively that singers are judged. Rotinese myths and oral history indicate the importance of the *sasandu* in the Rotinese structuring of reality, placing the origin of the instrument alongside the origins of marriage, exogamy, mourning and death.

As an instrumental form the *sasandu* has much in common with the *meko* gong ensemble. They share a common repertory, with the tuning of the nine *meko* corresponding to the nine lowest strings of the *sasandu*. In addition, the *sasandu* is always accompanied by a small drum, or by tapping the instrument with a stick, to produce rhythmic patterns like those played on the large *labu* drum that accompanies the *meko* group. *Meko* ensembles comprise nine (or sometimes ten) bossed gongs, made of either iron or imported bronze, and a *labu* drum. They are played at weddings, wakes, house-dedication ceremonies and other gatherings, often accompanying dance. The nine *meko* are divided into four groups; from largest to smallest in size they are the *ina* (three), *nggasa* (two), *leko* (two) and *ana* (two). If a tenth *meko* is added it extends the upper range of the ensemble. With its brash and bold style, the *meko* ensemble provides a sharp contrast to the relatively quiet and introspective *sasandu*.

Some Rotinese pitched and rhythmic expressive sound forms are not considered as 'music' by the Rotinese, such as the sung accompaniment to the circle dance (*e'ea*), led by a *manahelo* (chanter) and answered by the other dancers in chorus, and invocations chanted in strict ritual language accompanied by a single *labu* drum (*bapa*). The only Rotinese musical form not directly associated with traditional Rotinese music is the *sasando biola*, a diatonic and expanded version of the *sasandu*, used to play church hymns and non-Rotinese folk and popular songs. Its tuning and arrangement of pitches vary, but most instruments have between 24 to 39 strings and can play in two diatonic keys over a range of about three octaves. Some *sasando biola* players use a wooden box as a resonator rather than the traditional lontar leaf, and there is also a *sasando biola listrik* (electric *sasando biola*), which is played through an amplifier.

(iii) Savu.

Traditional life is governed by a lunar calendar that prohibits ceremonial music and dance during part of the year. This period of ritual silence ends with the harvest and the lively sound of the *padoa* circle dance. Participants attach small baskets filled with mung beans to their ankles to accompany their singing; when the season of ritual *padoa* dancing ends, these baskets of beans are stored until the following year when their contents are planted as seed.

For several weeks the singing and bean-basket percussion of the *padoa* dancers is the only ritual music allowed until the *namangngu* (gongs) and *dere* (drum) are played, the date depending on the ceremonial calendar. A complete *namangngu* group comprises seven gongs, a set of cymbals (*wo paheli*) and a drum (*dere*). Pieces typically begin with the two small gongs (*leko*), followed by the two medium gongs (*wo peibho abho*) and finally the three largest gongs (*didala ae*, *didala iki* and *gaha*).

Other Savunese musical instruments include the *tebe* wooden jew's harp, the *hekido* four-hole bamboo ring flute, and the *ketadu* ('that which satisfies') family of instruments. The *ketadu haba* tube zither with palm-leaf resonator is very similar to the Rotinese *sasandu*, but with eight metal strings rather than the ten or eleven found in Roti and with a different playing style and repertory. The distinguishing feature of both these tube zithers is their leaf resonator, which reflects the central place of the lontar

palm in the lives of these two eastern Indonesian peoples. The *ketadu mara* is a trough xylophone with nine wooden keys played with sticks made from lontar branches. The instrument called simply *ketadu* is a two-string boat lute similar to the Sumbanese *jungga*. Unlike the *namangngu*, these instruments are usually played by soloists in relatively informal situations.

(iv) Sumba.

This island was the last in Indonesia to maintain a pagan majority, and music in Sumba is primarily sacred, with followers of the traditional ways praying and singing to spirits and sacred objects collectively known as *marapu*, of which musical instruments are among the most important. Singing and dancing occur most often in the feasting months after the rice harvest (July to September), when people gather in the ancestral villages. As the rains approach in October and November there is a period of ritual silence, and music-making is taboo until the ceremonies held to welcome the new agricultural year in February or March.

In east Sumba gongs are played with a drum (*lamba*), whereas in west Sumba a similar drum (*bendu*) is used along with a hanging drum (*bapa*) and sometimes a hand drum (*deliro*). Whether played in mourning or rejoicing, the sound of the gong ensemble is always augmented by the cries of the men (*kayaka*) and the piercing, sustained ululation of the women (*kakalaku*). In east Sumba gong pieces usually begin with the two large *katala* gongs, which are hung next to each other with the larger gong on the player's right. Next, the two medium-sized *nggaha* gongs enter, with the larger suspended above the smaller. Finally the two small gongs (*kabolulu* and *paranjangu*) complete the ensemble along with the *lamba* drum.

The upright drum (*bendu*) is the primary ritual actor in *yaigho*, an all-night singing ceremony held in response to some form of affliction, when a song is sung to the spirit inside the drum. The song tells of the origins of the drum, how it was carved from a piece of driftwood and given the shapely form of a young woman. The first drum made was covered with the skin of a sacrificed slave girl whose spirit is believed to continue to live there, although nowadays the skin is made from the hide of a buffalo calf. The drum's song transposes her story of suffering to provide a model for the origins of the shamanistic power to cure; it is the drum that acts as the shaman rather than the singer. The *bendu* is played with sticks by a seated player, accompanied by an assistant who beats a horizontal drum (*diliro*) with his hands. Inside the house, gongs are hung from roof rafters near the front veranda and beaten rhythmically to accompany the singer's words.

Woleko is a more elaborate ceremony; a stand of five gongs is erected outside the house to thank the spirits for their assistance, and buffalo are sacrificed to feed them. At a *woleko*, the singing includes a series of long pieces 'sung to the dancing ground' (*lodo nataro*) where male and female dancers face each other, the men charging forward with spears, shields and bush knives towards the women, who tremble and flutter their hands.

Music is the required accompaniment to any form of large-scale collective work. Singers must be invited (and paid) at gatherings to drag the large wooden pillars that become house posts, to thatch the high roofs of

ancestral cult houses and to incite the several hundred people who drag large stones to the villages, where they are made into megalithic graves. Stone-dragging songs (*bengo*) are the longest and most elaborate of the work songs (*lodo paghili*), describing the stone as a bride who travels across the water to meet her intended husband in the ancestral village.

Love and recreational songs (*lavitti*) are often sung without musical accompaniment but can be accompanied by one-string fiddle (*dungga roro*) or two-string lute (*dungga*); the tunes can also be repeated on the nose flute (*poghi*). Recreational songs are also sometimes accompanied by a bamboo jew's harp (*nggunggi*) or a four-hole bamboo flute (*kapika* or *taleli*). As part of preparations for the yearly calendrical ceremonies and *pasola* jousting contests, teasing courtship songs called *kawoking* are sung along the beaches of the west coast of Sumba.

(v) West Timor.

The Atoni are the main inhabitants of West Timor. Although most are Christian, traditional ceremonial life centred on the ancestral spirits continues, with music and dance playing a vital role. Atoni society is arranged patrilineally, but only women perform in the ritually significant *sene tufu* (gong and drum) ensemble. This is usually played to accompany dance, with the dancers sometimes attaching *bano* (bracelets with metal jangles) or *te oh* (bracelets with leaf baskets containing sand) to their ankles to augment the sound of the gongs and drum. A *sene tufu* ensemble consists of six gongs (*sene*) and one single-headed drum (*tufu*). The six *sene* are divided among three players, with one woman playing the two largest *kbolo* gongs, one the two medium-sized *ote* and the other the two small *tetun*.

Atoni songs sung in informal gatherings are often improvised and narrate actual events; performers are usually male. *Koa* is a type of song in which the singer rhythmically speaks the text to musical accompaniment, a style that younger Atoni compare with rap. The main accompanying instrument is the *leku* (also *pisu* or *bijol*), a fretless lute with four strings (often made from rubber bands), strummed in a strong, rhythmic style. In a typical Atoni ensemble, one or more *leku* provide the chordal accompaniment for heterophonic playing of *heo* (viola), *feku* (wood ocarina) and *bobi* (end-blown bamboo flute). Portuguese-derived instruments may also be included in the Atoni ensemble, such as the *simaku* transverse flute, the *kili* comb and tissue kazoo, and the *gitar* (guitar). Atoni solo instruments are less frequently heard at social gatherings and include *sene hauh* (trough xylophone), *sene kaka* (six-string bamboo idiochord), *knobe besi* (jew's harp), *knobe oh* (wooden jew's harp, similar to the Balinese *genggong*) and *knobe kbetas* (musical bow), believed by the Atoni to be their oldest musical instrument.

Indonesia, §VII: Outer islands

4. Sulawesi.

- (i) Introduction.
- (ii) Instruments.
- (iii) Genres and ensembles.

BIBLIOGRAPHY

Indonesia, §VII, 4: Sulawesi

(i) Introduction.

The island of Sulawesi (formerly Celebes), consisting of long peninsulas extending outward from a mountainous central core, is home to roughly 13 million people and close to 60 distinct languages. The linguist Noorduyin has identified four language groups in the north and its neighbouring islands (Sangiric, Minahasan, Gorontalo-Mongondic and Tomini: 20 languages), two groups in the central region, eastern peninsula and its neighbouring islands (Kaili-Pamona and Saluan: 12 languages), two groups in the south-eastern peninsula, eastern-central region and south-eastern islands (Bungku-Mori and Muna-Buton: 18 languages), and one in the south-western peninsula (South Sulawesi: eight languages). In 1964 the island was divided into four provinces: South Sulawesi, South-east Sulawesi, Central Sulawesi and North Sulawesi. Islam is the dominant religion in most lowland communities, whereas Christianity has gained many followers in some of the central highland regions, Manado and surrounding areas in the north. Other systems of belief survive to various degrees throughout most of the island. The city of Ujung Pandang (known formerly as Makasar (Makassar)) in South Sulawesi, has served as an important trade centre since at least the early 1500s, resulting in the introduction of many varieties of musical instruments and practices (Chinese, Javanese, Malay, Arabic and European). The Dutch presence was strongest in the Minahasa region, where Dutch songs remain popular.

Throughout the island, the powerful forces of the global music industry and Jakarta-based popular music are evident, from the tapes and CDs sold in cassette stores and broadcasts on radio and television, to the music played

by guitar-strumming youth. Along with popular music from outside the island a number of Sulawesi musicians also perform popular music in local languages, usually with electric and electronic instrumental accompaniment and in popular *dangdut* or *langgam kroncong* styles (see §VIII, 1 below for discussion of these genres). Popular songs in local languages have been recorded since the late 1930s, when the Chinese-Makasarese musician Hoo Eng Djie sang with a small ensemble that combined violin and clarinet with indigenous gongs and frame drums. Local cassette production began in 1975 with a broad range of local genres, but only the music resembling Jakarta-based popular styles has proven to be commercially successful. Local radio and television stations broadcast a moderate amount of music from Sulawesi, but very little music that does not incorporate Western instruments and scales.

No comprehensive study of music in Sulawesi has been published since Kaudern's description of musical instruments in 1927. Holt's study (1939) describes dances of South Sulawesi, with modest data on musical accompaniment. Recent work with substantial music content has mostly consisted of detailed studies by anthropologists (especially Atkinson, 1989 and George, 1996) and inventories and short reports published in Indonesia (especially the works of Lathief, Mangemba, Najamuddin and Pat[t]adungan), with most of the latter concerning South Sulawesi, home of the Bugis and Makasarese (Sulawesi's largest ethnic groups) and the Toraja (the best-known group in the scholarly and tourist literature). Yet it is possible to make some general remarks on Sulawesi's music. Double-headed drums and instruments of bamboo (flutes and various idiophones) are especially widespread. Metal knobbed gongs are found in some ensembles, mostly in lowland coastal regions, but are less prominent than on other Indonesian islands. Vocal music ranges from the lyric and narrative song of the southern peninsulas accompanied by lute or spike fiddle to the pulsating choral music of the central highlands and the diatonic songs of the north.

Indonesia, §VII, 4: Sulawesi

(ii) Instruments.

A great variety of idiophones are found in Sulawesi, mostly used as accompaniment for dance ritual or for informal entertainment: cymbals (*kancing*, *sia-sia*), concussion slats and castanets (*dadalo*, *talontalod*), concussion plaques (*anak beccing*, *anak baccing*), rattles (*alosu*, *arumpigi*, *batutu*, *tiwolu*), fringed bamboo idiophones (*sia-sia*, *lae-lae*, *lea-lea*, *parappasa*), metal gongs (*gong gentung*, *jong*, *dengkang*, *padaling*, *tawa-tawa*, *ndengu-ndengu*), metal gong-chimes (*kolintang tambaga*, *kolintang wasei*, *kannong-kannong*, *katto-katto*), slit-gongs (*kattok-kattok*, *mbalolo*, *tetengkoren*), rice blocks (*balendo*, *assung*, [Lesung](#)), trough xylophones (*tennong*, *calong*, *latou-tou*, *katou*), frame xylophones (*kolintang*), metal key idiophones (*ganang*), percussion tubes (*pong-pong*, *kakula*, *kalung-kalung*), two-tongue bamboo buzzing wands (*rere*, *pore*, *tonggobi*, *sasasaheng*, *jarumbing*, *polopalo*, *alalo*, *ore-ore nggae*) and jew's harps (*genggong*, *karombi*, *oli*, *ore-ore mbondu*, *alingen*).

Membranophones, again used mostly to accompany dance and ritual, include kettledrums (*rabana*), single-headed cylindrical drums (*ganda*,

tiwal, towahu), double-headed cylindrical (*kanda, gimba*) and barrel drums (*ganrang, genrang, gandang, gendang*) and frame drums (*marwas, rabana, Rebana*), as well as a few hourglass drums (*kunti*), drums with feet (*karatu*) and rattle (*kamaru*) drums. Drums are often accorded special ritual status and given offerings, comparable to metal gongs in Java and Bali.

Song (without dance) is usually accompanied by chordophones. Plucked bar zithers (*kantung, kandile, sosanru*) and plucked and struck bamboo idiochord tube zithers (*salude, kalembosan, anthu-anthunga, sattung, ganrang bulo*) were widely distributed throughout central and northern Sulawesi, with some varieties also occurring in the south (*ganrang bulo*), although the bar zither has mostly fallen into disuse. Plucked boat-shaped lutes (*kacapi, kacaping, kecapi, kusapi, kabosi*), sometimes with elaborate filigree carving protruding past the tuning pegs, occur primarily in the south-western and south-eastern peninsulas and usually accompany lyric or narrative solo singing. The Middle Eastern-derived bowl lute (*Gambus, gambusu*) is found in southern and northern lowland areas. Spike fiddles (*arababu, araba, raba, geso-geso, gesok-kesok, gesong-gesong, kesok-kesok, tabolok, kere-kere gallang*), with one or two strings and a coconut-shell or heart-shaped resonator, occur throughout the island, in both upland and lowland areas, and often accompany narrative singing.

Most popular of the aerophones are the many varieties of vertical bamboo flute with external duct (*suling, suling lembang, suling lampe, suling ponco, suling balio, suling bonde, suling deata, susulingen, tualing*). Reed aerophones are limited mainly to the south, from the rice-stalk 'paddy pipe' and idioglot reedpipe (*sikunru, pupai, leleo*) to the conical-bore oboe (*puik-puik*), clarinet (*keke-keke, banci-banci, basing-basing*) and double clarinet (*basing-basing, bacing-pacing*). Other aerophones include transverse flutes (*bansi, Suling*), conch trumpets (*bia, pontuang*), bamboo trumpets (*tambolo, bonto, pompang, korno*) and metal aerophones (*tubalos, sola, remifa, overton, saksopon*).

Indonesia, §VII, 4: Sulawesi

(iii) Genres and ensembles.

Sulawesi maintains a variety of distinctive local genres, mostly involving small ensembles. In lowland South Sulawesi, the best-known dances are accompanied by one or more double-headed barrel drums, usually with oboe and/or gong. The slow and graceful movements of the Makasarese female ensemble dance *pakarena* are accompanied by two double-headed barrel drums (*ganrang*) played with fast interlocking patterns, one oboe (*puik-puik*) playing a continuous melody (with circular breathing), a single metal gong and a bamboo slit-gong (*kattok-kattok*), and sometimes also iron concussion plaques (*anak bacing*), and a fringed bamboo idiophone (*lea-lea, parappasa*). The contrast between the subdued dance and exuberant music is often interpreted locally to represent essential gender differences. A similar ensemble, but with slower drumming and without bamboo slit-gong, accompanies Bugis transvestite priests (*bissu*), who sometimes play narrow bamboo rattles (*alosu, arumpigi*) as they dance. Formerly prominent in ritual life as keepers of the royal regalia, the *bissu* perform for various ceremonies including weddings. Many other dances in lowland South Sulawesi (e.g. Bugis female dances *pajoge* and *paraga*,

Mandar female dance *pattuddu*, Konjo/Makasarese male dance *pabatte passapu*) are also accompanied by a pair of interlocking drums, usually with gong and sometimes additional idiophones: fringed bamboo idiophones (*sia sia, lae-lae, lea-lea*), cymbals (*kancing*) and concussion plaques (*anak baccing*). Duple metre predominates, but triple-metre drumming accompanies local varieties of martial arts (*mancak, mencak*). The Makasarese *ganrang bulo* is named after the bamboo idiochord played by the dancers, who are usually accompanied by boat lute (*kacaping*) and sometimes violin (*biola*) with frame drum (*rabana*). It is often performed by children playing bamboo castanets and singers accompanying themselves on *kacaping*, without bamboo idiochord. Ensembles of *kacaping* or *kecapi* and bamboo flute (*suling*), developed in the 1960s and called *sinfoni kecapi*, accompany local diatonic songs and, with drum added, often accompany the dances choreographed for stage performance by pioneering dancer-musician Andi Nurhani Sapada and her students. More recently, innovative musicians and choreographers, such as A. Halilintar Lathief, Syamsul Qamar, and Sirajuddin Dg. Bantang, have combined various instruments of South Sulawesi into unique ensembles playing a mix of traditional and experimental music.

Sinrilik and *massurek* present long narratives of local heroes and history in lyric prose and narrow-range melody, often accompanied by spike fiddle (for *sinrilik*) or *kecapi* (for *massurek*). Other vocal music often involves versified exchange between two or more singers (*sisila-sila, batti'-batti'*), usually accompanied by *kacaping, kecapi* or *gambus*. Several ensembles combine Western and local instruments, such as the Bugis *kecapi-biola* (with boat-shaped lute and violin) and Makasarese *orkes parambang* (*orkes rambang-rambang, orkes turiolo*). The *orkes parambang* presents locally composed songs, mostly in Western diatonic scales and duple metre and accompanied by violin, frame drums (*rabana*), hanging gong, a pair of horizontally mounted gongs (*kannong-kannong*) and sometimes clarinet, trumpet, mandolin, guitar or *suling*. Closely resembling the *langgam* and *keroncong* known elsewhere in Indonesia is the Makasarese *losquin*, with guitar and sometimes a few other Western-derived chordophones providing harmonic accompaniment. Many of South Sulawesi's diatonic songs can be played in several different styles, and some are thought to exhibit Chinese and Arabic as well as Western influence. Arabic influence is also evident in the widespread use of frame drums, particularly in the *qasidah* vocal ensemble (see §VIII, 1 below), whose repertory includes songs with Arabic texts.

Vocal music predominates among the Toraja in upland South Sulawesi. Pulsating responsorial and antiphonal singing – *dondī* (seated mixed chorus) and *badong* (male round-dance chorus) – is heard at Torajan funerals. At fertility (*bua'*) and purification (*bugi'* and *maro*) rites, male and female choruses also perform, in some cases with flute or drum accompaniment. Choral music is mostly in duple and sometimes triple metre. Flute ensembles (*suling bonde, suling lembang, suling deata*) and fiddle ensembles (*geso-geso*) also perform for purification rituals. A wind ensemble dating from late colonial times is referred to as *pompang*, after the many buzzed-lip bamboo aerophones that make up the core of the ensemble, complemented by bamboo flutes and drums. *Pompang* ensembles perform diatonic pieces with basic Western harmonies in a

hymn style introduced by Christian missionaries. Some dances, such as the well-known female *pagellu'*, are accompanied by a double-headed barrel drum (*gandang*) played simultaneously by two or more drummers, with one of the dancers standing on the body of the drum. Music similar to that of the Toraja is also found in highland areas to the west (Mamasa and upland Mamuju).

In South-east Sulawesi, as in South Sulawesi, drum and gong ensembles used to accompany ritual dances such as the *melulo* rice-harvest dance (drum and three gongs) and the *modinggu* rice-pounding dance (drum, gong, gong-chime, rice-block and pestle) of the Kolaka peoples. Drumming also accompanies Islamic *maulid* ceremonies of the Wolio people. The Wolio also practise narrative singing of local histories (*kabanti*), as well as songs accompanied by bowl lute (*gambusu'*). Other instruments include bamboo idiochords (*dimba-dimba*), bamboo buzzing wands (*ore-ore nggae*), the bamboo jew's harp of the Kolaka people (*ore-ore mbondu*), the *kapupurapi* bamboo aerophone with small tongues and four holes, played for courting, the three-key wooden xylophone (*katou*) of the Muna people, and the spike fiddle (*raba*) of the Wolio. Many other instruments were reported in the early 20th century by Kaudern, including bamboo buzzing wands, single-headed drums, boat-shaped lutes, bamboo flutes and double clarinets.

Musical ensembles in Central Sulawesi include purely vocal groups, small instrumental groups consisting of one or more drums with several other instruments (gongs, flutes, or cymbals) and vocal-instrumental groups, often performing songs in Western scales with guitar accompaniment. Many of these ensembles accompany shamanic and other rituals, in which drumming is usually considered a crucial element for efficacy (e.g. those of the Kulawi and Wana). The Kulawi *rego* is a round-dance in which the chorus of dancers provide the musical accompaniment. In one major variety, men and women alternate in close formation, with each man placing his arm over the shoulder of the woman to his left, a practice suppressed by both Christian and Muslim authorities but recently undergoing revival as part of wider efforts by the Indonesian government to promote regional arts. Western-influenced diatonic singing and guitar playing has replaced indigenous forms of accompaniment for some ritual and secular dances, such as the Kaili *dero*. Most music represented in available literature and recordings is in duple metre, but some major genres, including the Kulawi *rego*, employ triple metre.

Several distinctive ensemble types have developed in North Sulawesi, performing Dutch, Western and Western-influenced Indonesian songs as well as local songs in diatonic scales; these include the bamboo-brass band (*musik bambu seng*) and the xylophone ensemble (*kolintang*, *kulintang*). *Musik bambu seng* developed from ensembles of bamboo flutes and horns (known as *korno* or *tenor*) in the mid-19th century. Drums were added in the 1920s together with different registers of 'brass' instruments (*tubalos*, *sola*, *remifa*), which were made mostly of zinc (*seng*) in the 1930s and 40s and often of copper by the 1960s; sometimes saxophones and clarinets were also included (Boonzajer, 1992). Current ensembles are largely metal, but they retain the bamboo *korno* and are pitched between B and D. *Kolintang* ensembles, with several registers of diatonically tuned

xylophones played in a standing position, have spread from North Sulawesi to many other parts of Indonesia and are especially popular among Dharma Wanita groups (made up of the wives of civil servants). Experiments with the bamboo buzzing wand (*polopalo*) of the Gorontalo have resulted in large ensembles and even the construction of a two-octave *polopalo*, with each chromatic tone of the Western scale sounded by one wand. At Sam Ratulangi University, W.J. Waworeontoe developed the *sumisingka* ensemble, a pot pourri of North Sulawesi indigenous instruments (bamboo flutes, slit-gongs, concussion slats and drums) intended to fulfil the function of Western-influenced drum-bands, but at the same time to be clearly identifiable as from North Sulawesi.

2. New composition.

Indonesia, §VIII: Pan-Indonesian musical developments

1. Popular music.

The various forms of popular music (and, to a lesser extent, Islamic and Christian religious music) are the only kinds of music disseminated and accepted throughout Indonesia (see §I, 1, above). More than any other form, popular music crosses regional, ethnic and religious boundaries, and it can thus be considered the country's only 'national' music.

(i) 1890–1918.

(ii) 1920–42.

(iii) 1942–9.

(iv) 1950–65.

(v) 1965 to the late 1990s.

Indonesia, §VIII, 1: Pan-Indonesian musical developments: Popular music

(i) 1890–1918.

Before the 20th century, the only musics in Indonesia (then the Netherlands Indies) that crossed regional and ethnolinguistic boundaries were Islamic religious music and Qur'anic chant (the latter not, from the strict Islamic viewpoint, considered as 'music') and, to a much lesser extent, European marches, waltzes, operetta tunes and light classical music. These European genres, sung in European languages, appealed to the Dutch colonial administrators, to the most Westernized of the native aristocracy and to Eurasians favouring the European side of their dual heritage. The emergence, at the turn of the century, of popular music sung in Melayu (Malay), the lingua franca of the colony and the basis of the

modern Indonesian language, was fostered by two developments: the rise of commercial urban theatre and the advent of commercial recording.

Commercial Melayu-language theatre is thought to have originated in the Malay peninsula (Camoens, 1982; Tan, 1993) and to have spread in the 1890s to Java (initially Surabaya and Batavia (Jakarta)), where it was variously called *stambul*, *komedi stambul*, *bangsawan* and *opera*. *Stambul* was eclectic in its stories and music, drawing on Dutch, Middle Eastern, Chinese, Malay and local Indonesian (mainly Batavian) sources. The music was performed by a small ensemble: *rebab* and violin according to one early report (van Maurik); violin, flute and guitar according to another (Knaap). It is likely that other instruments were added. By the early 20th century the orchestra could include piano and European instruments, but it never extended to gamelan instruments or others regarded as essentially indigenous.

In the 1890s, the music for *stambul* was apparently derived mainly from European sources: opera, operetta and popular song. At least by 1910, a number of melodies perceived as Indonesian had been added to the repertory as vehicles for sung narration and monologue. These Indonesian melodies were of two classes: *stambul* and *kroncong* (*keroncong*). European in idiom, *stambul* melodies were identified by number: *stambul satu* (one), *stambul dua* (two) etc., reaching at least nine. They were presumably associated with specific scene-types or emotional states that occurred regularly in *stambul* plays.

Before World War I, *kroncong* melodies were also European in idiom, though later they became Indonesianized. The roots of *kroncong* lie in Portuguese songs and instruments brought to Indonesia in the 16th and early 17th centuries. Presumably introduced by Portuguese traders and sailors, they were perpetuated by mixed-race descendants of the Portuguese and by the 'Black Portuguese' or *Mardijkers*, descendants of Asian and African slaves owned and then freed by the Portuguese. The principal *Mardijker* settlements were in Batavia and Ambon (Abdurachman, 1975).

By the late 19th century the *Mardijkers* had intermarried with Eurasians and Indonesians and had largely disappeared as a distinct group. *Kroncong* was by then an urban folk music, associated primarily with Eurasians in Batavia and other large cities. For the most part Eurasians were closer in lifestyle, income and social status to *inlanders* or *pribumi* ('natives') than to full-blood Europeans, and *kroncong* was a lower-class music, though its adoption by the *stambul* theatre and the recording industry enhanced its status.

According to Manusama (1919) there were, strictly speaking, only two *kroncong* melodies: *Kroncong Moresco*, in major tonality, and *Prounga* or *Kroncong Bandan*, in minor tonality (others that are often grouped with them, e.g. *Nina Bobo* and *Kafrinyo*, are not titled '*kroncong*'). He asserted that these melodies were Portuguese in origin. Singers used them as vehicles for memorized or improvised quatrains called *pantun*. The accompaniment was variable. A strummed lute is always mentioned: a guitar or the small lute called *kroncong*, which resembles the ukulele or the Portuguese *cavaquinho*. It is often assumed that the *kroncong* genre takes

its name from the *kroncong* lute, but Seebass (1997) suggests that the terminology went in the other direction. Other instruments could be added, including violin, European flute and perhaps a frame drum.

The first commercial recordings of Indonesian musicians were made in Singapore by the Gramophone Company in 1903. About two-thirds of the titles recorded then are in European languages; the rest, including two *kroncong* and three *stambul*, are in Melayu. By the time of the Gramophone Company's next trips, in 1909 and 1910, *kroncong* and *stambul* (recorded in Batavia, Yogyakarta and Semarang) had become much more prominent. Gramophone records of *kroncong*, *stambul* and European operetta tunes, marches and waltzes were also issued in this pre-war period by other European companies and by Indonesian-Chinese entrepreneurs in Batavia and Surabaya.

Indonesia, §VIII, 1: Pan-Indonesian musical developments: Popular music (ii) 1920–42.

In this period, ending with the Japanese occupation of Indonesia and the collapse of Dutch colonial control, popular music was no longer dependent on the pre-war European forms, but rather upon the newer popular songs and dance-music of the United States and Europe: tangos, foxtrots, rumbas, blues and swing (Möller, 1987). Gramophone records purveyed countless imported and newly composed tunes, almost all of them sung in Melayu, with the exception of the 'Hawaiian' song genre, which was sung in English. Instrumentation and idiom were those of Western popular music of the time; for convenience these various forms will be termed 'Western-model' popular music.

The only indigenous song forms prominent in the popular music of the 1920s and 30s were *kroncong* and, to a lesser extent, *stambul*. *Kroncong Bandan* or *Prounga* vanished, leaving one melody (*Moresco*) for the entire *kroncong* genre; but recordings show that after the war the harmonic rhythm of *kroncong* slowed to half the pre-war speed, permitting greater variation in the realization of that melody, so that the single melody became a melody-type, a chord-sequence over which many melodies could be set. [Table 19](#) outlines the basic sequence, ignoring standard optional substitutions (such as I–I–IV–V–I–I–IV–V instead of I–I–I–I–I–I–I).

During a period of 10 or 15 years beginning in the late 1920s, the characteristic *kroncong* ensemble and performance idiom developed: a flowing vocal (or violin) melody is decorated by a rapid interlocking figuration of upper-register plucked lutes (e.g. ukulele and mandolin), with a 'walking' guitar line occupying the middle register and animated pizzicato cello in the lower register suggesting drumming. Although the melodic-harmonic base is Western, the stratified texture of this string band evokes the organization of Javanese gamelan music and Sundanese *kacapi-suling* (zither and bamboo flute genre), and it is a crucial element in creating the 'Indonesian' quality of *kroncong*. Songs using the *kroncong* chord sequence were also recorded during this period in non-stratified idioms (i.e. those of European dance music); such recordings were described as *krontjong tango*, *krontjong rumba* etc.

As the commercial theatre abandoned the sung narration and monologue typical of *stambul* in favour of spoken dialogue with inserted production numbers and 'cabaret' entr'actes, the function of numbered *stambul* melodies died out; however, songs using these melodies or their chord sequences (particularly that of *stambul dua*) were still heard.

Probably very near the end of this pre-World War II period, a variety of Melayu-language popular song emerged that was perceived to be related to *kroncong* but did not use the traditional *kroncong* form; instead it used AABA melodic form and chord sequences typical of ordinary Euro-American popular songs. This new form came to be known (after the war if not before) as *langgam kroncong* (Table 20). During and after the war *langgam kroncong* were performed in the stratified idiom that had developed for *kroncong*; this was probably the case before the war as well, but evidence has not yet surfaced to prove this. The famous song *Bengawan Solo*, composed by Gesang Martohartono in 1940, is an example of a *langgam kroncong*.

In the late 1930s, Western-model songs were recorded in Arabic and in several Indonesian languages other than the lingua franca: Acehnese, 'Batak' (i.e. Toba), Karo, Minangkabau and Makasar. There were also two genres of Islamic popular music not modelled on Western forms: *orkes harmonium*, the nucleus of which was harmonium, violin and vocal, usually sung in Arabic; and *orkes gambus*, consisting of violin(s), [Gambus](#) (wooden pear-shaped lute) and vocal (in Arabic or Melayu), plus other optional instruments (guitar, mandolin, cello, string bass and percussion). These used a largely Middle Eastern idiom, though European melodic influence and even a 'crooning' vocal style were sometimes present in *gambus* songs (see [Orkes](#)).

[Indonesia, §VIII, 1: Pan-Indonesian musical developments: Popular music \(iii\) 1942–9.](#)

Japanese soldiers invaded Indonesia at the beginning of 1942; in March of that year they achieved control of the colony and expelled the Dutch. The years of military occupation that followed, though a period of hardship for most Indonesians, were stimulating for popular music. The Japanese banned forms of music and dance that were obviously Western in origin or association. Suddenly the whole repertory of tangos, foxtrots, jazz, Hawaiian music and the like was off-limits; this led to intensive composition in the *kroncong* and *langgam kroncong* forms. During the four-year revolution that followed the proclamation of independence in 1945, these forms (along with marches and military songs) remained dominant in popular music. After independence was achieved, many of the songs of the 1940s (and, by extension, the stratified *kroncong* idiom in which they were performed) became imbued with nostalgia for the heroism, excitement and dedication of the revolution. These songs, sometimes expressing patriotic sentiments and sometimes depicting romance shadowed by war and privation, now constitute a distinct repertory known as *lagu perjuangan* ('songs of the struggle').

Indonesia, §VIII, 1: Pan-Indonesian musical developments: Popular music (iv) 1950–65.

After the revolution, explicit imitation of Western popular music re-emerged in Indonesia under the name *hiburan* ('entertainment'). Mexican and Latin American traits such as the cha cha cha rhythm and the inclusion of maracas and bongos were in vogue. Also during this period the idea of targeting adolescents as a principal market for the consumption of entertainment took hold in Indonesia. 'Smooth' American youth-market singers (e.g. Connie Francis, Pat Boone) became popular and were imitated by Indonesian singers. The government, working through the national radio network Radio Republik Indonesia (RRI) and its record-producing affiliate, Lokananta, attempted to counter this tendency by national promotion of *kroncong* and a new genre known as *hiburan daerah* ('regional entertainment'). The lyrics of *hiburan daerah* were in regional languages, sometimes sung to melodies from local traditions or, more often, to newly composed melodies; the arrangements were in Western (often Latin-inflected) idioms and were played by cocktail-lounge combos. The hope was that use of a musical lingua franca could overcome the inevitable parochiality of the regional languages. Performers were based in Jakarta, not in the regions. The genre was largely supported by government subsidy, though the Minangkabau style of *hiburan daerah* (from West Sumatra) enjoyed independent commercial success as well.

In this period, the distinction between *kroncong asli* ('true' *kroncong*, as shown in [Table 19](#)) and *langgam kroncong* ([Table 20](#)) largely disappeared; anything played in the stratified *kroncong* idiom and using the *kroncong* string-band instrumentation (sometimes augmented by transverse flute or piano) was considered *kroncong*. *Kroncong* was supported and subsidized by the government, similar to *hiburan daerah* but with the difference that *kroncong* actually had a wide and enthusiastic audience. In the 1950s the harmonic rhythm of *kroncong* slowed again, as it had after World War I: the typical tempo of the chords became four times slower than it had been in the earliest recordings. A compensating complication of melody and

figuration also occurred: melodies became more florid and chromatic, and the middle and upper strata doubled or quadrupled in rhythmic density.

In the 1950s the idiom and instrumentation of *kroncong* were applied to a new repertory of songs in *langgam* form, sung in Javanese and using a minor scale in tempered tuning to approximate a Javanese *pélog* scale. One of the most prolific composers of these *langgam Jawa* was Andjar Any (*b* 1936); one of the best-known singers was Waldjinah.

In the late 1950s and early 60s, guitar bands imitating the Everly Brothers, the Beatles and similar groups sprang up. In his 1959 Independence Day address, President Sukarno disparaged Western popular music and its Indonesian imitations as ‘ngak-ngik-ngok’ music; although this lacked the legal force of a ban, it was taken as such by government officials. Indonesian singers continued, however, to perform Western songs and Indonesian songs in Western style, to the government's increasing displeasure. In 1965 the government went as far as putting a popular group, Koes Bersaudara, in prison, but they were released a month later in the wake of the murderous turmoil that brought down Sukarno.

A separate stream of popular music in this period stemmed from Indian and Malaysian film music and popular songs. Indonesian-language songs were recorded using melodic and stylistic inflections from Hindi film songs; one of the most popular of these was *Boneka dari India*, a hit of the late 1950s. Malaysian songs shared some of these Indian inflections but also had a generalized ‘Melayu’ quality that was believed to be indigenous to the east coast of Sumatra as well as peninsular Malaysia. In fact, the connection of Malaysian film and popular music of the 1950s to the *lagu Melayu asli* of Sumatra is very tenuous. The East Javanese singer Effendi (also known as Said Effendi) became famous as a singer of Melayu songs in the manner of the Malaysian star P. Ramlee. These two styles, Indian and Malaysian, coalesced in the mid- and late 1960s to become the source of the popular and influential Indonesian genre *dangdut*.

The *orkes harmonium* died out during the upheavals of the 1940s. *Gambus* (the music of the *orkes gambus*, not the plucked lute itself) survived but lost whatever European traits it had, becoming more demonstratively Arabic in character and hence symbolic of Islam, although the song lyrics do not necessarily have any explicit religious content.

Indonesia, §VIII, 1: Pan-Indonesian musical developments: Popular music (v) 1965 to the late 1990s.

Dangdut emerged as the music of the urban lower class, at first in Jakarta and later in other cities as well. As most of the urban poor were (and are) Muslim, the frame of reference in *dangdut* lyrics was popular Islam, but the songs were not explicitly religious in the early phase. Instead they tended to be flirtatious or to refer conventionally to poverty and misfortune. At first the musical idiom was precisely the mix of Indian and Malaysian film song traits mentioned above. The *dangdut* ensemble was called a ‘Melayu orchestra’ (*orkes Melayu*); this term persists even today. (It is hard to make any clear connection between *dangdut* and the music of the Melayu ethnic group; more likely ‘Melayu’ here means the Melayu- or Indonesian-speaking urban poor, as distinguished from Javanese speakers and other

immigrants to Jakarta, who were perceived as having their own music, different from *dangdut*.) A prominent feature was *tablā*-like drumming with a characteristic rhythm in which a low sound just before the strong beat is followed by a heavy, higher-pitched sound on the strong beat; this rhythm can be imitated in syllables as 'dang-DUT' and has been plausibly suggested as the source of the genre's name.

In the early 1970s, Oma (later Rhoma) Irama (*b* 1947), the star who was to dominate *dangdut* for the next 25 years, became prominent. Rhoma instituted several important innovations: he reduced the Indian and Malaysian elements in *dangdut*, replacing them with inflections from the Middle East and, more pervasively, American rock music, and he broadened and deepened the content of lyrics. Instead of the coy dialogues and conventional laments of early *dangdut* songs (including those sung by Oma Irama and his first singing partner, Elvy Sukaesih), Rhoma introduced explicit social protest of a rather general but, by Indonesian standards, biting sort: e.g. 'the rich get richer and the poor get poorer'. For a period in the 1980s, at the height of his popularity, he was banned from television (at that time entirely government-controlled) because of the sting of such criticism. From the mid-1970s on, Rhoma also began to insert Islamic religious messages into his songs.

In the 1970s and the first half of the 1980s, *dangdut* retained its status as the music of the urban poor. In later years, however, it became more glamorous, and its stars became extremely wealthy. Rhoma himself joined the ruling political party, and the element of social protest in his songs virtually disappeared. Despite the religious messages favoured by Rhoma, the genre is predominantly secular. Musically, there are two streams: one, deriving from Rhoma, has a large component of rock; the other, exemplified by singers such as Mansyur S., continues to reflect the genre's origins in Indian film music. *Dangdut* reaches its widest audience through recordings, films and broadcast media, all emanating almost exclusively from Jakarta. The superstars also perform in live extravaganzas, and there are countless local bands, unknown outside their own districts, that perform for regional night fairs and local celebrations.

Aside from *dangdut*, the other principal category of Indonesian popular music after 1965 is music in the styles and idioms of Western youth-orientated popular music, sung in Indonesian (this category has no comprehensive name in Indonesia). With the accession of the Suharto government (the 'New Order'), official disapproval of Western and Western-influenced music abated, and from then on Western-model music has followed the trends of mainstream American and European popular music, albeit with a time-lag. The most commercially successful variety is known as *pop Indonesia*, which draws on sweet, slick and generally non-confrontational varieties of Western popular music. Other categories are known by English names (rock, punk rock, country, disco, rap), although the musical correspondence to their Western counterparts is not always exact. As with *dangdut*, the Western-model musics are disseminated mainly through commercial media rather than live performance, and the centre of production and distribution is Jakarta.

The Western-model genres have always been largely the property of comparatively affluent or educated youth, particularly those aspiring to elements of the lifestyle believed to be characteristic of Europe and America (*dangdut*, which originally belonged to the urban poor, has also become acceptable to these more upscale groups). The principal theme of *pop* lyrics is romantic love; despite occasional censure from official sources, one of the most common types of *pop* love song is the *lagu cengeng* ('weepy song'; see Yampolsky, 1989). The anger and intentional outrageousness typical of some rock music in the West is also found, somewhat muted, in Indonesian rock and punk rock, but not in *pop Indonesia*. In the period from the mid-1980s to the early 1990s, the social protest that had vanished from *dangdut* re-emerged in the songs of 'country' singers, most notably Iwan Fals.

Both Islam and the various forms of Christianity in Indonesia have produced religious popular music, which is 'popular' in so far as it is marketed in the same media with the same techniques and performed in the same manner (often by the same performers) as secular popular music. Christian popular music, known as *pop rohani* ('spiritual pop'), uses the idioms of *pop Indonesia*. The Islamic *qasidah* (*qasīda*) or *qasidah moderen* (Arps, 1996) is typically performed by a lead singer (usually female), a female chorus and an orchestra of guitars, violins, keyboards and percussion, including tambourines with jingles and the *tablā*-like bongos of *dangdut*. The instrumentation and the instrumental accompaniment combine features of *gambus* and *dangdut*. (*Qasidah rebana*, an earlier form of popular *qasidah*, used only frame drums to accompany the female singers.) The singing involves solo statements answered by a unison choral refrain. The lyrics typically affirm Islamic standards of morality and daily behaviour.

Hiburan daerah, the Old Order's attempt to develop Western-model popular music in regional languages, died out when the New Order took over. *Pop Indonesia* and *dangdut*, on the other hand, disseminated without government sponsorship, inspired young people in every corner of Indonesia to write their own *pop* and *dangdut* songs using local languages, and audio-cassette technology (introduced at the beginning of the 1970s) made it possible for these songs to be recorded cheaply and sold to local consumers. As a result, there are many varieties of regional *pop* and regional *dangdut* all over the country. Most regional *dangdut* styles and some regional *pop* styles are basically imitative of the Jakarta models. Some regional *pop* styles, however, make use of local melodies (*lagu daerah*) cast in the Western popular idiom, typically accompanied by strummed guitar, with perhaps some traditional instruments added for local flavour. In Christianized areas, where techniques of harmony are familiar, at least to singers with experience in the church choirs, the *lagu daerah* are often arranged for *vocal group* (the English term is used) in three-or four-part harmony. Strummed guitar accompaniment is again typical.

There is also one instance of what may be called 'traditional regional popular music': this is *jaipongan*, from the Sundanese region of West Java. *Jaipongan*, like any popular music, is geared to and dependent upon media dissemination, but its idiom is that of Sundanese gamelan, uninfluenced by Western or any other foreign music. Aside from a transient flurry of national

exposure in the early 1980s, *jaipongan* has been popular only among Sundanese; but apart from this regional or ethnic limitation it has followed the marketing and developmental patterns of *dangdut*, *pop Indonesia* and other national popular musics.

Indonesia, §VIII: Pan-Indonesian musical developments

2. New composition.

The meeting of Indonesian and European cultural traditions in the 20th century led to the emergence of composers who developed their own personal and unique styles of expression.

Four composers pioneered the idea of a meeting between traditional musical cultures and Western art music, an idea that has persisted in new Indonesian music. R.M. Soewardi Suryaningrat (later known as Ki Hadjar Dewantara) and R.M. Soerjopoetro set out to 'translate' gamelan music into Western musical forms in the compositions *Kinanthi Sandung* (1916) for voice and piano and *Rarjwo Sarajo* (1916–17) for voice and violin, respectively. In these compositions the two composers maintained the freedom to improvise around a Central Javanese *balungan* (skeletal melody), representing gamelan pitches in terms of their Western near-equivalences.

R. Atmadarsana and R. Soehardjo also 'translated' gamelan music in works such as *Wirangrong* (1922) for two-part choir and *Birvadda Warawidya* (1924) for three-part choir. Soehardjo used traditional *tembang* (sung poetry) and *gendhing* (gamelan composition) melodies such as *Pangkur*, *Tarupala* and *Clunthang*, while employing Western contrapuntal techniques and polyphonic textures .

On 28 October 1928, young Indonesians from a variety of cultural and political organizations adopted the pledge 'Satu nusa, satu bangsa dan satu bahasa' ('one land, one nation, one language'). At that time, the song *Indonesia Raya* ('Indonesia the Great') by W.R. Supratman, with a Western diatonic melody, was adopted as a national anthem. After Indonesia gained independence in 1949, music quickly became the subject of heated debate between prominent musicians and intellectuals whose background was in Javanese gamelan, and non-Javanese musicians from a Western music background. Both sides were anxious to promote their own music culture as the official national musical language. From then on, contemporary Indonesian composition became a political phenomenon.

Musicians of the 1940s from Tapanuli (North Sumatra) and Gorontalo, working within a diatonic idiom and including Amir Pasaribu, Liberty Manik and J.A. Dingga, not only believed that a national music should not be based on Javanese or any other 'ethnic music', but that it should be based on a 'new Indonesian music' that was best represented by the diatonic music of academic composers such as Cornel Simanjuntak and Pasaribu himself. This viewpoint was reinforced by the official adoption of *Indonesia Raya* as the national anthem and by the lifestyle of the Indonesian élite in the 1950s, which was orientated towards the West in its ideology of liberal democracy.

At the same time, Ki Hadjar Dewantara was Minister of Education and Culture in the first cabinet; Javanese intellectuals, among them many who

held government posts, succeeded in 'smuggling' his concept of culture into the 1945 constitutional ordinances in the following form: 'National culture consists of the peaks of regional cultures'. Dewantara's ideas were similarly applied to the problem of national music at the Second Cultural Congress in Bandung in 1951, resulting in the declaration that 'national music consists of the merging of peaks of regional musics'.

The conflict between these two entrenched views of music at this period was made explicit in the establishment of Konservatori Karawitan Indonesia (KOKAR) in Surakarta for the teaching of *karawitan* and Sekolah Musik Indonesia (SMI) in Yogyakarta for the teaching of Western art music. At KOKAR the government, which sided with Dewantara's views, put in place an agenda for the creation of a new Indonesian music that had its roots in regional musics.

This conflict was complicated by the emergence of the artists' groups Lembaga Kebudayaan Rakyat (LEKRA, 'People's Cultural League'), affiliated to the Indonesian Communist Party (PKI), and the Lembaga Kebudayaan Nasional (LKN, 'National Cultural League') affiliated to the Indonesian Nationalist Party (PNI). The LKN was endorsed by Sukarno, the first President of Indonesia, to put in place a people's ideology as a basis for their project of nationalism in the field of the arts. The emergence of a new generation of composers who accepted this ideology caused the world of Indonesian contemporary music to go through a new phase of transformation at the beginning of the 1960s.

In the world of contemporary gamelan music this new phase was marked by the emergence of pieces with lyrics that referred to the political ideologies of the Sukarno regime. One of these gamelan composers was Ki Wasitodipuro (see [Wasitodiningrat](#), [Kanjeng Radèn Tumenggung](#)), a pupil of Soeryopoetro. In these pieces Wasitodipuro used titles and lyrics that referred to the political wisdom of Sukarno's inclination to the left, for example *Nekolim* (ex.24), *USDEK* and *Modernisasi desa* ('village modernization').

While the position of contemporary diatonic music became stronger, there also emerged a new generation of composers connected with LEKRA who wrote vocal music with political lyrics. Sometimes these lyrics were taken from the poems of writers connected with LEKRA. Outstanding among the composers were Subronto K. Atmodjo and [Sudharnoto](#). Various works by these two were published by LEKRA, for example *Asia Afrika Bersatu* ('The unity of Asia and Africa' 1962) by Sudharnoto ([ex.25](#)).

The emergence of a new ideology pushed diatonic musicians with liberal ideas to criticize their 'comrades'. This conflict became sharper when a group of liberal artists produced the 'Manifes Kebudayaan' (MANIKEBU, 'cultural manifesto'). Binsar Sitompul, a diatonic composer of the 1940s, became a prime mover in this group, which stressed the value of universal humanism and followed the political opinions of LEKRA and LKN. The climax of this conflict came with the coup on 30 September 1965 that brought about the fall of the Sukarno regime and ended the whole drama in the artistic realm. LEKRA composers such as Subronto K. Atmodjo and Sudharnoto were imprisoned for a number of years.

With the end of the conflict between left-wing and liberal composers and between pentatonic and diatonic composers, along with the de-politicization of the arts under the Suharto government, from 1966 the world of contemporary Indonesian music entered a new phase, which stressed freedom of expression separated from ideological ties. One problem still remaining for composers was how to express Indonesian national identity within the context of the worldwide integration of contemporary music. This was a greater burden for composers using a diatonic musical language derived from Western music.

The issue, in fact, had already become noticeable in the works of [Amir Pasaribu](#) and Cornel Simanjuntak in the 1940s. In his efforts to find a special Indonesian idiom, Pasaribu tried to make use of pentatonic scales from gamelan music as melodic material in his compositions, while Simanjuntak, who composed mainly vocal music, used the characteristic elements of the rhythm of the Indonesian language to create a basic theory of melody. Composers of the 1950s and after who built on the approach of Amir Pasaribu include [Trisutji Kamal](#), [Jaya Suprana](#) and [Yazeed Djamin](#).

Diatonic composers also felt a large discrepancy between their world and that of traditional musics. Frans Haryadi was the composer most concerned with this problem in the 1960s, particularly as he was both a composer and an ethnomusicologist. In 1974 he began to experiment with gamelan players to produce a new approach to creating compositions that included gamelan and other traditional instruments. From this collaboration came the dance piece *Kenangan* ('Remembrance of times past'). In this work, Haryadi planned the structure of the composition as a single major line, while the gamelan players were given the opportunity to improvise according to traditional principles. Consequently, although the work was written by a composer with a background in academic music, it upheld traditional musical idioms.

Frans Haryadi's desire to bridge the gap between traditional and contemporary musics in the 'New Order' period (Suharto regime) was taken a stage further in 1979 with the foundation of the Pekan Komponis Muda ('young composers group') by the Dewan Kesenian Jakarta (Jakarta Arts Council), which gave birth to a new generation of composers from backgrounds of Sudanese, Javanese, Balinese and Minang (West Sumatra) traditional musics. These composers started to write pieces with the aim of using traditional instruments as sound-sources. With this goal, these composers freed themselves from the idioms and rules of the traditional musics that formed their backgrounds. As a substitute they

centred their music on experiments with form, frequently very theatrical in nature, and experiments with timbre, exploiting all the possibilities for producing sound from traditional instruments using new techniques. Some of them also created new instruments or further developed the mechanical aspects of traditional instruments.

Another distinguishing feature of these composers, especially apparent in the works that emerged during the 1990s, is a tendency to borrow traditional musical idioms from beyond their own ethnic group.

Consequently (though unintentionally perhaps) the musical language to which Ki Hadjar Dewantara aspired has eventually become a national musical language but with a more multicultural basis. Composers of the 1970s and later, from a traditional musical background, include [al. Suwardi](#), [I Wayan Sadra](#), [Djaduk Ferianto](#), [Dedy Satya Hadianda](#) and [M. Halim](#), from Surakarta, Bali, Yogyakarta, West Java and Padang Panjang (West Sumatra) respectively.

Beginning in the mid-1970s a number of composers have emerged in the field of diatonic music who have written works exploring traditional musical idioms and instruments. Outstanding among these have been [Sapto Raharjo](#), [Inisisri](#), [Tony Prabowo](#) and [ben m. Pasaribu](#), from Yogyakarta, Jakarta, Jakarta and Medan (North Sumatra) respectively. A number of composers who have been interested in the problem of choosing modes have composed by collaborating with traditional musicians to the extent that their works have become a meeting ground for traditional and contemporary music ([ex.26](#)).

The presence of composers such as Sutanto and Harry Roesli has created an increasingly dynamic situation. Starting from the environs of the village of Mendut in Central Java, [Sutanto](#), a composer with an academic background, creates work in cooperation with the villagers, producing complex and unusual texts. The work of [Harry Roesli](#) (see fig.25) is important not only because his works can bridge the world of contemporary music with Indonesian pop music, but also because he also uses music as a medium for comment on the social and political problems that have emerged during the New Order, especially concerning the political wisdom of the Suharto regime. More than three decades after the establishment of the New Order, the world of Indonesian contemporary music is returning to the area of politics, with all the risks that this entails.

Indy, (Paul Marie Théodore) Vincent d'

(*b* Paris, 27 Mar 1851; *d* Paris, 2 Dec 1931). French composer, teacher, conductor and editor of early music. His famed veneration for Beethoven and Franck has unfortunately obscured the individual character of his own compositions, particularly his fine orchestral pieces descriptive of southern France. As a teacher his influence was enormous and wideranging, with benefits for French music far outweighing the charges of dogmatism and political intolerance.

Indy, Vincent d'

1. Life.

D'Indy came from a military aristocratic family from the Ardèche region, a fact of the greatest importance in understanding his lifelong nationalist and right-wing political position. His mother died in childbirth, and he was brought up by his paternal grandmother, Thérèse (née de Chorier). Her strict regime, however, was mitigated by deep affection: she was not the tyrannical ogress of received opinion. D'Indy took lessons in piano from Louis Diémer and theory from Albert Lavignac; while showing definite promise, he showed more interest as a boy in military matters and the life of his hero Napoleon. At 18, having passed his *baccalauréat*, he was sent on an extended trip to Italy, which confirmed his growing, if unfocused sense of himself as a potential composer, rather than an army officer; this experience also fostered a permanent love of Dante, which helped form his philosophy of life. Nevertheless, his patriotic instincts impelled him to volunteer for active service in the National Guard during the Prussian siege of Paris in the freezing winter of 1870–71.

After this upheaval, his father Antonin insisted on his studying law at the Sorbonne, from which he was rescued by the death of Thérèse and a handsome legacy. Music thereafter was to be his life's work, and, on his friend Duparc's recommendation, he joined Franck's organ class at the Conservatoire. There, organ playing took second place to a composition course unrivalled, by French standards, in its depth and thoroughness. A slow and laborious developer, d'Indy gained only a *premier accessit* on graduating in 1875. Anxious to widen his horizons, he had already made a vacation tour of Germany in 1873, taking part in Liszt's piano masterclasses in Weimar, and experiencing the concert and operatic life of Dresden, Vienna and Munich. Enterprisingly, he attended the 1876 première of Wagner's *Ring* at Bayreuth, and was emotionally overwhelmed by *Die Walküre* and *Götterdämmerung*. Meanwhile in Paris he studied relentlessly to acquire solid compositional techniques and complete musicianship, gaining invaluable experience as second timpanist in Edouard Colonne's orchestra, and subsequently as salaried chorus master. These efforts were rewarded in 1885 when he won the prestigious Grand Prix de la Ville de Paris for his cantata *Le chant de la cloche*. Two years later, his best known work, the *Symphonie sur un chant montagnard français*, received its première.

Though personally ambitious, he also possessed a keen sense of *noblesse oblige*, actively encouraging his contemporaries, such as Chabrier and Fauré, and, together with Chausson, becoming joint secretary of the Société Nationale Musicale in 1885. Simultaneously he acted as musical adviser to the Brussels-based Circle XX, which promoted new developments in the visual arts, music and literature. Of the younger generation, Debussy and Dukas gained his admiration, particularly for their respective *L'après-midi d'un faune* and *L'apprenti sorcier*, works which he later took on conducting tours abroad. The 1890s were years of crusade. Grave dissatisfaction with the anachronistic teaching methods of the Conservatoire and the constricting requirements of the Prix de Rome

competition induced him to join Charles Bordes and Alexandre Guilmant in founding the Schola Cantorum in 1894; he took over as full director in 1904. The Schola initially set out to propagate reforms to the music of the Catholic liturgy, with special emphasis on Gregorian chant and Palestrinan polyphony; soon it developed into a complete musical academy in its own right. In these years, d'Indy was also occupied with two ambitious music dramas, *Fervaal* and *L'étranger*.

Disturbed by the Dreyfus affair, he had become increasingly nationalistic and anti-Semitic, and with the political author Maurice Barrès he joined the Ligue de la Patrie Française, which sought a common definition of France to heal its cultural fragmentation. The death of his wife Isabelle in 1905 removed the stabilizing influence in his life, and thereafter he became increasingly vulnerable to politically motivated attacks on the Schola Cantorum and apprehensive of dangerously decadent trends in contemporary music in both France and Germany. Consequently he became increasingly reactionary and dogmatic in his aesthetic ideas. His biography of his beloved master Franck (1906) established the persuasive myth of a medieval saint-like figure; the Franckian cyclic symphony he interpreted, in Ruskinian terms, as structurally analogous to a Gothic cathedral.

The outbreak of World War I in 1914 he welcomed both as a necessary confrontation with the German menace and as a purifying force for his own country. Rejected for active military service at the age of 63, he served on cultural missions to allied countries, and succeeded in completing his third music drama, *La légende de Saint-Christophe*. Peace brought new problems, however. Financial difficulties caused by massive inflation induced him to increase his regular load of conducting tours throughout Europe and America. Yet remarriage in 1920 to the much younger Caroline Janson brought a true creative rebirth, witnessed in the serene Mediterranean-inspired compositions of his final decade. At the same time, determined not to be marginalized as a relic of the past, he engaged forcefully with modernistic developments; there was vigorous criticism – highly prejudiced and not always well informed – of Les Six, Schoenberg and Varèse, as well as such supposedly dehumanizing phenomena as pianolas and gramophones. Indomitable to the end, he continued to compose, conduct, and direct the Schola Cantorum right up to his brief final illness.

[Indy, Vincent d'](#)

2. Teaching and criticism.

D'Indy's critical awareness began with his own invaluable lessons with Franck, which emphasized the fundamental importance of tonal architecture and the clear deployment of themes, as exemplified in the works of Bach and Beethoven. At Weimar, Liszt introduced him to the notion of an historically based pedagogy, by following which students could discover for themselves the evolution of their art through its successive stages. D'Indy thus glimpsed the possibility of Franck's timeless methods enriched with wider historical perspectives, and the resulting synthesis was first tried out successfully in the 1880s with his first pupil, Albéric Magnard,

who laboriously worked on his first two symphonies and opera *Yolande* under d'Indy's guidance.

In 1892 d'Indy sat on a state commission to propose reforms to the Paris Conservatoire's curriculum, but the separate report he submitted – advocating a rather idealistic two-tier system of instrumental teaching, with pure technical instruction followed by in-depth study of aesthetic and interpretative questions – was not acted on. Declining a Conservatoire professorship in disgust, he took the opportunity to develop his own scheme of composition teaching at the Schola Cantorum, attracting increasingly large numbers of students from the Latin-speaking world: France, Spain, Romania and South America. These courses proved invaluable for late developers like Roussel, and those with special needs like Satie. On the other hand, the anarchic Varèse reacted violently against his master's paternalistic manner. Yet d'Indy operated his seemingly dogmatic system with considerable flexibility, being concerned with the students' individual needs and problems, and encouraging active participation in class. Indeed, as director he conceived the Schola essentially as a community devoted to fostering a modern social art, according to his enlightened Roman Catholic philosophy. Novel anti-bureaucratic principles included the abolition of prizes, a wide social mix of students – all being obliged to sing in the choir – and full admission of women to all courses.

D'Indy's composition courses were subsequently edited by his assistants Auguste Sérieyx and Guy de Lioncourt as *Cours de composition musicale*, which proved highly influential outside the walls of the Schola, to be studied, for example, by Messiaen at the Conservatoire and by Villa-Lobos in Brazil. At its core, in the second part, are extensive sections devoted to sonata and symphonic structures, derived above all from the practices of d'Indy's hero figures Beethoven and Franck. These structures were held to embody eternal humanistic and ethical values, a bulwark against the formal flux and harmonic sensationalism of Debussy's *Pelléas et Mélisande* and Strauss's expressionistic anarchy in *Salome* and *Electra*. Above all, the unifying device of cyclic themes is invested with theological symbolism, as representing the Holy Trinity and the idea of perfection. For all its Catholic ethos, however, the work's fully comprehensive and unified presentation of musical history, theory and analysis owed much to current scientific positivism.

Inevitably, in the context of the secular and increasingly politicized Third Republic, the Schola attracted a great deal of controversy and hostility; despite its admirably progressive intentions, it became increasingly regarded as a reactionary and anti-Semitic institution. Moreover, d'Indy's dogmatic emphasis on the teaching of counterpoint (and refusal to acknowledge harmony as a separate subject of study) was irresponsibly exploited by the young critic Emile Vuillermoz, who in 1905 unleashed a fatuous journalistic war. According to his ideological distortion, the 'verticalist' party of Debussy, Ravel and the Impressionist school represented the future with their cult of experimental harmonies and orchestral effects, whereas the 'horizontalists' of the Schola remained imprisoned in their outdated formal and contrapuntal procedures. Wisdom, however, had prevailed in Fauré's 1905 reforms of the Conservatoire,

which belatedly adopted d'Indy's ideas of historically based composition courses and strengthened contrapuntal studies.

In its work of reviving forgotten masterpieces of the medieval, Renaissance and Baroque eras, the Schola Cantorum justly won widespread acclaim. Of particular note were d'Indy's concert performances, with student forces, of Monteverdi's *Orfeo* and *L'incoronazione di Poppea* in his own editions from manuscript sources discovered in Italian libraries by Romain Rolland. D'Indy also contributed to the enterprising Durand edition of Rameau's works with *Hippolyte et Aricie* and *Dardanus*; these, together with *Castor et Pollux*, were also given at the Schola's concerts, winning the approval of Debussy.

Indy, Vincent d'

3. Works.

D'Indy's somewhat academic corpus of chamber music (including three completed string quartets) is generally less interesting than his orchestral works which, while always manifesting his concern for the utmost structural coherence, invariably contain important programmatic or symbolic elements; above all, nature painting brought out his full imaginative mastery of orchestral texture. His major apprentice work was *Wallenstein* (1870–81), a group of three interrelated concert overtures on Schiller's drama. Although it cost him an enormous amount of time and labour, the result is all too derivative in style, with his Wagner obsession apparent in heroic themes blatantly adapted from the 'forging' and 'sword' motives in the *Ring*. Increasing refinement of technique was achieved in this early German-inspired period, as in the Weberian *La forêt enchantée* (1878). Impressions of medieval Nuremberg (visited in 1873) lay behind the conventionally romantic cantata *Le chant de la cloche* (1879–83). Employing Wagner's leitmotif technique, this work is remarkable mainly for its bold orchestral realizations of a variety of bell sonorities, to which two pianos contribute. The finale's assembly of civic worthies to judge Wilhelm's last bell is very obviously indebted to *Die Meistersinger*.

Happily, d'Indy's ancestral roots in the Ardèche ultimately proved stronger than the enchantments of Bayreuth, and the *Symphonie sur un chant montagnard français* for piano and orchestra (1886) proved to be a breakthrough in the development of his personal style. Though Franckian in its symphonic structure, with two cyclic themes, the work's superb orchestral invention evokes the mountainous terrain and sounds of nature. The solo piano, Lisztian in its Impressionistic textures, is essentially decorative and interacts with rather than opposes the orchestra. Likewise, his long gestated music drama *Fervaal* (1889–95) is set in the Ardèche, in the remote era of the Saracen invasions, and portrays a conflict of religious civilizations. Though conceived on a Wagnerian scale, with pervasive use of leitmotifs, the opera also owes much to Meyerbeer (d'Indy's boyhood idol) in its local and exotic colour, as well as in its assured handling of crowd scenes. Moreover, it follows the example of Berlioz rather than of Wagner in its orchestral technique of highlighting individual sonorities. D'Indy's invention is at its boldest in the earth goddess Kaito's prophesy of the new religion of light in Act 2, using extraordinary sequences of whole-

tone harmonies and parallel triads to create an atmosphere of awe and mystery.

During the following years, d'Indy's compositions display a structural radicalism as if in opposition to the pedagogical strictness of the Schola's courses. *Istar's* novel set of orchestral variations in reverse order – moving from complexity towards simplicity, and ending with a bare unison statement of the theme – aptly illustrates the Assyrian legend of Istar gradually divesting herself as she passes through the seven doors of the underworld to release her beloved. The piece was subsequently choreographed with great success, notably by Ida Rubinstein in the 1920s.

D'Indy's urge to confront the scientific materialism of his age generated the unusual opera *L'étranger* (1898–1901), in part an expression of contempt for Zola's and Bruneau's doctrine of realism. Set in a fishing community on the Atlantic coast, *L'étranger* is a deliberately hybrid conception, opposing banal *verismo* scenes to others of a mystical, symbolist character owing something to Maeterlinck; in the later scenes the redeeming figure of the Stranger appears, characterized by two themes of liturgical type. For his intimate dialogues with Vita, a local girl, d'Indy adapted the psychological conversation technique of Ibsen. But the work's outstanding feature is undeniably its vivid depiction of the sea, both in Vita's pantheistic communings and in the final catastrophic storm scene, which uncannily anticipates Debussy's *La Mer*.

The Ardèche reappears in *Jour d'été à la montagne* (1905), whose three movements depict the course of a day in the country, from sunrise to sunset. The music grows out of and finally returns to the primordial darkness of a C spread over six octaves, the closing section being more or less a palindrome of the opening. Also noteworthy are the advanced features of the orchestration; for example, piano and chromatic timpani graphically depict a brief clap of thunder in an almost Bartókian manner. By contrast, the Symphony in B \flat (1902–3) exemplifies the grand canonical cyclic structures as taught at the Schola Cantorum, concluding with a fugal finale to restrain the initial motto theme's tendency to generate subversive whole-tone harmonies and textures.

D'Indy's politically reactionary beliefs are given full voice in his third music drama, *La légende de Saint-Christophe* (1908–15), a celebration of traditional Catholic regionalism as opposed to modern liberal democracy and capitalist values. The most notorious part, and at the same time the weakest, is the first act's tasteless parade of false thinkers, scientists and artists united in their hatred of Christ and charity, in which stylistic features of Debussy and Stravinsky are ruthlessly parodied. However, an appropriately elevated tone is achieved thereafter. The second act's magnificent symphonic poem represents Auférus's disappointing journey in search of the King of Heaven, with clashing bell sonorities to evoke Papal Rome. The Ardèche becomes hallowed by the appearance of the Christ-child, whom Auférus unknowingly carries across a raging torrent (depicted by *moto perpetuo* chromatic semiquavers), thereby becoming St Christophe. Crucial dramatically are the convulsive, harshly dissonant scene of his baptism and that of the conversion of Nicéa, Queen of Pleasure, both accompanied by a chromatic chord sequence representing

the waters of life, obviously derived from the magic fire music in *Die Walküre*. Appropriately, some Gregorian themes - *Vexilla regis*, *Haec dies* and *Qui vult venire* – also play a significant role in the spiritual drama.

The outstandingly poetic orchestral works of d'Indy's Indian summer, *Le poème des rivages* (1919–21) and *Diptyque méditerranéen* (1925–6), atmospherically evoke the coasts and seascapes of the Mediterranean. Here d'Indy's visual sense is at its most acute in the creation of translucent textures to realize the effects of changing light, and the music has a restrained warmth of feeling and colouristic beauty that totally undermines the standard image of the man as a bigoted, desiccated pedant. If outwardly his militaristic persona, addiction to polemics and urge to pedagogical systems represented the assertive traits in his character, a more subtle dimension is evidenced in his attraction to the Italian 'primitive' painters and late 19th-century symbolism, particularly the poetry of Mallarmé and the earlier music of Debussy. He was a man of contradiction and complexity.

Indy, Vincent d'

WORKS

operas

op.

- Les burgraves du Rhin (R. de Bonnières), 1869–72, inc.
- Les maîtres-sonneurs (after G. Sand), project, 1874
- Mahomet (after J.W. von Goethe), project, 1874
- Les abencérages (after F.R. de Chateaubriand), project, 1874
- Axel (d'Indy, after E. Tegnér), project, ?1878, only lib completed, later used as basis for Fervaal
- Peau d'âne (féerie, after C. Perrault), project, 1879
- L'organiste de Harlem (oc, 3, d'Indy), project, ?c1880, lib in *F-Pn*
- 14 Attendez-moi sous l'orme (oc, 1, J. Prével, de Bonnières, after J.F. Régner), 1876–82, Paris, Opéra Comique (Favart), 11 Feb 1882
- 18 Le chant de la cloche, 1879–83, Brussels, Monnaie, 21 Nov 1912 [stage version of choral work]
- 40 Fervaal (action musicale, prol, 3, d'Indy), 1889–93, orchd 1893–5, Brussels, Monnaie, 12 March 1897
- 53 L'étranger (action musicale, 2, d'Indy), 1898–1901, Brussels, Monnaie, 7 Jan 1903
- 67 La légende de Saint-Christophe (drame sacré, 3, d'Indy, after J. de Voragine: *Legenda aurea*), 1908–15, Paris, Opéra, 9 June 1920
- 80 Le rêve de Cinyras (comédie musicale, 3, X. de Courville), 1922, orchd 1922–3, Paris, Petite Scène, 10 June 1927

orchestral

- Symphony no.1 (Symphonie italienne), A, 1870–72, unpubd
- La divine comédie, sym. poem after Dante, project, 1871
- 5 Jean Hundaye, sym., 1874–5, unpubd
- 6 Antoine et Cléopâtre, ov. after W. Shakespeare, completed 1876, unpubd
- 8 La forêt enchantée (Harald), sym. legend after Uhland, 1878
- 12 Wallenstein, 3 sym. ovs. after F. Schiller, 1870–81: Le camp, Les piccolomini, 1873, rev. as Max et Thécla, 1881, La mort de Wallenstein
- 19 Lied, vc/va, orch, 1884

- 21 Saugefleurie, legend after de Bonnières, 1884
- 25 Symphonie sur un chant montagnard français (Symphonie cévenole), pf, orch, completed 1886
- 28 Sérénade et valse, 1885, op.17/3 also orchd after 1887, only frag. extant [after pf works opp.16/1 and 17/1]
- 31 Fantaisie sur des thèmes populaires français, ob, orch, 1888
- 34 Karadec (incid music, A. Alexandre), 1890
- 36 Tableaux de voyage, 1889, orchd 1892 [after pf works op.33/1, 2, 5, 4, 6, 13]
- 42 Istar, sym. variations, 1896
- 47 Médée (incid music, C. Mendès), 1898
- 55 Choral varié, sax/va, orch, 1903
- 57 Symphony no.2, BL, 1902, orchd 1902–3
- 61 Jour d'été à la montagne, sym. triptych, 1905
- 62 Souvenirs, poem, 1906
- 70 Symphony no.3 (Sinfonia brevis (de bello gallico)), 1916–18
- 76 Veronica (incid music, C. Gos), 1919–20, unpubd
- 77 Poème des rivages, sym. suite, 1919–21
- 87 Diptyque méditerranéen, 1925–6
- 89 Concert, fl, vc, str, 1926

sacred vocal

- 22 Cantate Domino, canticle, 3vv, org, 1885
- 23 Sainte Marie-Madeleine (cant.), S, female vv, pf, hmn, 1885
- 41 Deus Israel conjungat vos (motet), 4–6vv, 1896
- 46 Les noces d'or du sacerdoce (P. Delaporte), canticle, 1v, hmn, 1898
- 49 Sancta Maria, succure miseris (motet), 2 equal vv, org, 1898
- 75 Pentecosten (24 popular Gregorian canticles), 1v, unison vv, org, 1919
- 79 Ave, regina coelorum (motet), 4vv, 1922
- 83 Deux motets en l'honneur de la canonisation de Saint Jean Eudes, 4vv, 1925
- 88 O domina mea (motet), 2 equal vv, org, 1926

secular vocal

Infantas, Fernando de las

(*b* Córdoba, 1534; *d* c1610). Spanish composer and theologian. He was his family's third son, heir to a coat-of-arms bestowed by Edward III of England, and the only Spanish composer of his time of sufficiently high social rank to be called 'Don'. He received a fine classical education and the best musical training obtainable in Córdoba, where Alonso de Vieras was *maestro de capilla* of the cathedral. In 1571 or 1572 he went to Rome, aided by a pension from Philip II of Spain. Alarmed by proposed revisions to the Roman Gradual according to the recommendations of humanist scholars, Infantas protested to Philip II in a letter of 25 November 1577. The king intervened, causing Pope Gregory XIII to delay Palestrina and Annibale Zoilo in their preparation of the new version. From 1572 until about 1597 Infantas lived on his patrimony at Rome, working as a volunteer in a hospital for the needy. He was ordained in 1584, and served afterwards as chaplain of a small church in a poor suburb. In 1601 he published at Paris three theological treatises, one of which, *Tractatus de praedestinatione*, was placed on the Index in 1603 by Pope Clement VIII. During the last years of his life he became involved in theological and political disputes. By 1608 he was in such penury that he petitioned Philip III for aid.

All his compositions were written before his ordination. *Plura modulationum genera* (1579) is a set of 101 counterpoints, in three to eight parts, based on a single ten-note Gregorian incipit (Psalm cxvi). The first 14 are three-voice exercises composed during his student days in Córdoba. His next datable works are three five-voice motets in the second book of *Sacrae varii styli cantiones* (1578): no.28 commemorates the death of Charles V of Spain at the monastery of Yuste near Plasencia in 1558; no.20 implores divine aid against the siege of Malta by the Turks in 1565; and no.5 celebrates the naval triumph at Lepanto in 1571. His last datable composition is a motet from the third book of *Sacrae varii styli cantiones* (1579), *Jubilate Deo*, written for the jubilee year 1575. Three motets from the same collection also appeared in anthologies published at Nuremberg. Many of the motets of *Sacrae varii styli cantiones*, even those which are comparatively free, reveal Infantas's interest in plainsong. In the virtuoso 8-voice setting of *Loquebantur variis linguis*, the composer depicts 'the Apostles speaking with divers tongues' by having three voices sing a whole tone higher than notated; the lower voices sing a mirror canon.

WORKS

Sacrarum varii styli cantionum liber 1 (Venice, 1578); 10 motets, 4vv, *Antología polifónica sacra*, ii (Madrid, 1956); *Loquebantur variis linguis*, 8vv, ed. B. Turner (London, 1984)

Sacrarum varii styli cantionum liber 2 (Venice, 1578)

Sacrarum varii styli cantionum liber 3 (Venice, 1579); 1 motet also in 1583², 2 in 1585¹

Plura modulationum genera (Venice, 1579); 2 canons also in 1591²⁶, 1 in P. Cerone: *El melopeo y maestro* (Naples, 1613/R)

ROBERT STEVENSON

Inflection [inflexion].

A deviation from a pitch or pitches regarded in some way as standard.

(1) In Gregorian and other chant, the term 'inflection' is generally reserved for simple customary deviations from a monotone reciting note (*tenor, tuba*) dictated by considerations of punctuation during the singing of prose texts: the simplest method of singing a religious service, or part of one, may be described as 'monotone with inflections'. It is often said that the inflected recitative originated for practical reasons: that it made the text more intelligible, that it helped readers by providing simple melodies that would serve for many texts, and that it made words and voice more audible in large gatherings. Though partly true, such explanations are probably too narrow. The formulaic solo chants especially are examples of sacral song-

speech found in many religions and cultures, the explanation of which lies largely in the psychology of the religious mind. The regulation and codification of lesson formulae, psalm tones and related matters imposed in the Middle Ages on the old oral traditions of this song-speech gave it the trappings of practicality but obscured its origins.

Three classes of inflection may be distinguished. The ascent to a reciting note is called the intonation; the descent from it is called the ending (termination, cadence, *punctum*); the variation that may occur between these two is called the mediation (or median cadence), or, for a more minor variation, the flex (*flexa*). In their normal form the Gregorian psalm tones illustrate the use of these inflections: an intonation leads to the monotone reciting note, which is broken by a half-close at the mediation; the reciting note is then resumed until the closing inflection, or ending (*differentia*) (see [Psalm, §II, 7\(iv\)](#)). Of the three types of inflection, the ending is the most universal, and the intonation that most readily forgone.

Regular inflections have been used for the reading of prose texts such as lessons, collects (prayers), versicles and responses by the officiant and the choir, and also for some of the melodies used for certain chants with fixed texts, such as the [Pater noster](#), [Exultet](#), [Te Deum](#), [Credo](#) and [Gloria in excelsis](#). These inflections have differed in detail at various times and places, but the same principles underlie them all. Some examples from the Sarum rite, compared with Guidetti's revised inflections in his *Directorium chori* and the revised choirbooks of Solesmes (as conveniently laid down in *LU*, 98–127, for example), clearly illustrate the types of similarity and difference. (The *Liber usualis* versions seem as dependent on Benedictine tradition as on general medieval practice.)

The narrow ambitus of most Gregorian recitation tones prevents their being assigned to any of the church modes, although they are characterized by an important modal feature, the positioning of the reciting note a tone or a semitone above its lower neighbour; the more ancient of the tones for collects and lessons seem to have favoured a reciting note on *a* or *g*, a tone above the inflections on *g* or *f* respectively. Later medieval practice favoured recitation on *c'* or *f*, with the result that inflections occurred using the semitone and minor 3rd below the reciting note.

For the collect of the day the Sarum books prescribed mostly a simple cadence at the end, taken up by the 'Amen' ([ex.1](#)); sometimes there was a mediation as well as a cadence. Guidetti prescribed two ferial forms and one festal: the ordinary ferial was an uninflected monotone (thus also in the *Liber usualis*), whereas the festal had two inflections ([ex.2](#); these inflections occur also in the *Liber usualis*). The second was used at the principal break (*metrum*) in the body of the collect, and the first, the flex, at minor breaks.

x

x

For the ordinary versicles and responses the drop of a minor 3rd is universal. In the case of a sentence ending with a monosyllable Guidetti and the Solesmes books prescribed a return to the reciting note, the Sarum rite a rise of a tone. Some versicles had more elaborate cadences (e.g. [ex.3](#), from the Sarum rite). The 'ekphonesis', or closing sentence pronounced aloud at the end of a prayer, had two forms, one with a drop of a semitone at the end, and another, more elaborate one ([ex.4](#)). The drop of a perfect 5th occurred in Sarum at the end of certain versicles and for the collects; it occurred also in Old Testament lessons at Mass and at the end of the preliminary *Jube Domine benedicere*.

<input type="checkbox"/>
<input type="checkbox"/>

Lessons ended with the drop of a semitone, or included both a mediation and a termination ([ex.5](#)). The chapter had inflections broadly similar to those of the lessons ([ex.6](#)), the drop of the 5th being modified for a monosyllable like that of the minor 3rd in the versicles. Sentences containing a question were recited a semitone lower, with a rise at the end to the normal reciting note.

<input type="checkbox"/>
<input type="checkbox"/>

The singing of the [Epistle](#) and [Gospel](#) followed the lines already indicated, but the forms were more elaborate. Each sentence had in Sarum a mediation (*metrum*, [ex.7](#), the same in Epistle and Gospel) and ending (*punctum*, differing between Epistle and Gospel; [ex.8](#) shows that for the Epistle). The final sentence had a special form of its own, common to Epistle and Gospel, and interrogatives were treated as in ordinary lessons. These Sarum forms were preserved in a slightly different shape by the Benedictines; Guidetti prescribed a greatly simplified version, which subsequently became very common.

<input type="checkbox"/>
<input type="checkbox"/>

The inflections of the Ambrosian rite are numerous and very different from those described above (see C. Perego: *La regola del canto fermo ambrosiano*, Milan, 1622; see also [Ambrosian chant](#), §4). For details of

early variant traditions see Wagner (pp.19–82). For the adaptations of the Sarum inflection for Anglican use, with English texts, see Arnold. For the more elaborate developments in Gregorian chant denoted by the term ‘inflection’ see [Psalm, §II](#). For details of the various notational systems devised for the simpler inflection of various early traditions, including the Latin, see [Ekphonic notation](#).

(2) The term ‘inflection’ is used also to signify the bending of pitch for artistic purposes, especially in vocal music. The degree to which pitch inflection is used varies from one culture to another. The cultural aesthetic of classical European traditions allows little more than the tasteful use of vibrato or the occasional use of portamento, and in the case of vocal music, tremolo. By contrast, in most South Asian traditions the importance of various techniques of pitch inflection as a stylistic feature can hardly be overemphasized. The same is true for performance on the Japanese *shakuhachi*, on which a mastery is expected in a wide range of techniques for inflecting pitch in combination with amplitude, dynamics and subtle gradations of timbre. The hourglass drum of West Africa derives its structure from the need to be able to vary the pitch widely while the drum is sounding after it is struck.

In most cultures, moreover, the inflection of pitch is a normal technique of ornamentation: the ‘blue’ notes of jazz, for example, may vary in pitch by more than a semitone and thus range between a sharp and a flat intonation of the pitch in question. [Ex.9](#) shows the blues scale, the ‘blue notes’ being indicated by asterisks. Pitch bending is also used by jazz and rock keyboard players (see [Electronic instruments, §IV, 5\(ii\)](#)). Caccini (*Le nuove musiche*, 1601/2) described two methods of ‘tuning the voice’ (*intonazione della voce*), one of which he claimed was overused in his time and involved attacking an initial note from a 3rd below.

See Intonation (2).

Information theory.

A theory which seeks to describe, by means of mathematical equations, the properties and behaviour of systems for storing, processing and transmitting information. Here the term 'information' is interpreted broadly as covering not only messages transmitted via the familiar communications media (radio, television, telephone and computer networks), but also the signals (aural, visual and other sensory stimuli) by means of which an individual perceives its immediate environment or communicates with others.

One of the fundamental tenets of information theory is that information can be quantified and measured in terms of the number of bits (binary digits: 0, 1) required to store or transmit a message. Information is understood as the selection by a message source of one particular message from a set of all possible messages. Since the simplest choice (that between two equally likely alternatives) can be represented by a single bit, the quantity of information represented by this choice is taken as the fundamental unit. Similarly, two bits represent a choice among four alternatives each with probability $1/4$, and three bits represent a choice among eight alternatives each with probability $1/8$. If the alternatives are not all equally likely, then each message in the set will have its own probability of occurrence. The average information content of the message set, or the average number of bits required to represent a message from the set, is called the entropy of the set (H). The entropy is found by adding up the information content of each message multiplied by its probability of occurrence. If the entropy of a message source is H bits per message then every binary encoding representing the source requires an average of at least H bits per message. Conversely, it is always possible to find binary encodings representing the source which use arbitrarily close to H bits per message. Thus entropy can be interpreted as the average number of bits required per message in the most efficient binary encoding of the source. Suppose, for example, we have a source which selects randomly from a message list of eight musical phrases $m_1 \dots m_8$ with associated probabilities $p_1 \dots p_8$. If all eight phrases have an equal probability of $1/8$ then $H=3$ bits, its maximum possible value; however if four phrases each have a probability of $1/16$ while the other four have probabilities of $1/4$, $1/8$, 0 and 0 then $H=2$ bits. The difference is a result of the unequal probabilities and reveals some of the statistical structure of the source; since it contains only $2/3$ of the maximum information it is said to exhibit 33% redundancy. This is known as a [Stochastic](#) process and is characteristic of all information sources in information theory. In fact a music source is not a simple stochastic process; it is a Markov chain, where the probability of a future musical event occurring in the sequence depends explicitly on the occurrence of previous events.

From 1956 a spate of publications appeared applying information theory to many aspects of music analysis and the aesthetics of music. In particular, information theory has been used to determine the relative information rates or entropy profiles of different samples of music in attempting to analyse content, style or perception objectively. Youngblood (1958) made considerable use of the concept of redundancy in defining the notion of style, whilst Moles (1958) addressed the broader issues of aesthetic perception including what he termed 'sonic material'. Meyer (1956) came close to information theory in viewing styles as culturally conditioned

systems of expectations which are continually aroused, fulfilled or frustrated, thereby engendering musical meaning. Revising his definition to explicitly include information theory led Meyer (1957) to a three-stage model for the evolution of musical meaning, and to the notion of designed entropy which measures a composer's intentional deviation from a stylistic norm. Both Meyer (1957) and Moles (1956) addressed the modulating or distorting effect of noise on musical information. The situation in which music is frequently reheard was examined by Meyer (1961).

Krahenbuehl and Coons (1958) devised quantitative indexes of articulateness and hierarchy which essentially measure the degree of coherence of a sequence of musical events in terms of their unity and diversity. Hiller and Bean (1966) analysed four sonata expositions statistically and derived a variety of 'contours of information fluctuation' from which they were able to draw conclusions regarding the composers' styles and make useful comparisons between the sonatas. Böker-Heil (1971, 1972, 1977) applied statistical and related data analysis techniques to 12-note rows from works by Berg and Schoenberg. His stylistic analyses of madrigals by Palestrina, Rore and Marenzio used three-dimensional graphical profiles of statistically determined functions to define and differentiate stylistic features of works. He later employed a novel tripartite computer simulation model to analyse folksong melodies from the southern Tyrol.

More recently important work has been done by Conklin, Witten and others (1988, 1992, 1994, 1995) on the entropies of Bach chorale melodies as measured by both human and computational models of music prediction. Human subjects were asked to predict the next pitch in each chorale melody using a gambling technique to quantify their degree of confidence in the prediction. The computational approach involved learning inductively the rules for generating the musical sequences. Good agreement between the human and computational estimates was obtained, both for the entropy profiles and for the average pitch entropies. For the latter, values of between 1.5 and 2.1 bits per musical event were found, corresponding to an average probability of between 35% and 23% per musical event respectively.

The combinatorial complexity of two classes of algorithm for musical similarity and melodic recognition has been analysed in detail and compared quantitatively by Overill (1993). The computational problems associated with approximate string-matching techniques for music analysis and musical information retrieval are considered by Crawford, Iliopoulos and Raman (1998).

RICHARD E. OVERILL

Ingalls, Jeremiah

(*b* Andover, MA, 1 March 1764; *d* Hancock, VT, 6 April 1838). American tune book compiler, composer, choir leader, singing school master and bass viol player. Over half the 137 tunes in his only tune book, *The Christian Harmony, or Songster's Companion* (Exeter, NH, 1805/*R*), were composed in the New England style prevalent in northern tune books before 1820. The remaining settings constitute the first appearance in print of the spiritual folksong – a sacred text set to a formerly secular melody – a genre that appeared frequently in southern tunebooks from the second decade of the 19th century. Other characteristics of *The Christian Harmony* that appear rarely in northern tune books but commonly in later southern ones are rhythmic and scalar influences from folk and secular music, repeated phrases, three-voice settings, tunes with added choruses, revivalist poetry, the inclusion of complete texts, and tunes named after the texts to which they are set. Ingalls's book thus occupies a unique position in the tune book literature.

DAVID G. KLOCKO

Inganno (i)

(It.: 'deception').

A technique of hexachord transposition resulting in the alteration, development or transformation of thematic material and found particularly

in imitative textures of works (mostly non-vocal) written during the later Renaissance and earlier Baroque periods.

Artusi explained the term in the second part of his treatise attacking modern musical practice (1603): 'The deception [*inganno*] takes place whenever one part begins a theme and another voice follows it without using the same intervals but still retaining the same names of the hexachord syllables'. He provided an illustration of the technique (ex.1). An initial theme in the natural hexachord (*a*) is changed (*b*) by transposing the first pitch into the hard hexachord (*D sol* replaces *G sol*) and the third and fifth pitches into the soft hexachord (*B fa* replaces *F fa*, and *F ut* replaces *C ut*). Although this example is related to a single imitative point, contemporary composers seem to have taken advantage of the technique as a means of interconnecting the thematic material of a whole work. Artusi made it clear that the use of *inganni* was, however, not confined to his contemporaries ('li Moderni') but might be found in the works of earlier composers ('gli valenti Compositori passati'). He claimed that some modern musicians misunderstood the technique; he was perhaps referring here to the greater flexibility with which it was used in the early 17th century and to its occurrence in dissonant and chromatic contexts.

The only known composition to refer to the term in its title is Trabaci's *ricercare* on the 4th tone (1603), 'con tre fughe et inganni'. *Inganni* used in his later *ricercares* (1615) are identified in the musical text. It has been suggested (by Jackson, 1971) that *inganni* played a part in the chromaticisms of the late polyphonic madrigal, including works by Gesualdo. They are certainly found in many of the polyphonic instrumental and keyboard works of Frescobaldi – thus highlighting the consummate versatility of his handling of thematic variation – and to some extent in the instrumental music of Tarquinio Merula.

The mid-16th century repertory of the Bourdeney Codex (*F-Pn* Rés.Vm 851) contains the earliest identified examples of the systematic use of *inganni* in *ricercares*. Four of these pieces also appear in the Chigi Manuscript (*I-Rvat* Chigi Q.VIII.206), there attributed to 'Giaches'; once thought to be Giaches Wert, it is now considered more likely to refer to 'Giaches Brumel' ([Jacques Brunel](#); Newcomb, and see RRM, lxxxix, 1991), organist of the court of Ferrara from about 1532 to 1564. Luzzaschi, Frescobaldi's teacher, succeeded Brunel, coincided with him at Ferrara, and may have been his pupil. The likelihood that Jacques Brunel was organist of Rouen Cathedral in 1524 may establish successive links between a Franco-Flemish composer and composers working in Ferrara, Rome and Naples. This may suggest that the technique of *inganno* dates back to the earliest years of imitative composition and may not be confined to Italy. Given the importance of the hexachord system, and especially of

hexachordal mutation, in applied music theory and education this would not be a surprise. Although the most systematic use of *inganno* is found in keyboard and instrumental music, there are less overt examples in 16th-century vocal polyphony, but it is not always possible to determine whether its use is deliberate (Harper, 1978).

JOHN HARPER

Inganno (ii)

(It.).

See [Interrupted cadence](#).

Ingegneri [Ingegnieri, Ingignieri, Ingignero, Inzegneri], Marc'Antonio

(*b* Verona, 1535–6; *d* Cremona, 1 July 1592). Italian composer and instrumentalist. He was an important madrigalist and composer of sacred music in the north Italian tradition. He taught Monteverdi, in whose early music particularly his influence is strongly heard.

1. Life.

Ingegneri was born in Verona, the youngest child and only son of Innocenzo Ingegneri, a goldsmith, and Giulia Foscari. The civic register of May 1541 gives Marc'Antonio's age as five years. Later documents show that the family lived in a house on Via Paradiso, in the parish of S Vitale. He became a choirboy at Verona Cathedral and was probably taught by Jacquet de Berchem and Giovanni Brevio; he may have remained at the cathedral long enough to be taught by Vincenzo Ruffo, who was appointed *maestro di cappella* in 1551. He later dedicated his first book of masses to

the cathedral canons, referring to himself as 'an alumnus of your teaching'. By 1557 his father had died and Ingegneri had left Verona for the environs of Padua and Venice, where he was employed as a 'suonadoro di violino' for processions of the Scuola Grande of S Marco.

No clear documentary evidence of Ingegneri's activities in the first half of the 1560s has yet been discovered; however, he may have gone to Parma to study with Rore. In the dedication of a madrigal book 21 years after Rore's death, Ingegneri recalled that he had been 'on friendly terms with M. Cipriano, and talked to him, and personally received his tuition'. His claim is supported by the fact that three of his madrigals – *Non mi toglia il ben mio*, *Chi vuol veder tutta raccolta* and *Spess'in parte del ciel* – were misattributed to Rore and included in *Le vive fiamme* (RISM 1565¹⁸), a posthumous collection produced only three months after Rore's death.
